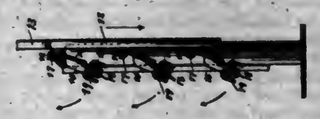
3. An improved heurter having a seat or bearing for the lower end of the prop, and provided with a guide or deflector arranged for engagement by the prop as the latter is moved upstream and forward from its seat, and having its upper side and its face next the seat or bearing curved or inclined, substantially as set forth.

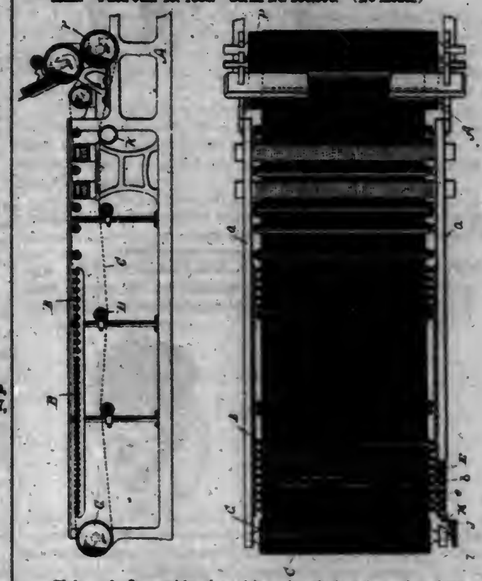
398,088.



398,089. CLOTHES-STICK. WILLIAM H. SCOTT, Toronto, Canada, assignor of one-half to Hester Veale Hardy, same place. Filed July 7, 1888. Serial No. 279,274. (No model.)

Claim.—The clothes-stick described, consisting of the stocks A, pivotally connected together and formed with sockets, the sticks B, fitted into the sockets at one end of said stocks, the shorter sticks, C, fitted into the sockets at the other end of said stocks, and the spiral spring connecting the ends of said shorter sticks, substantially as and for the purpose specified.

398,090. FENCE-MACHINE. JOHN SORNSON, Brayton, Iowa. Filed Dec. 21, 1888. Serial No. 294,304. (No model.)



Claim.—1. As a means for wiring fence-pickets, a twister comprising a body portion, arms hinged upon one face of the body, grooved to receive the wire strands, and a clamping-fork attached to the free extremity of the said arms, substantially as shown and described.

2. As a means for wiring fence-pickets, a twister comprising a body portion, arms hinged at intervals upon one face of the body, said arms being provided with a transverse groove in opposite sides near their free end, and a clamping-fork extending across the said grooves, all combined for operation, as and for the purpose specified.

3. The combination, with fence-posts and strands of wire secured to said posts and arranged in parallel pairs, of a twisting device comprising a body portion, arms hinged at intervals upon one face of the body, said arms being provided with a transverse groove in opposite sides to receive the wires, and an adjustable clamping-fork attached to the arms and extending across the grooves therein, substantially as shown and described.

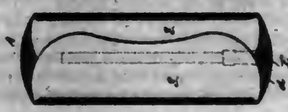
4. As a means for wiring fence-pickets, a twister comprising a body portion, arms hinged at intervals upon one face of the body, said arms being provided with a transverse groove in opposite sides near their free end, and a revoluble U-shaped fork pivoted in the free end of said arms, the members of which fork extend across the grooves produced in the arms, substantially as shown and described.

398,091. PAPER-MAKING MACHINE. RICHARD SMITH, Boston, Mass. Filed Jan. 13, 1888. Serial No. 260,506. (No model.)

Claim.—1. In combination with a wire-cloth and a series of tube-rolls which support it, the driving-shaft and gearing which connects said driving-shaft with said series of rolls, substantially as set forth.

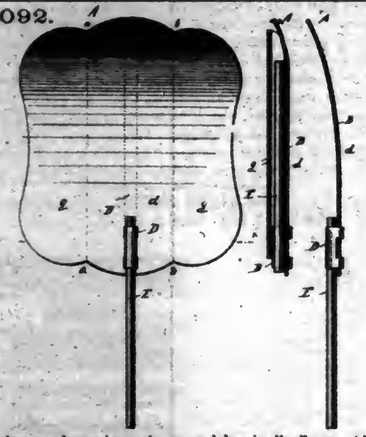
2. In Fourdrinier paper-making machines, the combination, with an endless wire-cloth and the series of independently-mounted removable tube-rolls, of the intermediary driving-shaft and the series of socketed shafts which interconnect the tube-rolls with said intermediary shaft, whereby each tube-roll is independently and positively rotated, substantially as stated.

3. In combination with the drive-roll P, the driving-shaft E, provided with gears, the series of tube-rolls *a a*, and the wire-cloth C, resting thereon, the shafts *d d*, socketed at *f* at one end and furnished with the gears *e e* on the opposite end, said sockets engaging the shafts of the tube-rolls and the gears meshing with said gears upon the driving-shaft E, substantially as set forth.



4. The combination, with the main shaft E, its gears *b b*, and the independently-mounted tube-rolls B B, having shafts *i i*, with lugs *j j*, of the interconnecting gear-furnished shafts *d d*, socketed at *f*, whereby the tube-rolls are connected and disconnected, and the wire-cloth carried by said tube-rolls, as and for the purposes specified.

398,092. FOLDING FAN. FRIEDMAN SCHEINEMANN, New York, N. Y. Filed Mar. 29, 1888. Serial No. 268,856. (No model.)



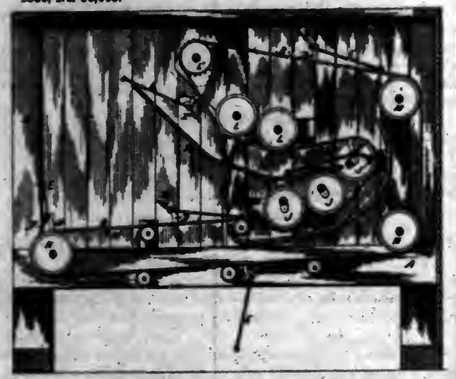
Claim.—1. In a fan, the combination, with a sheet creased or jointed longitudinally, of a handle-socket on the said sheet and a sliding handle in said socket, substantially as herein shown and described.

2. In a fan, the combination, with a sheet creased or jointed to fold, of a spring mounted longitudinally on the central section of the sheet, a socket held longitudinally on the central section of the sheet, and a sliding handle in said socket mounted to slide longitudinally over the central section of the folding sheet, substantially as herein shown and described.

3. In a fan, the combination, with a sheet, of a handle secured

398,092.

on said sheet, and a spring-strip secured longitudinally on said sheet, substantially as herein shown and described.

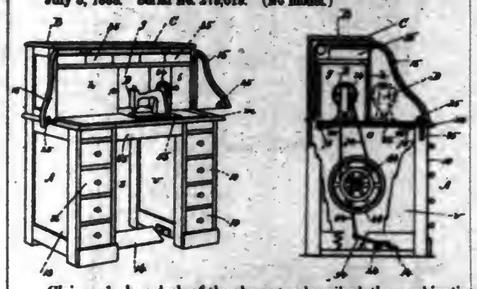


398,093. MOUTH-PIECE FOR BAGS OR RECEPTACLES. WARREN H. TAYLOR, Stamford, Conn., assignor to The Yale & Towne Manufacturing Company, same place. Filed Aug. 10, 1888. Serial No. 282,411. (Model.)

Claim.—1. In combination with a mouth-piece of a bag or receptacle, a lock having a rotary key-plug and an arm rigidly connected to the plug at one end, whereby the mouth-piece is opened and closed by turning the key-plug, substantially as set forth.

2. In a mouth-piece for a bag or receptacle having two parts, a fastening for securing these parts together, a rotary plug-lock, and an arm secured to the key-plug of the lock and covering the fastening when the lock is locked, substantially as set forth.

398,094. CLEANING METAL PLATES OR SHEETS. RICHARD R. THOMAS, Lydbrook, County of Gloucester, England. Filed Nov. 22, 1887. Serial No. 255,896. (No model.) Patented in England Dec. 8, 1886, No. 16,065.



Claim.—1. The herein-described apparatus for cleaning metal plates or sheets, said apparatus comprising platforms containing cleaning material, a traveling band to carry the plates, and rollers carrying the band, one side up over one platform and the reverse side up over the next platform, as and for the purpose set forth.

2. The herein-described apparatus for cleaning metal plates or sheets, said apparatus comprising curved platforms containing cleaning material, a traveling band having rigid and pivoted holding-fingers for the plates, and rollers carrying the band, one side up over one platform and the reverse side up over the next platform, as and for the purpose set forth.

3. The herein-described plate-carrying band, comprising endless bands with connecting stretchers, ringers and standards on the stretchers, and counterbalanced fingers pivoted to the standards, substantially as described.

398,095. DESK. HERBERT I. THOMPSON, Waltham, Mass. Filed July 5, 1888. Serial No. 279,019. (No model.)

Claim.—1. In a desk of the character described, the combination of a body, a sliding carriage in the top of said body, a sewing-machine secured to said carriage, a case hinged to the rear of said body and adapted to conceal said machine, and treadle mechanism for said machine disposed in said body, substantially as set forth.

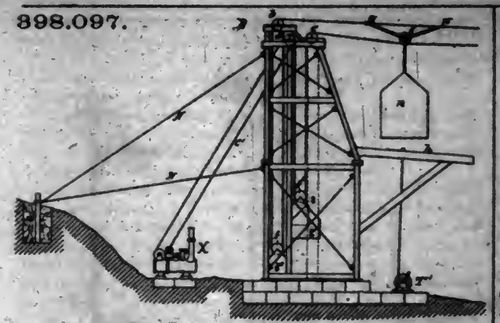
2. In a desk of the character described, the combination of the body A with the case B, provided with the pigeon-holes *d f*, drawers 35, cover C, wings 15, and doors *h i*, said case being hinged to said body and adapted to form a table therewith, substantially as specified.

3. In a desk of the character described, the combination of a body provided with a foot-space, drawers on one side of said space and a case on the opposite side thereof, a case hinged to said body, wings hinged to said case and adapted to be secured to said body, a rolling cover in said case, a rolling carriage in the top of said body, a sewing-machine secured to said carriage and adapted to be concealed in said case, and treadle mechanism for said machine disposed in the case in said body in such a manner that said machine may be operated when withdrawn from said hinged case, substantially as set forth.

4. In a desk of the character described, the combination of the body A, provided with the case *v* and top *m*, the crank-shaft 54, journaled in said case at the rear of the center thereof and carrying the driving-wheel 44, the shaft 24, provided with the treadle 14, and rocking arm 34, connected by a pitman-rod, 64, with the shaft 54, the carriage 55, fitted to slide in the top *m*, the machine D, secured to said carriage, the belt 74, and the case B, hinged to the body A and provided with the wings 15, drawers 35, pigeon-holes *d f*, opening *g*, and doors *h i*, all being constructed and arranged to operate substantially as specified.

398,096. CUFF OR COLLAR BUTTON. GEORGE S. TIFFANY, Tecumseh, Mich. Filed July 30, 1888. Serial No. 281,363. (No model.)

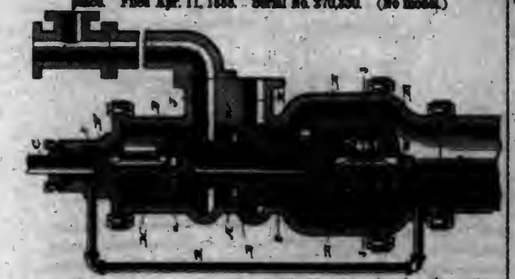
Claim.—1. The combination, with a collar or cuff button having a head and shoe each formed with oppositely-arranged and registering apertures, of a reciprocable fastening-pin arranged in said apertures, and adapted to lie with its point over the face of the head when thrust to the limit of its forward movement, substantially as described, and for the purpose specified.



2. The combination, with a collar or cuff button having a head and shoe formed with oppositely-arranged and registering apertures and a stem formed with a groove on its edges, of a reciprocable fastening-pin arranged in said groove and through the said apertures, and adapted to move with its point back and forth over the face of the head, substantially as described, and for the purpose specified.

3. The collar-button herein described, consisting of a head and shoe formed with apertures, a stem having a groove in its edges, and a fastening-pin having a finger-lug arranged in said groove and through the apertures, and adapted to move back and forth over the face of the head, substantially as described, and for the purpose specified.

398,097. SUSPENDED ROPEWAY. LEONARDO TORRES, Portella, Spain. Filed Oct. 12, 1887. Serial No. 252,157. (No model.)



Claim.—1. An aerial wire or rope way having stations, pulleys, and multiple wires provided with tension-weights and a carriage to travel on all of the multiple wires and attached to some of them.

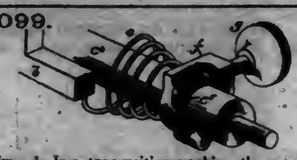
398,097.

2. An aerial wire or rope way having at one end a tower-station and at the other an elevated station, pulleys, and multiple wires passing over them, tension-weights at the tower-station to which some of the ropes are connected, and other tension-weights with pulleys over which other ropes pass, and a carriage to travel on all of the said ropes and also attached to some of them.

398,098. HYDRAULIC ELEVATOR-VALVE. ISAAC H. VEBB, Yonkers, N. Y., assignor of one-half to Elbridge G. W. Bartlett, same place. Filed Apr. 11, 1888. Serial No. 270,330. (No model.)

Claim.—1. The combination, with the main pipe for the motor-fluid, the main valve and its casing, of a tube carrying the main valve between its ends, pistons at the ends of said tube fitting the casing, and an auxiliary adjustable valve consisting of a rod extending through said tube and provided with two ports in proximity to each piston, and passages connecting the said ports, substantially as described.

2. The combination, with the main valve and the casing, of the tube to which the main valve is secured, provided at its ends with piston-heads and having a port, P, through which the interior of the tube communicates with the fluid-feed supply, and an auxiliary valve having fluid-passages provided with two ports adapted to be moved to opposite sides of the said piston-head or to be covered thereby and arranged to deliver the fluid from the interior of the pipe to one or the other of the outer faces of the piston-heads, substantially as described.



3. The combination of the main valve, a tube carrying the main valve between its ends, pistons at the ends of the tube, the casing in which the main valve and the pistons are fitted, having the cross-plate E adjacent to one of the pistons, and the discharge-passages L L passing around the said head, and an auxiliary valve arranged to deliver the motor-fluid to opposite sides of the said pistons to move the main valve, substantially as described.

4. The combination, with the main valve, of the tube to which is secured the main valve, provided with a piston and having a port through which it communicates with the motor-fluid, a casing-head opposite the piston-head, a discharge-passage beyond the casing-head, and an auxiliary valve passing through the tube and the head and having a fluid-passage in proximity to the head, adapted as said valve is moved either to make communication between the tube and the space between the piston and casing heads or between said space and the discharge-passage, substantially as described.

5. The combination, with the main valve and the casing, of the tube O, to which the main valve is secured, provided at its ends with piston-heads, and having a port, P, through which the interior of the tube communicates with the fluid-feed-supply pipe, and an auxiliary valve, C, having the fluid-passages M and N, and the discharge-passages situated, respectively, adjacent to the two piston-heads, substantially as described.

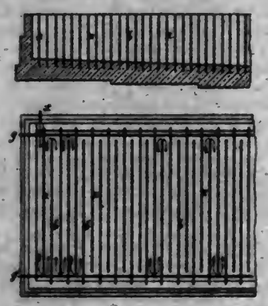
398,099. TENSION-ADJUSTER. GEORGE B. WYNN, Newark, N. J., assignor to Wyckoff, Seamans & Benedict, New York, N. Y. Filed Apr. 6, 1887. Serial No. 233,893. (No model.)

398,099.

Claim.—1. In a type-writing machine, the combination, with a shaft and a collar mounted thereupon, of a spring coiled loosely around the shaft and secured at one end to a fixed part of the machine and at the other end to the collar, and a screw for varying the position of the collar and adjusting the tension of the spring.

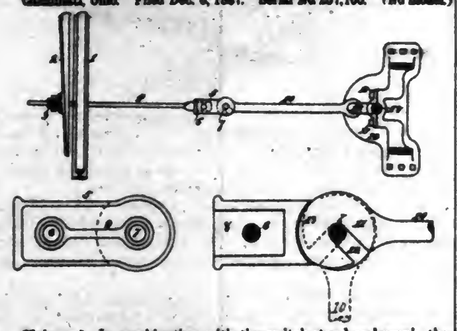
2. In a type-writing machine, the combination, with a rock-shaft provided with feed-dogs, of a returning-spring therefor, a movable support carrying one end of said spring mounted upon the rock-shaft, and an adjusting-screw serving to move the support, all substantially as shown.

3. In a type-writing machine, the combination, with the rock-shaft having a peripheral threaded groove, of a collar encircling the shaft, a screw journaled in the collar and engaging the shaft, and a spring secured at one end to the collar and at its other end to a fixed part of the machine.



4. In a type-writing machine, the combination, with a shaft and a collar mounted thereon, of a spring secured at its ends to the collar and a fixed part of the machine, and a screw for varying the position of the collar and adjusting the tension of the spring.

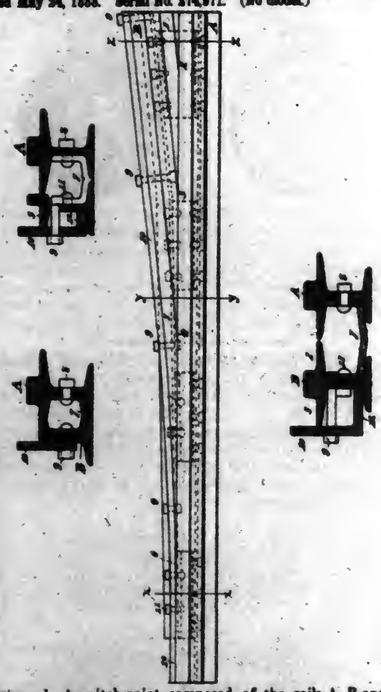
398,100. ORNAMENTING GLASS. THOMAS W. WEBB, Stourbridge, County of Worcester, England. Filed Feb. 20, 1888. Serial No. 264,591. (No specimens.)



Claim.—The herein-described process in producing articles in glass in imitation of old carved ivory, consisting in painting or printing the pattern with an acid-resist upon the opaque glass article, then submitting the article to the action of acid to remove the surface of the uncovered portions, then completing the pattern with a cutting-wheel, then tinting the ground and parts of the pattern with glass-color, and fixing the same by firing, substantially as set forth.

398,101. PROCESS OF PURIFYING SEWAGE BY ELECTRICITY. WILLIAM WEBSTER, Jr., Lee Park, Lee, County of Kent, England. Filed Dec. 22, 1887. Serial No. 258,724. (No model.) Patented in England Jan. 27, 1887, No. 1,333; in France Dec. 9, 1887, No. 187,697; in Cape of Good Hope Jan. 28, 1888, No. 426; in Natal Feb. 2, 1888; in Victoria Feb. 8, 1888, No. 5,615; in New South Wales Feb. 10, 1888, No. 405; in South Australia Feb. 10, 1888, No. 961; in Tasmania Feb. 12, 1888, No. 540/10; in New Zealand Feb. 20, 1888, No. 2,317, and in India Apr. 13/26, 1888, No. 16/888.

Claim.—The process herein described of purifying sewage and other impure water, which consists in passing the same in contact with electrically-excited positive and negative electrodes of iron, whereby salts of iron are produced at the positive electrode, which, in reacting with the alkalies produced at the negative electrode, form a flocculent precipitate of ferrous hydrated oxide, which, together with the gases generated, effect the precipitation of the solid matter and the purification of the impurities held in solution.



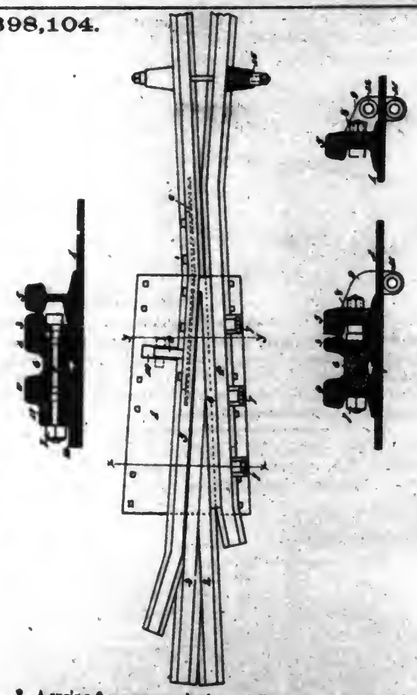
398,102. CONNECTING-ROD FOR SWITCHES. FREDERIC C. WEIR, Cincinnati, Ohio. Filed Dec. 6, 1887. Serial No. 257,160. (No model.)

Claim.—1. In combination with the switch-stand and crank, the connecting-rod 10, provided with a circular end, 11, having the slot 12, and the coupling-box 5, provided with the pivot-bolt 7, attached to the switch-bar, substantially as specified.

2. A connecting-rod and joint composed of the coupling-box 5, provided with the circular slot and pivot-bolt 7, the connecting-rod 10, provided with the enlarged end 11, and the slot 12, to engage over the pivot-bolt, substantially as specified.

398,103. BLIND-SWITCH. FREDERIC C. WEIR, Cincinnati, Ohio. Filed May 24, 1888. Serial No. 274,971. (No model.)

Claim.—1. A switch-point composed of the rails A B and the angle and guard iron 10, secured thereto by bolts 9, said guard-iron having its web beveled off along a part of its length, for the purpose set forth.

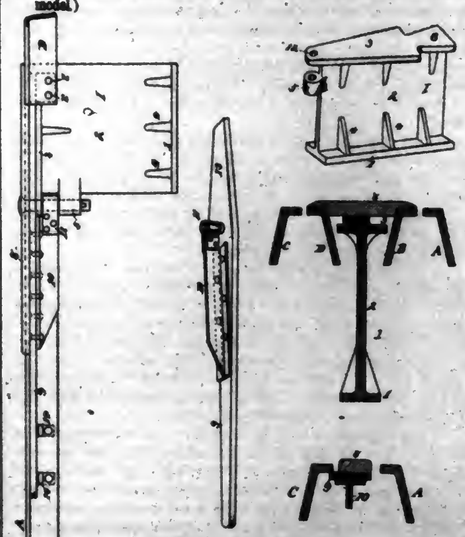


2. In combination with the rails A B, secured together by the U-iron 7, the angle and guard iron 10, said parts being secured together by the bolts 8, 9, and 11, substantially as herein specified.

398,104. SPRING-FROG. FREDERIC C. WEIR, Cincinnati, Ohio. Filed June 19, 1888. Serial No. 277,543. (No model.)

Claim.—1. In combination with the spring-rail 5, the arm 9, bent and projected through the slot in the base-plate, having a movable bearing upon the under side of said plate, substantially as specified.

2. In combination with the spring-rail 5, resting on the base-plate 1, the arm 9, attached to said rail and bent through the slot in said base-plate, and provided with one or more friction-rollers bearing against said plate, substantially as herein specified.



398,104.

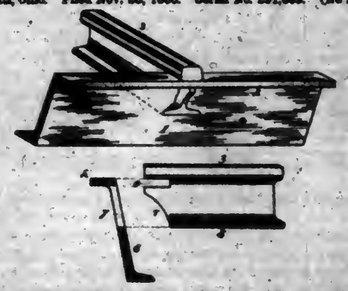
3. A spring-frog composed substantially of the point-rail, the base-plate 1, and fish-plate 16, secured together by through-bolts having spring-rail 5, moving on said base-plate and provided with a frictional bearing-support, substantially as herein specified.

4. In combination with the spring-rail 5, the supporting fish-plate 8, provided with the arm 9, passing through the base-plate, with a holding-down device bearing on the under side of said plate, substantially as specified.

398,105. SLOT-RAIL SWITCH. FREDERIC C. WEIR and NATHANIEL C. GOLDSMITH, Cincinnati, Ohio, assignors to the Weir Frog Company, same place. Filed Nov. 15, 1888. Serial No. 290,909. (No model.)

Claim.—1. The abutment I, provided with base 1 and journal-support for the tongue, and having the top flange, 3, for supporting the rear end of the tongue 13, substantially as set forth.

2. In a slot-rail switch, the combination of the abutment I, the bracket 7, the slot-rails B D, bolted firmly to said bracket, and the cover-piece 8, supported by the bracket and said slot-rails to form a space for the tongue, substantially as herein specified.

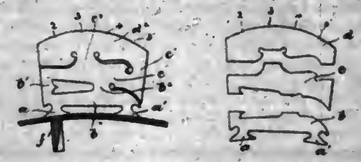


3. In combination with the tongue 9, the T-iron bolted to the under side of said tongue and forming a brace and hinge-journal, 11, substantially as specified.

4. In combination with a slot-rail switch, the abutment I, supporting the inner slot-rails and provided with a journal support or ear, 5, for the journal of the tongue 9, and a top flange, 3, for supporting the rear end of said tongue, substantially as described.

5. In a slot-rail switch, the combination of the outer slot-rails, A C, the inner slot-rails, B D, the abutment I, supporting said inner rails and provided with base 1, top flange, 3, and ear 5, the tongue 9, journaled to said abutment and having its rear end supported on the top flange of said abutment, and the lugs 14, secured to the outer slot-rails to form a support for the forward end of the tongue, substantially as described.

6. In a slot-rail switch, the combination of the outer rails, A C, the inner rails, B D, the abutment I, supporting the inner rails, the tongue 9, journaled to said abutment and provided with T-iron 10 and eye 11, and the lugs 14, for supporting the forward end of the tongue, substantially as described.



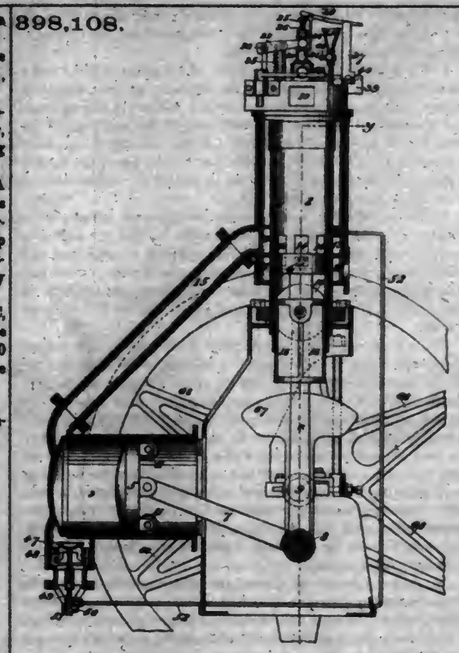
398,106. CABLE-RAILWAY CROSSING. FREDERIC C. WEIR, Cincinnati, Ohio. Filed Nov. 23, 1888. Serial No. 291,689. (No model.)

Claim.—1. In a cable-crossing, the crossing-rail 3, provided with slot 4, which embraces the head 2 of the slot-rail, substantially as herein specified.

2. The combination of the slot-rail 1, provided with mortise 7, formed below the head of the rail 2, and the crossing-rail 3, provided with slot 4, for embracing the head of the slot-rail and resting in said gain, substantially as herein specified.

398,107. BRIDGE FOR STRINGED INSTRUMENTS. MAURICE W. WHITE, Boston, Mass., assignor of one-half to George W. Ross, same place. Filed July 9, 1888. Serial No. 279,434. (No model.)

Claim.—1. A bridge for stringed instruments, formed to present three horizontally-arranged bars, *b c d*, connecting parts $b' c'$, and the waists $b^2 c^2$, to act as a set of compound levers, substantially as described.



2. A bridge for stringed instruments, formed to present the bar *b*, having feet *a a'*, the bar *c*, the part b', and waist c^2, said bars being arranged substantially horizontal and the waists being slightly offset from the middle, thereby leaving one end of the bar *d* and the opposite end of the bar *c* free, substantially as and for the purposes set forth.

3. A bridge for stringed instruments, formed to present the horizontal bar *b*, having feet *a a'*, the foot *a* resting directly above the base-bar, and a crown portion, the connecting part b', and waist b^2, as described, whereby the entire bridge may vibrate or rock on the foot *a'*, substantially as described.

398,108. GAS-MOTOR. CARL T. A. H. WIESLING, New York, N. Y., assignor to John S. Connelly, Plainfield, N. J., and Thomas R. Connelly, Brooklyn, N. Y. Filed Dec. 22, 1887. Serial No. 258,736. (No model.)

Claim.—1. A gas-engine having a primary cylinder and a secondary cylinder, said cylinders having pistons and being connected, and the piston of the primary cylinder being driven in advance of the piston of the secondary cylinder, whereby the propelling energy of the charge acts first on the primary cylinder and then through the connecting-channel on the secondary cylinder, the said secondary cylinder being made of such capacity that the outstroke of the secondary piston shall reduce the tension of the exploded gases below that of the charge of the explosive gas and air which is supplied to the primary cylinder, thereby creating a suction by which the explosive charge shall be drawn into the primary cylinder, substantially as and for the purposes described.

398,108.

2. In a gas-engine, a lift disk-valve controlling an air-inlet port, a gas-channel passing through the disk of the lift-valve, and a second disk-valve seated on the disk of the air-valve and controlling the gas-inlet, substantially as and for the purposes described.

3. In a gas-engine, an air-inlet valve worked mechanically by action of the driven parts of the engine, and a gas-inlet valve, and an adjustable lever which is connected to the air-valve and arranged to move the gas-valve when the air-valve is moved, substantially as and for the purposes described.

4. A gas-engine having a primary cylinder and a secondary cylinder, said cylinders having pistons and being connected, whereby the propelling energy of the charge acts first on the primary cylinder and then through the connecting-channel on the secondary cylinder, the said secondary cylinder being made of such capacity that on the outstroke of the piston of the secondary cylinder the exploding gases, which first act expansively upon the said piston, shall afterward be reduced thereby to a tension below that of the charge of explosive gas and air which is supplied to the primary cylinder, thereby creating a suction by which the explosive charge shall be drawn into the primary cylinder, substantially as and for the purposes described.

5. In a gas-engine having a primary cylinder which is charged by suction of another cylinder, the combination of the primary cylinder and a secondary cylinder, said cylinders having pistons and being connected by a channel which is opened during the outstroke of the primary cylinder, the secondary cylinder being of such capacity that on the outstroke of the secondary piston the exploded gases, which first act expansively upon the said piston, shall afterward be reduced thereby to a tension below that of the explosive charge while the said cylinders are in communication, and an exhaust through which the gases are expelled by the return-stroke of the piston of the secondary cylinder, substantially as and for the purposes described.

6. In a gas-engine, the combination, with a primary explosion cylinder which is charged by suction of another cylinder, and a primary driving-piston, of a secondary cylinder and its piston, said cylinders communicating, and the piston of the primary cylinder in its passage opening and closing said communication, the piston of said primary cylinder being set to move in advance of the other piston, substantially as and for the purposes described.

7. In a gas-engine having a primary explosion-cylinder which is charged by the suction of another cylinder, the combination, with the primary cylinder and its piston, of a secondary cylinder and its piston, a port or channel which affords communication between the cyl-

inders and which is controlled by the primary piston, an exhaust-port, and a sliding valve on the piston which connects these ports, substantially as and for the purposes described.

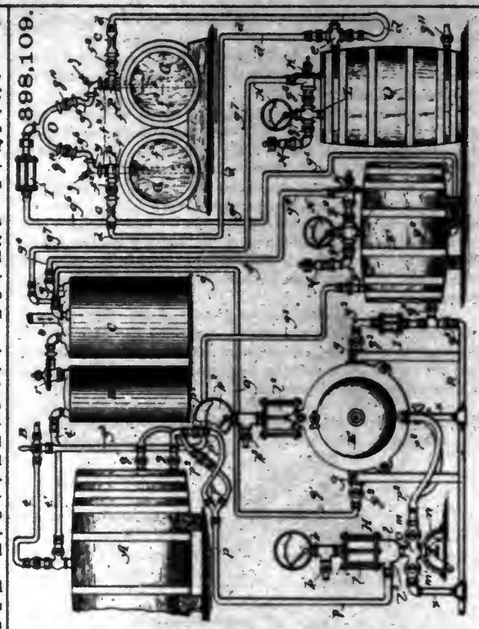
8. The combination, in a gas-engine, of a primary cylinder and a secondary cylinder communicating therewith, so that the exploding gas shall exert its energy on the cylinders in succession, and an opening to the external air which is opened before the beginning of the entrance of the gases to the secondary cylinder, and also at the end of the action of the gas therein, whereby the burned gas in the secondary cylinder is interposed between layers of cold air, substantially as and for the purposes described.

9. The combination, in a gas-engine, of a primary cylinder and a secondary cylinder communicating therewith, so that the exploding gas shall exert a propelling force on the cylinders in succession, said cylinders having an air-inlet which is opened positively at each outstroke of the piston of the secondary cylinder to admit air to be mingled with the burned gas, substantially as and for the purposes described.

10. In a gas-engine, the combination of the primary and secondary cylinders which are connected by a passage, an inlet into the primary cylinder for the explosive charge, and a piston in the primary cylinder which on its outstroke opens communication between the cylinders and maintains the same until the gases in the cylinders, having first acted with propulsive force on the secondary piston, shall have been reduced in tension below that of the explosive charge, and which on its back-stroke cuts off said communication after the admission of the charge, as aforesaid, and during the remainder of its back-stroke compresses the charge, said secondary cylinder being in free communication with the atmosphere immediately before the communication between the cylinders is established, substantially as and for the purposes described.

11. A gas-engine having a valve operated by suction and a special cylinder communicating with the engine-cylinder, and having a piston connected with the stem of the valve, whereby the valve is shut through the pressure in the engine-cylinder, substantially as and for the purposes described.

12. A gas-engine having a primary cylinder and a secondary cylinder connected therewith and acting to create a suction in the primary cylinder for the indraft of the charge, and a suction-valve in the secondary cylinder which is opened when the pressure in the secondary cylinder falls below a certain limit, substantially as and for the purposes described.



13. A gas-engine having a speed-governor, a primary cylinder provided with a valve for the admission of the explosive charge, which valve is controlled by action of the speed-governor, and a secondary cylinder which charges the primary cylinder with explosive mixture by suction when the said valve is opened, and an automatic inlet-valve in the secondary cylinder which opens by suction to admit air when the inlet-valve of the explosive charge is not opened, substantially as and for the purposes described.

14. A gas-engine having a primary high-pressure cylinder provided with an inlet for the explosive charge and a secondary low-pressure cylinder communicating therewith, said cylinders being provided with pistons, the piston of the latter expanding the partially-spent gases from the primary cylinder during the first part of its stroke and charging the primary cylinder by suction during the termination of its stroke, substantially as and for the purposes described.

15. In a gas-engine, the combination of a primary explosion-cylinder, a secondary cylinder connected therewith by a port, an exhaust-port, and a slide-valve on the piston of the primary cylinder, which in its passage connects the said ports, said slide-valve being separated from the piston by an intervening space which affords access of air to the first-named port before its connection with the exhaust-port by the slide-valve, substantially as and for the purposes described.

16. A gas-engine having a primary cylinder and a secondary cylinder which communicate with each other and are provided with pistons, the primary cylinder being in communication with the secondary cylinder during the outstroke of the piston of the latter and arranged so that the exploding gas shall exert a propelling force on the cylinders in succession, and that the gases shall then be so expanded in the secondary cylinder as to create a suction in the primary cylinder, an inlet for the explosive charge, a valve controlling the same, and mechanism which holds the said valve open at the time when the piston has moved sufficiently to create a suction in the primary cylinder, substantially as and for the purposes described.

398,109. APPARATUS FOR FILTERING AND FILLING LIQUIDS UNDER PRESSURE. Otto Zwietusch, Milwaukee, Wis. Filed Jan. 18, 1888. Serial No. 260,473. (No model.)

Claim.—1. In an apparatus for filtering liquids under pressure, the combination, with the vessel containing the liquid and with the outlet-pipe and filter, of a reservoir for containing an aeriform fluid under pressure controllably communicating with the filter, whereby the filter and its connections with the vessel containing the liquid may be supplied with such aeriform fluid under pressure to afford a yielding resistance to the advancing liquid, substantially as described.

2. In an apparatus for filtering and filling liquids under pressure, the combination, with the supply-vessel, discharge-conduit, and filter, of a vessel, F, interposed in the discharge-conduit between its outlet end and the filter and provided with a suitable vent, and a reservoir for an aeriform fluid under pressure controllably communicating with the interposed vessel, whereby the liquid in its progress enters the said vessel against a counteracting pressure of aeriform fluid, substantially as described.

3. In an apparatus for filtering and filling liquids under pressure, a filter and an intermediate vessel interposed in the conduit leading from the supply-vessel to the ultimate receptacles, and each provided with a suitable vent and communicating controllably with a reservoir for an aeriform fluid under pressure, substantially as described.

4. In combination with the vessel A and conduit leading therefrom to the ultimate receptacle, a filter interposed in the said conduit, a vessel also interposed in the said conduit, a suitable vent upon the said vessel, a reservoir for aeriform fluid under pressure controllably communicating with the said vessel, and counter-pressure mechanism between the said vessel and ultimate receptacle, substantially as described.

5. The combination, with the vessel A, of the main air-reservoir C, auxiliary reservoir D, a conduit connecting the two reservoirs, a pressure-reducing valve, *r*, in the said conduit, a conduit connecting the reservoir D with the upper part of the vessel A and provided with a valve, the discharge-conduit for beer leading from the vessel A, filter E, interposed in said discharge-conduit, and counter-pressure mechanism acting upon the filter, substantially as described.

6. The combination, with the vessel A, air-reservoir for forcing compressed air upon the surface of the beer in the vessel A, and discharge-conduit for beer leading from the vessel A, of the filter E, interposed in the said discharge-conduit, a vessel, F, beyond the filter and communicating therewith by means of the discharge-conduit and provided with a vent, and counter-pressure mechanism operating to retard the flow of liquid to and through the filter, substantially as described.

7. In an apparatus for filtering and filling liquids under pressure, a transparent receptacle interposed in the discharge-conduit between the supply-vessel and the filter and provided with a branch outlet, both the branch outlet and conduit being provided with stop-cocks, substantially as described, whereby the flowing liquid may be inspected on its way to the filter and diverted therefrom, if desired.

8. The foam-indicator H, comprising, in combination, the receiver *l l'*, in part transparent and provided with the upper and lower seats, h^3 and *h'*, for the ball-valve *h*, and with the pressure-gage and air-outlet *k k'* and liquid-inlet l^2, and the four-way casting *o*, having its lateral branches provided with cocks *n n'*, and the rod i^2, entering the vertical branches through a stuffing-box, *i*, substantially as described.

9. The four-way bung L, provided on its three upper branches with a pressure-gage, a pressure-reducing valve, and a pressure-relief valve, and having stop-cocks q^6 and q^5, substantially as described.

10. The combination, with the vessel A, air-reservoir, filter, and connecting-pipes suitably provided with stop-cocks, of the pipe g^7, connecting the filter with the air-reservoir and provided with a valve for controlling the flow, substantially as described.

11. The vessel F, interposed in the discharge-conduit of the vessel A and provided with a pressure-relief valve, in combination with a pipe, g^8, connecting the vessel F with the common conduit B of the bunging apparatus and provided with a valve for controlling the flow, substantially as described.

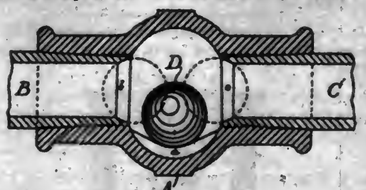
12. In combination with the vessel A and its discharge-conduit and with the air-reservoir communicating with the vessel A, the vessel F, interposed in the discharge-conduit and provided with a pressure-relief valve and pressure-gage, and the pipe g^9, connecting the vessel F with the air-reservoir and provided with a pressure-regulating valve, substantially as described.

13. The filling-bung P, comprising the body *f*, having its internal passage enlarged below a point, f', packing f^2, screw-collar f^3, and outlet f^{12}, provided with a stop-cock, in combination with the tube f^{13}, having the air-cock *z*, substantially as described.

14. In combination with the discharge-conduit of the vessel A, the T-cock O, branches g^8 and g^9 of the discharge-conduit, filling-bungs P upon the separate branches, vessel Q, provided with the T-cock *e* and with the pressure-gage N and the pressure-relief valve M, and pressure-reducing valve K, having suitable stop-cocks, pipes *c d*, connecting the filling-bungs with the T-cock *e*, air-reservoir C, and pipe g^9, leading from the air-reservoir to the pressure-reducing valve K, substantially as described.

15. The discharge-conduit *p*, having at its ingress end the branches p', provided with stop-cocks p^3, whereby separate supply-vessels may be successively emptied without interruption of the flow, substantially as described.

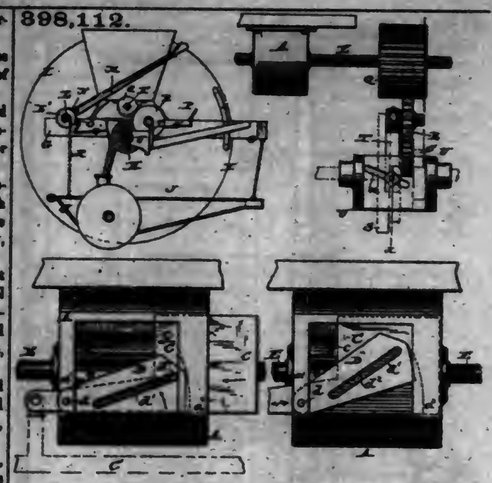
16. The combination of the cask A, a receptacle into which the beer in the cask A is to be transferred, and a discharge-conduit, *p*, connecting the cask A with the said receptacle, and provided at its ingress end with two branches, p', having stop-cocks p^3, whereby one of said branches may be connected to an adjacent cask before the other is detached from the cask A, and the discharge thus rendered continuous, substantially as described.



17. The vessel A, provided with discharge-cocks *q q'* at different levels, in combination with the discharge-pipe *p*, having separate branches p', provided with stop-cocks p^3, substantially as described.

398,110. FILTERING MATERIAL. Otto Zwietusch, Milwaukee, Wis. Filed July 16, 1888. Serial No. 280,065. (No specimens.)

Claim.—As a new article of manufacture for filtering purposes, a compressed block of comminuted and purified wood fiber, substantially as described.



398,111. AUTOMATIC VALVE AND COUPLING. Arthur V. Ador, Chester, N. J., and Frank C. F. Kraak, New York, N. Y., assignors, by mesne assignments, to the National Heating Company, New York, N. Y. Filed July 30, 1887. Serial No. 245,677. (No model.)

Claim.—1. The combination, with a coupler having a central globular chamber provided with inclined or concave ribs or ways extending longitudinally of the lower part of said chamber, of a ball-valve, substantially as described.

2. The combination, with a coupler having a central globular chamber provided with inclined or concave ribs or ways extending longitudinally of the lower part of said chamber and guides *c'* extending laterally and upwardly from the outer side of each rib or way, of a ball-valve, substantially as described.

398,112. SEEDING-MACHINE. William D. Arney, Springfield, Ohio. Filed May 19, 1888. Serial No. 274,257. (No model.)

Claim.—1. The feed-roll and the feed-cup having the delivery-opening *c*, in combination with the gate C, to reduce the width of the opening, and the co-operating gate D, to vary the angle of the lower edge of the opening, substantially as described.

2. In a seeding-machine, the axle and its cone-gear and the feeder-shaft and its cylindrical gear, in combination with the intermediate idle-pinion, R, the slotted block U, loosely mounted on the axle, and the pinion-supporting arm T, connected with the block U by means of the rib and groove, as shown.

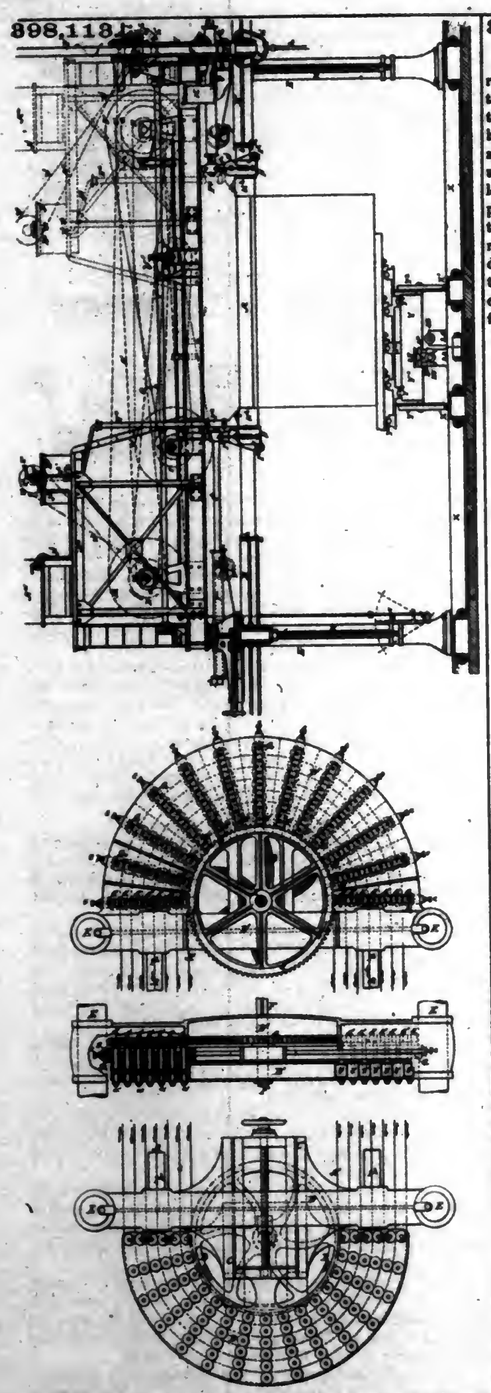
3. In a seeding-machine, the main frame whereon the driver rides, as usual, and the drag-bars hinged thereto, in combination with the winding-roll and chains at the rear end of the frame, the ratchet-wheel on said roll, its actuating-pawl, the pawl-carrying hand-lever extended forward in reach of the rider, the locking-dog engaging the ratchet-wheel, the rod extending thence forward, and the foot-lever for operating the rod, located on the forward end of the frame, whereby the driver is enabled to lift the drag-bars by short vibrations of the lever.

398,113. MACHINE FOR SAWING STONE. Armand Absolye, Paris, France. Filed Feb. 23, 1888. Serial No. 264,917. (No model.) Patented in France Mar. 30, 1888, No. 174,886; in Belgium Mar. 30, 1888, No. 73,843; in England May 6, 1887, No. 6,804, and in Italy May 12, 1887, No. 21,672.

Claim.—1. The combination, in a stone-sawing machine, of the foundation-plate, the vertical supports, the horizontal cutting-frame, and gearing for adjusting the cutting-frame vertically with the elevated platforms fixed upon the standards above the cutting-frame, the grit and water boxes on said platforms, and flexible distributing-tubes leading therefrom to the cutting mechanism.

2. The combination, in a stone-cutting machine, of the cutting-band and adjustable guides located at either side of the stone to be cut, with the longitudinally-moving rods carrying the guides and gearing for adjusting the rods at will.

3. The combination of a cutting-band, a drum around which the band passes, and an adjustable guide on each side of the drum with a shaft and operating-connections between the shaft and guides, whereby both guides are adjusted simultaneously.



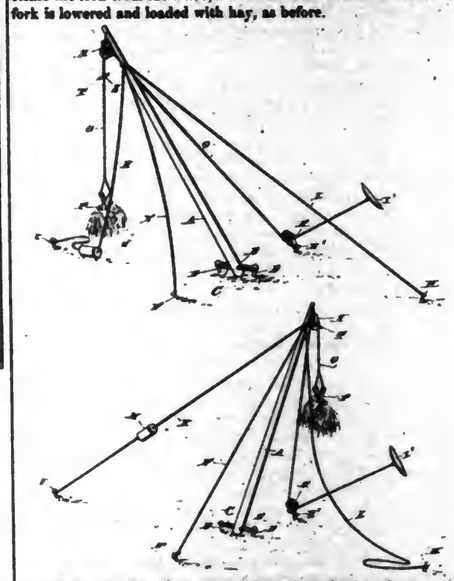
4. In a stone-sawing machine, the combination of the drum B', which drives the cutting-blade, and the support therefor, provided with cap-bearing G, with a cistern, H, containing a suitable lubricant, and pipes conveying the lubricant to and away from the bearing, substantially as described.

5. In a stone-sawing machine, the combination of the cutting-band and the horizontal drums around which the band passes with separate flanges upon the drums projecting beyond the band and holding it in place, and fastening devices attaching the flanges to the drums, whereby the removal of the band is facilitated.

6. In a stone-cutting machine, the combination of the truck movable relatively to the cutting-blade and carrying the stone to be operated upon with the traveling nut and gear for moving said nut, and a suitable lock, one member of which is carried by the truck and the other by the nut, whereby the truck may be secured to the nut and be controlled in its movement thereby.

7. In a stone-sawing machine, the combination of the supports carrying the main driving-drum and a plurality of smaller rollers suitably journaled thereupon with a plurality of cutting bands or blades passing around and driven by the said drum and rollers, and power-

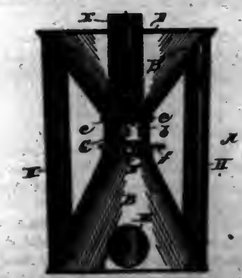
398,113.



transmitting gear between the drum and the rollers, substantially as described.

3. In a stone-sawing machine, the combination of a plurality of cutting bands or blades with a series of supporting-rollers arranged concentrically, around which the blades pass, and power-transmitting gear between the different rollers, whereby they are all driven by a single power-shaft, and adjacent blades moving in opposite directions, substantially as described.

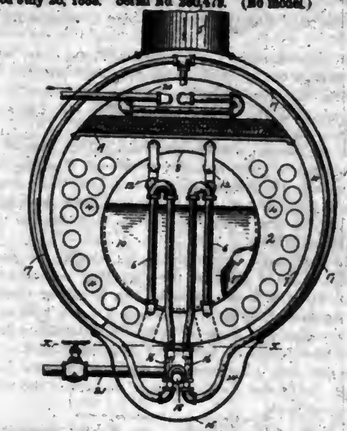
398,114. HAY-STACKER. HENRY A. BARKELEW, Williamstown, Mo. Filed Oct. 31, 1888. Serial No. 289,992. (No model.)



Brief.—When the pole is in the position shown, Fig. 1, with the rope L taut and the rope K slack, the block N is over the point where the fork is loaded. The elevating-rope is then drawn outward from the block R until gage T strikes the block N and the loaded fork has been elevated a sufficient distance to clear the top of the stack, and as the elevating-rope continues to be drawn outward it swings the upper end of the pole toward the stake-pin H, and thereby carries the loaded fork over the stack. By stopping the horse the fork may be poised at any desired point above the stack. As the pole moves in this direction the rope L slackens and the rope K becomes taut and raises weight M. The hay is discharged from the fork at any point desired on the top of the stack, and the horse is then backed, when the weight M swings the pole backward to its initial position and clears the fork from the stack, and as the horse continues to back the fork is lowered and loaded with hay, as before.

Claim.—1. In a hay-stacker, the pole A, having the transverse opening in its lower end, the rope-loop C in the said opening, and the stake-pins D, driven into the ground on opposite sides of the lower end of the pole and engaging the said loop, substantially as described.

2. The combination, in a hay-stacker, of the leaning pole A, having the transverse opening in its lower end, the loop C in said opening, and the stake-pins D, driven in the ground on opposite sides of the lower end of the pole and engaging the loop, the guy-ropes connected to the pole, whereby it is adapted to be swung in either direction, one of said guy-ropes having the weight M, the block suspended from the upper end of the pole, and the elevating-rope engaging the block, said rope having the gage T secured thereto at a suitable point and adapted to come in contact with the block, for the purpose set forth, substantially as described.

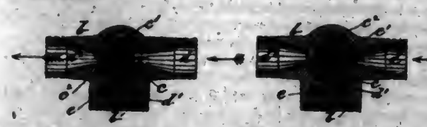


398,115. HEATING DRUM OR RADIATOR. NEBRASKUS H. BARBER, Wahoo, Nebr. Filed Oct. 30, 1888. Serial No. 289,551. (No model.)

Claim.—1. In a heating drum or radiator, the combination of the casing comprising the lower conical section and the inverted conical upper section, the spaces of the said sections being connected by neck *b*, the outlet-pipe passing through the closed upper end of the upper section and extending into the said neck, whereby an annular passage, *c*, is formed, the valve G, arranged in the neck below the lower end of the outlet-pipe, and the approximately vertical fines H H, connecting the bases of the said sections, substantially as and for the purpose specified.

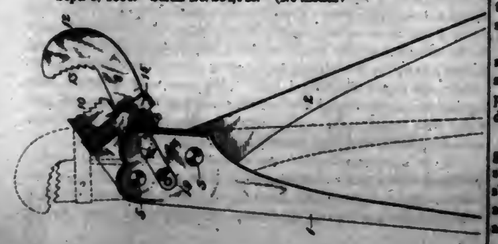
2. In a heating drum or radiator, the combination of the upper and lower conical sections, having their adjacent apexes connected by a neck in which is arranged a valve, the vertical central pipe extending downward into the said neck and terminating above the valve, and the outside vertical fines connecting the remote ends of the sections, substantially as specified.

398,116. STEAM-BOILER. ANDRIAN I. BARRANOFF, Bangor, Me. Filed July 20, 1888. Serial No. 280,479. (No model.)



Claim.—1. In an annular boiler, as described, the combination, with said boiler 2, its fines 4 4, the bridge-wall 10 interiorly thereof, and the circulating-pipe 6, which connects the upper and lower water-spaces, and having the horizontal extension 12 in rear of and above the bridge-wall, of the injector 16 and its steam-pipe 17, substantially as specified.

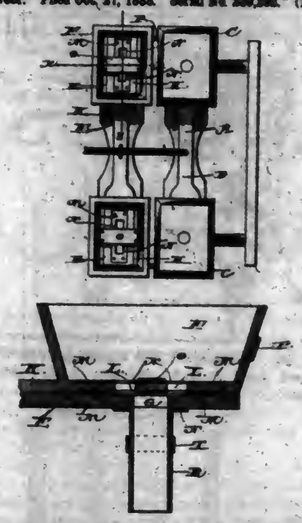
2. The combination, with the boiler 2, bridge-wall 10, the circulating-pipes 6 in rear thereof, which connect the upper and lower water-spaces, and the injectors 16, co-operating with said circulating-pipes, of the jacket 15 and the steam-pipes 17 exteriorly of the boiler, each of which supplies an injector, for purposes substantially as herein set forth.



3. The boiler 2, provided with the fines 4 4, bridge-wall 10, partition 19, and jacket 15, combined with the steam-pipes 17, leading from the steam-space and exteriorly of the boiler to the injectors, and the circulating-pipes 6, which connect the lower and upper water-spaces of said boiler, substantially as herein set forth.

398,117. COCK. GUSTAV A. BARTH, St. Louis, Mo., assignor to Pierre Chouteau, same place. Filed Dec. 6, 1888. Serial No. 292,823. (No model.)

Claim.—In a cock, the combination of a plug, *c*, having openings c c^2, and shell *b*, having openings d d^2 d^3, with a pocket, *e*, and outlet-passage e^2, formed in said shell, substantially as shown, and for the purpose described.



398,118. PIPE-WRENCH. MARTIN V. BARTON, Bath, N. Y. Filed Sept. 5, 1888. Serial No. 284,640. (No model.)

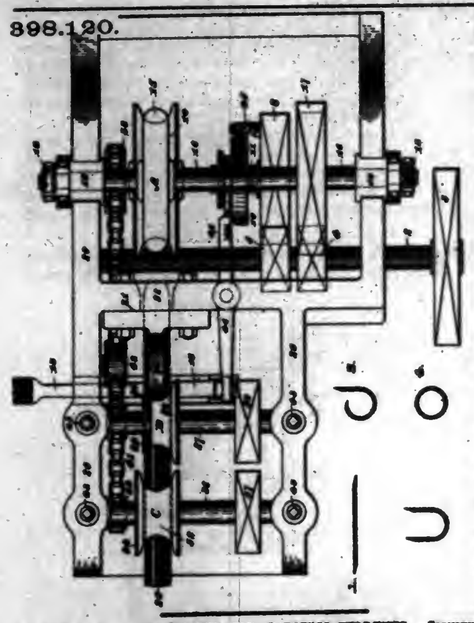
Claim.—1. In a pipe-wrench, a pair of pivoted jaws arranged side by side and having curved shoulders disposed in the same direction, in combination with a pivoted lever having a central cam adapted to remain between the two jaws when closed, and having an end cam, the two being adapted for operation against their respective shoulders when in the act of opening, substantially as specified.

2. The lever 1, having the transverse opening and having the lever 2, formed with the cams 16 and 17, and pivoted, as at 3, in said opening, in combination with the jaws 7 and 8, pivoted, as at 5 and 6, and having the shoulders 9 and 14, and having the band 15, fixed to the jaw 7 and loosely embracing the jaw 8, substantially as specified.

398,119. POTATO-PLANTING ATTACHMENT. OLLIE BAUGH, Tobias, Nebr. Filed Oct. 27, 1888. Serial No. 289,262. (No model.)

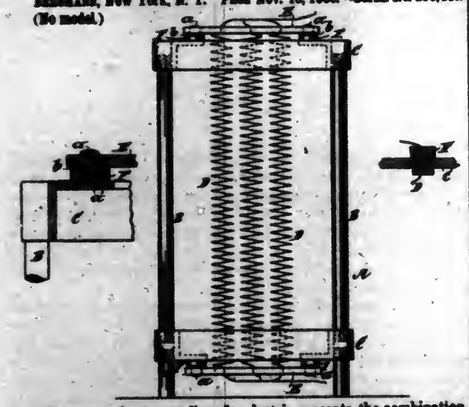
Claim.—1. In a potato-planter, the hoppers having the discharge-opening and the plates O, arranged above said opening, said plates being arranged transversely in the hopper and having their edges sharpened, in combination with the reciprocating slide-bar K, having the openings L, adapted to register with the discharge-opening of the hopper, and the plates M, secured on the upper and lower sides of said slide-bar, and having the openings N coincident with the openings L, substantially as described.

2. A potato-planting attachment to corn-hoppers, comprising the board E, the hoppers F on the ends thereof, said board having the openings G in its ends, the spouts depending from said board and registering with said openings, the cutter-plates O, arranged transversely in the hoppers above the openings G, the slide-bar K in the bottoms of the hoppers under the cutter-plates and having the openings L, adapted to register with the openings G, the bracket-arms adapted to be bolted to the hoppers F and to the corn-hoppers to secure the former in rear of the latter, and the clip-bolts to secure the spouts to the depending corn-spouts, substantially as described.



398,120. MACHINE FOR FORMING SKELP-IRON. CHRIST BERGER, Pittsburg, Pa., assignor of one-half to Ebenezer R. Matthews, same place. Filed Feb. 27, 1888. Serial No. 265,463. (No model.)

Claim.—1. In a machine for forming skelp-iron, the combination of tongue and groove rollers, a mandrel, a pair of single-flange rollers at one end of the mandrel, and a pair of double-flanged rollers at the other or delivery end, the mandrel being arranged between the upper and lower members of the two pairs of rollers and sustaining the skelp as it is formed about it by the rollers, substantially as described.



2. In a machine for forming skelp-iron, the combination of tongue and groove rollers, a shaft for the tongue-roller, movable bearings for said shaft, and crank-connections for said shaft, with a rotary shaft periodically to raise and lower the tongue-roller shaft, substantially as described.

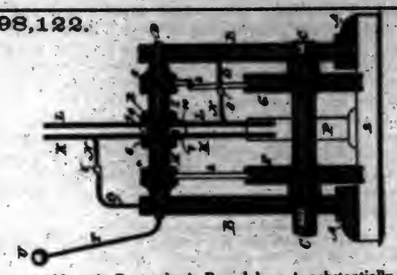
3. In a machine for forming skelp-iron, the combination of a grooved roller, a tongued roller mounted on a vertically-movable shaft, cam crank-arms connected with the movable shaft, a power-shaft, a clutch for connecting the power-shaft with the power mechanism, and a cam for throwing the clutch out of gear, substantially as and for the purposes specified.

398,120.

398,121. EQUALIZER FOR ELECTRIC CURRENTS. SIGMUND BERGMANN, New York, N. Y. Filed Nov. 10, 1888. Serial No. 290,447. (No model.)

Claim.—1. In an equalizer for electric currents, the combination, with the coils, of the metal frame comprising the uprights having the threaded ends, the end castings or plates having threaded openings engaging the uprights, and the insulators in said end castings or plates, substantially as specified.

2. In an equalizer for electric currents, the combination, with the coils, of the metal uprights, the metal end plates secured thereto having the openings, and the perforated insulators in said openings receiving the ends of the coils, substantially as specified.



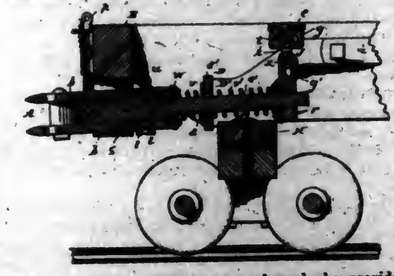
3. In an equalizer for electric currents, the combination, with the resistance-coils and the metal frame, of the transverse metal strips, the insulators between said strips and the frame, and disks of flexible material interposed between the insulators and the transverse strips substantially as specified.

4. In an electrical equalizer, the combination, with the coils and the metal frame, of the transverse strips having the openings, the insulators between the strips and the frame having the projection, and the flexible washer surrounding said projection below the lower face of the transverse strips, substantially as specified.

398,122. STATIC-INDUCTION GENERATOR. EDWARD T. BIRGE, New York, N. Y. Filed Nov. 14, 1888. Serial No. 290,788. (No model.)

Claim.—1. The glass disks K and L, having varnished surfaces and provided with strips of foil and each having a central notched opening, in combination with the wooden hubs H I, fitting into the central openings in the respective disks and secured by screws, and

398,122.



the removable axis D, standards B, and base A, substantially as set forth.

2. The knobs R, combs S, and cylinders 10, cast in one and having holes through the knobs, in combination with the glass rods Q, around which the cylinders 10 are cast, and the wires T, passing through the holes of the knobs R and provided with knobs or electrodes U upon their ends, substantially as set forth.

3. The combination, with the glass disks and the respective tubular hubs to which they are connected, of the axis D, passing through the hubs, the base A, and standards B, and the arms O and brushes N, the standards being slotted or saw-cut diagonally for the reception of the arms, and the arms being perforated for the passage of the axis, substantially as set forth.

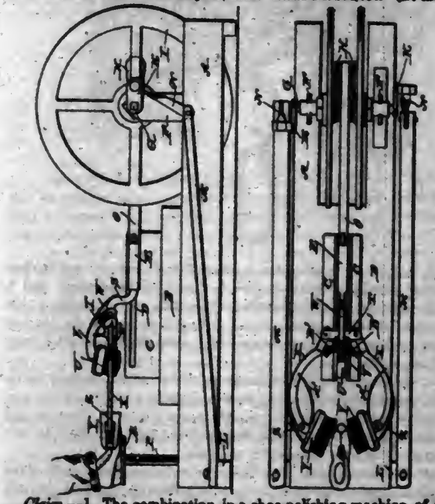
4. The combination, in the electric machine, of the glass disks K L, wooden hubs H I, to which the glass disks are connected, the base A and standards B, the removable axis D, passing through the hubs and standards, the shaft C, belt-wheels F G, and belts to pulleys upon the respective hubs, the arms O within diagonal slots in the standards, the brushes N upon the ends of the arms, the knobs R and combs S, and the glass rods Q, for supporting the same, the wires T, passing through the knobs, and the electrodes at the ends of the wires, substantially as set forth.

398,123. CAR-COUPLING. JOHN M. BOOUR, Gouverneur, N. Y. Filed June 5, 1888. Serial No. 276,119. (No model.)

Claim.—1. In a car-coupler, a recessed coupler-bar provided with a nut, *r*, having a rigid piece, *g*, secured thereto, in combination with a link, *i*, and a second rigid piece, *g'*, secured to a supporting-bar, *c*, a rigid piece *f* having an oblong perforation, the longer axis of said rigid pieces *f* having an oblong perforation, the longer axis of which extends in the direction of the track, said link *i* being pivoted to said rigid piece *g* and *g'* by one pivot-pin extending through said oblong perforation, substantially as and for the purposes specified.

2. In a car-coupler, a recessed coupler-bar provided with a nut, *r*, having a rigid piece, *g*, secured thereto, in combination with a link, *i*, and a second rigid piece, *g'*, secured to a supporting-bar, *c*, said rigid piece *f* having an oblong perforation, the longer axis of which extends in the direction of the track, said link *i* being pivoted to said rigid pieces *g* and *g'* by one pivot-pin extending through said oblong perforation, and a pair of levers, L and L', the inner ends of which bear against the under side of the coupler-bar and the outer ends provided with handles, substantially as and for the purposes specified.

3. In a car-coupler, a recessed coupling-bar provided with a nut, *r*, having a rigid piece, *g*, secured thereto, in combination with a link, *i*, and a second rigid piece, *g'*, secured to a supporting-bar, *c*, said rigid piece *f* having an oblong perforation, the longer axis of which extends in the direction of the track, said link *i* being pivoted to said rigid pieces *g* and *g'* by one pivot-pin extending through said oblong perforation, and a pair of levers, L and L', the inner ends of which bear against the under side of the coupling-bar and the outer ends provided with handles, one of said levers having an auxiliary foot-post extending up through the platform, substantially as described.



4. In a car-coupler, the combination of a recessed coupler-bar provided with a nut, *r*, having a rigid piece, *g*, secured thereto, with a link, *i*, and a second rigid piece, *g'*, secured to a supporting-bar, *c*, said rigid piece *f* having an oblong perforation, the longer axis of

which extends in the direction of the track, said link *i* being pivoted to said rigid pieces *g* and *g'* by one pivot-pin extending through said oblong perforation, and a buffer-guard having perforated lips, which are adapted to embrace the perforated jaws of the coupling, the perforations in the buffer registering with those of the coupling, substantially as described.

5. In a car-coupler, a pair of coupler-bars supported at their rear ends by a toggle-joint and supported near their jaws by saddles, and free to move vertically and horizontally within predetermined limits, in combination with bridle D, and coiled springs encircling the coupler-bars and abutting against the bridle from opposite sides, substantially as and for the purposes specified.

6. In a car-coupler, a pair of coupler-bars supported at their rear ends by toggle-joints and supported near their jaws by saddles, and free to move vertically and horizontally within predetermined limits, in combination with bridle D, and a disk, W, loosely mounted on the coupler-bar, and a coiled spring between said disk and bridle, and a second coiled spring between said bridle and the toggle-joint, all constructed and combined to operate substantially as described.

398,124. MACHINE FOR POLISHING SHOES. JOSEPH D. EBERT, Lampasas, Tex. Filed May 28, 1888. Serial No. 274,787. (No model.)

Claim.—1. The combination, in a shoe-polishing machine, of the reciprocating slide or cross-head, the pivoted arms connected thereto, the springs bearing on the said arms, and the brushes attached to the free end of the said arms by pivotal connections, substantially as described.

2. The combination, in a boot and shoe polishing machine, of the support for the boot or shoe, the reciprocating cross-head or slide, the arms pivoted thereto and arranged with relation to the support, the springs bearing on the said arms, for the purpose set forth, and the brushes connected to said arms, substantially as described.

3. The combination, in a machine for polishing boots and shoes, of the reciprocating slide or cross-head E, the arms X, pivoted thereto, the springs keeping said arms normally pressed toward each other, the brushes Y, hinged or pivoted to the rear free end of the arms, and the springs Z and A', extending from the arms X and bearing against the backs of the brushes at points in front and rear of the pivots thereof, substantially as described.

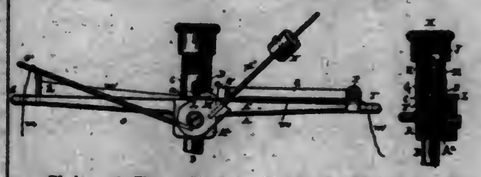
398,125. SHAWL-STRAP. DARIUS W. BROKAW, Dover, Me. Filed Dec. 26, 1888. Serial No. 294,841. (No model.)

Claim.—1. In a shawl-strap, the combination, with the bundle-inclosing straps and a handle, of a base-rod circular in cross-section, made in three parts, arranged end to end, and connected together by dowel-pins or tenons and sockets, and provided with circumferential grooves to receive the bundle-inclosing straps, and having spaces between the ends or shoulders of the several parts to receive the ends of the handle.

2. In a shawl-strap, the combination of a base-rod composed of three parts arranged end to end and connected together by dowel-pins or tenons and sockets, a plurality of bundle-inclosing straps secured in fixed positions longitudinally on said base-rod, and a bent handle having a hole in each end, through which the dowel-pins or tenons pass to connect said handle and rod.

3. In a shawl-strap, the combination of a base-rod made circular in cross-section and provided with a plurality of annular grooves, a plurality of bundle-encircling straps, each having one end thereof wrapped around said rod in one of said grooves, with the end secured to the main body of said strap, thus forming a loop freely movable about said rod, and a buckle attached to the looped end of each of said straps and held in place by having its bar confined between said rod and the surrounding loop of the strap.

398,126. EAR-RING. LUTHER P. BROOKS, Boston, Mass. Filed June 21, 1886. Serial No. 205,303. (No model.)

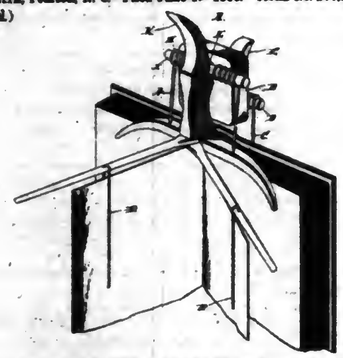


Claim.—1. The combination of the loop and drop and the connection or bearing between them, consisting of two opposed pieces of hard metal having their straight horizontal bearing-edges arranged transversely to each other.

2. The combination of the loop and drop and the connection or bearing between them, consisting of two opposed pieces of steel or other hard metal having straight horizontal knife-edges arranged transversely to each other.

3. In an ear-ring setting, the combination of a supporting ring or loop having a slot formed therein, and a hard-metal plate or bearing-piece secured in said slot having a straight horizontal bearing-edge which extends across the opening in the ring or loop parallel with the chord of its curve.

398,127. TENSION DEVICE FOR KNITTING-MACHINES, &c. FREEMAN A. CALLET, Pawtucket, R. I., assignor to the H. Jenks Manufacturing Company, same place. Filed July 27, 1887. Serial No. 245,416. (No model.)



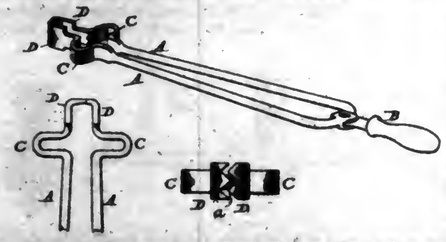
Claim.—1. The combination, with a bar having thread-guiding eyes, of a tubular standard on the bar, a tubular sliding block in the standard, which block has a bottom aperture, and a packing-piece—such as felt or cotton waste—in said block, substantially as set forth.

2. The combination, with a bar having thread-guiding eyes, of a tubular standard provided with apertures for the passage of the thread, a sliding block in said standard, a pin projecting from the block through a slot in the standard, a cam pivoted on the side of the bar, which cam can act on the pin of the sliding block, a weighted arm on the cam, and an arm provided with an eye on the cam, substantially as set forth.

3. The combination, with a bar having thread-guiding eyes, of a tubular standard provided with apertures for the passage of the thread, a sliding block in the standard, a lever pivoted on one end of the bar and having its swinging end resting on the top of the bar, a cam acting on said lever and on the sliding block, which cam is provided with a weighted arm, and an arm having an eye, substantially as set forth.

4. The combination, with a bar, A, having opposite thread-guiding eyes, the leg P on one end of the arm, the lever Q, pivoted on said leg and provided with a laterally-projecting lug, Q', on its swinging end, the cam M, pivoted to the side of the bar and provided with a weighted arm, M', and the arm O, having an eye, the tubular standard C on the bar, a sliding block in said standard, and a pin projecting from the sliding block through a slot in the standard, which pin rests on cam M, substantially as set forth.

398,128. MUSIC-BOOK HOLDER. JAMES P. CASTON and LEONIDAS C. SMITH, Polkton, N. C. Filed June 19 1888. Serial No. 277,573. (No model.)



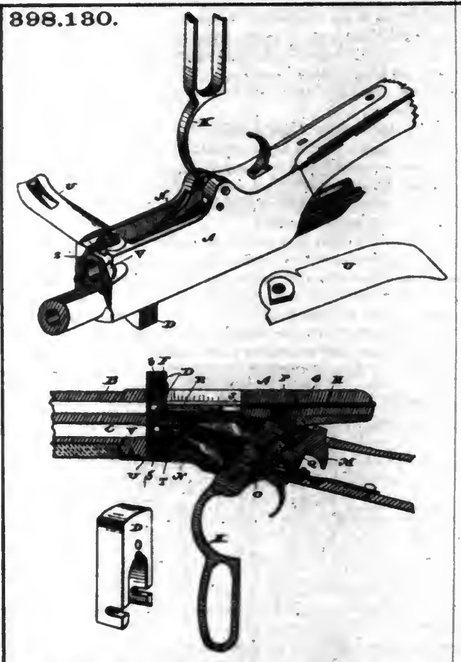
Claim.—1. In a music-book holder, the combination, with a suitable block or body, of the front spring-actuated pressure-lever pivoted to the block near its upper edge, and the rear spring-actuated lever pivoted to the block near its lower edge, substantially as specified.

2. In a music-book holder, the combination of the block, the registering spring-coils B B, secured to the rear side of the block near its lower edge and provided with the integral arms C C, the registering spring-coils H H, arranged on the front side of the block near its upper edge and provided with integral arms N, the transverse spindles D and I, engaging the coils B and H, respectively, and the pressure-levers E and K, mounted, respectively, on the said spindles and provided with transverse pressure-bars, to which are attached the extremities of the arms C and N, respectively, substantially as specified.

3. In a music-book holder, the combination of the block A, the registering spring-coils B B on its rear side, having arms C C, the registering spring-coils H H on its front side, having the arms N, the revoluble spindles D I, arranged, respectively, in the said registering coils, the front and rear pressure-levers provided with loops engaging the said spindles and connected to the arms C and N, the swinging arms O, pivoted to the lower end of the front lever, and the depending parallel wire fingers P P, attached to the swinging arms and adapted to engage on opposite sides of a page, substantially as specified.

398,129. COMBINATION-TONGS. JOHN H. COOK, Washington, D. C. Filed Feb. 23, 1888. Serial No. 264,902. (No model.)

Claim.—1. The tongs herein described, comprising a pair of pivoted levers, each having a lateral U-shaped arm near its end and an extension, D, beyond the lateral arms provided with teeth or notches.



2. The tongs herein described, comprising the pivoted levers A A, provided with the U-shaped arms C C, one of said arms being provided with a curved arm or extension, D.

398,130. MAGAZINE FIRE-ARM. WILLIAM M. COOPER and EDWIN J. CASHMORE, Toronto, Ontario, Canada; said Cashmore assignor to said Cooper. Filed July 7, 1883. Serial No. 279,360. (No model.) Patented in England July 17, 1883, No. 10,394; in Canada Aug. 1, 1883, No. 20,615; in Belgium Aug. 31, 1883, No. 63,254; in Italy Sept. 20, 1883, XXII, 23,856, XLVII, 130, and in France Sept. 25, 1883, No. 160,053.

Claim.—1. In a rifle having a magazine beneath the barrel, a recoil-block cut away to form vertical legs, and an opening between said legs for the passage of the cartridge from the magazine to the carrier when the block is in its normal position and from the carrier to the barrel when the block is elevated, as set forth.

2. The combination, with the barrel of a repeating-rifle, of a bifurcated recoil-block located between the end of the barrel and the case containing the action of the repeater, and a pivoted carrier having its forward end within the vertical slot in the breech-block and guided by the vertical portions of said block, substantially as described.

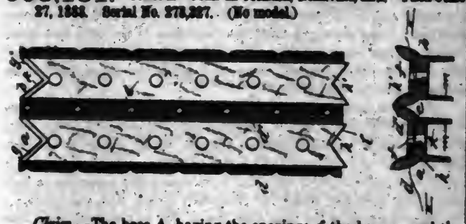
3. A vertically-adjustable recoil-block fitted into the case immediately behind the inner end of the barrel of the rifle, in combination with an inclined firing-needle inserted into the recoil-block, and a plunger disconnected from the block, movable at right angles to the movement of the recoil-block, and arranged to convey the blow of the hammer to the cap of the cartridge, substantially as and for the purpose specified.

4. A cartridge-magazine made parallel with and forming an integral part of a rifle-barrel, in combination with a half-round bayonet having a shank formed to fit onto the magazine, and a clip arranged to connect the neck of the bayonet with the barrel of the rifle, substantially as and for the purpose specified.

5. The combination, with the barrel and the sliding bolt G, of the extractor endwise movable through a portion of said bolt, and the trigger-guard lever engaging said bolt and extractor to move the same forward, substantially as described.

6. The combination, with the sliding bolt G, formed with horn P, of the extractor J, endwise movable in the forward portion of said bolt, and the pivoted trigger-guard lever K, having its inner end arranged to engage said horn to throw the bolt in one direction and to engage and throw the extractor and bolt in the opposite direction, substantially as described.

7. The combination, with the trigger-guard lever formed with the lug O, of the recoil-block D, forward of the pivot of said lever, and the lever N, pivoted forward of the trigger-guard lever and at the rear of and engaging said block, with its short arm arranged in the path of and designed to be operated by said lug to raise the block, substantially as described.



8. The combination, with the barrel, the recoil-block, and the pivoted carrier beneath said block, of the lever N, engaging and acting on said block to raise the same, and the pivoted trigger-guard lever having bearings which engage first with the lever N to throw up the block and then with the carrier, substantially as described.

9. The pivoted carrier R, having a tail, Q, formed on it, in combination with the recoil-block D, the pivoted lever N, and the pivoted trigger-guard lever K, having bearings at different distances from its pivot, one engaging said lever N and the other said tail, both of said levers being pivoted forward of the pivot of the carrier, substantially as and for the purpose specified.

10. The combination, with the rifle body or case having an opening in its bottom in front of the trigger-guard lever, of a cover, U, pivoted to said body on a vertical pivot and arranged to swing horizontally and completely close such opening, substantially as described.

11. The combination, with the rifle body or case provided with a magazine having an opening in its bottom in front of the trigger-guard lever, of a cover, U, for closing said opening, formed with a vertical angular hub, and a spring-plate, 2, on the body acting on said hub, substantially as and for the purpose specified.

398,131. GRATE. JOHN A. CHERRY, Rockville, Ark. Filed June 27, 1888. Serial No. 278,227. (No model.)

Claim.—The base A, having the openings *f*, the bars *m*, and the solid flanges *d* and *d'*, said flanges having openings only in the outer edges thereof, in combination with the sliding damper A, provided with openings communicating with the openings *f'*, and adapted to close the same, substantially as described, and for the purpose set forth.

398,132. GALVANIC BATTERY. REES D. CROSS, Chicago, Ill. Filed Aug. 2, 1888. Serial No. 281,830. (No model.)

Claim.—1. In a galvanic battery, the negative electrode separated into two parts, which are electrically connected together and respectively arranged in separate cells, whereof one contains an excitant, in combination with a tube arranged to conduct the fumes from the cell that contains the excitant and discharge the same into the remaining one of said two cells, substantially as set forth.

2. In a galvanic battery, the negative electrode separated into two parts, which are electrically connected together and respectively arranged in separate cells, whereof one contains an excitant, in combination with a tube arranged to conduct the fumes from the cell that contains the excitant and discharge the same into the other cell, which latter contains a vehicle capable of being impregnated with the fumes, so as to provide therein an excitant due to the fumes from the cell wherein they are first generated, substantially as set forth.

3. In a galvanic battery, a carbon electrode consisting of two sets of carbon tubes, which are electrically connected together and respectively arranged in separate cells, whereof one contains an excitant, in combination with a tube arranged to conduct the fumes from the cell that contains the excitant and discharge the fumes into the other cell, substantially as set forth.

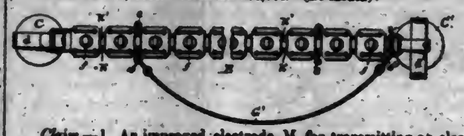
4. In a galvanic battery, the negative electrode separated into two parts, which are electrically connected together and respectively arranged in separate cells, whereof one contains an excitant, in combination with a tube arranged to conduct the fumes from the cell containing the excitant and discharge such fumes into the other cell, and a packing of charcoal and asbestus in the latter cell, substantially as and for the purpose set forth.

5. In a galvanic battery, a carbon electrode formed of carbon tubes, each having a longitudinally-formed slot or opening, for the purpose set forth.

6. In a galvanic battery, the combination, with a couple of cells, each having a carbon cover, of a couple of sets of carbon tubes respectively arranged within one and the other of said cells and attached to the carbon covers, said covers being electrically connected together, substantially as set forth.

7. In a galvanic battery, the combination, substantially as hereinbefore set forth, of three concentric cells, a carbon electrode separated into two parts, which are electrically connected together, with one part arranged in the central cell and the other in the extreme outer cell, a zinc electrode arranged within the intermediate cell, and a tube leading from one to the other of the two cells which contain the said parts of the carbon electrode, substantially as set forth.

8. In a galvanic battery, a carbon electrode formed of carbon tubes, each having a longitudinal slot or opening and combined with a filling consisting of a tube or lining of porous material packed with asbestus, substantially as and for the purpose described.



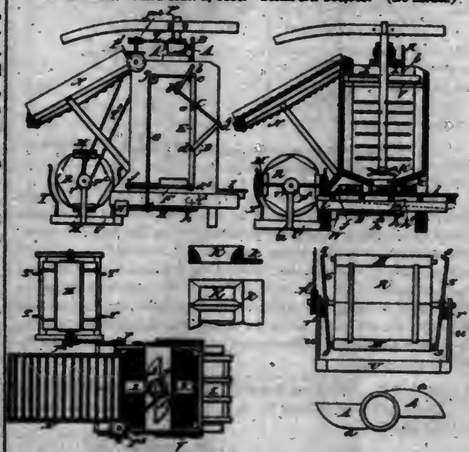
9. In a galvanic battery, a zinc electrode consisting of a set of zinc rods attached to a metal plate by screws which engage in the upper ends of the zinc rods, substantially as and for the purpose described.

10. In a galvanic battery, the negative electrode, combined with a solution of nitric acid and nitrate of ammonium.

11. In a galvanic battery, the negative electrode composed of carbon and combined with a solution of nitric acid and nitrate of ammonium.

12. In a galvanic battery, a carbon electrode composed of carbon tubes, each having a longitudinal opening and containing a filling of asbestus packed in a tube of porous material, combined with a solution of nitric acid and nitrate of ammonium, substantially as set forth.

398,133. ELECTRIC BELT. SAMUEL DE BARS, Kansas City, Mo. Filed Nov. 22, 1888. Serial No. 291,560. (No model.)



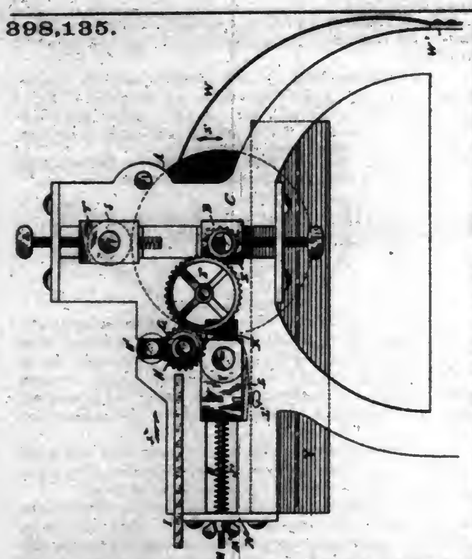
Claim.—1. An improved electrode, M, for transmitting an electrical current to the forehead or back of the neck, composed of an exterior metallic plate, a porous pad, Q', secured to the plate, and an elastic band, Q, also secured to said plate and arranged to encircle the wearer's head, in combination with the battery and an electrical connection between said plate and said battery, substantially as set forth.

2. In an electro-galvanic body-belt, the combination, with a copper and zinc element, of a porous pad placed between them, a split key, *f*, a sleeve, *m*, and washer *n*, substantially as set forth.

3. In an electro-galvanic body-belt, the combination of an outer casing that permits the removal of a flexible electro-galvanic battery, a pliable electro-galvanic battery which is made up of a series of individual galvanic piles, each of which piles is composed of a zinc and copper plate having a porous or fibrous pad inserted between these elements, a split key, a sleeve or ferrule, an da washer over which the ends of the key are bent, substantially as set forth.

398,134. BRICK-MACHINE. CONRAD DOERFLER and EDWARD DOERFLER, Springfield, Ill.; said Edward Doerfler assignor to said Conrad Doerfler. Filed Mar. 3, 1888. Serial No. 266,005. (No model.)

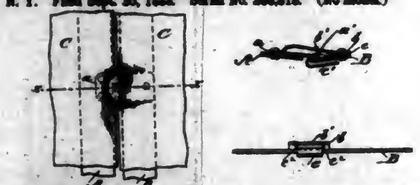
Claim.—1. The combination, in a brick-machine, of a system of levers, cords, pulleys, and weights, consisting of the revolving arms A A, the levers B and D, the rods C and F, with the roller-bar *f*, the levers E and H, the cord G, and pulley *g*, the movable mold-slide frame I, supported at *i* and i^2, all for delivering the molds under and from under the die, substantially as described, and for the purposes set forth.



2. The combination, in a brick-machine, of a mold-sanding box consisting of the hexagonal box R, revolving on a center rod in the frame U and *u u*, the guides T T, the clamp-hooks S S, the inclined semicircular slides *r r*, the pulleys *p* p^2, and chain belt q^2, all for the purposes described and set forth.

398,135. MACHINE FOR APPLYING ADHESIVE MATERIAL. EMMOR DEETTHS, New York, N. Y. Filed Aug. 1, 1888. Serial No. 281,683. (No model.)

Claim.—1. In a machine for applying adhesive material on sheets of paper, the combination, with a frame, of a roller, a receptacle for the adhesive material, into which receptacle said roller extends, a doctor-roller made adjustable toward and from the same, a cleaning-doctor resting on the cylindrical surface of said doctor-roller, and a pair of feed-rollers, substantially as herein shown and described.



2. In a machine for applying adhesive material on sheets of pa-

398,135.

per, the combination, with a frame, of the roller A, the receptacle V for the adhesive material, the doctor-roller K, the feed-rollers H H', the pressure-roller S, and the guide-wires W, substantially as herein shown and described.

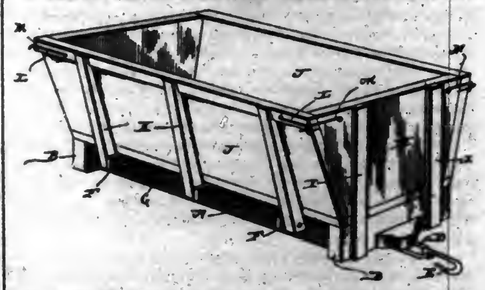
398,136. CORSET-FASTENING. WILLIAM M. DUNKER, New York, N. Y. Filed Sept. 25, 1888. Serial No. 286,313. (No model.)

Claim.—A corset-fastening consisting of a stiff catch, *a*, and hook portion *a'*, adapted to be secured to one corset-steel, in combination with a spring-catch, *b*, adapted to be secured to the opposite corset-steel, such spring-catch *b* being provided with a centrally-located slot as *b'*, a guide-plate, *c*, disposed between the spring-catch and the steel having a turned-back portion, *c'*, and ears c^2 c^2, supporting the spring-catch above the guide-plate and forming a suitable opening adapted to receive the stiff catch and to be disengaged therefrom by bringing the outer ends of the catches toward each other, substantially as described and shown.

398,137. EXTENSION-STRIP FOR WINDOW-SHADE ROLLERS. ABRAM R. DUNKLE, Steelton, Pa. Filed Feb. 23, 1888. Serial No. 264,913. (No model.)

Claim.—1. In an extension-strip for window-shade rollers, the wooden sections B B, having inclined grooves or channels along their upper and lower edges, and the metallic extension or face plate D, secured rigidly to one section and having inclined flanges at its upper and lower edges working in the inclined grooves of the other section, said extension or face plate spanning the space between the adjoining separated ends of the two sections, so as to cover this space and make the strip have all the appearance of an ordinary one.

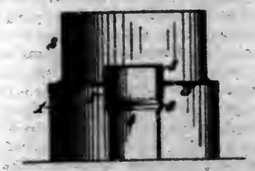
2. In an extension-strip for window-shade rollers, the wooden strip divided into sections B B', carrying the roller-brackets at the ends, and the metallic extension or face plate D, rigidly affixed to one section and having flanges along its upper and lower edges to engage the upper and lower edges of the other section, and said extension or face plate being arranged along the front face of the strip and spanning the space separating the adjoining ends of the sections, whereby this space is concealed and the strip is given the appearance of an ordinary one, as set forth.



3. In an extension-strip for window-shade rollers, the wooden strip divided into sections B B', carrying the roller-bracket at the ends, and the metallic extension or face plate D, rigidly affixed to one section and having flanges along its upper and lower edges to engage the upper and lower edges of the other section, and said extension or face plate being arranged along the front face of the strip and spanning the space separating the adjoining ends of the sections, whereby this space is concealed and the strip is given the appearance of an ordinary one, and the clamp *a* or locking device arranged on the section over which the extension-plate slides, so as to clamp the free end of the said plate, as set forth.

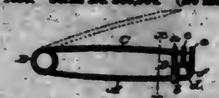
4. The combination, in a shade-roller strip, of the grooved or channeled section B', the section B, having an extension or face plate provided with flanges engaging in the grooves of the section B', and the catch or clamp *a*, pivoted to the section B', and having a spring-jaw, *c*, engaging the upper edges of the section and the extension or face plate mounted thereon, whereby they are locked together, substantially as and for the purpose specified.

5. The strip for shade-rollers, having rabbets or recesses in its ends, flanges on the sides of the rabbets or recesses, and the projecting plates overhanging the rabbets or recesses, substantially as and for the purpose specified.



6. The strip for shade-rollers, having rabbets or recesses in its ends, the straps G G, embracing the ends of the strip and projecting outward to form the flanges H H on the outer and lower sides of the rabbets or recesses, and the plates I I, secured to the face of the strip and projecting outward over the said rabbets or recesses to form the pockets K K and the slots L L, all constructed and arranged substantially as specified.

398,138. CAR FOR CARRYING SUGAR-CANE. ZACK T. EARLE, White Castle, La. Filed Nov. 21, 1888. Serial No. 291,464. (No model.)

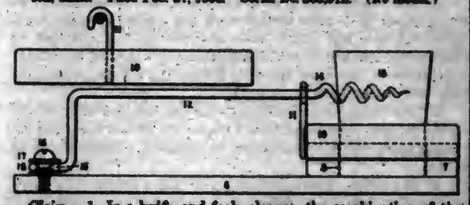


Claim.—The improved car herein described and shown, comprising the longitudinal beams A A, the transverse sills B B, secured to the ends of said beams, the longitudinal brace-rods C C, connecting the said sills, the cross-bars F, secured on the upper sides of the beams A A, the ends of said cross-bars projecting beyond the ends of the sills B, the cylindrical rods G G, secured in the ends of the cross-bars, the floor G', rigidly secured upon the cross-bars F and the sills B, the standards I, rigidly secured to the sills D, the end pieces, H, secured rigidly to said standards, the standards K, pivoted on the rods G, the sides J, secured to said standards, the hooks M, secured to the upper corners of the ends H, and the hooks L, secured to the corners of the sides J and engaging the hooks M, as specified.

398,139. CAKE, BISCUIT, AND DOUGHNUT CUTTER. WILLIAM H. EATON, Fitchburg, Mass. Filed Sept. 11, 1888. Serial No. 285,131. (No model.)

Claim.—The combination, with a double-ended biscuit or cake cutter having an internal double-ended socket, of a removable and replaceable tubular cutter having one extremity to fit either end of the socket for reversing the tubular cutter, substantially as described.

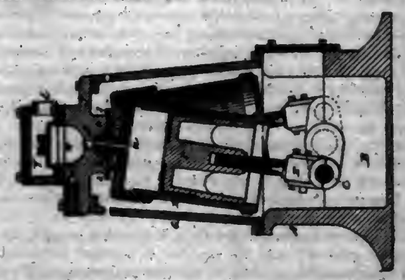
398,140. SAFETY-PIN. GEORGE P. FARRER, Montclair, N. J. Filed Aug. 25, 1888. Serial No. 283,504. (No model.)



Claim.—A safety-pin having its shield made integral with the wire of the pin and consisting of two lateral folds, as *b* and *d*, on each side of the central plane of the body and point of the pin parallel therewith, and of three transverse loops, as *a*, *c*, and *e*, connecting the lateral folds with each other and with the outer end of the shield, and terminating in a guide-post at the inner end of the shield, substantially in the manner and for the purpose herein set forth.

398,141. SAFETY-PIN. GEORGE P. FARRER, Montclair, N. J. Filed Aug. 31, 1888. Serial No. 283,565. (No model.)

Claim.—The combination, with the retaining and protecting shield for the point of a safety-pin, of a dividing bar or post extending centrally from the inner side of the transverse arch of the shield to the opposite member of the pin, whereby the hood or recess under the shield is divided into two lateral pockets, and the pin-point is positively prevented from passing from the one to the other within the shield, substantially in the manner and for the purpose herein set forth.



398,142. KNIFE AND FORK CLEANER. HENRY R. FAY, Boston, Mass. Filed Feb. 27, 1888. Serial No. 265,512. (No model.)

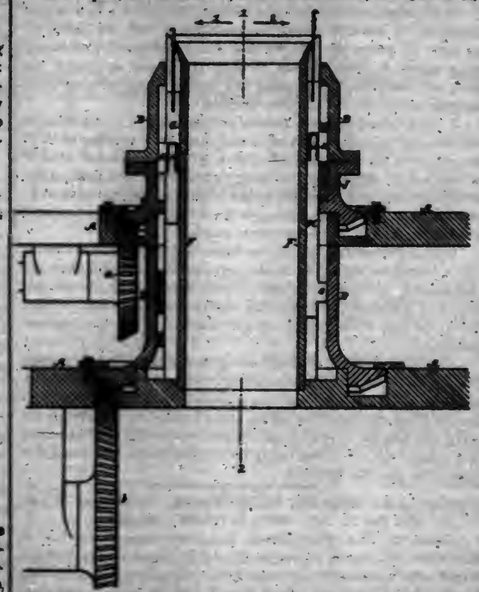
Claim.—1. In a knife and fork cleaner, the combination of the cork-holder 8, provided with the cork 9, with the cork 13, provided with the cork-carrier 12, which is loosely pivoted and is provided with the cork-screw end, thereby permitting the cork 13 to be operated in lines radial, vertical, and curvilineal, substantially as and for the purposes set forth.

2. In a knife and fork cleaner, the combination of the tank 7 adapted to be used as a holder of supplies to be used in the cleaning of knives and forks and to be conveyed therefrom by the use of cork 13, and provided with the cork-holder 8 and cork 9, with the cork-carrier 12, provided with the cork 13, said carrier 12 being loosely pivoted and provided with the cork-screw end, thereby permitting the cork 13 to be operated in lines radial, vertical, and curvilineal, substantially as described.

398,143. STEAM-ENGINE. HERBERT N. GALE, Bristol, Conn., assignor of one-half to Fred A. Dennett, Sheboygan, Wis. Filed July 16, 1887. Serial No. 243,075. (No model.)

Claim.—1. In a piston steam-engine, the cylinder-head opposite the crank end constructed with a cylindrical rocker or rib diametrically across its outside, combined with a stationary seat in shape corresponding to said rib and so as to support said cylinder by said rib, gibs 2 2, arranged longitudinally in said seat and so as to bear upon said rocker or rib below its axis, and set-screws arranged to bear upon said gibs, substantially as and for the purpose described.

2. In a piston steam-engine consisting of two or more single-acting cylinders, the pistons from the respective cylinders connecting directly to oppositely-turned cranks on the driving-shaft, the head of each cylinder opposite the crank end constructed with a cylindrical rocker diametrically across it and in a plane parallel with the driving-shaft, each of said rockers constructed with a longitudinal steam-passage leading into its cylinder, a steam-chest constructed with inlet and exhaust ports in a plane at right angles to the plane of the said passage through said rockers, and a passage between said ports corresponding to and communicating with said passage through the rockers, and a valve arranged to work upon said ports, substantially as described, and whereby steam is first admitted to one cylinder while exhausting from another, and vice versa.

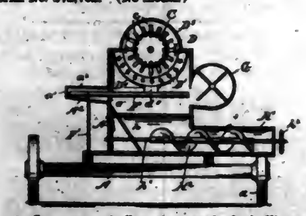


3. In a piston steam-engine consisting of two or more single-acting cylinders, the pistons from the respective cylinders connecting directly to oppositely-turned cranks on the driving-shaft, the head of each cylinder opposite the crank end constructed with a cylindrical rocker diametrically across it and in a plane parallel with the driving-shaft, each of said rockers constructed with a longitudinal steam-passage leading into its cylinder, a steam-chest with two ports, from one of which a passage leads to the said passage through the rocker of one cylinder, and from the other port a passage leads to the steam-passage through the rocker of the other cylinder, with an escape-cock, *n*, from each of the passages between the ports and the rockers, substantially as and for the purpose described.

398,144. DOOR-SPRING CONNECTION FOR ELECTRIC BURGLAR-ALARMS. JOHN GRANT, Philadelphia, Pa., assignor to Shaw & Geary, same place. Filed Aug. 22, 1888. Serial No. 283,416. (No model.)

Claim.—In a door-spring connector for electric burglar-alarms, the combination of movable plug F, contact-piece G, carried thereby, spring contact-piece E, plate C, through which the movable plug F works, and insulating-block D, with the supporting-arms B B, having lugs *b b*, whereby the insulating-block D and plate C are supported, substantially as described.

398,145. CIRCULAR-KNITTING MACHINE. GEORGE H. GILBERT, Philadelphia, Pa. Filed Jan. 3, 1888. Serial No. 260,294. (No model.)



Claim.—1. The combination of the two cam-rings, one above the other, with a needle-cylinder having needles, all of which have bits engaging with the cams of one ring, a portion only of the needles

having secondary bits engaging with the cams of the other ring, and these latter needles being movable in the cylinder, whereby their secondary bits can be moved into and out of range of the operating-cams therefor, all substantially as specified.

2. A knitting-machine in which are combined two cam-rings, one above the other, a needle-cylinder having needles, all of which have bits engaging with the cams of one ring, a portion only of the needles having secondary bits engaging with the cams of the other ring and being movable into and out of range of said cams, mechanism for rotating the cam-ring which controls all of the needles, and mechanism for reciprocating the cam-ring which controls only a portion of the needles, all substantially as specified.

3. The combination of the needle-cylinder and its needles, a cam-ring having cams whereby each needle is operated two or more times on each rotation of said ring, a supplementary cam-ring whereby certain of the needles are operated once on each reciprocation of said ring, and devices for rotating the main cam-ring and reciprocating the supplementary cam-ring, the needles being movable in the cylinder independently of the supplementary cams, whereby they may be removed from and restored to the influence of said cams, all substantially as specified.

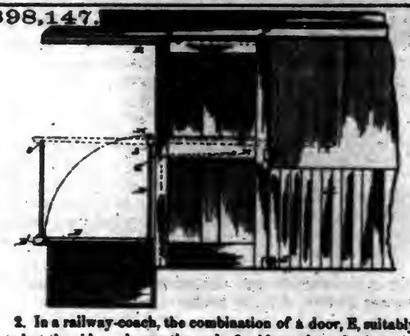
398,146. CORN-SHELLER. JOHN H. GILMAN, Ottawa, Ill., assignor to the King & Hamilton Company, same place. Filed May 3, 1888. Serial No. 272,702. (No model.)

Claim.—1. In a corn-sheller, the toothed shelling-cylinder, in combination with a series of square or angular bars parallel to the cylinder and set at an angle to each other somewhat less than forty-five degrees, substantially as and for the purposes specified.

2. In a corn-sheller, the shelling mechanism, in combination with a vertical shaft arranged at the end thereof and provided with a throwing disk or wheel upon which the cobs are discharged, substantially as and for the purposes specified.

3. In a corn-sheller, the shelling-cylinder, in combination with the cylinder-casing having a cob-discharge aperture, a^3, the vertical shaft E, provided with a throwing-wheel, J, arranged at said aperture, and the casing J', substantially as and for the purposes specified.

4. In a corn-sheller, the main casing A', provided with a lateral opening, a', in one side thereof, in combination with the incline A^3 and cover a^3, projecting from the side of said casing, and the reciprocating screen F, extending out through said lateral opening in the casing and reciprocating between the incline A^3 and cover a^3, substantially as and for the purposes specified.



5. In a corn-sheller, the vertical driving-shaft E, in combination with the shelling-cylinder geared to said shaft, the transverse shaft I^3, also geared to the shaft E, the feed-elevator B, the sprocket-wheel i^3 on the shaft I^3, and chain I^2, running thence to the feed-elevator, the shelled-corn elevator I, and the sprocket-wheel i^2, also on the shaft I^3, and the chain I^1, running thence to the driver of the said elevator, substantially as and for the purposes specified.

6. In a corn-sheller, the main or supporting frame, in combination with a casing containing the shelling mechanism mounted thereon and a cob-stacker pivoted to the main frame at one corner thereof and outside of the casing, whereby the stacker may be turned around against the side of the casing, substantially as and for the purposes specified.

7. In a corn-sheller, the main or supporting frame, in combination with the casing A', mounted thereon and containing the shelling mechanism, the cob-stacker mounted on a pivotal support at one corner of the frame and outside of the casing, and a bracket, k', mounted on the casing and adapted to receive and retain the cob-stacker when turned back against the side of the casing for transportation, substantially as and for the purposes specified.

398,147. DOOR FOR RAILWAY-CARS. JACOB HAHN, De Kalb Ill. Filed Feb. 22, 1888. Serial No. 265,038. (No model.)

Claim.—1. In a railway-coach, the combination of the door E, adapted to slide in line therewith, the lid D, hinged on the platform of said coach perpendicular to said door, the pitman G, connecting the top of lid D with the side of door E, and the latch H, projected within said coach, whereby said door E can be operated from within said coach and said lid raised and lowered coincidently with the sliding of said door, substantially as described.

2. In a railway-coach, the combination of a door, E, suitably supported at the side and near the end of said coach, and adapted to be slid back and forth, a lid, D, hinged to said coach at or near the lower outer corner thereof, and pitman G, connecting said door and lid, whereby the shifting of the door E to and from the side of the end platform of said coach will coincidently raise and lower the lid D, so as to open and close the step-space at the side of said platform, the pitman being drawn between the car side and door when the door is slid back, substantially as shown, and for the purpose described.

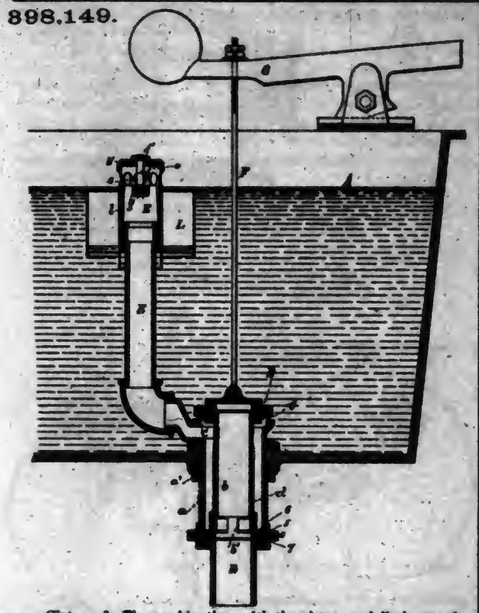
3. In a railway-coach having a rail, 3, in front of the platform, a door adapted to be slid to and fro at the side, combined with a latch pivoted at its inner end to the inner side of the door and adapted to be wholly withdrawn between the car side and door when the door is open, and having a knob on its pivot, whereby it can be lifted either from the outside or inside of the coach.

4. The combination, in a railway-coach, of a sliding door at the end, a hinged lid to cover the car-steps, and a pitman pivoted at one end to the door and at the other near the top of the hinged lid, whereby the door and lid can be simultaneously operated, for the purpose set forth, and when the door is open the pitman is concealed from view, substantially as set forth.

5. In a railway-coach, a sliding door and a hinged lid for covering the car-steps, and connections between the lid and door, whereby simultaneously the door and lid can be operated, substantially as described.

6. In a railway-coach, a sliding door and a hinged lid to cover the car-steps, and means, substantially as described, for connecting the two, so that they can be operated simultaneously, and a lock or latch for securely holding the door closed and the lid down, all substantially as described.

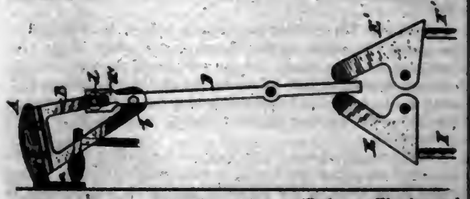
398,148. VEHICLE-HUB. JACOB HAHN, De Kalb, Ill. Filed Sept. 27, 1888. Serial No. 286,612. (No model.)



Claim.—1. The combination of the parts D' and D^2, one or both of said parts being provided with dovetailed recesses F, spokes E, provided with conformable dovetailed inner ends, adapted to be moved laterally into said recesses F, pipe-box G, provided with external annular flange G' with exterior thread, 7, and with thickened ends 10, ring J, provided with interior threads, 12, and the skein B, provided with peripheral spiral grooves P, substantially as shown, and for the purpose described.

2. The combination of the skein B, provided with the interior end threads, 2, and with the flange 6 and annular recess 5 therein, the rubber ring 13, the cap H, provided with flange 3 and threads 4, and hub D, provided with the pipe-box G, substantially as shown, and for the purpose described.

3. The combination of the skein B, provided peripherally with the spiral grooves P, and the pipe-box G, provided with thickened ends 10 and central oil-recess, N, whereby the bearing-surface of the axle is reduced and the rotation of said hub tends to carry the oil under the bearing portions of said axle, substantially as shown, and for the purpose described.

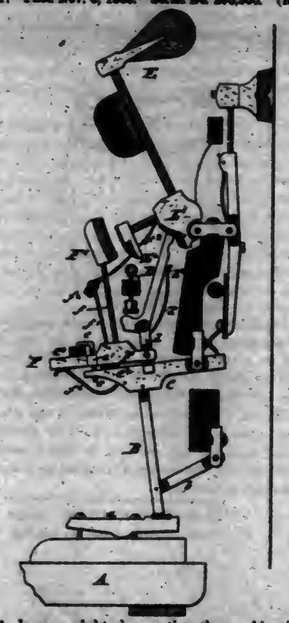


398,149. VALVE FOR WATER-CLOSETS, &c. EDWARD HAHN, Brooklyn, assignor to The J. L. Mott Iron Works, New York, N. Y. Filed Nov. 12, 1888. Serial No. 290,894. (No model.)

Claim.—1. The combination, with the cistern and discharge-pipe to the closet, of a tubular thimble passing through the bottom of the cistern and having a valve-seat at its upper edge and connected to the discharge-pipe at its lower end by a coupling-ring, a stand-pipe and perforated ring-base within and secured to the thimble, a valve, and an open-ended pendent pipe from said valve, said pipe surrounding the stand-pipe, substantially as and for the purpose set forth.

2. The combination, with the cistern-valve and discharge-pipe, of the thimble attached to the discharge-pipe and to the cistern and having the valve-seat at the upper end and an inward flange, 6, at the lower end, and the tubular stand-pipe closed at its upper end and having holes through its base, and a flange, 5, to pass below the flange 6, and the hanging pipe attached at its upper end to the valve and surrounding the stand-pipe, substantially as set forth.

398,150. MUFFLER FOR UPRIGHT PIANOS. SIGMUND HAHNE, New York, N. Y. Filed Nov. 8, 1888. Serial No. 290,209. (No model.)



Claim.—1. The combination, with an oscillating muffling bar and apron pivoted to the supporting action-frame, of a fulcrumed lever engaging one of the supporting-arms of the muffling-bar, a muffler-pedal, a soft pedal, and intermediate lever mechanisms between the fulcrumed lever and said pedals for applying or removing the muffling-bar to or from the strings, substantially as set forth.

2. The combination, with an oscillating muffling bar and apron, of an oscillating lever engaging the supporting-arms of the same, pivoted elbow-levers engaging the lower end of said oscillating lever, a separate muffler-pedal, a soft pedal, and mechanism between said pedals and the elbow-levers for applying the muffler to the strings or returning the same to its normal position of rest, substantially as set forth.

3. The combination, with a muffling bar and apron, of pivoted bracket-arms supporting the muffling-bar, a pin applied to one of said arms, a fulcrumed lever having a forked upper end for engaging said pin, elbow-levers engaging the lower end of the actuating-lever, pusher-rods for raising the elbow-levers, a muffler-pedal, a soft pedal, and pedal-levers between the muffler and soft pedals and the pusher-rods, whereby the elbow-levers and muffler-bar are alternately operated and the latter either applied to or removed from the strings, substantially as set forth.

398,151. UPRIGHT-PIANO ACTION. SIGMUND HAHNE, New York, N. Y. Filed Nov. 8, 1888. Serial No. 290,203. (No model.)

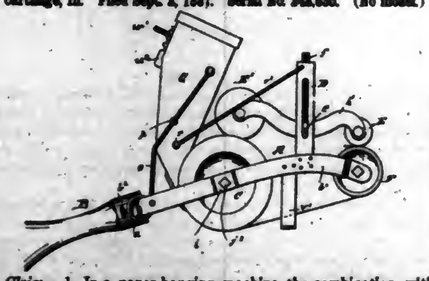
Claim.—1. In an upright-piano action, the combination, with the fulcrumed jack-lever having an adjustable check-wire and a cushioning-spring at its front end, of a hammer-check lever pivoted to a fixed post of the jack-lever, said hammer-check lever being provided with a slotted opening for the check-wire, and a cushion for the same, substantially as set forth.

2. In an upright-piano action, the combination, with a fulcrumed jack-lever having an adjustable check-wire and a cushioning-spring at its front end, of a fixed post secured to the check-lever, a hammer-check lever pivoted to said post and provided with a slot for the passage of the check-wire and a cushion for the same, a hammer-check secured by a wire shank to the hammer-check lever, a bridle-wire, also secured to the hammer-check lever and a hammer the butt of which is provided with a shoe, and a bridle connected to the upper end of the bridle-wire, substantially as set forth.

398,152. LEVER. ROBERT W. HAMER, Albany, N. Y. Filed Aug. 30, 1888. Serial No. 284,186. (No model.)

Claim.—1. The combination, with a notched sector, of a pivoted bar, a longitudinally-movable spring-actuated latch, a handle pivoted to said bar, movable independently in the same plane as the bar or in a parallel plane, limited in said independent movement by means of stops, and provided with arms extending in opposite directions, and connections between said arms and the aforesaid latch, substantially as shown and described.

2. The combination, with a notched sector, of a pivoted bar, a longitudinally-movable spring-actuated latch, a handle provided with offsets adapted to serve as stops, and with arms extending in opposite directions, said handle being movable independently on its pivot in the same plane as the bar or in a parallel plane, and connections between said arms of the handle and the aforesaid latch, substantially as shown and described.



3. The combination, with a notched sector, of a pivoted bar, a longitudinally-movable spring-actuated latch, a handle pivoted to said bar, movable independently in the same plane as the bar or in a parallel plane, limited in said independent movement by means of stops, and provided with arms extending in opposite directions, and flexible connections between said arms and the aforesaid latch, substantially as shown and described.

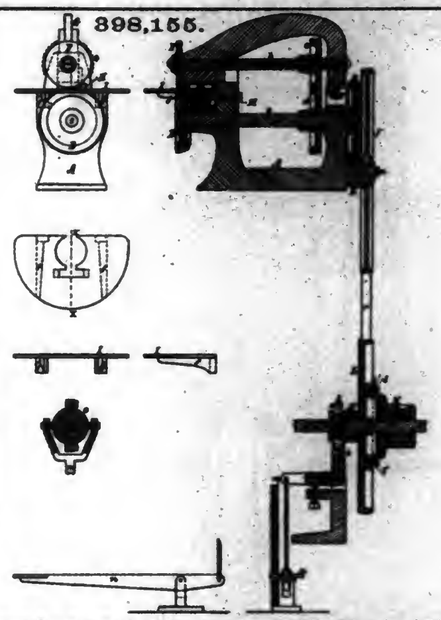
398,153. BARREL-COVER. JOHN P. HARP, Donaldsonville, La. Filed July 31, 1888. Serial No. 281,597. (No model.)

Claim.—The improved barrel-cover herein described, consisting, essentially, of the fixed section composed of the semicircular plates G G, arranged so as to form an interspace, *a*, the hoop H, bound around the curved margin of the said fixed section and depending from the under side thereof, the ledge H', secured to the inner side of the hoop, as shown, the semicircular frame B, the glass A, secured therein, the said glass frame being pivoted at its straight portion to the straight portion of the fixed section, so that it may turn within the plates G thereof, and the flanges K, adapted to embrace a barrel-mouth, substantially as specified.

398,154. PAPER-HANGING MACHINE. JOSEPH R. HARTFORD, Carthage, Ill. Filed Sept. 2, 1887. Serial No. 248,636. (No model.)

Claim.—1. In a paper-hanging machine, the combination, with the frame provided with a handle, of the paper and distributing rollers journaled in said frame, and the rollers E and E', bearing against the aforesaid rollers, substantially as set forth.

2. In a paper-hanging machine, the combination, with the frame provided with a handle, of the paper and distributing rollers journaled in said frame, the frame V', secured between the said rollers, and the spring-knife blade and cutting-off block supported in said frame V', substantially as and for the purpose set forth.



3. In a paper-hanging machine, the combination, with the frame A, of the paste-box provided with adjustable outlets and a brush, the rods pivotally securing the paste-box to the frame, the paper-roller journaled in the said frame, and the springs pressing the paste-box and brush against the paper on the roller, substantially as and for the purpose set forth.

4. In a paper-hanging machine, the combination, with a paste-box provided with internal guides *d* and *f*, and apertures for the paste, and the brush at its lower end, of the regulating-slide inside the box, and the cranked rod for adjusting said slide, substantially as and for the purpose set forth.

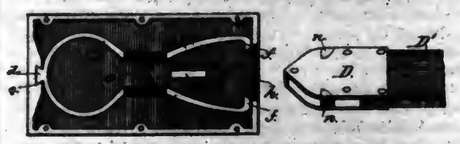
5. In a paper-hanging machine, the combination, with the frame V', having upper and lower members, of the block secured to the lower member, the spring-pressed cutting-off blade, and the retaining-arm V, pivoted to an extension on the back of the blade, and passing through a hole in the said upper member, substantially as and for the purpose set forth.

6. In a paper-hanging machine, the combination, with the frame A, of the rollers C and F, journaled in said frame, the slotted arms D, secured to said frame, the bars *h'*, provided with pins sliding in said arms D, the rollers E and E', journaled in said bars, and the springs pressing the pairs of rollers together, substantially as and for the purpose set forth.

398,155. CHANNELING-MACHINE. WILLIAM H. HAVEN, Jr., Oxford, assignor of one-half to John Rhodin, Brookline, Mass. Filed July 31, 1888. Serial No. 281,606. (No model.)

Claim.—1. In a channeling-machine, the combination of a feed-wheel, B, a presser-wheel, F, and an edge-wheel, H, with a plane-table, I, substantially as described.

2. The combination, in a channeling-machine, of a feed-wheel, B, a presser-wheel, F, an edge-wheel, H, with the hub K, having a conical surface, *l*, and the hub N, with a conical surface, *l'*, for the purpose and substantially as set forth.



398,156. VEHICLE-SPRING. CHARLES C. HAYES, Penn Yan, N. Y. Filed Oct. 13, 1888. Serial No. 288,008. (No model.)

Claim.—1. The combination, with the axle, of the central concave spring, C, a single section clipped to the center of the axle near the center of its length, with the ends free of the axle, the caps D on the free ends of said spring, and the convex side springs, E E, having their ends pivoted in said caps, said springs being disconnected from each other and from the central spring, substantially as shown and described.

2. The combination, with the axle and the block B thereon near the center thereof, of the central bowed spring, C, a single section clipped to the block by the same clips that secure the said block to the axle, with the ends free, the hangers or caps D, pivoted on the free ends of said spring and each formed with four ears, *a*, at equal distances apart, and the two bowed side springs, E E, independent of each other and of the central spring and secured between the outer ears, *a*, of said caps, substantially as shown and described.

398,157. MAIL-BAG LOCK. THEODORE W. IVORY, Glenwood, Iowa. Filed Aug. 28, 1888. Serial No. 283,960. (No model.)

Claim.—1. The combination, with a mail-pouch having the strap D', provided with a metallic pointed head having recesses formed in its sides, of the casing B, permanently secured to the pouch and having an opening in one end, a curved spring secured at its center to the casing and having its ends formed with hooks for engaging the recessed sides of the metallic head, whereby the latter is secured, substantially as herein described.

2. The combination, with a mail-pouch having the strap D', provided with a recessed and pointed metallic head or harp, of a casing having projecting pins for securing the casing permanently to the pouch, a curved spring secured in the casing and provided with hooked ends adapted for automatic engagement with metallic head, and the springs F within the casing bearing against the inserted head to automatically eject the same when the locking mechanism is released, substantially as herein described.

398,158. VELOCIPEDE. THOMAS B. JEFFERY, Ravenswood, Ill. Filed Mar. 16, 1888. Serial No. 267,374. (No model.)

Claim.—1. In a velocipede, in combination with a rear driving-wheel and the frame in which it is journaled, the seat-supporting frame hinged to the forward part of the driving-wheel frame, and extending thence forward and upward to the steering-head and to the seat, the former being at the forward part and the latter at the rear upper part, and the spring reacting between the rear upper portion of the seat-supporting frame and the rear driving-wheel frame, substantially as set forth.

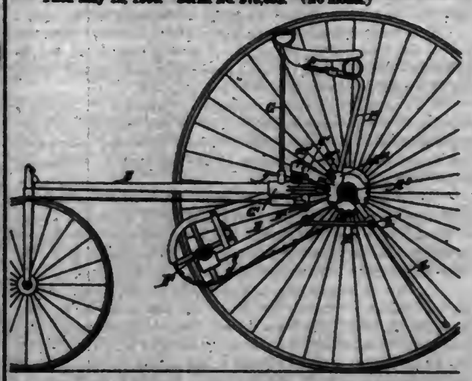
2. In a velocipede, in combination with a rear driving-wheel and the frame in which it is journaled, the seat-supporting frame pivoted to the forward part of said driving-wheel frame, and extending thence to the steering-head and to the seat, the former being at the forward part and the latter at the rear part, the mud-guard secured to the rear driving-wheel frame, and extending thence rearward over the wheel to a point in the vicinity of the rear part of the seat-supporting frame, and a spring reacting between said mud-guard and said rear part of seat-supporting frame, substantially as set forth.

3. In a velocipede, in combination with the rear driving-wheel and the frame in which it is journaled, the seat-supporting frame hinged to the forward part of said driving-wheel frame, and extending thence to the steering-head and to the seat, the former being at the forward part and the latter at the rear part, and a spring mud-guard secured to the rear driving-wheel frame, and extending back over the wheel to the vicinity of the rear part of the seat-supporting frame, and connected to said seat-supporting frame at the said rear part, whereby it acts as a spring reacting between the seat-supporting frame and the rear driving-wheel, substantially as set forth.

4. In a velocipede, in combination with the rear driving-wheel and the frame in which it is journaled, the seat-supporting frame hinged to said rear driving-wheel frame, and extending thence to the steering-head and to the seat, the former being at the forward part and the latter at the rear part, a spring mud-guard secured to the rear driving-wheel frame, and extending over the wheel to the vicinity of the rear part of the seat-supporting frame, and a spring connecting said spring mud-guard with the said rear part of the seat-supporting frame, substantially as set forth.

5. In a velocipede, in combination with the rear driving-wheel and the frame in which it is journaled, the seat-supporting frame hinged to the forward part of said rear driving-wheel frame, and extending thence to the steering-head and to the seat, the former being at the forward part and the latter at the rear part, and a spring connected to the said rear driving-frame and to the seat-supporting frame and reacting between said frames, its connection with one of them being adjustable to vary the tension of the spring, substantially as set forth.

6. In a velocipede, in combination with the rear driving-wheel frame, the seat-supporting frame hinged thereto and having a seat-supporting bracket overhanging the rear driving-wheel and vertically adjustable with respect to the remainder of the seat-supporting frame, and a spring secured to said seat-bracket and to the rear driving-wheel frame, substantially as set forth.



7. In a velocipede, the seat-supporting frame in the form of a bow convex forward and open rearward, and having its two branches, in a vertical plane and diverging rearward, and the steering-head located at the apex of said bow, substantially as set forth.

8. In a velocipede, the seat-supporting frame in the form of a bow convex forward and having its two arms diverging rearward and in the same vertical plane, and having a re-enforcing piece secured to it at the vicinity of the apex of its curvature, substantially as set forth.

9. In a velocipede, the seat supporting frame in the form of a bow convex forward and having its two arms diverging rearward and in the same vertical plane, and having the steering-head formed with the flanges K, fitting the bow, whereby said steering-head constitutes a re-enforcement of the bow at its apex, substantially as set forth.

10. In combination with the pedal-crank shaft, the pedal-crank provided with a hub, by which it is secured to the shaft, and with arms for securing the power-communicating wheel, such power-communicating wheel having no hub, but having an opening about its center large enough to permit the crank-hub and its arms to pass through, whereby said power-communicating wheel may be passed over the crank and its arms, and secured behind or within the same without detaching the crank from the shaft, substantially as set forth.

398,159. VELOCIPEDE. THOMAS B. JEFFERY, Ravenswood, Ill. Filed May 12, 1888. Serial No. 273,652. (No model.)

Claim.—1. In a velocipede, in combination with two rear supporting-wheels which have a common axis, the rear frame in which such wheels are journaled, the pedal-crank-shaft bearings secured to the rear frame and located forward of the vertical plane of the rear wheel-axle, and a forward frame or reach to the steering-head pivoted to the rear frame on a horizontal frame located rearward of the vertical plane of the pedal-crank-shaft bearings, whereby cross-bars forward of the pedal-crank-shaft bearings may be avoided, substantially as set forth.

2. In a velocipede, in combination with two rear supporting-wheels which have a common axis, the rear frame in which such wheels are journaled, the pedal-crank-shaft bearings secured to the rear frame and located forward of the vertical plane of the rear wheel-axle, and a forward frame or reach to the steering-head provided at its rear end with a bracket-like extension in a horizontal plane, which constitutes a horizontal pivot for said reach, whereby it is connected to the rear frame, said bracket-like extension being located wholly rearward from the vertical plane of the pedal-crank-shaft bearings, substantially as set forth.

3. In a velocipede, in combination with two rear supporting-wheels having a common axis, the rear frame in which such wheels are journaled, the pedal-crank-shaft bearings secured to the rear frame and located forward of the rear wheel-axle, a forward frame or reach to the steering-head, connected to the rear frame by a horizontal pivot which is located rearward of the vertical plane of the pedal-crank-shaft bearings, said forward frame or reach consisting of an arm extending forward from its pivot outside of the vertical plane of the nearest pedal, and a horizontal bracket-like extension proceeding from the rear end of said forwardly-reaching arm laterally toward the opposite side of the machine and located wholly rearward of the vertical plane of the pedal-crank-shaft bearings, whereby the frame is rendered entirely open above and forward of the pedals, substantially as set forth.

4. In a velocipede having two rear driving-wheels which have a common axis, the frame in which said wheels are journaled, consisting of a cross-bar, A^1, and a side bar extending forwardly therefrom at the extremity thereof, a front frame or reach to the steering-head, pivoted to said rear frame upon a horizontal pivot and extending forwardly therefrom, and a spring reacting between said side bar and

said reach to depress the reach with respect to the side bar, substantially as set forth.

5. In a velocipede, in combination with the rear frame, comprising the cross-bar A^3 and a side bar, as A', extending forwardly therefrom, the forward frame or reach to the steering-head, pivoted to the rear frame upon a horizontal pivot parallel with the axis of the driving-wheels and extending forwardly from said pivot, the said side bar, A', having a portion extended laterally and overhanging the reach, and a spring reacting between said overhanging extension and tending to depress the reach with respect to the side bar, substantially as set forth.

6. In combination, substantially as set forth, the rear frame having the journal-bearings for the pair of driving-wheels and the front frame pivoted to said rear frame, its pivot being parallel with the axis of said wheels, a spring reacting between the two frames and tending to depress the forward frame relatively to the rear frame, and a check to limit the action of said spring and retain the frames against too great separation, substantially as set forth.

7. In a velocipede having two rear driving-wheels which have the same axis, the rear frame having the journal-bearings for said wheels, and side bars projecting forwardly from the lateral extremities of said frame, and the forward frame or reach pivoted to said rear frame between said side bars, and a spring reacting between one of the side bars and the reach to depress the latter, substantially as set forth.

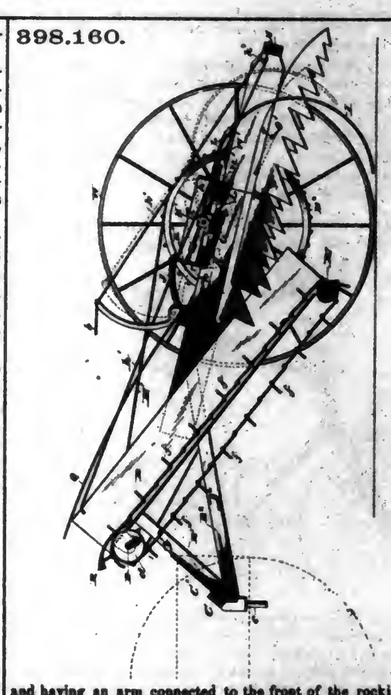
8. In combination, substantially as set forth, the rear frame comprising the cross-bar A^3, having the projecting lugs A^4 A^4, and the pedal-crank-shaft-bearing arms D, connected to said lugs and extending forwardly therefrom, substantially as set forth.

9. In combination with the transverse frame-bar A^3, the clip or bracket A^6, secured upon the forward side of said frame-bar, and having a pivot-bearing for the reach or forward frame and an upwardly and downwardly extending socket for the seat-support, substantially as set forth.

10. In a velocipede, in combination with a shaft-bearing comprising two parts longitudinally separated by an interval, a handle-rod journaled in said bearings and having secured upon it and located in said interval a stop-collar, whereby said stop-collar stops the bar from movement in both directions, substantially as set forth.

11. In a velocipede, in combination with the rear frame comprising the cross-bar A^3 and the side bar A^2, said side bar having in its forward end the bearing for the brake-rod, comprising the parts A^{20} A^{20}, longitudinally separated, the brake-rod journaled in said bearing and having secured upon it and located in said interval the stop-collar H', having the crank-arm H^{10}, the brake-lever pivoted to the frame on a horizontal pivot, and the brake-connecting rod H^9, joined to said lever and to the crank-arm H^{10}, substantially as set forth.

12. In combination with the frame-bar A^3, the trailing arm pivoted thereto, the clamp E', adapted to slide and be set fast in said arm, and the link E^2, connecting said clamp to the frame, whereby said arm may be caused to extend more or less directly rearward, and may be adjustably secured at any desired position between horizontal and vertical, substantially as set forth.

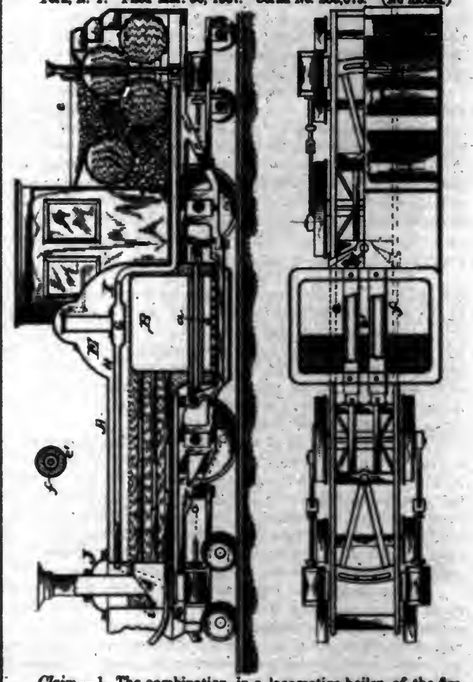


13. In combination with the frame, the telescoping trailing arm E E^2, having one part connected to the frame, the said part E being tubular and split at its rear end and provided with lugs clamped upon the part E^2, substantially as set forth.

398,160. HAY RAKE AND LOADER. OLE K. KAASA, Oslo, Minn. Filed May 3, 1888. Serial No. 273,041. (No model.)

Claim.—1. In a hay rake and loader, the combination, substantially as described, of the main frame having a transverse pivot-rod, the rectangular rocking frame having its end sills pivoted on said rod, spiders secured to the rear sill of the rocking frame and having spring-arms extending in front and rear thereof, rake-teeth fulcrumed on the pivot-rod and each connected to the front and rear ends of one of the spring-arms of a spider, a lever fulcrumed on the main frame and connected at one end to the rocking frame, and flexible connections secured to the other end of the lever to control its position.

2. In a hay rake and loader, the combination, substantially as described, of the main frame, the elevator-frame and endless elevator, the supporting-wheels, to the hub of one of which is secured a gear-wheel, multiple crank-shafts O and O', journaled on the main frame at opposite sides of the carrying-wheel axles, and each provided with a pinion meshing with the gear-wheel on the wheel-hub, rake-teeth carried by a rocking frame pivoted to the main frame, means for tilting the rocking frame to raise the rear ends of the rake-teeth, and rake-blades carried by the cranks of shafts O O' and extending between and to the rear of the rake-teeth, whereby the rake-blades serve as clearers for the rake-teeth when the latter are raised.



3. In a hay rake and loader, the combination, substantially as described, of the main frame, the inclined elevator-frame and its endless elevator, a rocking frame pivoted to the main frame and carrying rake-teeth, an elbow-lever fulcrumed at its end on the main frame

398,160.

and having an arm connected to the front of the rocking frame, a flexible connection, *k*, secured at one end to the vertical arm of the lever and at its other end to the front of the elevator-frame, and a flexible connection, *k'*, also secured to said arm of the lever and passing thence over a pulley in rear of said lever and thence forward and secured to the front of the elevator-frame.

398,161. LOCOMOTIVE-BOILER. GUSTAVUS A. KARWISER, New York, N. Y. Filed Mar. 30, 1887. Serial No. 233,079. (No model.)

Claim.—1. The combination, in a locomotive-boiler, of the fire-box, the smoke-box connected by flues with the fire-box, and a top extension over the smoke-box, forming a part of the boiler and having a downwardly-inclined bottom forming a deflecting-plate at the top of the smoke-box, substantially as described.

2. The combination, with a locomotive-boiler, of an extension over the smoke-box forming a part of the boiler, the bottom of said extension forming a deflector for the sparks, an upward guide for the smoke, and a pocket for the collection of sediment in the boiler, substantially as described.

3. A locomotive having a boiler substantially T-shaped in longitudinal section and the fire-box extending down between and beyond the two sets of the driving-wheels, in combination with a dome at the fire-box end of the boiler, as set forth.

4. The combination, in a locomotive-boiler, of the fire-box extending down between and beyond the two sets of the driving-wheels, the horizontal flues, brace-rods extending through the fire-box, and water-tubes surrounding the same and communicating with the main water-chamber of the boiler, substantially as described.

398,162. BOTTLE-TAP. M. JOSEPH KRAMS, New Haven, Conn. Filed July 18, 1888. Serial No. 280,241. (No model.)

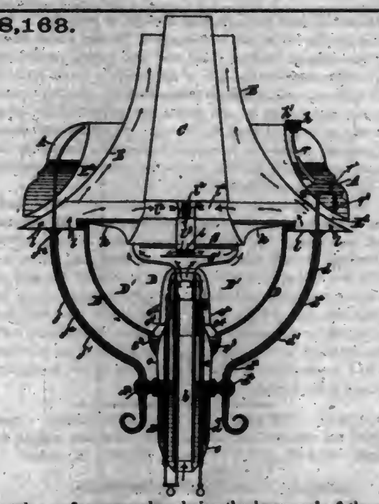
Claim.—1. A bottle-tap having an inner tube provided near its lower end with an induction-port, a point located in the lower end of such tube and provided with a shoulder offsetting from it, and an outer tube provided with a corresponding port and engaging at its lower end with the offsetting-shoulder of the said point, substantially as set forth.

2. A bottle-tap having an inner tube provided near its lower end with an induction-port, a point located at the lower end of such tube and provided with a shoulder offsetting therefrom, and an outer tube provided with a corresponding port and having means to resist torquing in the cork, substantially as set forth.

3. A bottle-tap having an inner tube provided near its lower end with an induction-port, a point located in the lower end of such tube and provided with a shoulder offsetting therefrom, an outer tube provided with a corresponding port, and a fin offsetting from the outer tube for preventing the same from turning in the cork, substantially as set forth.

4. A bottle-tap having an inner tube provided near its lower end with an induction-port, a point located in the lower end of such tube and provided with a shoulder offsetting therefrom, an outer tube provided with a corresponding port and with a fin or point for preventing it from turning in the cork, and a faucet having means at its lower end to close over the fissure made in the cork by the said point, substantially as set forth.

5. A bottle-tap having an inner tube provided near its lower end with an induction-port, a point located in the lower end of such tube and provided with a shoulder offsetting therefrom, and an outer tube provided with a corresponding port and with a fin to prevent it from turning in the cork, and a cap entering the cork above the fin to close the fissure made thereby, substantially as set forth.



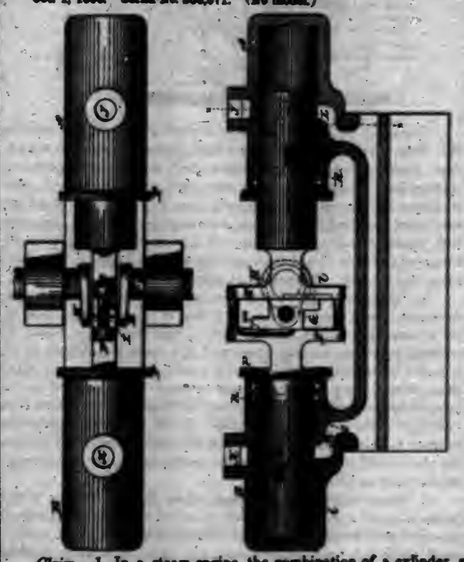
398,163. OIL-LAMP. ERNEST A. KENT, Kingsland, County of Middlesex, England. Filed May 20, 1886. Serial No. 276,420. (No model.) Patented in England Nov. 25, 1887, No. 16,268.

Claim.—1. In an oil-lamp, the combination, with the oil-reservoir above the burner and small oil-receptacle below the same, of a chimney and a casing between the oil-reservoir and chimney, said casing being perforated at the bottom, so that air can pass up between it and the chimney, and being separated from said reservoir by a free space, so that air can enter at the bottom of the reservoir between it and said casing and pass upward to keep the oil in the reservoir cool, substantially as described.

2. The combination, with the oil-reservoir above the burner, of an inclosing glass globe, a burner, a chimney having transverse air-tubes and a vertical air-tube, and a casing interposed between the chimney and reservoir and having air-inlets on its under side, so that air heated by contact with the globe may pass up inside the casing and to the burner through the chimney-tubes, while cool air passes outside said casing between it and the reservoir, substantially as described.

3. The combination of the casing having air-inlets on its under side, the globe beneath the casing, the chimney within the casing provided with air-tubes for supplying air to the upper side of the flame, the flame-spreader and air-distributer, the central air-tube passing through said globe, and the perforated casing surrounding said air-tube, substantially as described.

4. The combination of the chimney having transverse and vertical air-tubes, a flame-spreader closing the lower end of the vertical tube, a second flame-spreader above the first and extending beyond the same, said vertical tube having air-openings between said flame-spreaders, the central air-tube for supplying air from below, the oil-chamber inclosing the same, the perforated casing, and the inclosing-globe, substantially as described.

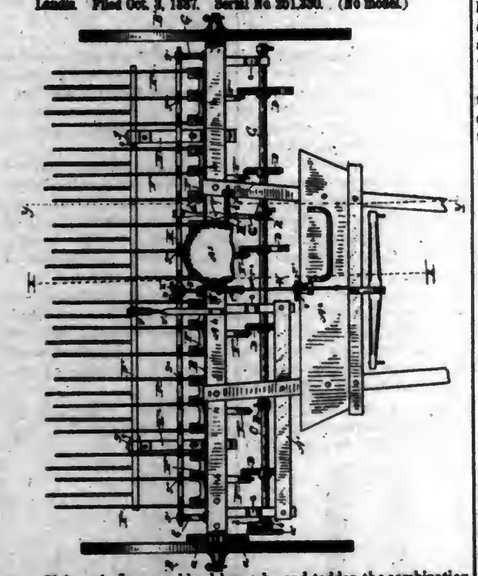


398,163.

5. The combination of the burner, the glass globe beneath and around the burner, the oil-reservoir above the burner, the chimney provided with air-passages, the air-tube passing centrally through said globe, the casing inclosing said air-tube and forming therewith a small oil-chamber, a pipe connecting this chamber with the upper oil-reservoir, and the perforated casing for supplying air to the under side of the flame, substantially as described.

6. The combination of the upper reservoir, the chimney, the casing between said reservoir and chimney, the glass globe, and the reflector extending from said chimney to the rim of said globe, said casing overhanging said globe and being provided with perforations on its under side, so that air heated by contact with said globe may pass within said casing, substantially as described.

398,164. DIRECT-ACTING STEAM-ENGINE. FREDERICK H. LAFORCE, Waterbury, Conn., and HUGH J. BARKER, Philadelphia, Pa. Filed Oct. 1, 1888. Serial No. 286,671. (No model.)

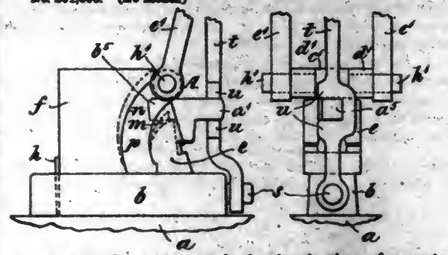


Claim.—1. In a steam-engine, the combination of a cylinder, a reciprocating piston, the cylinder constructed with inlet and exhaust passages terminating in ports into the cylinder distant from that end of the cylinder with which they are adapted to communicate greater than the stroke of the piston, a piston greater in length than its stroke,

with inlet and exhaust ports opening through its periphery to the cylinder through the active end of the piston, the said piston extending outside the cylinder and provided with two guides parallel to each other at right angles to the axis of the piston, a crank, a crank-pin extending between said guides, a crank-block on said crank-pin working between and guided by said guides, grooves in the face of one or both of said guides, and studs on the said crank-block corresponding to said grooves, the said studs equidistant from the central line of the crank pin, and the said grooves curved from the center, substantially as and for the purpose described.

2. In a steam-engine in which the cylinder is constructed with inlet and exhaust passages opening through ports into the cylinder, and in which one end of the cylinder is open, and in which the piston works through the said open end of the cylinder, and having a stuffing-box in the said open end of the cylinder around the said piston, the cylinder constructed with an annular groove upon its inner surface and inside the said stuffing-box, with an outlet from said annular groove directly to the steam-exhaust passage of the cylinder, substantially as described, and whereby the water arising from condensation in the said annular groove may flow directly to the steam-exhaust passage and there escape.

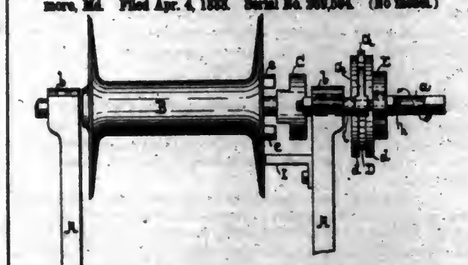
398,165. COMBINED HAY RAKE AND TEDDER. ISRAEL I. LANDIS and ALBERT ESHLEMAN, Lancaster, Pa.; said Eshleman assignor to said Landis. Filed Oct. 3, 1887. Serial No. 251,330. (No model.)



Claim.—1. In a combined hay rake and tedder, the combination of a frame mounted upon driving-wheels, an endwise-movable tappet-shaft, gearing for rotating this tappet-shaft, a rake-shaft, oscillating rake-sections journaled upon this rake-shaft and provided with rearwardly-extending rake-teeth, tappets upon the said tappet-shaft for oscillating these rake-sections, an endwise-movable rod, H, provided with hooks adapted to engage the said rake-teeth, a pivoted lever, G', connecting the rod H and the tappet-shaft, and a hand-lever for operating this lever G', substantially as described.

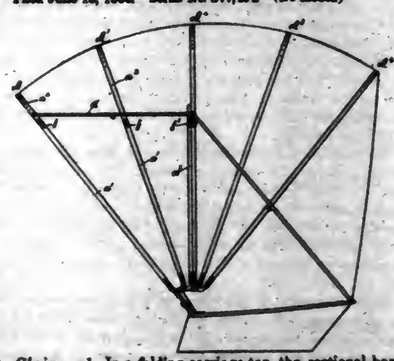
2. The combination of the frame of the machine mounted upon driving-wheels, a spur-wheel, *a*, upon one of the driving-wheels, an endwise-movable tappet-bearing shaft, C, provided with a pinion, *a'*, adapted to engage the said spur-wheel *a*, a transverse rake-shaft, E, mounted in bearings on the frame and provided with arms G, rake-teeth pivoted upon said shaft E and adapted to be operated by the tappets upon the shaft C, an endwise-movable rod, H, mounted in bearings in the arms G on the shaft E, and provided with hooks adapted to engage the said rake-teeth, a pivoted lever, G', connecting the shaft C and rod H, and a lever for operating this connecting-lever, substantially as described.

3. In a combined hay rake and tedder, the combination of the frame mounted upon driving-wheels, an endwise-movable tappet-shaft provided with tappets, gearing for rotating this tappet-shaft, a rake-shaft, oscillating rake-sections upon this rake-shaft, these sections being adapted to be oscillated by the tappets upon the tappet-shaft, rake-teeth secured to these rake-sections, an endwise-movable rod, H, provided with hooks adapted to engage the said rake-teeth, a pivoted lever, G', connecting the endwise-movable rod H with the endwise-movable tappet-shaft, the rear end of this lever being bifurcated, a curved arm, *i*, secured to the endwise-movable rod H and engaging with the rear bifurcated end of the lever G', a hand-lever for operating the lever G', and a lever connected to the rod H for raising or lowering the rake-teeth, substantially as described.



398,166. DIE FOR SHAPING THE CLAWS OF HAMMER-HEADS. ANDREW LAMBERT, Montreal, Quebec, Canada, assignor of one-half to Henry Harrison Warren, Massena, N. Y. Filed Nov. 17, 1888. Serial No. 291,066. (No model.)

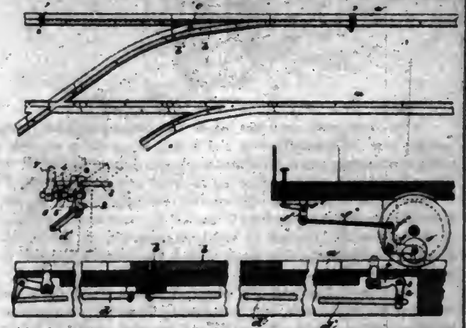
Claim.—1. In an apparatus for forming the claws of carpenters' hammers, the combination of the die *c*, having curved surfaces *g* and *l*, also having projection *m*, with guide *f*, having curved surfaces *n*, and roll A, arranged to be guided by the curved surfaces *g* and *n*, the whole substantially as and for the purposes set forth.



2. In an apparatus for forming the claws of carpenters' hammers, the combination of the die *c*, having surfaces *g* and *l*, guide *f*, having surfaces *n*, and roll A, arranged to be guided by the surfaces *g* and *n*, the whole substantially as and for the purposes set forth.

398,167. OYSTER-DREDGE WINDLASS. HENRY LAWSON, Baltimore, Md. Filed Apr. 4, 1888. Serial No. 269,594. (No model.)

Claim.—In an oyster-dredge windlass, the combination of the frame A, sliding shaft *a*, having the feather *g*, barrel B, placed loosely on the shaft *a* and provided with lugs *e* on one of its faces, clutch C, secured to the said sliding shaft, ratchet-disk D, fitted with flanges *d* and provided with the hub *e* and having the inclined groove *f*, plate E, with a central hole in which the hub of the ratchet-disk is supported and held to the said frame by means of the bolts A, and pawls *g*, hinged to the said bolts and adapted to rest on the periphery of the said ratchet-disk, substantially as and for the purpose specified.

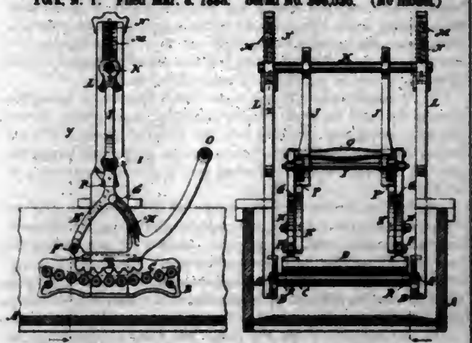


398,168. VEHICLE-TOP. GEORGE D. W. LESSER, Boston, Mass. Filed June 18, 1888. Serial No. 277,404. (No model.)

Claim.—1. In a folding carriage-top, the sectional bow above described, having the part a^6 in a separate piece from the part a^5, substantially as and for the purpose specified.

2. In a folding carriage-top having one or more sectional bows, A A', the auxiliary brace *g*, substantially as and for the purpose specified.

398,169. AUTOMATIC RAILWAY-SWITCH. JAMES W. LESLIE, Everett, Mass. Filed Nov. 1, 1888. Serial No. 289,743. (No model.)

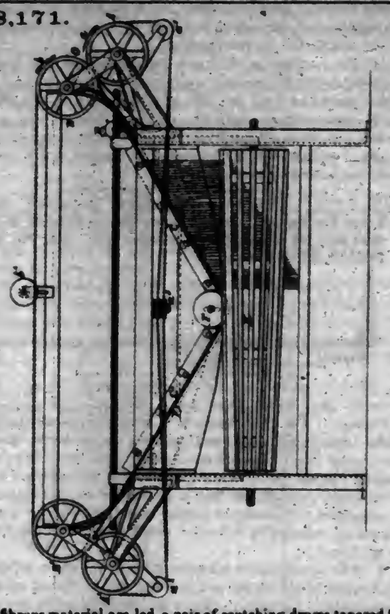


Claim.—1. The switch or tongue and the longitudinally-movable rods *d d'* for moving it in opposite directions, combined with two vertically-movable studs for each rod *d d'*, pivotally-arranged cross-bars connected with the said rods and to which the studs are connected, the roller *f'*, and means, substantially as described, for effecting its movement, all substantially as and for the purposes specified.

2. The switch or tongue, the longitudinally-movable rods *d d'*, and the pivoted cross-bars 5, connected with the rods or bars *d d'*, combined with the studs downwardly movable independently or simultaneously, substantially as described.

3. The switch or tongue, the longitudinally-movable rods *d d'*, the bell-crank levers and pivoted cross-bars, and the independently or simultaneously movable studs, combined with the roller *f'* and means for moving it to co-operate with the car-wheel to effect the simultaneous movement of the studs, substantially as described.

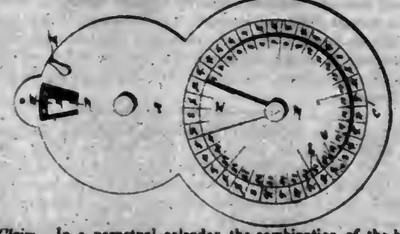
398,170. WASHING-MACHINE. EDWARD R. LEVERICH, New York, N. Y. Filed Mar. 8, 1888. Serial No. 266,536. (No model.)



Claim.—1. The combination, with the uprights L, having slotted upper ends, the vertically-movable spring-pressed horizontal bar K, having its ends arranged in the slots, the swinging arms J, suspended upon the bar, and the frame E, pivoted to the lower ends of the swinging arms, of the rubber D, pivoted at one side to the lower end of the pivoted frame and provided at its opposite side with upwardly-projecting arms G, adjustably secured to the pivoted frame, substantially as described.

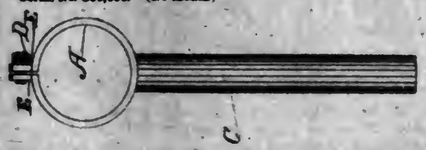
2. The combination, with the tub A, having the attached frames B, and the rollers C, mounted in said frames, of the uprights L, the swinging arms J, the frame E, suspended from the swinging arms, the rubber D, pivoted at one side to the frame and provided at the other side with upwardly-projecting arms G, having curved slots, and screws H, adjustably connecting the slotted arms with the suspended frame, substantially as described.

398,171. APPARATUS FOR SCUTCHING FLAX, &c. JOHN MCGRATH, Lavagh, County of Monaghan, and EDWARD MANNEY, Dundalk, County of Louth, Ireland. Filed Oct. 13, 1887. Serial No. 252,262. (No model.) Patented in England Sept. 13, 1887, No. 13,099; in France June 30, 1888, No. 191,536, and in Belgium July 5, 1888, No. 82,457.



Claim.—1. In a machine for scutching, hackling, or similarly treating flax and other fibrous material, in combination with a guide inclined first downward, then upward, along which the grasped parts

of the fibrous material are led, a pair of scutching-drums tapered from a larger diameter at the entering end to a smaller diameter at the leaving end, substantially as and for the purpose herein set forth.



2. In a machine for scutching or hackling flax and other fibrous material, the combination, with the driving and guide wheels and the stationary guide, of the four traveling chains, one crossing another, and the star-wheel and skid-rail for effecting and maintaining said position of the chains, all operating to grasp and hold the upper ends of the fiber while the lower portions are being operated on, substantially as described.

398,172. PERPETUAL CALENDAR. THOMAS A. MCKEE, Beloit, Kans. Filed May 29, 1888. Serial No. 275,507. (No model.)

Claim.—In a perpetual calendar, the combination of the body provided with a circular day-table, C, and an opening, B, the revolubie month-disk concentric with the day-table and containing thirty-one days, the segment of a disk, E, concentric with and arranged on the month-disk, and adapted to cover the extra days in months containing less than thirty-one days, the year-disk mounted on the rear side of the body and provided with spaces containing the names of the months, which spaces are partly darkened to indicate the relation between the night and day in the indicated month, one of said spaces being adapted to be exposed through the opening B at all times, substantially as specified.

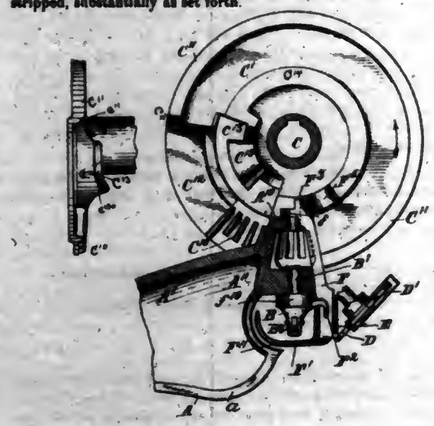
398,173. BRUSH-HOLDER. GEORGE E. MERRICK, Meriden, Conn., assignor of one-half to Selah A. Hull, same place. Filed Jan. 14, 1888. Serial No. 260,696. (No model.)

Claim.—1. As an article of manufacture, a brush-holder formed of metal and comprising a circular clamping-band or frame-piece provided with a projecting hand-piece and two projecting parallel lugs

slightly separated from each other, and a set-screw for drawing such lugs together and contracting said band or frame, all arranged as described, and for the purpose specified.

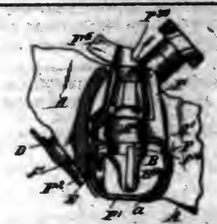
2. The combination, with two dashing-brushes, of a detachable holder consisting of a circular clamping frame-piece provided with a handle projecting from one side and two projecting parallel lugs slightly separated from each other, and a screw for drawing such lugs together and contracting said frame-piece, thereby causing it to clasp and retain the bodies of said brushes, all arranged as described, and for the purpose specified.

398,174. APPARATUS FOR SANDING RAILWAYS. HENRY C. NOBLE, New York, N. Y., assignor of two-thirds to William F. Monaghan, same place, and Charles W. Swan, Brooklyn, N. Y. Filed Feb. 25, 1888. Serial No. 265,323. (No model.)



Claim.—1. The combination of a hopper for containing sand, a cylinder beneath said hopper and provided with a slotted opening, a valve adapted to rest upon the top of said cylinder and having a stem extending therein, a lever-arm connected with said stem and extending outwardly through said slot, a shaft to which said lever-arm is also connected, and means for turning said shaft, whereby a vertical movement is imparted to said valve, substantially as and for the purpose set forth.

2. The combination of a hopper for holding sand, a cylinder arranged beneath said hopper and provided with a slotted opening, a valve adapted to rest upon the top of said cylinder and having a stem extending downward therein and also upward into said hopper, and the upper portion of said stem being provided with fingers or cross-pieces for loosening the sand, a lever-arm connected with the lower portion of said stem and extended outwardly through the slot in said cylinder, a shaft to which said lever-arm is also connected, and means for turning said shaft, substantially as and for the purpose set forth.



3. The combination of a hopper for holding sand, a cylinder arranged beneath said hopper and provided with a slotted opening, a valve adapted to rest upon the top of said cylinder and having a stem extending downward therein and also upward into said hopper, the upper portion of said stem being provided with fingers or cross-pieces for loosening the sand, a lever-arm connected with the lower portion of said stem and extended outwardly through the slot in said cylinder, a shaft to which said lever-arm is also connected, means for turning said shaft, another lever also connected with said shaft, and a retractive spring having connection with the free end of said second lever, all arranged and operating substantially as and for the purpose set forth.

398,175. CORD-KNOTTER FOR GRAIN-BINDERS. LA VERNE W. NOYES, Chicago, Ill. Filed Apr. 13, 1886. Serial No. 198,673. (Model.)

Claim.—1. In combination with the knotter-actuating wheel, the looper, and the breast-plate, a frame pivoted about the looper-spindle engaged directly and actuated positively by the knotter-actuating wheel and bent across the line of the axis of the looper at the end thereof, obstructing the rift in the breast-plate while the looper forms the knot and swung aside by the said wheel when the knot is to be stripped, substantially as set forth.

398,175.

2. In combination with the looper and breast-plate, the frame rocking over the spindle thereof, and having at one end a projection or finger extending across the line of the looper-axis at the end of the looper, and having at the other end the lever projections F^3 and F^4 at right angles to each other, the knotter-actuating wheel having the sectoral cams and delay-surfaces C^{13} and C^{14} in planes on opposite sides of the knotter-axis, the ends of said tracks engaging the projections F^3 and F^4, respectively, alternately to rock the frame in opposite directions, substantially as set forth.

3. In combination with the knotter-actuating wheel, the looper reversing its revolution to strip the knot, the frame pivoted about the looper-spindle and engaged directly and actuated positively by the knotter-actuating wheel independently of the looper, and having the cam which opens the looper-jaws, said frame rocked by the knotter-actuating wheel and accompanying the looper in its reverse movement, substantially as set forth.

4. In combination with the looper, the bill-opening cam having the undercut shoulder f^{12}, over which the heel of the vibrating jaw drops to allow the bill to close, said looper reversing its revolution after the heel passes said shoulder, whereby the heel is crowded under the shoulder and the bill is forced shut, substantially as set forth.

5. In combination with the looper reversing its revolution to strip the knot, the bill-opening cam having the undercut shoulder f^{12}, over which the heel of the vibrating jaw drops to allow the bill to close before reversing, the said cam remaining stationary when the looper first reverses, but afterward rocking with it in its reverse motion, substantially as set forth.

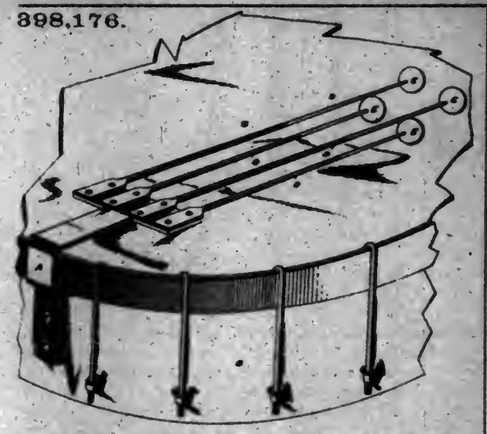
6. In combination with the knotter-actuating wheel, the looper reversing its revolution to strip the knot, the frame pivoted about the looper-spindle, engaged directly and actuated positively by the knotter-actuating wheel independently of the looper, and having the cam which opens the looper-jaws provided with the undercut shoulder f^{12}, to engage the heel of the vibrating jaw, said frame accompanying the looper in its reverse movement, substantially as set forth.

7. In combination with the looper which reverses its revolution to strip the knot, the frame pivoted about the looper-spindle having the bill-opening cam provided with the undercut shoulder f^{12}, and having the lever-arm F^3, and the knotter-actuating wheel having the cam C^{14}, to engage the lever-arm and rock the frame, substantially as set forth.

8. In combination with the looper which reverses to strip the knot, the frame pivoted about the looper-spindle having the bill-opening cam provided with the undercut shoulder f^{12}, and having the lever-arm F^4, and the knotter-actuating wheel having the gear-segment engaging the looper-pinion, and the delay-surface C^{15}, engaging the lever-arm F^4 until after the pinion clears the segment, substantially as and for the purpose set forth.

9. In combination with the looper, the frame F, pivoted on the looper-spindle and rocked thereabout by direct engagement with the knotter-actuating wheel, and having the bill-opening cam and the cord-receiving hook F^5, substantially as set forth.

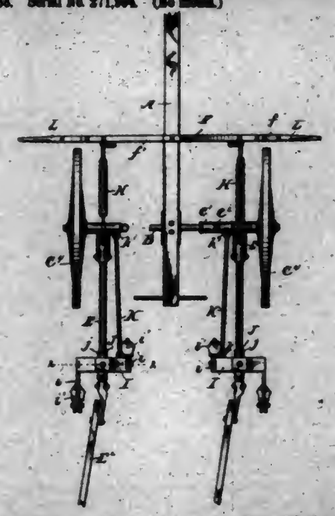
10. In combination with the knotter-actuating wheel and the looper, the frame F, pivoted on the looper-spindle and rocked thereabout by direct engagement with the knotter-actuating wheel, which engages it directly and actuates it positively, and having the bill-opening cam and the cord-obstructing gate both integral with it, substantially as set forth.



11. In combination with the looper, the frame F, pivoted about the looper-spindle and rocked thereabout by the knotter-actuating wheel, and having integral with it the cord-obstructing gate and the cord-receiving hook F^5, substantially as and for the purpose set forth.

398,176. DRUM ATTACHMENT FOR BANJOS. ROBERT OEHLER, New Orleans, La. Filed July 25, 1888. Serial No. 280,977. (No model.)

Claim.—1. The combination, with a banjo, of a bracket attached to the frame thereof and spring-arms secured to said bracket and carrying weights or beaters in close relation to the banjo-head, substantially as specified.



2. A drum attachment for musical instruments, consisting of a suitable holder and spring-arms of different lengths, and carrying

398,176.

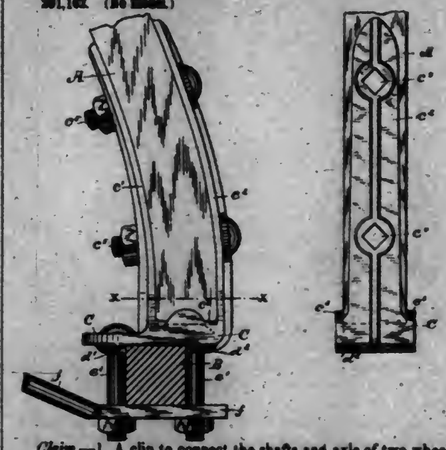
weights or beaters, said arms being attached to said holder, substantially as specified.

398,177. CULTIVATOR. WILLIAM H. PARLIN, Canton, Ill., assignor to the Parlin & Orendorff Company, same place. Filed Apr. 26, 1888. Serial No. 271,994. (No model.)

Claim.—1. In a cultivator, the combination, with the gangs, free to move longitudinally independently of each other, and the pivoted arms to which said gangs are attached, of the centrally-pivoted evener arranged in front of the same and having the horses connected to its ends, and a single draft-rod for each gang, forming the sole draft-connection between said gang and the evener, and having its rear end attached immediately in front of the beam of the gang and its front end connected to the evener at a point about midway between its pivot and its ends, whereby the longitudinal motion of the gangs is reduced, substantially as and for the purposes specified.

2. The combination, with the main frame, of the pivoted arms connected thereto, the gangs connected to said arms, the centrally-pivoted evener arranged in front of the same, and draft-rods, each having its rear end connected to one of the arms immediately in front of the point of attachment of the gang and its front end connected to the evener and adjustable laterally in relation to the same, substantially as and for the purposes specified.

3. In a cultivator, the combination, with the main frame, the pivoted arms, the gangs connected to said arms, the evener arranged in front of the same, and the draft-rods connecting the arms and the evener, of constantly-acting coiled springs having their rear ends connected to the gangs and their front ends connected to the evener, substantially as and for the purposes specified.



4. In a cultivator, the combination, with the vertically and horizontally movable gang, of an evener arranged in advance of the same, a yoke or loop pivoted to the beam of the gang and provided with a series of notches, h^3, and a spirally-coiled spring having its front end connected to the evener and its rear end connected to the loop, and provided with a hook to engage with any one of the notches h^3, substantially as and for the purposes specified.

5. The combination, with the evener, of the notched bars H', connected thereto, the vertically-swinging gangs, and the springs H, having their rear ends connected to the gangs and their front ends provided with loops to engage any one of the notches of the bars H', substantially as and for the purposes specified.

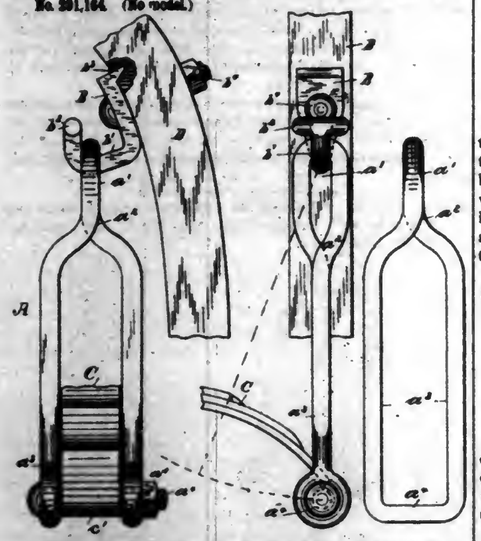
6. In a cultivator, the combination, with the vertically and horizontally swinging gangs, the evener arranged in front of the same, and the draft-rods connecting the evener and the gangs, of coiled springs having their rear ends connected to the gangs and laterally adjustable at said connection, and their front ends connected to the evener and longitudinally adjustable at that point, substantially as and for the purposes specified.

7. The combination, with the cross-head I, having conical sockets I', of the beam E, the semi-cylindrical saddle-pieces J, secured thereon and provided with conical bearings f' to enter the sockets I', and the bolt I^2, passing through the same, substantially as and for the purposes specified.

398,178. TWO-WHEELED VEHICLE. DAVID M. PARRY and THOMAS H. PARRY, Indianapolis, Ind. Filed Nov. 17, 1888. Serial No. 291,162. (No model.)

Claim.—1. A clip to connect the shafts and axle of two-wheeled vehicles, comprising the base-plates C, each having the two upwardly-extended arms c' c^2 to engage the front and rear sides of the shaft, as shown, and having the flanges d' d^2 to embrace the upper edges of the axle, the strap f to engage the lower part of the axle, and the bolts to secure the said parts together, substantially as set forth.

2. In a two-wheeled vehicle, the combination of the clip, consisting of the horizontal plate C, having the socket d at its upper face, the transverse vertical flanges d' d^2 at its lower face, and the upwardly-projecting curved arms c' c^2, the shaft A, secured by bolts between the inner faces of the arms c' c^2, the strap f, and the axle B, secured between the strap, lower face of the plate C, and between the inner walls of the flanges d' d^2, with its rear edge in a line, or approximately so, with the center of the lower end of the shaft, and secured in place by the vertical bolts extended through the plate C, and strap f, substantially as shown, and for the purpose set forth.



398,179. VEHICLE-SEAT. DAVID M. PARRY and THOMAS H. PARRY, Indianapolis, Ind. Filed Nov. 17, 1888. Serial No. 291,163. (No model.)

Claim.—1. In a vehicle-seat, the combination of the front and back rails, A B, grooved longitudinally on their inner faces their entire length, the end rails, C D, secured thereto, the resilient slats F, secured at their ends in said grooves, and the spacing-blocks G, interposed between said slats at their ends, substantially as shown and described.

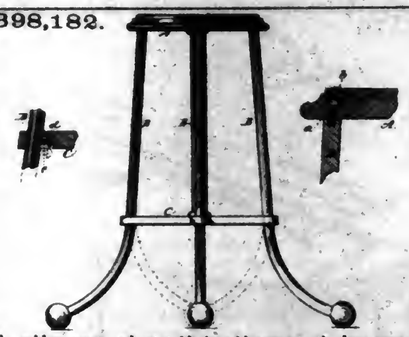
2. The combination, in a vehicle-seat, of the longitudinally-grooved front and back rails, A B, the end rails, C D, the guard-rail E, secured thereto, the resilient slats F, having their ends secured in the groove in the front and back rails by nails or otherwise, and the spacing-blocks G, interposed between the slats at their ends and secured in the grooves aforesaid in the manner and for the purpose substantially as shown and described.

398,180. SPRING-SUPPORT FOR VEHICLES. DAVID M. PARRY and THOMAS H. PARRY, Indianapolis, Ind. Filed Nov. 17, 1888. Serial No. 291,164. (No model.)

Claim.—1. In combination, the hanger A, constructed from a single piece of wrought metal, having an elongated vertical eye at its upper end and a spring-supporting leg at its lower end, and the plate B, having the headed hook to engage the hanger, and the burr or flange to enter the shaft, said plate being secured by a bolt or otherwise, substantially as set forth.

2. In a spring-support for vehicles, a hanger constructed from a single piece of wrought metal, having an elongated eye at its upper end and a removable spring-support at its lower end, as described.

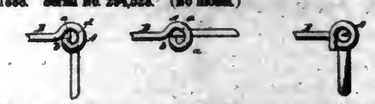
398,181. DRAWER-PULL. GEORGE S. PEARSON, Waterbury, Conn. Filed Dec. 15, 1888. Serial No. 293,696. (No model.)



Claim.—1. A drawer-pull comprising a shank having a flange near its outer end, an inner shell having cut-away portions, and a central opening through which the shank is passed and then headed down, said shell resting upon the flange, and an outer shell having holes which register with said cut-away portions, and which are adapted to receive a pull, the edge of said outer shell being closed inward over the edge of the inner shell, substantially as described.

2. In combination, a shank having a flange near its outer end, an inner shell having cut-away portions, and an opening through which the shank is passed and headed down, an outer shell having openings which register with the cut-away portions, and a pull whose ends pass through said holes and openings and rest under the flange, so that the entire strain in use is upon the shank.

3. In a drawer-pull, a shank having a flange, 3, and an inner shell through which the shank passes, and which is secured by heading down the shank, in combination with an outer shell closed inward over the inner shell, as and for the purpose set forth.



398,182. METAL TABLE. ROBBIE H. PECK and AUGUSTUS H. JOHNS, Meriden, Conn., assignors to the Meriden Brass Company, same place. Filed Nov. 26, 1888. Serial No. 291,582. (No model.)

Claim.—The herein-described improvement in metal tables, consisting of a top combined with several legs, a support below the table-top and through which the legs pass, the legs curved outward below

the said supports and rotatable in said supports, the legs connected to the table at their upper ends by an extensible pivot, and the supports below constructed with a notch upon their under side, and the legs with a corresponding stud, the said studs and notches adapted to interlock when the legs are in the turned-out position, substantially as described, and whereby the said legs upon being withdrawn from the top may be turned to bring the curve inward.

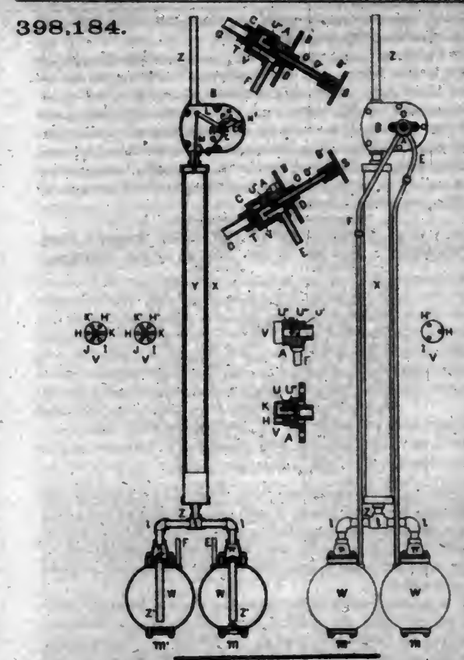
398,183. DRAWER-PULL. ROBBIE H. PECK, Meriden, Conn., assignor to the Meriden Brass Company, same place. Filed Dec. 24, 1888. Serial No. 294,523. (No model.)

Claim.—1. The herein-described improvement in drawer-pulls, consisting of a socket made from wire bent to form an eye at the outer end to receive the pivot, the end of that portion of the wire which forms the eye serving as a stop against which the handle may rest, substantially as described.

2. A socket for drawer-pulls, made from wire, its end bent to form an eye to receive the pivot of the handle, the end of the wire turned into the eye and so as to form a shoulder within the eye, the pivot of the handle being non-cylindrical in transverse section, substantially as described, and whereby the said end of the wire within the eye forms a stop both for the up and down swing of the handle.

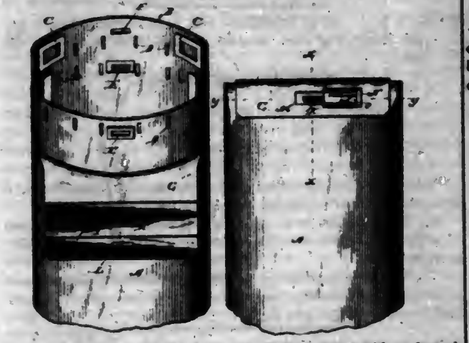
3. A drawer-pull consisting of the ornamental base, constructed with holes through which the shank of the sockets may be introduced, combined with sockets made from wire, the outer end of the wire bent to form eyes, the shank of the sockets inserted through the holes in the base and so as to bring the eye against the front of the base, and the shank spread inside and close up to the base, forming projections on the shank on the inside of the base and whereby the base is clamped between the said projections on the inside and the eye upon the outside, substantially as specified.

398,184. PNEUMATIC WATER-ELEVATOR. THOMAS O. PERRY, Tecumseh, Mich. Filed Aug. 13, 1886. Serial No. 210,761. (No model.)



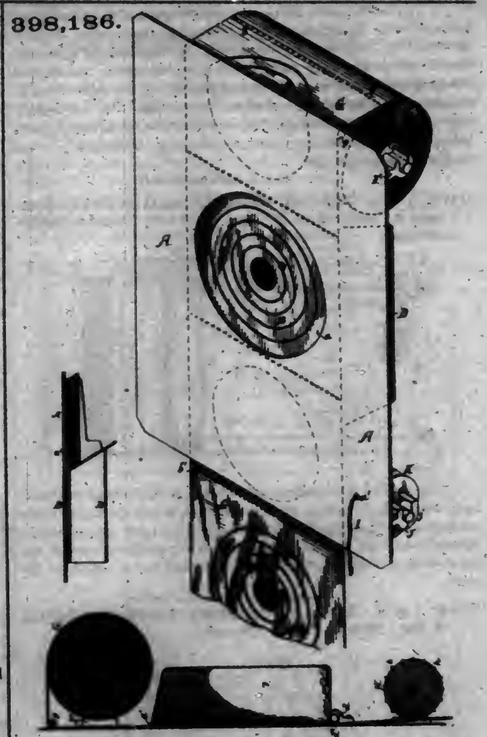
Claim.—1. In a pneumatic water-elevator, a pair of submerged water-chambers, air-ducts opening into them, a common discharge-pipe leading from them, and within said discharge-pipe and operating together a reciprocating float and revolving air-valve adapted to be opened and closed by the reciprocation of the float, so as to feed each duct alternately, all combined substantially as and for the purpose set forth.

2. In a pneumatic water-elevator, a pair of submerged water-chambers, air-ducts opening into them, a common discharge-pipe leading from them, and within said discharge-pipe a reciprocating float, revolving air-valve, and a ratchet-wheel and pawl connected to the oscillating float, whereby the valve is opened and closed, so as to feed each duct alternately, all combined substantially as and for the purpose set forth.



3. In a pneumatic water-elevator, a revolving air-valve having the cap C, valve-seat A, having apertures I and J, forming terminals of the air-ducts E and F, and the hollow stem U of the air-valve, having an aperture, U', always communicating through the semicircular recess U'' in the valve-seat A with the aperture U''', whereby the ducts E and F are alternately relieved of air-pressure, substantially as and for the purpose set forth.

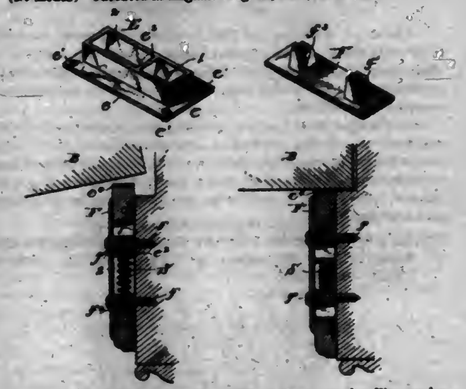
398,184.



398,185. MAIL-BAG. ALLEN B. GORHAM, Baltimore, Md. Filed Dec. 6, 1888. Serial No. 292,795. (No model.)

Claim.—The bag having the openings E on opposite sides, adapted to register when the bag is closed, the flap B, adapted to fold over the mouth of the bag and provided with the opening F, to register with openings E, and provided, further, with the stiffening metallic plates C at its corners, for the purpose set forth, the supplemental flap G, secured to one side of the bag and adapted to fold over the flap B, the stiffening-plates H I, secured to the inner side of said supplemental flap, said plate H having the staple K, adapted to extend through the registering openings E F, and said plate I having the opening L, adapted to receive the projecting end of the staple, substantially as described.

398,186. TARGET. MARTIN O. REHFUSS, Philadelphia, Pa., assignor to himself, George Rehfuss, and J. George Rehfuss, same place. Filed May 4, 1888. Serial No. 272,700. (No model.)

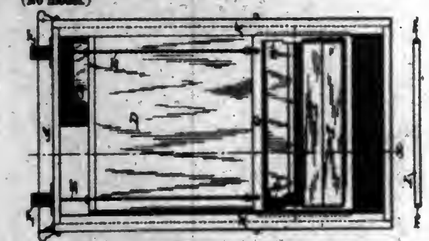


Claim.—1. The combination of the target-plate having an opening therein, a box located in the rear of said opening and forming a shot-receiving chamber, and a perforable target-sheet closing the opening in the target and serving to prevent the escape of shot rebounding from the back of the box, all substantially as specified.

2. The combination of the target-plate having an opening therein and a slotted shot-collecting box in the rear of the opening, a roll of target-sheets mounted on the plate above and outside of the box, and means for drawing the sheet of targets down through the slots of the box and past the opening in the target-plate.

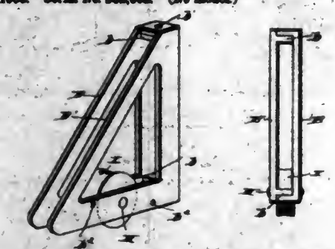
3. The combination of the target-plate having an opening therein, a target-sheet roll, and a feed-roller mounted on opposite sides of the opening, and a shot-collecting box located back of the opening and between the target-sheet roll and feed-roll and slotted for the passage of the target-sheet, all substantially as specified.

398,187. WEATHER-STRIP. JOHN C. REED and JAMES REED, Leeds, County of York, England. Filed Apr. 7, 1888. Serial No. 270,000. (No model.) Patented in England Aug. 22, 1887, No. 11,410.



Claim.—1. The combination, with a door or the like and a weather-strip, of a casing rigidly connected therewith and having its open chamber divided by a partition, of a guide-plate provided with perforated lugs extending into said chamber on opposite sides of the partition, said guide-plate being rigidly secured to the door by screws passing through said perforated lugs, and a coiled spring arranged in said chamber to exert its power upon one of the lugs, substantially as and for the purposes specified.

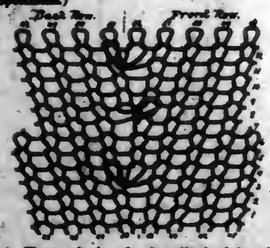
2. The combination, with a door or the like and a weather-strip, of a casing rigidly connected therewith and having its open chamber made tapering inwardly and divided by a partition, of a guide-plate provided with correspondingly-tapering perforated lugs extending into said chamber on opposite sides of the partition, said guide-plate being rigidly secured to the door by screws passing through said perforated lugs, and a coiled spring arranged in said chamber to exert its power upon one of the lugs, substantially as and for the purposes specified.



3. The combination, with a movable element and a stationary element, of means for forming a tight joint along the meeting edges of said elements, comprising a weather-strip, the flanged casing E, secured thereto, said casing being made tapering in cross-section and divided into two unequal parts by a stationary partition, the guide-plate F, connected with the movable element and provided with correspondingly-tapering perforated lugs f' f^2, and the coiled spring S, said parts being constructed and arranged for co-operation substantially as and for the purposes specified.

398,188. BOOK-CASE. GEORGE H. ETTENGER and GEORGE J. RHEINGART, Jr., New York, N. Y. Filed Nov. 5, 1888. Serial No. 289,949. (No model.)

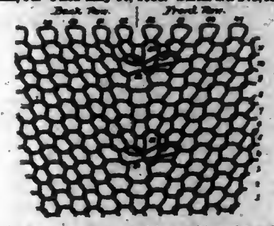
Claim.—The combination, substantially as set forth, of the book-case, the vertically-sliding set of shelves, the counterbalancing-frame moving in vertical ways formed in the case, the cords connecting the shelves and frame, the pulleys over which the cords are carried, and the detachable weights fitting edgewise in said frame, one above the other.



398,189. GATE. JACOB T. SARGENT, Carlinville, Ill. Filed Aug. 16, 1888. Serial No. 282,962. (No model.)

Claim.—1. A hanger for sliding and swinging gates, consisting of the side pieces secured together and provided in their lower sides with a series of holes arranged at different heights, and a roller adapted to be secured in any of the holes to raise and lower the gate, substantially as described.

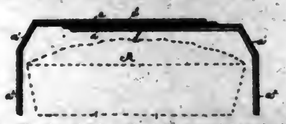
2. A hanger for sliding and swinging gates, consisting of the side portions provided with overlapping lugs adapted to receive a bolt to secure the portions together and to a post and having a series of holes arranged at different heights along their lower sides, and a roller adapted to be secured in said holes, substantially as and for the purpose described.



398,190. ART OF KNITTING WIDENED TUBULAR FABRICS. ROBERT W. SCOTT, Philadelphia, Pa. Filed May 10, 1888. Serial No. 273,409. (Specimens.)

Claim.—1. The mode herein described of forming additional widening-wales in knitted fabrics, said mode consisting in knitting the narrow portion of the fabric on two opposite rows of needles, throwing additional needles into operation in succession alternately at the finishing end of one row and at the starting end of the other row, drawing a new loop on each fresh needle thrown into action, and interrupting the regular run of the thread in some of the courses by forming next to a fresh loop an extra loop on the last acting needle of the row opposite that in which the new needle is brought into action, all substantially as specified.

2. The mode herein described of forming additional widening-wales in knitted fabrics, said mode consisting in knitting the narrow portion of the fabric on two opposite rows of needles, throwing additional needles into operation in succession, first at the starting end of one row and then at the finishing end of the other row on completing the course, and interrupting the regular run of the thread by forming immediately after the fresh loop on the new needle at the starting end of one row an extra loop on the end acting needle of the opposite row, all substantially as specified.



398,191. WIDENED TUBULAR KNIT FABRIC. ROBERT W. SCOTT, Philadelphia, Pa. Filed May 10, 1888. Serial No. 273,410. (Specimens.)

Claim.—1. A tubular knitted fabric widened by the introduction of additional wales and having at each such widening an extra loop drawn in one of the adjacent standing wales, the thread being carried from said extra loop across the space formed by the widening-wale to the standing wale on the opposite side of said widening-wale, substantially as specified.

2. A tubular knitted fabric widened by the introduction of additional pairs of wales, the wales of each pair starting in successive courses, and the thread, after starting the first wale of the pair, being drawn into an extra loop in a standing wale at one side of the said widening-wale, and then crossed to a standing wale on the opposite side of the same, all substantially as specified.

398,192. HEAT-PROTECTOR FOR BAKE-OVENS. JOHN J. SHUPERT, Gilmore City, Iowa. Filed Oct. 20, 1888. Serial No. 289,281. (No model.)

Claim.—1. The herein-described improved bread shield or protector, composed of adjustable sections, substantially as set forth.

2. The herein-described improved bread shield or protector, composed of adjustable sections having lower vertical ends, substantially as set forth.

3. The herein-described improved bread shield or protector, composed of adjustable sections, one of which has guideways for the other section, substantially as set forth.

398,193. RUFFLING AND GATHERING ATTACHMENT FOR SEWING-MACHINES. EDWARD SMITH, Peoria, Ill. Filed Jan. 25, 1888. Serial No. 261,880. (Model.)

Claim.—1. The combination, with a base-plate and an operating-lever, of a reciprocating slide carrying the ruffling-blade and provided in its upper side with the herein-described recess having a pair of engaging-faces, respectively, for the backward and forward throw of the ruffling-blade, said engaging-faces slanting upwardly, the face for the backward throw of the blade having a greater degree of inclination than the face for the forward throw, and a vertically-adjustable operating-bar carried by and operating with said lever, and having its lower end confined in said recess, whereby the blade is reciprocated when the lever is operated, and by which the backward throw of the blade is regulated, while the limit of its forward throw remains the same, substantially as described.

2. In a ruffling attachment, the combination of the ruffling-blade, an operating-lever, the vertically-adjustable operating-bar provided with ratchet-teeth, a graduated scale, and an indicating-finger operating over the scale and provided with teeth meshing with the teeth of said bar, whereby the finger and bar operate simultaneously when the bar is adjusted.

3. In combination, a reciprocating ruffling-blade slide, the pivoted operating-lever, a vertically-adjustable operating-bar carried by said lever to actuate said slide, a graduated scale upon the operating-lever, and an indicating-finger operating over said scale and pivoted to the operating-lever at one side of its pivotal point and connected at one end with the vertically-adjustable operating-bar, so that said finger and bar operate simultaneously when the bar is being adjusted.

4. In a ruffling attachment, the combination of the base-plate, the operating-lever, a vertically-adjustable operating-bar, the reciprocating ruffler-blade slide, the ruffler-blade, an upwardly-extending block on the upper face of said slide provided with engaging-faces, respectively, for the backward and forward throw of the ruffler-blade, and between which the lower end of said bar is confined, the face for the backward throw of the blade slanting upwardly at a greater degree of inclination than the face for the forward throw, a stationary horizontal guide-track held parallel with said slide by ears secured to the base-plate, and sleeves secured to the slide and loosely embracing said stationary track.

5. In a ruffling attachment, the combination of the reciprocating slide carrying the ruffling-blade, an operating-lever pivoted at one end, an operating-bar to actuate the ruffling-blade slide and secured to the pivoted end of the operating-lever in vertical adjustment and provided with ratchet-teeth, an indicating-lever pivoted to the operating-lever and provided at one end with a toothed sector engaging the teeth of the operating-bar, and with a pointer or finger at its opposite end, and a graduated plate carried by the operating-lever and over the face of which said pointer or finger operates, for the purpose substantially as set forth.

6. The combination of the base-plate, the reciprocating ruffling-blade, a detachable separator-blade, a plate carrying the same and provided with an upwardly-extending arm or flange at one end, having an inwardly-projecting lug, a corresponding upwardly-bent arm at the outer edge of the base-plate, having an aperture for the passage of said lug, and a locking-lever pivoted to said arm of the base-plate.

7. The combination, with the base-plate and the reciprocating ruffling-blade, of a plate extending transversely beneath the base-plate, a separator-blade secured to one end of said plate, an arm provided with flanges and a lug extending upwardly from the opposite end of said plate, a corresponding arm extending upwardly from the outer edge of the base-plate and provided with an aperture, said before-mentioned arm of the separator-blade plate engaging the arm of the base-plate and its lug extending through said aperture in the same, and a lever pivoted to the arm of the base-plate to engage said lug and detachably lock the separator-blade to the base-plate, as set forth.

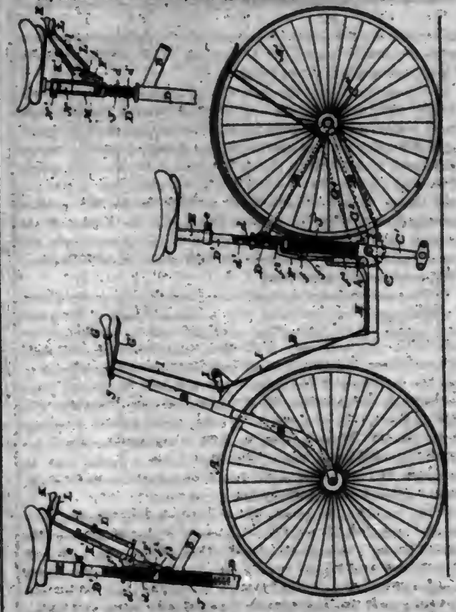
8. In a ruffling attachment, the combination, with a base-plate and the reciprocating ruffling-blade, of a laterally-adjustable guide comprising a body portion extending over the upper face of the base-plate, a laterally-bent arm adjustably secured to the base-plate, and an arm at the opposite end of the body portion and extending downwardly between the edges of the base-plate and the inner edge of the ruffling-blade and adapted to engage and guide the cloth operated upon, substantially as described.

9. The combination, with the base-plate and the reciprocating ruffling-blade, of the herein-described adjusting blocks or bars pivoted or journaled at one end in the base-plate to turn on a longitudinal axis and extending from the pivotal end transversely across and bearing upon the upper face of the ruffling-blade, as set forth.

10. The combination, with the base-plate and the reciprocating ruffling-blade, of an adjusting bar or block journaled or pivoted at one end to turn on a longitudinal axis and extending transversely across and bearing upon the upper surface of the ruffling-blade, said bar or block being provided with an eccentric outer surface, whereby the downward pressure of the ruffling-blade is regulated by rotating said bar or block so that its outer surface will bear with greater or less pressure upon said blade.

11. The combination, with a base-plate and an operating-lever, of a reciprocating slide carrying the ruffling-blade, and provided in its upper face with a recess having a pair of engaging-faces, respectively, for the backward and forward throw of the ruffling-blade, the face for the backward throw of the blade slanting upwardly at a greater degree of inclination than the face for the forward throw, a vertically-adjustable operating-bar carried by said lever and having its lower end confined in said recess, a graduated scale on the operating-lever, and an indicating-finger pivoted to said lever, connected with said operating-bar, and operating over said scale.

398,194. SECONDARY BATTERY. ELIHU A. THOMSON, 2 Great George Street, Westminster, County of Middlesex, England. Filed Oct. 1, 1888. Serial No. 286,963. (No model.)



Claim.—1. An element for secondary batteries, consisting of a plate composed of litharge and a solution of sulphate of ammonia, and a supporting-frame, substantially as described.

2. An element for secondary batteries, consisting of a plate composed of litharge and sulphate of ammonia, and a supporting-frame of ebonite, substantially as described.

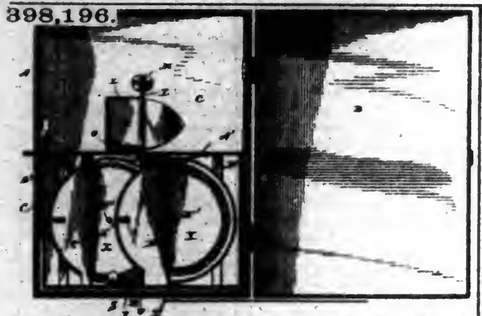
3. An element for secondary batteries, consisting of a plate composed of litharge and a solution of sulphate of ammonia, and a supporting-frame of inoxidizable material, substantially as described.

398,195. BICYCLE. EDWARD THUEMLER, Chicago, Ill. Filed Aug. 16, 1888. Serial No. 282,982. (No model.)

Claim.—1. In a bicycle, a seat having a supporting device whereby the seat may be adjusted vertically by the rider when mounted thereon, with means under his control for locking it at any desired elevation, substantially as hereinbefore set forth.

2. The combination of a seat-supporting post, D', provided with notches d', the sleeve or standard in which it is fitted, the spring detent-catch F, taking into the notches, and means whereby the rider when mounted on the seat may withdraw the catch from the notches, substantially as and for the purpose hereinbefore set forth.

3. The combination of the seat-supporting post D', provided with a notched rack or series of recesses, the tubular sleeve in which it is fitted, the detent-catch pivoted to the sleeve and taking into the notches of the rack, and a spring pressing upward to raise the seat when the detent is withdrawn from the rack, substantially as hereinbefore set forth.



4. The combination of the seat-supporting post provided with a groove, d, and notches d', the tubular sleeve in which it is fitted, the spring detent-catch pivoted to the sleeve and taking into the groove and notches, and the spring pressing upward to raise the seat, substantially as hereinbefore set forth.

5. In a bicycle, the combination of the seat-supporting post D', with its series of notches, the sleeve-standard into which it is fitted, the spring detent-catch pivoted to the sleeve and taking into the notches in the post, and the trip-lever G', pivoted on the steering-handle G of the bicycle and connected by suitable mechanism to the detent-catch, whereby the latter may be withdrawn from engagement with the notches in the seat-post, substantially as and for the purpose hereinbefore set forth.

398,196. VOTING-MACHINE. GEORGE W. TRAHAN and TELESPHORE BABIN, Houma, La. Filed Sept. 22, 1888. Serial No. 286,086. (No model.)

Claim.—1. In a registering device for ballot-boxes, &c., the combination, with the outer box or casing, of the inner tray provided with a suitable deposit-opening, the deposit-lid above said opening having

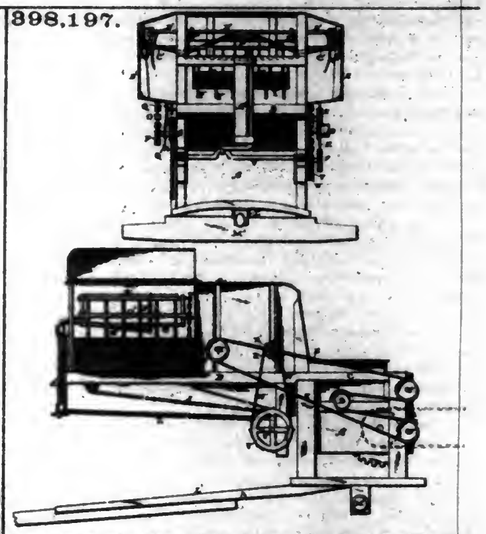
398,196.

a shaft rigidly secured thereto, and the toothed registering mechanism mounted in suitable bearings in the bottom of the tray actuated by said shaft, substantially as set forth.

2. The combination of the outer casing having inner corner-pieces, the hinged inner tray provided with a deposit-opening, the deposit-lid having a transverse shaft rigidly secured thereto, said shaft being provided with cranks, the side apartment, the spring adapted to engage the innermost of said cranks, the sliding plate or bar having a spring-pawl secured thereto, the sleeves in which this sliding bar moves, one of said sleeves having a spring-pawl secured thereto, the toothed registering-dials mounted in suitable bearings in the bottom of the apartment, one of said dials being provided with an eccentric-pin, and the spring-pawl adapted to engage the teeth of the rearmost registering-dial, substantially as set forth.

3. The combination of the outer casing having inner corner-pieces, the hinged inner tray provided with a deposit-opening, the guard located beneath said opening and provided with an alarm-bell, the deposit-lid having a transverse shaft rigidly secured thereto, said shaft being provided with cranks, the side apartment, the spring adapted to engage the innermost of the cranks upon the shaft, the sliding plate or bar having a spring-pawl secured thereto, the sleeves in which this sliding bar moves, one of said sleeves being provided with a spring-pawl, the toothed registering-dials mounted in suitable bearings in the bottom of the apartment, one of said dials being provided with an eccentric-pin, and the spring-pawl adapted to engage the teeth of the rearmost registering-dial, substantially as set forth.

4. The combination of the outer casing having inner corner-plates, the hinged inner tray provided with a deposit-opening, the deposit-lid having a transverse shaft rigidly secured thereto, said shaft being provided with cranks, the side apartment, the spring adapted to engage the innermost of said cranks, the sliding plate or bar having a spring-pawl secured thereto, the sleeves in which this sliding bar moves, one of said sleeves having a spring-pawl secured thereto, the flat spring adapted to engage the forward end of said sliding plate or bar, the toothed registering-dials mounted in suitable bearings in the bottom of the apartment, one of said dials being provided with an eccentric-pin, and the spring-pawl adapted to engage the rearmost registering-dial, substantially as set forth.

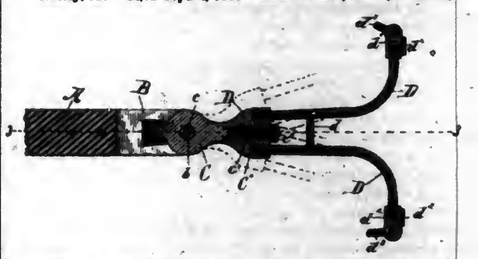


5. The combination of the outer casing having inner corner-pieces, the hinged inner tray provided with a deposit-opening, the guard located beneath said opening and provided with an alarm-bell, the deposit-lid having a transverse shaft rigidly secured thereto, said shaft being provided with cranks, the side apartment having a hinged cover, said cover being provided with suitable openings having pivoted covers above the same, the spring adapted to engage the innermost of the cranks located upon the transverse shaft, the sliding plate or bar having a spring-pawl secured thereto, the sleeves in which this sliding bar moves, one of said sleeves being provided with a spring-pawl, the flat spring adapted to engage the forward end of said sliding plate or bar, the toothed registering-dials mounted in suitable bearings in the bottom of the apartment, one of said dials being provided with an eccentric-pin, the slitted curved plates having the slits therein registering with the openings in the cover of the side apartment, and the spring-pawl adapted to engage the teeth of the rearmost toothed dial, substantially as set forth.

398,197. RAKE-CUTTER AND FEEDER. HENRY A. UNDERWOOD, Lamoure, Dak. Filed Sept. 11, 1888. Serial No. 285,133. (No model.)

Claim.—1. The combination of the crank-shaft U, connecting-rod Z, partially-rotating shaft A', provided with a crank at each of its ends, an endwise-moving frame operated by the shaft, and a pivoted rake which is carried by the frame and also operated by the shaft, substantially as shown.

2. The combination of an endless carrier or apron, an endwise-moving frame which is made to reciprocate over the outer end of the carrier, a pivotal double-ended rake placed in and carried by the



398,197.

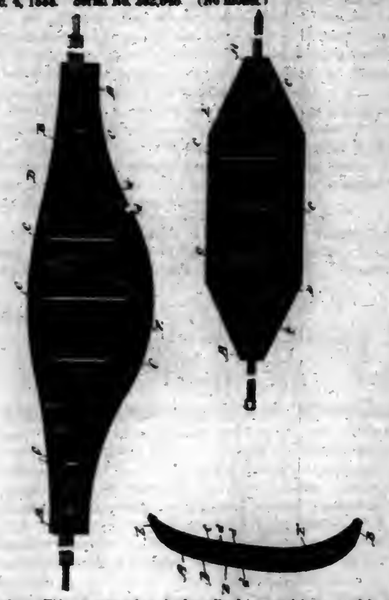
frame, an operating-crank, chains for connecting the ends of the rake to the crank, and an operating mechanism, substantially as described.

3. The combination of the frame B, the endless carrier, the endwise-moving frame, the pivoted double-ended rake, the operating-crank, chain or strap for connecting the two ends of the rake to the crank, means for operating the crank, and the pivoted doors on opposite sides of the frame to form platforms, substantially as specified.

398,198. BREAST-YOKE. GILBERT VAN CAMP, Geneva, Jennings County, Ind. Filed Sept. 4, 1888. Serial No. 284,541. (No model.)

Claim.—1. The combination, in a breast-yoke, of a joint-block mounted pivotally in a housing upon the end of the tongue or pole, and the breast-yoke proper mounted and adapted to swivel upon a stem forming part of said joint-block.

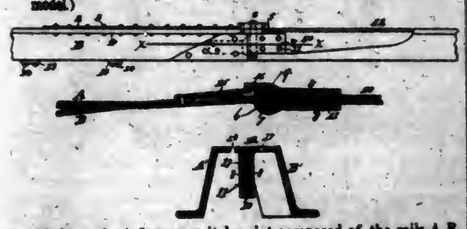
2. The combination, in a breast-yoke, of a housing secured to the end of the pole, and a joint-block supporting the yoke mounted therein on a pivot-bolt, and a sleeve surrounding said pivot-bolt slightly longer than the thickness of said joint-block, substantially as described, and for the purposes specified.



3. The combination, in a breast-yoke, of a joint-block secured to the tongue, the stem portion of which extends through the base portion of the neck-yoke proper, said stem portion being surrounded by a sleeve slightly longer than the distance through the portion through which it extends, substantially as shown and described.

4. The combination of a breast-yoke adapted to move pivotally upon the end of the pole or tongue, and a pin whereby it may upon occasion be secured to position, said pin being provided with a small projection upon one side of its head, whereby by reversing said pin said movable portion may be either left free or secured rigidly in position and the openings for the pin at the same time kept covered, substantially as set forth.

5. The combination of the pole A, the housing B, the joint-block C, and the breast-yoke proper, D, said several parts being constructed and operating substantially as shown and described.



6. The combination of the pole, a housing thereon, and a breast-yoke secured in said housing, that portion which connects the breast-yoke to the housing having a rearward projection, and the housing having an opening larger than said projection, and a pin adapted to pass down through said housing and either through or alongside said projection, thus securing the breast-yoke either directly in line with the pole or to one side thereof, substantially as set forth.

398,199. COMPRESS. MARTIN V. WAGNER, Marshall, Mich. Filed Dec. 4, 1888. Serial No. 292,645. (No model.)

Claim.—The compress herein described, comprising a pad having a fibrous filling and a casing having two thicknesses of rubber cloth, and a series of transverse tapes having their ends attached to the top and bottom edges thereof, whereby the casing is adapted to securely hold the pad in position, either in the pocket formed between the two thicknesses of the casing or on one side thereof, and thus the action of the pad be graduated as desired, substantially as described.

398,200. CABLE-RAILWAY SWITCH. FREDERIC C. WEIR and NATHANIEL G. GOLDSMITH, Cincinnati, Ohio, assignors to the Weir Frog Company, same place. Filed May 24, 1888. Serial No. 274,910. (No model.)

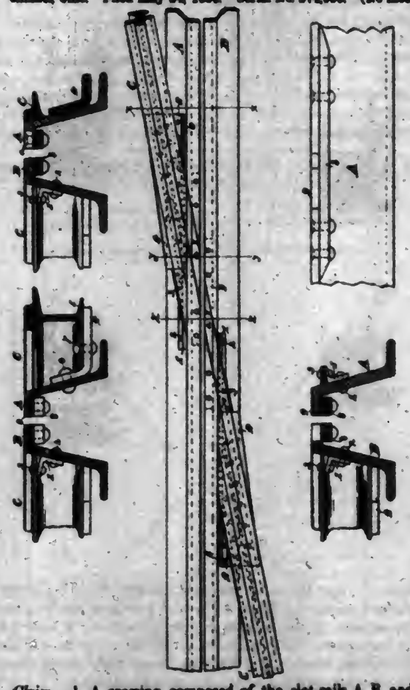
Claim.—1. A frog or switch point composed of the rails A B, fitted to each other, said rails being secured at the bottom by means of a brace-plate, 13, and rivets 14, and also secured at the top by means of a brace-plate, 2, and rivets 3, substantially as described.

2. In combination with the slot-rails forming two slots, 17 and 18, the tongue 10, hinged to the heel rails by means of the plate 5, substantially as herein specified.

3. In combination with the rails A B, secured together, the tongue 10, hinging-plate 5, and the spring 15, secured to the webs of the rails A B and engaged with the lug 16 of the tongue-rail, substantially as specified.

4. In combination with the slot-rails A B, secured together, the tongue 10, made of T-iron, hinging-plate 5, and pivot 6, the journal-arm 7, having an eye, 9, which encircles the pivot 6, and arms 8, which embrace the web of the tongue 10 and are united thereto, substantially as shown and described.

398,201. RAILWAY-FROG. FREDERIC C. WEIR and NATHANIEL G. GOLDSMITH, Cincinnati, Ohio, assignors to the Weir Frog Company, same place. Filed May 24, 1888. Serial No. 274,911. (No model.)



398,201.

Claim.—A frog composed of point-rails A A, having their flanges 1 bent to overlap the inclined flanges 2 of the wing-rails B B, and secured together by rivets 3, and the bottom flanges of said rails secured to the base-plate D, substantially as specified.

398,202. CABLE-RAILWAY CROSSING. FREDERIC C. WEIR, Cincinnati, Ohio. Filed May 24, 1888. Serial No. 274,909. (No model.)

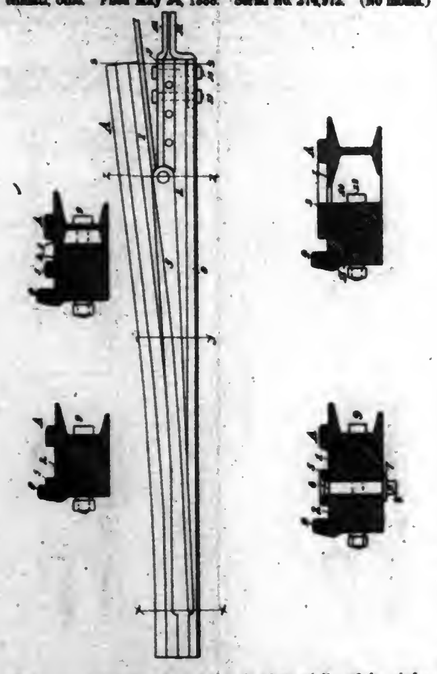
Claim.—1. A crossing composed of the slot-rails A B, and the girder-rail C, beveled to fit said slot-rails, and secured to them by the brace-plate 4 and the rivets 6 and 7, substantially as herein specified.

2. A crossing formed of slot-rails A B, and the girder-rail C, beveled to fit said slot-rails, and secured thereto by means of the brace-plates 1 and 4, bolted to the flange and web of said rails, substantially as specified.

3. In combination with the rails A B, having the gains *a*, the guide-plates 8, secured to the under side of the flanges 9 of the rails A B, substantially as herein set forth.

398,203. RAILWAY-FROG. FREDERIC C. WEIR, Cincinnati, Ohio. Filed May 24, 1888. Serial No. 274,910. (No model.)

Claim.—1. A frog consisting of the pointed T and girder rails, the interposed filling-block 1, the fish-plates 2, and the tie-bolts 3 and 5, extending through the T and girder rails, the filling-block, and the fish-plates, substantially as described.



2. A frog consisting of the pointed T and girder rails, the latter having laterally-extending flanges resting against the sides of the former, the interposed filling-block, the fish-plates 2, and the tie-bolts 3 and 5, extending through the T and girder rails, the filling-block, and the fish-plate, substantially as described.

3. A frog composed of T-rails A B, the girder-rails C, the filling-

blocks 1 and 7, and through-bolts 3 5 10, passing through the webs of said rails and said filling-blocks, substantially as herein specified

4. A frog-point composed of the T-rails A B, the filling-block 1, the bent fish-plates 2, projecting beyond the said rail, and the parts secured by bolts 3, substantially as specified.

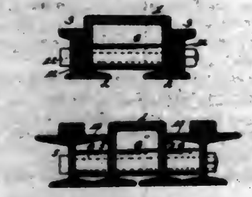
398,204. STREET-RAILWAY SWITCH. FREDERIC C. WEBB, Cincinnati, Ohio. Filed May 24, 1888. Serial No. 274,972. (No model.)

Claim.—1. A switch-point composed, substantially, of the girder-rail and guard and spacing block 2, provided with guard-flange 4, and secured together by means of through-bolts, substantially as specified.

2. A switch-point composed, substantially, of the girder-rail and spacing and guard block 2, provided with flanges 3 and 4, secured together by through-bolts 9, substantially as herein specified.

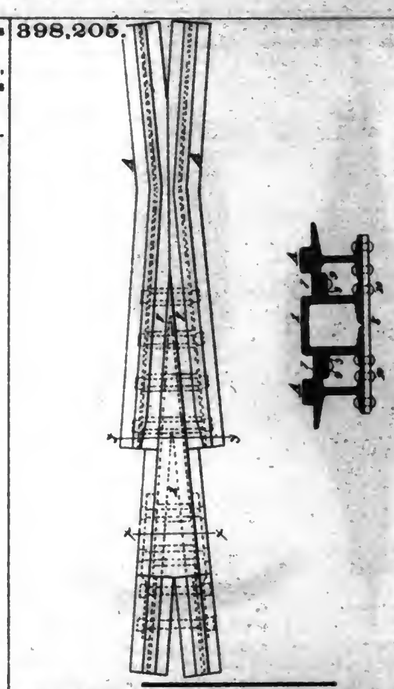
3. In combination with the girder-rail A and guard and spacing block 2, the fish-plates 10 and 11 for connecting the girder-rail to said casting-block 2, substantially as specified.

4. In combination with the girder-rail A, guard and spacing block 2, provided with flange 4, the switch-tongue 5, pivoted to said guard and spacing block, substantially as herein specified.



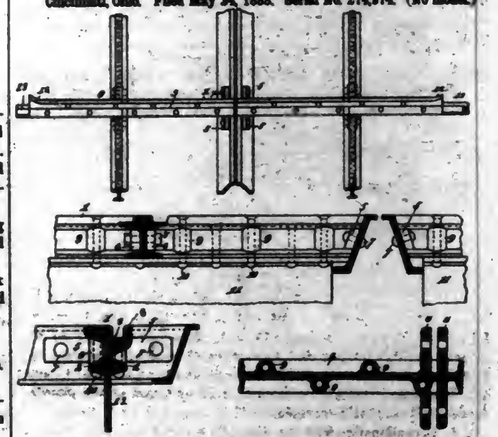
398,205. RAILWAY-FROG. FREDERIC C. WEBB, Cincinnati, Ohio. Filed May 24, 1888. Serial No. 274,973. (No model.)

Claim.—1. The point of a railway-frog, composed of U-rail 1, provided with the base-support 2 and side flanges, 3, substantially as herein specified.



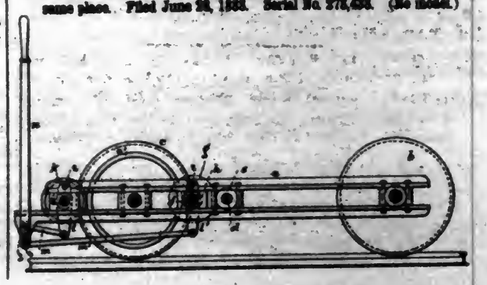
2. A railway-frog composed of the U-shaped point 1 and the side flanges, 3, in combination with the guard-rails A A, secured together by rivets or bolts, substantially as herein specified.

3. A railway-frog composed of the guard-rails A, having side flanges, the U-shaped point 1, having the lateral side flanges, 3, the through-bolts 5, and the spacing-blocks 6, located on the bolts between the point and guard-rails, substantially as described.



4. A railway-frog composed of the guard-rail A A, the U-point rail 1, provided with flanges 3, the side rails being secured together by through-bolts 5, substantially as herein specified.

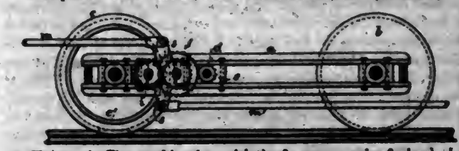
398,205.



398,206. CABLE AND RAILWAY CROSSING. FREDERIC C. WEBB, Cincinnati, Ohio. Filed May 24, 1888. Serial No. 274,974. (No model.)

Claim.—1. The crossing-rail 1, provided with base 2, tramway 3, flange 4, and the ears 5, substantially as herein set forth.

2. The crossing-rail 1, provided with bosses 9, ears 5 and 6, with the tramway 3, and guard 4, substantially as herein specified.



398,207. DRIVING MECHANISM FOR CARS. FRANCIS J. WEBB, Jersey City, N. J., assignor to the United States Machine Company, same place. Filed June 28, 1888. Serial No. 278,436. (No model.)

Claim.—1. The combination, with the pair of wheels *b* and a supporting-frame and the electrically-rotated shaft, of the pair of wheels *c*, having flanges *c'*, a pair of friction-wheels, *k*, adapted to engage the annular flanges at one side, and a pair of friction-wheels, *h*, adapted to engage the opposite side of the annular flanges, and mechanism, substantially as herein shown and described, for imparting motion to the friction-wheels, substantially as set forth.

2. The combination, with the pair of wheels *b* and a supporting-frame and an electrically-rotated or motor-shaft, of a pair of wheels, *c*, having flanges *c'*, the pairs of friction-wheels *h k*, adapted to engage the opposite sides of the annular flanges, the swinging levers *l l'*, the pull-levers *m m'*, and a lever, *n*, by which the same are operated, substantially as and for the purposes set forth.

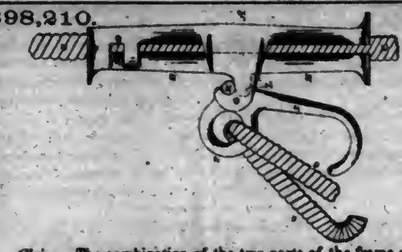
398,208. DRIVING MECHANISM FOR CARS. FRANCIS J. WEBB, Jersey City, N. J., assignor to the United States Machine Company, same place. Filed June 28, 1888. Serial No. 278,439. (No model.)

Claim.—1. The combination, with the frame *a*, a pair of wheels, *b*, the pair of wheels *c*, having flanges *c'*, and an electrically-rotated or motor shaft, of pairs of friction-wheels adapted to grasp the outer and inner peripheries of the flanges *c'*, the rocking frame in which the shafts of said friction-wheels are mounted, gearing connecting said shafts with each other and with the electrically-rotated shaft, and mechanism, substantially as specified, for operating the pairs of friction-wheels for driving the wheels *c*, substantially as and for the purposes set forth.

2. The combination, with the frame *a*, the pair of wheels *b*, the pair of wheels *c* and their flanges *c'*, and an electrically-rotated motor-shaft, of the shafts *f i*, the rocking frames *s d'*, forming bearings for said shafts, short shafts by which the rocking frames are pivoted to the frame *a*, pairs of friction-wheels *h k*, mounted upon the respective ends of the shafts *f i*, and the gears *i'*, *f'*, and *e*, substantially as and for the purposes set forth.

398,209. DRIVING MECHANISM FOR CARS. FRANCIS J. WEBB, Jersey City, N. J., assignor to the United States Machine Company, same place. Filed June 28, 1888. Serial No. 278,440. (No model.)

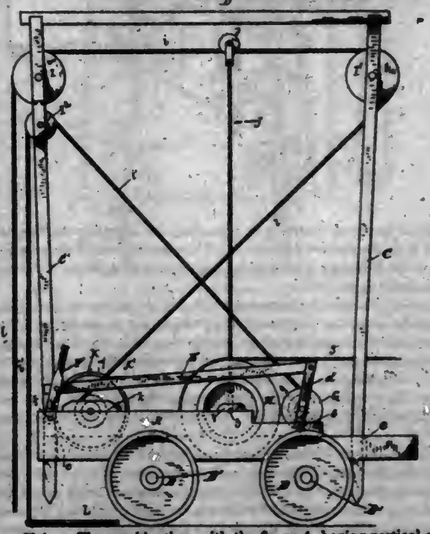
Claim.—1. The combination, with the frame *a* and the pair of wheels *b* and an electrically-rotated motor-shaft, of a pair of wheels, *c*, having grooved flanges *c'*, the grooved pulleys *k*, and mechanism, substantially as herein shown and described, for moving the driving-wheels *c* to engage their flanges *c'* and the pulleys *k*, substantially as set forth.



2. The combination, with the frame *a*, the pair of wheels *b*, and an electrically-rotated motor-shaft, of the pair of wheels *c*, the flanges *c'* upon the same, said flanges having V-shaped grooves across their faces, with channeled bases to said grooves, the friction-wheels *k*, having V-shaped grooves, the shaft *f* for said friction-wheels, the gears *e* and *g*, and mechanism, substantially as specified, for moving the driving-wheels to engage the flanges and friction-wheels, substantially as set forth.

3. The combination, with the frame *a*, the pair of wheels *b*, and an electrically-rotated motor-shaft, of the driving-wheels *c*, having grooved flanges *c'*, the grooved friction-wheels *k*, the rocking frames *s s'*, pivoted at 4, the yokes *o o'* and levers *n n'*, pivoted at 5, and the rods *m m'*, for operating the same, substantially as set forth.

398,210. FIRE-ESCAPE. FRANK A. WHITMORE, Port Jervis, N. Y. Filed July 16, 1888. Serial No. 280,221. (No model.)

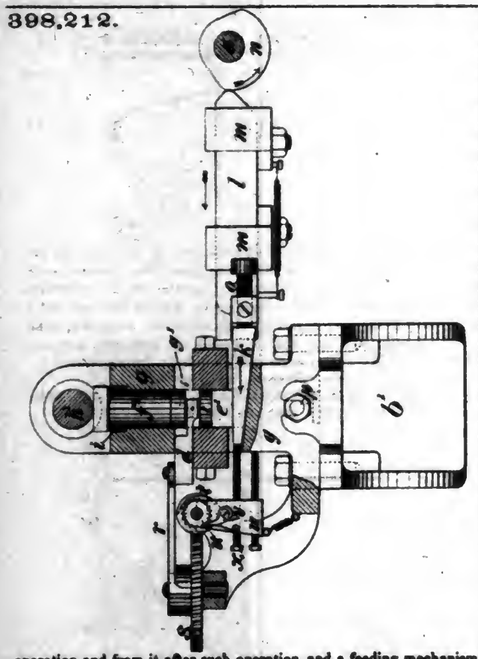


398,210.

Claim.—The combination of the two parts of the frame applied to opposite sides of the rope, one of the parts being provided with ears and the other with a projection upon its outer side, the operating-lever provided with journals or bearings to catch in the ears, and a ring or loop at its upper corner through which the suspending strap or belt is passed, said lever bearing against the projection upon one of the parts of the frame, substantially as shown and described.

398,211. WELL-BORING MACHINE. SAMUEL ADAMS, Denver, Pa. Filed July 7, 1887. Serial No. 243,614. (No model.)

Claim.—The combination, with the frame A, having vertical end standards, C C, the wheel K, mounted on the frame, and the drive-wheel H, provided with a crank-arm, of the sheaves I and I', pivotally mounted on the respective end standards of the frame, the cable *i*, anchored to the wheel K and carried over the sheave on the standard at the opposite end of the frame, thence carried horizontally between the standards and over the sheave I, and the cable J, provided with a sheave on its upper end to run on the drill-cable and having its lower end connected to the crank of the drive-wheel, substantially as described.



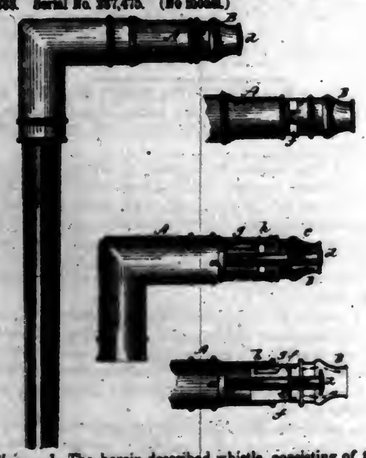
398,212. APPARATUS FOR FLATTENING CARD-WIRE AT INTERVALS. GEORGE ASHWORTH and ELIJAH ASHWORTH, Manchester, County of Lancaster, England. Filed June 26, 1888. Serial No. 278,096. (No model.)

Claim.—1. In a machine for flattening or altering the section of card-wire by pressure, a rapidly-vibrating presser and an anvil, in combination with parts for decreasing the mean distance between the presser and anvil during each flattening operation and increasing the distance after the operation, and with a feeding mechanism timed to be inoperative while that distance is so diminished, whereby the wire is flattened or shaped by a succession of squeezes or blows, substantially as set forth.

2. In a machine for flattening or altering the section of card-wire, a rapidly-vibrating presser and an anvil, in combination with the wire-guide, the eccentric-link, the worm-wheel carrying an eccentric, the worm, the ratchet-wheel and catch, and a moving part of the machine to act on the latter at each flattening operation, substantially as and for the purpose set forth.

3. In a machine for flattening or altering the section of card-wire, the rapidly-vibrating presser and the anvil, in combination with parts for gradually moving the said anvil toward the presser during the

398,212.

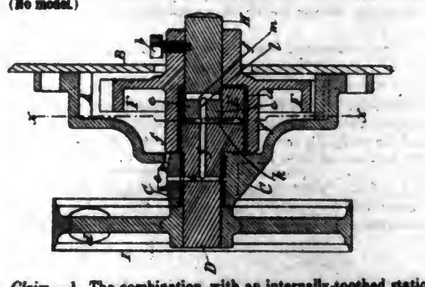


operation and from it after such operation, and a feeding mechanism timed to be inoperative while the anvil is so moved toward the presser, so that the flattening is effected by a succession of squeezes or blows, substantially as set forth.

4. In a machine for flattening or altering the section of card-wire, the rapidly-revolving eccentric *k'*, the presser-piece *f'*, the spring *l*, the presser, and the movable anvil, in combination with the sliding wedge for moving the anvil toward the presser, substantially as set forth.

5. As applied to a card-setting machine, the rapidly-vibrating presser, the movable anvil, the sliding wedge, the sliding bar *l*, and the cam for acting upon the said bar, substantially as and for the purpose set forth.

6. As applied to a card-setting machine, the wire-guide traversed to and fro, the rapidly-vibrating presser or hammer, and the anvil, the last two parts shorter on the face than the length of wire cut off to form a card-staple, combined with means for rapidly vibrating the said presser, and with means for lessening the distance between the presser and the anvil during the times when the wire is at rest, substantially as set forth.



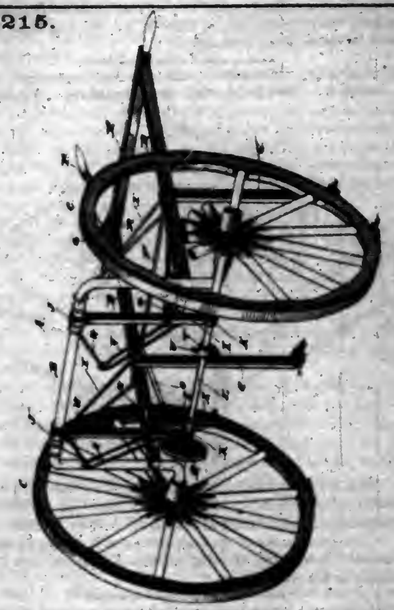
398,213. WHISTLE. HERBERT ATKINSON and GORDON W. HULL, Wallingford, Conn.; said Atkinson assignor to said Hull. Filed Oct. 8, 1888. Serial No. 287,475. (No model.)

Claim.—1. The herein-described whistle, consisting of the combination of the tubular body A, the tip B, arranged to slide longitudinally in said tubular body, the outer end of the tip open but contracted, an extension from the body within said tip and terminating at its outer end in a head corresponding to the contracted opening through the outer end of the tip, and so as to close the outer end of the tip when the tip is in the closed position, the tip constructed with one or more openings through it in such relation to the body that the openings in the tip are exposed only when the tip is drawn from the body, and the extension from the body provided with a disk of less transverse area than the interior of the tip at the openings and at a point corresponding to the outer edge of the opening when the tip is withdrawn, substantially as described.

2. The combination of the tubular body A, open at one end and closed at the opposite end, the tubular tip B, arranged to slide in the said tubular body and project through the open end, the body constructed with a spindle, *b*, projecting therefrom through the tip and terminating at its outer end in a head, *d*, of less diameter than the internal diameter of the tip, and the outer end of the tip contracted to an internal diameter corresponding to the said head, and so that in the closed position the said head will close the outer end, the spindle also constructed with a disk, *e*, in a plane at right angles to its axis within the tip and outside the open end of the body, the said disk of less diameter than the internal diameter of the tip, and the tip constructed with circumferential slots *f* in such relation to the said disk *e* that when the tip is drawn out the outer edge of the slots will come into the plane of the disk, and a stop to arrest the outward movement of the tip when the slots of the tip have reached their proper position in relation to the disk, substantially as described.

398,214. MECHANICAL MOVEMENT. ERNST F. AUTENRIETH, New York, assignor to the Glen Cove Machine Company, (Limited,) Green Point, Brooklyn, N. Y. Filed Nov. 13, 1888. Serial No. 290,662. (No model.)

Claim.—1. The combination, with an internally-toothed stationary gear, a driving-shaft concentric with said gear and an eccentric carried by said driving-shaft, of a second shaft arranged in line with the driving-shaft, a gear having fewer teeth arranged within and gearing with said stationary gear and secured fixedly on the second shaft in eccentric relation thereto and containing a concentric bearing fitted loosely to the eccentric on the driving-shaft, substantially as herein described.



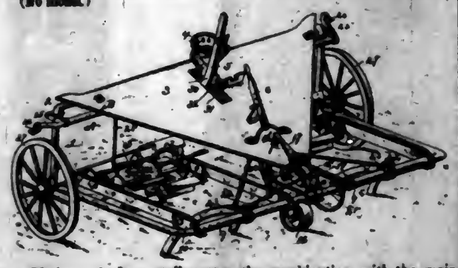
2. The combination of an internally-toothed stationary gear, a driving-shaft concentric therewith and an eccentric carried by said driving-shaft, a second shaft arranged in line with the driving-shaft, a gear internal to and gearing with said stationary gear secured fixedly on the second shaft in eccentric relation thereto and fitted to the eccentric on the driving-shaft, and a bearing within said eccentric for the end of the second shaft, substantially as herein described.

3. The combination, with a driving-shaft, a stationary internally-toothed gear, and a journal-box for said driving-shaft secured concentrically upon said toothed gear, of an eccentric fast upon the said driving-shaft, a second shaft in line with the driving-shaft, and an eccentric gear fast on the second shaft and fitting loosely to the eccentric on the driving-shaft, substantially as herein described.

4. The combination of an internally-toothed stationary gear, a driving-shaft concentric therewith, a stationary journal-box for said shaft, an eccentric carried by said shaft, a second shaft arranged in line with the driving-shaft, an eccentric gear secured to said second shaft in eccentric relation thereto and fitted to the eccentric on the driving-shaft, and a bearing within said eccentric for the end of the said second shaft, the said driving-shaft and eccentric having longitudinal and transverse oil-passages, and the said second shaft having longitudinal and transverse oil-passages, substantially as herein described, whereby oil is to be delivered from said stationary journal-box to the exterior of the eccentric, and also to the bearing provided within the eccentric for the second shaft, all substantially as herein described.

398,215. FENCE-WIRE-WINDING MACHINE. ARTHUR BALDWIN and JOHN CLEMENT, Prairie du Sac, Wis. Filed Nov. 7, 1888. Serial No. 290,214. (No model.)

398,215.



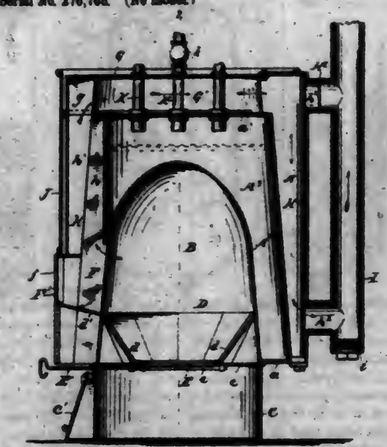
Claim.—1. In a machine for winding fence-wire, the combination of the axle, the swinging reel-arms having their upper ends hung thereon, the reel-shaft supported by said arms, and mechanism for rotating the reel-shaft, as set forth.

2. The combination of the axle, the push-bars secured thereto, the reel-arms hung on the axle, the pawls secured to the push-bars and engaging the reel-arms, the reel-shaft supported by said arms, and mechanism for rotating said shaft, as set forth.

3. The combination of the axle, the push-bars secured thereto, the reel-arms hung on the axle, the guides for said arms supported by the push-bars and the axle, the pawls secured to the push-bars and engaging said arms, the reel-shaft supported by said arms, and mechanism for rotating said shaft, as set forth.

4. The improved machine for winding fence-wire, comprising the axle, the push-bars secured thereto, the reel-arms hung on the axle, the pawls secured to the push-bars and engaging said arms, guides for said arms supported by the axle and the push-bars, the reel-shaft supported by said arms, the driving-shaft mounted on one of the push-bars and geared to the reel-shaft, the cross-bar connecting the push-bars, and the supporting-legs pivoted to said cross-bar, as specified.

398,216. CORN OR COTTON STALK CUTTER. MATHIAS B. BADGWEIT, Brown's Station, Iowa. Filed Sept. 10, 1888. Serial No. 285,083. (No model.)



Claim.—1. In a stalk-cutter, the combination, with the main frame, the cutter-frames, the collars or sleeves 9, the stalk-cutters journaled in said frames, and each consisting of three hubs, 12, the spokes 13, and blades 14, and the mechanism, substantially as described, whereby the said cutter-frames and collars are moved laterally on the main frame, of the lever 30, journaled on the main frame, the shaft B, provided with the brake-shoes 26, the wires 28, connecting the arms of said shaft B with the rears of the cutter-frames, and the detent mechanism for said lever, constructed substantially as described, and situated upon the top of the main frame, as specified.

2. In a stalk-cutter, the combination, with the main frame, the cutter-frames, rendered adjustable laterally on the main frame by means of the collars 9, the lever 17, and rods connecting said lever and collars, and the vertically-adjustable drags secured to said collars, of the stalk-cutters, each consisting of the three hubs 12, the spokes 13, and blades 14, and having their shafts journaled in the corresponding cutter-frames, as specified.

3. In a stalk-cutter, the combination, with the guide-wheel having its shank or standard journaled in the front portion of the main frame and flattened on opposite sides between its bearings, of the springs 33, secured to the main frame and bearing on said flattened sides, substantially as and for the purpose specified.

398,217. APPARATUS FOR HEATING AND CIRCULATING WATER. WILLIAM J. BARNSTEAD, Galesburg, Ill. Filed June 11, 1888. Serial No. 276,766. (No model.)

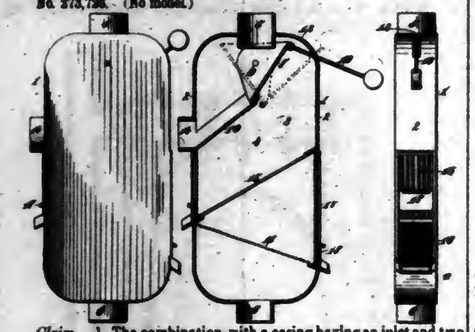
Claim.—1. In an apparatus for heating and circulating water, the combination, with the boiler, of the centrally-located combustion-chamber having an opening at the front thereof and a flue arranged in the space between the casing and the boiler and extending upward from said opening to the top of the boiler, substantially as and for the purposes specified.

2. In an apparatus for heating and circulating water, the combination, with the boiler, of the centrally-located combustion-chamber having an opening at the front thereof and a flue arranged in the space between the casing and the boiler and extending upward from said opening to the top of the boiler, and thence rearward over the top of the boiler, substantially as and for the purposes specified.

3. In an apparatus for heating and circulating water, the combination, with the boiler and the centrally-located combustion-chamber having an opening arranged at the front thereof and serving both as a charging and flue opening, of a suitable door or damper at the front of said opening, and a flue arranged in the space between the casing and the boiler, leading upward from said opening to the top of the boiler and thence rearward over the top of the boiler, substantially as and for the purposes specified.

4. In an apparatus for heating and circulating water, the combination, with the boiler and the centrally-located combustion-chamber having an opening at the front of the same, of a flue arranged in the space between the casing and the boiler, extending upward from said opening along the boiler and thence rearward and downward along the boiler, substantially as and for the purposes specified.

5. In apparatus for heating and circulating water, the combination, with the boiler and the centrally-located combustion-chamber having an opening at the front of the same, of a flue arranged in the space between the casing and the boiler, extending upward from said opening along the boiler and thence rearward across the top of the boiler and thence downward along the boiler, substantially as and for the purposes specified.



6. In an apparatus for heating and circulating water, the combination, with the boiler and the centrally-located combustion-chamber, of the hood arranged on top of the boiler and forming a second inclosed chamber within the main chamber between the casing and the boiler, an opening at the front of the combustion-chamber, and a flue leading upward from said opening to the second chamber, substantially as and for the purposes specified.

7. In an apparatus for heating and circulating water, the combination, with the boiler A, of the centrally-located combustion-chamber B, the opening F at the front thereof, and outer casing, J, the hood G, forming the chamber G' on top of the boiler within the space between the casing J and the boiler A, the flue H, leading from the

opening F to the chamber G', and the water-pipes K, leading upward from the boiler through the chamber G', substantially as and for the purposes specified.

8. In an apparatus for heating and circulating water, the combination, with the frusto-conical outer shell, A', of the similarly-formed inner shell, A^2, forming the combustion-chamber, and having a domed conoidal top and an opening, F, in the front thereof communicating with the space between the outer casing and the boiler, substantially as and for the purposes specified.

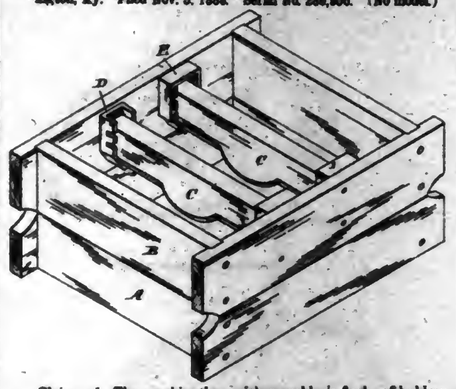
398,218. WATER FILTER AND CUT-OFF. WILLIAM C. BAYLISS and JAMES C. NICHOLS, Mossy Creek, Tenn. Filed May 12, 1888. Serial No. 273,726. (No model.)

Claim.—1. The combination, with a casing having an inlet and two outlets, and provided at its top with a longitudinal slot arranged in a vertical plane, of a tilting chute pivoted at or near its center in the casing, and a swinging and lengthwise-movable lever extending through and resting on the lower edge of the slot, and having its inner extremity pivoted to one end of the tilting chute, said lever provided at its outer end with a weight, serving to force the lever down upon the lower edge of said slot to hold the chute in its adjusted position, substantially as described.

2. The combination, with a casing having a slot in its top, a top inlet, a lateral side outlet, and a bottom outlet, of an inclined duct rising from the side outlet and extending inward and upward, a tilting chute pivoted at or near its center above the upper end of the inclined duct, and a swinging and lengthwise-movable lever extending through and resting on the lower edge of the slot and having its inner extremity pivoted to one end of the tilting chute and its outer end carrying a weight for forcing the lever into contact with the lower edge of the slot, substantially as and for the purposes described.

3. The combination, with a casing having an inlet, a lateral side outlet, and a bottom outlet, of inclined strainers located between the lateral side outlet and the bottom outlet, an inclined duct rising from the side outlet and extending upward and inward above the strainers, a tilting chute pivoted at or near its center above the strainers and duct, and a lever for tilting the chute, substantially as described.

4. The combination, with a casing, 1, having an inlet, 5, a lateral side outlet, 14, a bottom outlet, 6, and lateral side orifices, 17, of oppositely-inclined strainers 15 and 16, rising from the lateral side orifices, an adjustable gate, 18, located in each of said orifices at the lower end of the strainer rising therefrom, an inclined duct, 19, rising from the lateral side outlet and extending upward and inward above the strainers, a tilting chute, 8, pivoted above the upper end of the chute, and a lever for tilting the chute, substantially as described.

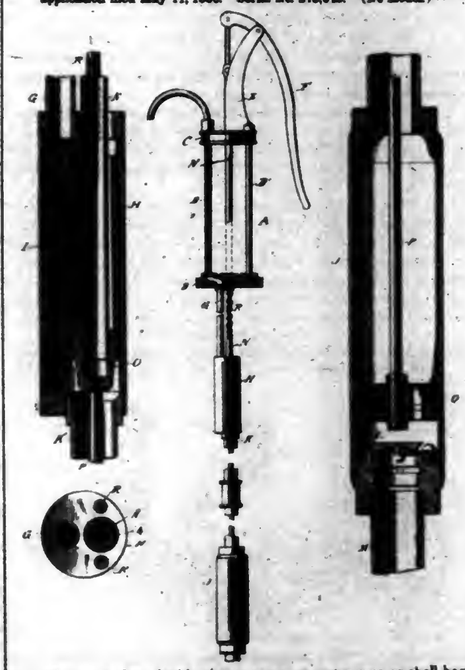


5. The combination, with the casing 1, having a top inlet, 5, a bottom outlet, 6, and a series of lateral outlet-openings, 17, provided at their sides with vertical guideways, a series of inclined strainers arranged in the casing and having their lower edges extending down to the lower edges of said lateral outlets, and a series of vertically-sliding gates, 18, having their vertical edges arranged in said guideways, said gates when raised permitting the water passing down the strainers to flow laterally to the outside of the casing, and when lowered to the edges of the strainers intercepting the downflow and forcing it back upon the strainers, substantially as described.

6. In a water filter and cut-off, the combination, with a casing having an upper and a lower outlet, of an inclined strainer composed of parallel straight bars, and an oppositely-inclined straight strainer composed of a foraminous plate, substantially as described.

7. In a water filter and cut-off, the combination, with a casing having an upper inlet and a lower outlet, and provided with a series of inclined bars and with an oppositely-inclined foraminous plate, of vertically-movable gates mounted in the edges of the casing at the foot of the inclined bars and at the foot of the foraminous plate, substantially as described.

8. The combination, with the casing 1, having an inlet, 5, and outlet 6, and provided with the inclined chute 19, of the pivoted chute 8, gravity-lever 10, the inclined bars 15, and the oppositely-inclined screen 16, substantially as described.



398,219. MOLDER'S FLASK. CHARLES BOERSCHUTZ, Jr., Covington, Ky. Filed Nov. 5, 1888. Serial No. 289,856. (No model.)

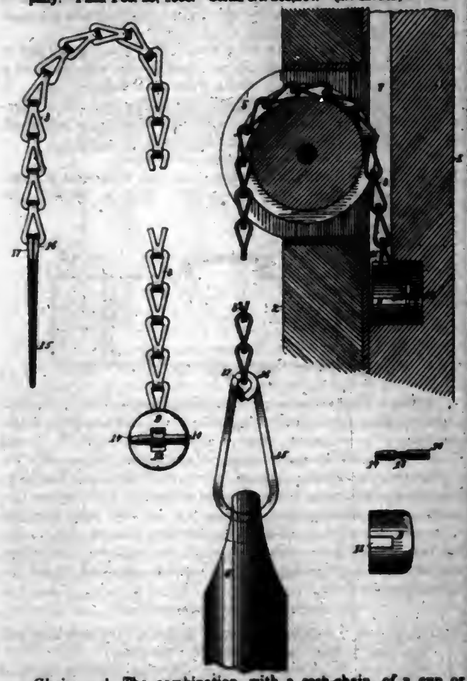
Claim.—1. The combination, with a molder's flask, of holders, a cross-bar or cross-bars supported thereby, and caps provided with locking devices, substantially as and for the purpose specified.

2. The combination of the flask, holders D D, having recesses *d d*, cross-bars C C, supported thereby, and caps E E, having lugs *e e*, substantially as described.

398,220. PUMP. JOSEPH H. BRANSON, Belmont, N. Y. Original application filed Sept. 7, 1885, Serial No. 176,412. Divided and this application filed May 11, 1888. Serial No. 273,643. (No model.)

Claim.—1. In a double-piston pump, an outer case or shell having the upper cylinder depending therein, and provided with separate openings at its upper end for the discharge-pipe and piston-rod, in combination with a pump-standard having a passage for the piston-rod, and a connection for the discharge-pipe, the discharge-pipe being turned outwardly from the piston-rod above the base-line of the pump-standard, substantially as shown and described.

2. In a double-piston pump, an outer case or shell having the upper cylinder depending therein, and provided with separate openings at its upper end for the piston-rod and discharge-pipe, and supporting-rods, in combination with a pump-standard having a passage for the piston-rod, and connections for the discharge-pipe and supporting-rods, whereby the case or shell is suspended, the discharge-pipe being turned outwardly from the piston-rod above the base-line of the pump-standard, substantially as shown and described.

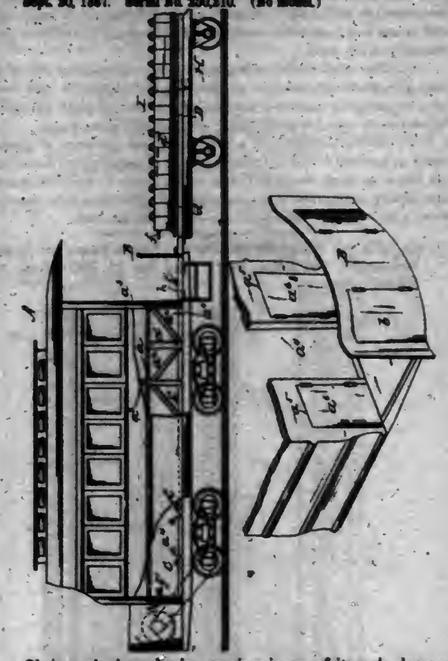


3. In a double-cylinder pump, an outer case or shell having the upper cylinder depending therein, and suspended below the platform by a discharge-pipe, and provided at its upper end with separate openings for the piston-rod and discharge-pipe, in combination with a pump-standard having a passage for the piston-rod and a separate opening for the discharge-pipe, the discharge-pipe communicating with the pump-spout through a passage cast in the pump-standard, substantially as shown and described.

4. In a double-cylinder pump, an outer case or shell having the upper cylinder depending therein, and suspended below the platform by a discharge-pipe, and provided at its upper end with separate openings for the piston-rod, discharge-pipe, and supporting-rods, in combination with a pump-standard having a passage for the piston-rod, a separate opening for the discharge-pipe, and connections for the supporting-rods, the discharge-pipe communicating with the pump-spout through a passage cast in the pump-standard, substantially as shown and described.

5. In a double-piston pump, an outer case or shell having the upper cylinder depending therein, and suspended below the platform by a discharge-pipe, said shell having separate openings at its upper end for the piston-rod and discharge-pipe, the discharge-pipe and piston-rod being substantially parallel with each other to the bottom line of the pump-base, the discharge-pipe communicating with the discharge-spout above said bottom line of base through a passage leading outwardly from said piston-rod, substantially as shown and described.

6. In a double-piston pump adapted for drilled wells, an outer case or shell having the upper cylinder depending therein and suspended below the platform by a discharge-pipe, said shell having separate openings for the piston-rod, discharge-pipe, and supporting-rods, the discharge-pipe, piston-rod, and supporting-rods being substantially parallel with each other below the bottom line of the platform, the discharge-pipe communicating with the discharge-spout above the said platform line through a passage leading outwardly from said piston-rod, substantially as shown and described.



398,221. CHAIN ATTACHMENT FOR SASH-BALANCES. REINHARD A. BEIHL, Bridgeport, Conn., assignor to the Bridgeport Chain Company. Filed Feb. 25, 1888. Serial No. 265,267. (No model.)

Claim.—1. The combination, with a sash-chain, of a cup or thimble having an opening at the back, through which the loop of the last link passes, and a slot at the top, which receives the loop of the second link, and a pin passed between the loop of the last link and the back of the cup or thimble, whereby the chain end is held without lost motion.

2. An approximately oval loop for connecting sash weights and chains, formed from a single piece of wire and having at its upper or narrower end two hooks lying side by side and parallel to each other, either of which will pass through the usual opening in the weight, the ends of said hooks being curved inward past each other, so that an eye, 17, is formed, which incloses the chain in use and prevents jumping of the weight.

398,222. RAILWAY-CAR. JOHN A. BELL, Philadelphia, Pa. Filed Sept. 20, 1887. Serial No. 250,210. (No model.)

Claim.—1. A car having openings in one of its ends, doors or covers for said openings, and roller-guides C, having bearings in the floor of the car, in combination with movable platforms or planks D, having rails *d* on their under sides, substantially as set forth.

2. A car having openings in one of its ends, doors or covers for said openings, dasher B, having hinged sections *b* in line with said car-end openings, and roller-guides C, having bearings in the floor of the car, in combination with movable platforms or planks D, having rails *d* on their under sides, substantially as set forth.

3. A car having longitudinally-arranged seats, end dashers, openings in one of the car-body ends and in the dasher adjacent thereto in line with the spaces below said seats, doors or covers for said openings in the car end, and dasher for effecting the transfer of storage-batteries to and from the car, substantially as set forth.

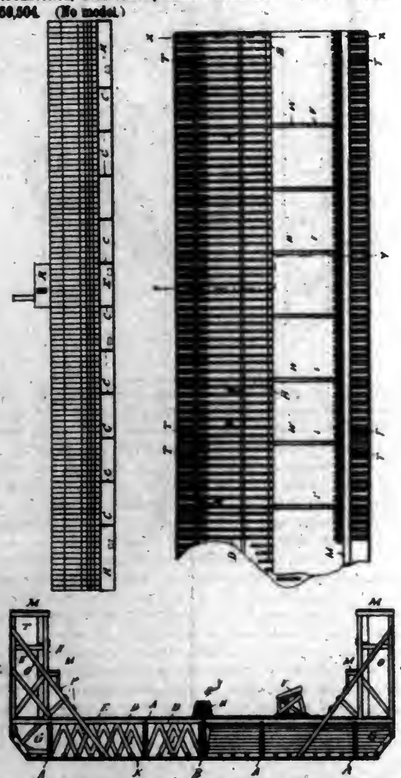
4. A car having longitudinally-arranged seats, end dashers, openings in one of the car-body ends and in the dasher adjacent thereto in line with the spaces below the seats, and doors or covers for the openings in said car-body end and dasher, in combination with movable platforms or planks D in said spaces and guide rails and rollers between said planks D and the floor of the car, substantially as set forth.

5. A car having longitudinally-arranged seats, end dashers, openings in one of the car-body ends and in the dasher adjacent thereto in line with the spaces below the seats, and doors or covers for the openings in said car-body end and dasher, in combination with a removable platform or plank, D, substantially as set forth.

6. A car having end platforms, dashers thereon, longitudinally-arranged seats, with spaces between the seats and the car-floor, and openings in one end of the car and in one of the dashers in line with said seat-spaces for effecting transfer of storage-batteries to and from said seat-spaces across the end platforms, substantially as set forth.

7. A car having openings in one of its ends, removable doors or covers therefor, and removable or hinged dasher-sections in line with said doors, substantially as set forth.

8. A car having longitudinally-arranged seats, end dashers, guideways on the floor below said seats, and openings in one end of the car and in one of the dashers in line with the space below the seats, in combination with movable planks or platforms D, adapted to said guideways, substantially as set forth.

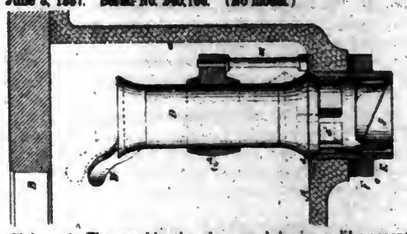


9. The combination, in a car having seats and spaces beneath the seats, of the fixed binding-post sections *f'* at one end of said spaces, openings at the opposite ends of said spaces, and removable covers or doors for said openings, with traveling planks or storage-battery trucks having at one end binding-post sections *f*, for engagement with and disengagement from said sections *f'* when the trucks are inserted into and withdrawn from said seat-spaces, substantially as set forth.

10. The combination, with a car having openings in one of its ends and track-rails for said car, of narrow-gage track-rails bridging the car-track rails and a transferring-truck having on it guideways and at one end a movable or adjustable guide-plank or platform, substantially as set forth.

11. The combination, with a car having openings in one of its ends and track-rails therefor, of narrow-gage track-rails with turn-outs bridging the car-track rails and a transferring-truck having an adjustable or movable guide-plank, substantially as set forth.

12. In combination with a car having end openings, *a'*, dasher doors or sections *b*, and coupling-sections *f'*, located at one end of the car below its seats, movable planks or platforms C, supporting storage-battery sections having at one end coupling-sections *f*, for engagement with coupling-sections *f'*, substantially as set forth.



398,223. FLOATING DRY-DOCK. CHARLES BROWN and THOMAS RIDDLECOMBE, Port Huron, Mich. Filed Dec. 31, 1887. Serial No. 258,504. (No model.)

Claim.—1. The combination, in a floating dock, of the inclosed buoyant caisson or vessel of substantially rectangular shape, the series of transverse and the series of longitudinal solid timber division-walls dividing the hold into compartments, of outside and inside openings to admit the water into the compartments of the hold, valves controlling the outside openings, valves controlling the inside openings into the side and end or trimming compartments, the scaffolds on the deck of the caisson, the inclined anchoring-brace O, the longitudinal stringers P, secured to said brace, the vent-shafts extending through such scaffolds, and the pump apparatus housed on top of such scaffolds, all arranged substantially as described.

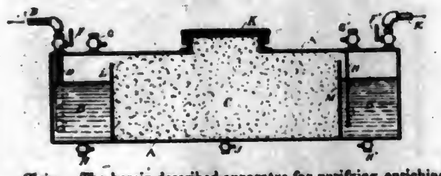
2. The combination, in a floating dock, of the buoyant caisson or vessel of substantially rectangular form, the series of longitudinal and transverse solid timber walls dividing the hold into compartments, the intermediate transverse trusses, the openings at the bottom of the outside and inside walls to admit the water into the different compartments, the valves for controlling such openings, the side and end compartments, the keel-block in the center of the deck, the lateral brace-shores movably supported upon lateral guides, the scaffolds extending along the sides of the deck and supporting the platforms, the anchoring-braces of the scaffolds, and the air or vent shafts extending through the scaffolds, all substantially as described.

398,224. COMBINED WASTE AND OVERFLOW TUBE FOR SANITARY STRUCTURES. GEORGE F. BROWN, Philadelphia, Pa. Filed June 3, 1887. Serial No. 240,166. (No model.)

Claim.—1. The combination, in a wash-basin or like receptacle having a top slab overhanging said basin, of a combined waste and overflow tube, D, with an operating-cam for the tube, said cam being below the top of the tube, all substantially as set forth.

2. The combination, in a wash-basin or like receptacle, of the overhanging top slab, the waste and overflow tube, and valve with a cam below the top of the overflow-tube to raise the tube as it is turned, all substantially as specified.

3. The combination, in a wash-basin or like receptacle, of the combined waste and overflow tube with a waste-pipe provided with a cam on which the tube rises when it is turned, substantially as set forth.



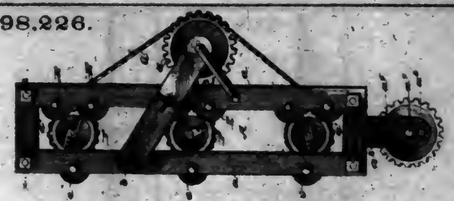
4. The combination, in a wash-basin or like receptacle, of the combined waste and overflow tube and a raising-cam below the top of the same with a jointed rod squared at its lower end to fit into a squared opening in the tube and extending above the level of the slab, and provided with a suitable handle, whereby on turning said handle the tube will turn with and slide on the jointed rod, substantially as described.

5. The combination of a waste and overflow tube having legs, a guide for said tube, and an outlet-tube provided with cams forming bearings for said legs, whereby the tube is raised when it is turned, as and for the purpose set forth.

6. The combination of a waste and overflow tube having legs, a waste-pipe provided with cams forming bearings for said legs, and a removable guide for the tube, substantially as set forth.

7. The combination of the waste and overflow pipe and an operating-cam below the top of the pipe upon which said pipe is supported, but from which it is removable, all substantially as specified.

398,225. CARBURETOR. RICHARD A. BURT and ROBERT M. BIDELMAN, Adrian, Mich. Filed Apr. 15, 1887. Serial No. 234,980. (No model.)

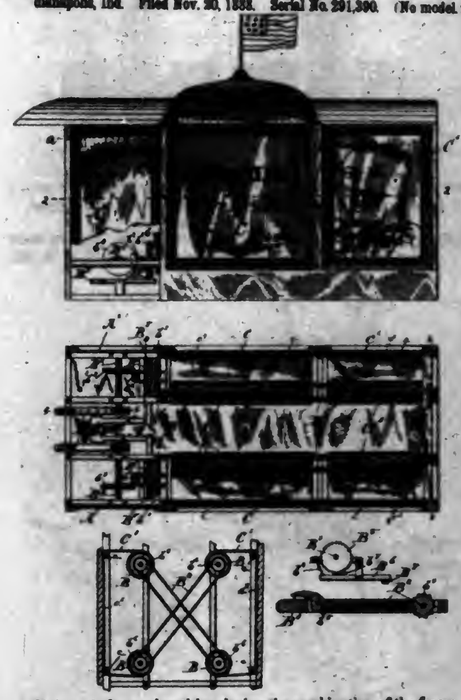


Claim.—The herein-described apparatus for purifying, enriching, and controlling the pressure of natural gas and other aeriform fluids, consisting of a rectangular box, A, having compartments B, B', and C, each provided with means for ingress and egress, the parts B B' being filled with an alkaline solution, and the part C filled with a densely-packed absorbent material impregnated with liquid hydrocarbon, two partition-walls dividing the box at one end, one wall rising from the bottom to near the top and the other extending from the top to near the bottom, with a space between them, and a single wall rising from the bottom to near the top dividing it at the other end, as and for the purpose set forth.

398,226. FENCE-MACHINE. HENRY G. CADY, Pine Bluff, Ark. Filed Sept. 8, 1888. Serial No. 284,898. (No model.)

Claim.—1. As an improvement in fence-machines, the series of twisting-heads having opposite slits and the plates pivotally secured to said twisting-heads and having a series of oppositely-projecting short arms, substantially as shown and described.

2. As an improvement in fence-machines, the frame having the small grooved rollers secured thereto, the twisting-heads resting in



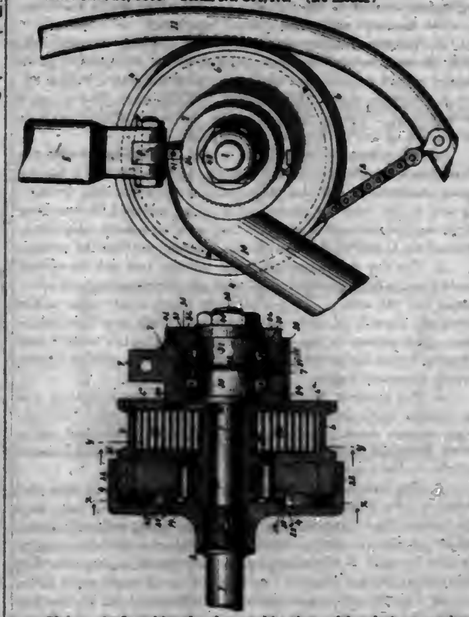
398,226.

the grooves of said rollers and between the latter, the operating chain or belt passed around said twisting-heads and rollers, and the means for operating said chain or belt to which the same is secured, substantially as set forth.

3. The combination, with the frame having the rollers arranged in pairs and the centrally-disposed opposite rollers, of the operating-wheel, the adjustable arms therefor, the series of twisting-heads located between said rollers, and the chain or belt, passed around said twisting-heads and operating-wheel, substantially as shown and described

398,227. ADVERTISING DEVICE. WILLIAM L. CALDWELL, Indianapolis, Ind. Filed Nov. 20, 1888. Serial No. 291,390. (No model.)

Claim.—1. In an advertising device, the combination of the frame-work, four reels or rollers arranged two at the top and two at the bottom of said frame-work, each top roller being geared to the opposite bottom roller, suitable mechanism for operating the same, and display-curtains mounted on said reels or rollers, substantially as set forth.



2. The combination, in an advertising device, of the frame-work, the bulletin-boards A', mounted thereon, the four reels arranged therein, two at the top and two at the bottom of said frame-work, the gearing for operating said reels, and separate display-curtains attached to the reels on each side of the device, substantially as set forth.

3. The combination, in an advertising device, of the frame-work A, the reels B, arranged two at the top and two at the bottom of said frame-work, and geared together, each top to the opposite bottom reel, the display-curtain C, mounted thereon and bearing a series of advertisements, the display-curtain C', also mounted thereon and bearing a series of pictures calculated to attract attention to the advertisements on the curtain C, and the operating mechanism, substantially as set forth.

4. In an advertising device, the combination of the frame A, the reels B, arranged therein substantially as described, the curtains C and C', mounted upon said reels and passing over the idler-rolls *c*, mounted close to the sides of said frame-work, and the gearing for operating said reels, consisting of the levers B^6, having the cam-pawls arranged to engage with the ratchet-wheels b^4, the pinion upon the end of the journal to said reels, the intermediate gearing and the ratchet-wheel B^5, and pawl engaging therewith, substantially as shown and described.

5. The combination, in an advertising device, of the frame-work provided with open sides, as described, the bulletin-boards arranged in the front openings, the four reels B, journaled inside said frame-work, and geared together, the top roll on each side to the bottom roll on the opposite side, the curtains C and C', carrying a series of advertisements and pictures mounted on reels and arranged to fill the middle and rear open spaces on the sides of said frame-work, and passing over the idler-rolls *c*, and the back C, mounted behind said curtains to steady them in position, substantially as set forth.

398,228. BICYCLE. LARUS F. CARPENTER, Bridgeport, Conn. Filed Nov. 21, 1888. Serial No. 291,473. (No model.)

Claim.—1. In a bicycle, the combination, with a hub, a ratchet within the hub, and a spring-controlled drum having an extension within the hub to which the pawls are pivoted, of a ball-case and fulcrum outside of the drum, and a fork attached to the ball-case, so that the bearings are placed at the greatest possible distance apart and the weight is placed directly upon the bearings.

2. In a bicycle, a rotating axle, hub, and ratchet, a drum turning on the axle, and a ball-case placed outside of the hub and drum, and having a fulcrum made integral therewith and a fork attached thereto.

3. The combination, with the hub and drum, of the ball-case placed outside of both and a fulcrum and fork connected to the ball-case, as and for the purpose set forth.

4. A ball-case having incline 34 and ring 36, threaded to engage the interior of the ball-case, and having an incline, 37, in combination with the axle having reversed cones and a duplicate series of balls connected by cross-bars which engage said cones and inclines.

5. The combination, with the ball-case having incline 34 and ring 36, threaded to engage the ball-case, and having incline 37, of the axle threaded at its outer end and having a shoulder, 33, a cone, 30, resting against said shoulder and having an outward incline, a cone, 31, engaging the screw-thread and having an inward incline, and pairs of balls connected by cross-bars engaging said inclines and cones.

6. The ball-case having incline 34, ring 36, threaded to engage the ball-case, and having incline 37, in combination with the cones having reversed inclines, as shown, balls connected by cross-bars engaging said inclines and cones, and means, as a check-nut, engaging the axle, and a key engaging the ring, whereby the parts are secured in place after adjustment.

7. The axle having a shoulder, 33, and a screw-thread, 32, the ball-case having an incline, 34, and the fork secured to the ball-case, in combination with ring 36, having incline 37, inner and outer cones having reversed inclines, the inner cone engaging shoulder 33, and a

duplicate series of balls connected by cross-bars and engaging the inclines and the cones.

8. The ball-case and ring 36, having inclines, as shown, the ring being threaded to engage the ball-case, in combination with the axle having a screw-thread, inner and outer cones engaging the axle, a duplicate series of balls connected by cross-bars which engage the inclines and cones, said ring having notches, as shown, which are engaged by a key, 41, to lock it in position, and a check-nut engaging the outer cone to lock that in position.

9. The axle and the inner and outer cones, the latter being adjustable, the ball-case having an incline, and the adjustable ring engaging the ball-case, and also having an incline, in combination with a duplicate series of balls connected by cross-bars, the bearing being adjusted by turning the outer cone and ring inward, as described.

10. In a bicycle, the combination, with a rotating axle and hub, and ratchet and pawls within the hub, of a drum having lugs 18 on its inner periphery, spring 16, engaging either of said lugs, and an angle-plate secured to the ball-case and extending within the drum, to which the inner end of the spring is connected.

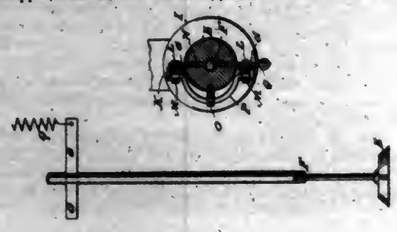
11. The drum having extension 13 and a spring, 16, within the drum, in combination with the rotating axle, hub, and ratchet, pawls pivoted to said extension and engaging the ratchet, and a friction device to which the pawls are connected, whereby when the backward movement of the drum commences the pawls are disengaged from the ratchet, as and for the purpose set forth.

12. The rotating axle, hub, and ratchet, in combination with the drum, pawls pivoted thereto and engaging the ratchet, and a friction device consisting of a holder, 25, pivoted to the drum, links connecting said holder with the pawls, and a spring-actuated friction-piece which engages the ratchet when the backward movement takes place, whereby the holder is tilted and the pawls disengaged from the ratchet.

13. The hub rigidly secured to the rotating axle and the ratchet secured to the hub, in combination with the drum and extension 13, turning on the axle, a spring within the drum, whose outer end is connected thereto, its inner end being connected to a fixed angle-plate, pawls pivoted to the extension and engaging the ratchet, and a friction device within the hub, which disengages the pawls when the reverse movement begins.

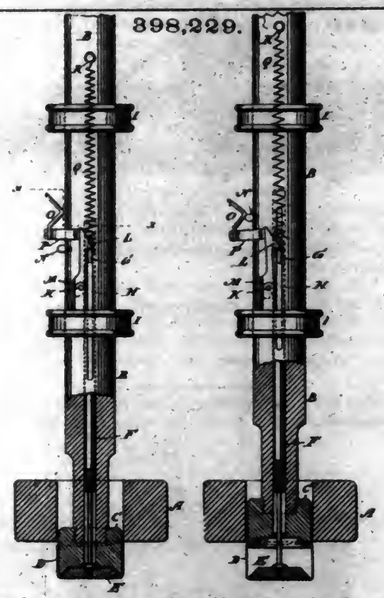
14. The ball-case having angle-plate 19, connected thereto and the fulcrum made integral therewith, in combination with the hub, drum, ratchet, pawls, and friction device acting as described, and a spring within the drum, whose outer end is adjustably connected thereto, its inner end being connected to the angle-plate.

15. The ball-case and fulcrum made integral and the fork connected to the ball-case, in combination with the rotating axle, hub, and ratchet, the drum turning on the axle, the spring within the drum, and the pawls and friction devices, arranged as described, whereby the entire weight is supported by the bearings which are placed at the greatest possible distance apart, as and for the purpose set forth.



16. The drum having extension 13 and flange 14 and the hub and ratchet, in combination with the pawls pivoted between said flange and the drum and a friction device carried by a holder pivoted to the drum, and links connecting said holder with the pawls, as and for the purpose set forth.

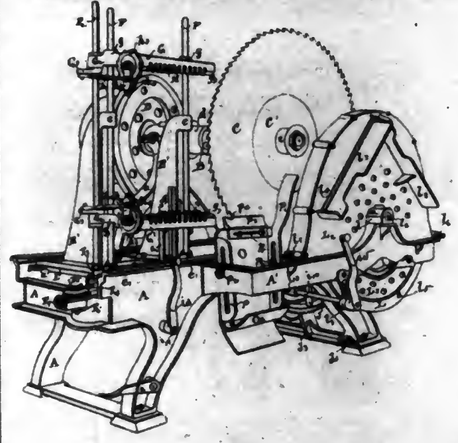
398,229. DRAWING-PRESS. MATTHEW C. CHAMBERS, Brooklyn, N. Y. Filed Nov. 17, 1888. Serial No. 291,121. (No model.)

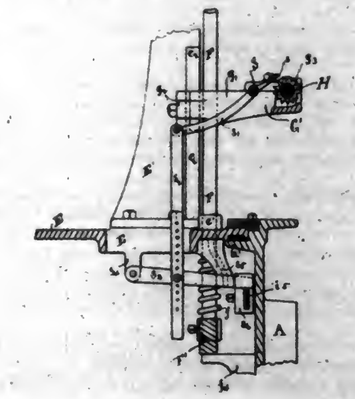


Claim.—1. The combination, with the presser and a die, of an internal stripper having a guided stem, mechanism, substantially as described, for holding the stripper and stem while the presser recedes from the die and automatically releasing the stripper and stem during such receding movement, and a retractor-spring connected with the presser and stem for retracting the stripper toward the presser when released by the holding mechanism.

2. The combination, with a hollow presser, of a stripper adapted to slide in said presser, a pin-and-slot connection between the presser and the stripper, a detent, L, for said stripper, a release, N, for said detent, and a retractor, Q, for the stripper, substantially as described.

3. The combination, with a hollow presser, of a stripper adapted to slide in said presser, a pin-and-slot connection between the presser and stripper, a detent, L, for said stripper, a release, N, for said detent,

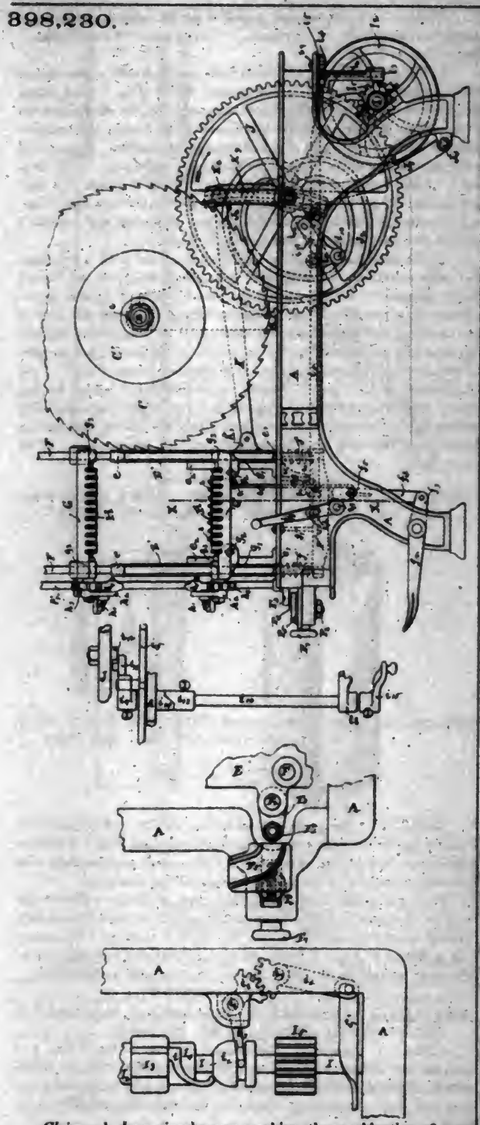




398,229.

and a retracting-spring connected to said stripper and to the presser for drawing the stripper to the presser, substantially as described.

398,230. MACHINE FOR SAWING SHINGLES. DENISON CRASE, Orange, and WILLIAM L. CRASE, Worcester, Mass. Filed Aug. 29, 1885. Serial No. 175,628. (No model.)

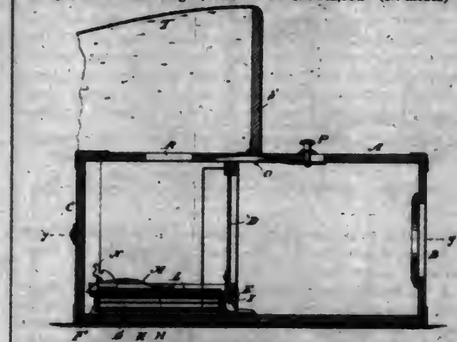


Claim.—1. In a circular-saw machine, the combination of a reciprocating carriage, the cam J^3, constructed substantially as described, the oscillating lever J^2, having in its upper arm a slot, K^3, which is curved so as to lie in a circle, the center of which is at or near the pivot connecting the pitman to the carriage, and the rod or pitman K, pivoted at one end to the carriage and having the other end adjustable in the curved slot K^4, substantially as and for the purpose described.

2. In a circular-saw machine, the combination of the driving gear-wheel J, with the shaft I, a driving-pulley free to revolve on said shaft, a friction-clutch coupling, 13, a tooth-pinion, 15, fast on the shaft I, said gear-wheel J being provided with a cam, J^3, constructed substantially as described, and connected to the reciprocating carriage by means of rod or pitman K, and the oscillating lever J^2, having in its upper arm a slot, K^3, which is curved, so as to lie in a circle, the center of which is at or near the pivot connecting the pitman to the carriage, all substantially as described.

3. In a circular-saw machine, the combination, with the reciprocating carriage and its driving-gear, of the shipper-shaft i^{10}, and the arm i^9, having complementary spiral lugs i^{12} i^{13}, the arm i^9, having a slot which engages a lug upon the shipper-rod i^3, the arm i^9 being also provided with the arm i^{11}, carrying a lug adapted to be tripped by a lug, i^{15}, upon the driving gear-wheel, all so arranged that the inward motion of the shaft i^{10} operates by means of the lugs i^{12} i^{13} to

398,230.



throw the lug upon the arm i^{11} in the path of the moving lug i^{15}, for the purpose of throwing the shipper-rod i^3 and stopping the carriage, substantially as described.

4. In a circular-saw machine, a shaft, S, having the fingers *s* so arranged as to be automatically depressed by the presence of a block between the set-rolls, in combination with the arm S^7, link S^8, arm S^9, and the sliding shipper-rod i^3, carrying the lug S^{10}, all so arranged that as soon as the pressure is removed from the fingers the arm S^9 is allowed to fall in the path of the lug S^{10}, upon the return-stroke of the carriage, thereby throwing the shipper-rod i^3, and stopping the carriage, substantially as described.

5. In a circular-saw machine, the set-rolls provided with ratchet-wheels A^3, secured to the hubs of the rolls, the pawls A^4, operating the ratchets by means of the splined shaft F^9, feathered sleeves G^3, and their connections, in combination with the adjustable curved set-plate F^8, all so arranged as to set the rolls upon the forward stroke of the carriage, substantially as described.

6. In a circular-saw machine, the vertically-adjustable shingle-box consisting of the slotted side flanges, *p p'*, bolts p^3, the plate O, and the removable bottom O^2, in combination with the adjustable slide p^2, arranged to guide the shingles into the box and separate them from the dust, substantially as described.

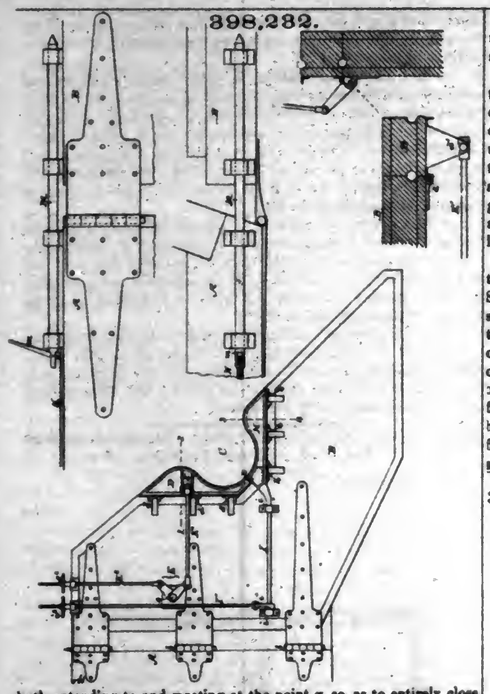
398,231. PHOTOGRAPHIC CAMERA. LOUIS CHEVALLIER, Brooklyn, N. Y. Filed Aug. 9, 1888. Serial No. 282,304. (No model.)

Claim.—1. The combination, with the case of a photographic camera, of a rotating frame, E, located therein and provided with a handle outside the case for rotating the frame from the exterior, and a plate-holder, F, and a sight-plate, D, both rigid on the rotating frame and arranged substantially at right angles to each other, so that by rotating the frame in one direction the sight-plate swings into the field to focus the object and the plate-holder swings out of the field, and by rotating the frame in the opposite direction the sight-plate swings out of the field and the plate-holder into the field, substantially as described.

2. The combination, with the case of a photographic camera, of a swinging sensitized-plate holder, F, having a cover, L, hinged thereto and provided with a spring which normally holds the cover closed over a plate, and a lug or catch in the camera-case which acts on the cover and automatically opens it when the plate-holder is swung into the field, substantially as described.

3. The combination, with the case of a photographic camera, of a pivoted swinging sensitized-plate holder having a cover normally held closed over the plate, and a device inside the camera-frame which acts on the cover and automatically opens it when the holder is swung in the arc of a circle into the field, substantially as described.

4. The combination, with a camera-case, of the pivoted swinging sensitized-plate holder F, the cover L, hinged to said holder and having the projecting lug N, the spring M, acting to press the cover closed on the holder, and the catch O on the camera-case, arranged to strike the lug of the cover and open the latter when the holder is swung into the field, substantially as described.



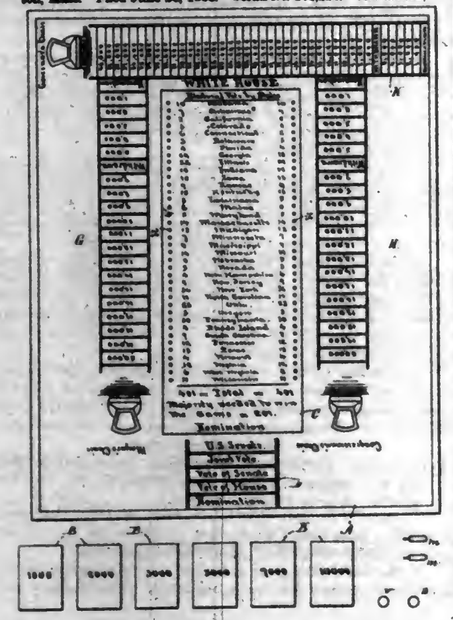
5. A camera having a swinging sight-plate, D, a sight-opening, R, in its top wall between its rear end and the sight-plate, a hinged shield, S, adapted to stand upright, and the hood T, secured to the shield over the sight-opening, substantially as shown and described.

398,232. COFFER-DAM FOR VESSELS. GEORGE CLARKE, Jersey City, N. J., assignor to Horace G. Phillips, Wilmington, Del. Filed Dec. 14, 1888. Serial No. 293,562. (No model.)

Claim.—1. The combination of the main gates of a coffer-dam, of auxiliary gates hinged thereto, and mechanism for moving said gates into and out of position, substantially as described.

2. The combination of the main gates of a coffer-dam, of the vertical hinged auxiliary gate, and a longitudinal hinged auxiliary gate,

398,232.

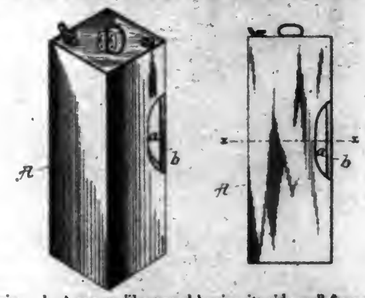


both extending to and meeting at the point *x*, so as to entirely close the irregular opening for the screw-shaft projections of the vessel, substantially as described.

3. The combination of the main gate, an auxiliary gate hinged thereto, the two-armed lever, one arm connected to said gate and the other arm connected to a vertically-movable screw-shaft, and a handled nut for said shaft, on turning which the gate will be opened or closed substantially as described.

4. The combination, with the coffer-dam, of the hinged main gate, a bolt on one and adapted to pass into keepers in the other, a lever on said bolt, and a rack with which the lever engages, substantially as and for the purpose described.

398,233. GAME. JEANIE P. CLARKE and JAMES W. CLARKE, Boston, Mass. Filed June 26, 1888. Serial No. 278,227. (No model.)



Claim.—1. A game-board provided with a number of divisions marked, respectively, "U. S. Senate," "Joint Vote," "Vote of Senate," and "Vote of House."

2. The game-board herein described, provided with a presidential table containing the names of the several States of the United States disposed in a vertical column, figures representing the electoral votes of the States disposed opposite the names of the States, and two columns of scoring-points also disposed opposite said names; a senatorial table having a number of divisions marked, respectively, "U. S. Senate," "Joint Vote," "Vote of Senate," and "Vote of House;" a congressional ladder having figures representing votes between each rung; a gubernatorial table having figures between each rung, and a mayor's ladder, also having figures between each rung.

3. The game-board herein described, provided with a presidential table containing the names of the several States of the United States disposed in a vertical column, two columns of figures representing the electoral votes of the States disposed on opposite sides of the names of the States, and two columns of scoring-points disposed opposite said columns of figures; a senatorial table having a number of divisions marked, respectively, "U. S. Senate," "Joint Vote," "Vote of Senate," and "Vote of House;" a congressional ladder having figures representing votes between each rung; a gubernatorial table having figures between each rung, and a mayor's ladder, also having figures between each rung, in combination with scorers and a set of game-cards.

398,234. CAN OR SIMILAR VESSEL. JAMES K. CLEARY, Washington, D. C. Filed Dec. 1, 1888. Serial No. 292,370. (Model.)

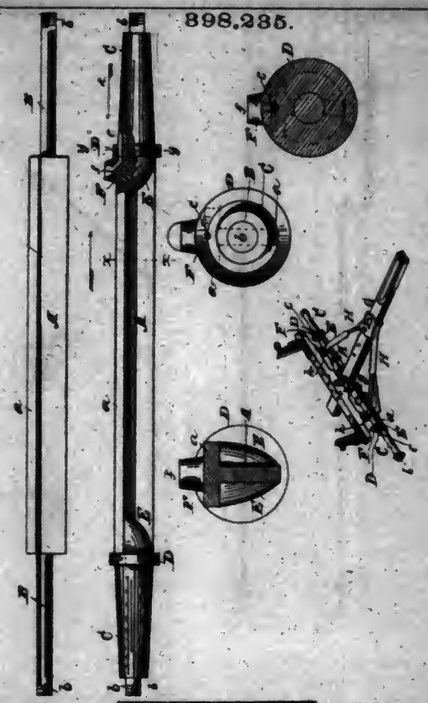
Claim.—1. A can or like vessel having its side wall formed with a cavity for the reception of the hand and provided with a handle or grip located before such cavity and in a plane flush or coincident with the sides or surface of the vessel, substantially as described.

2. A can or like vessel having a portion of its side walls cut out to form an opening, and having a handle or grip located before such opening in a plane coincident with the sides or surface of the vessel, and a dished or curved piece set into the opening and soldered or otherwise secured to the edges thereof, substantially as described.

398,235. VEHICLE-AXLE. AMASA CORBIN, Jr., Gouverneur, N. Y. Filed Nov. 15, 1888. Serial No. 290,900. (No model.)

Claim.—1. A wagon-axle formed of a wrought-metal T-bar, A *a*, with the flat web *a* uppermost, and provided with cast-metal skeins, each having forked re-enforcements E E on opposite sides of the vertical web and immediately below the flat web, substantially as set forth.

2. A wagon-axle formed of a wrought-metal bar, in combination with a cast-metal skein, and re-enforcements integral with the skein projecting inward therefrom and welded to the steel bar, substantially as set forth.



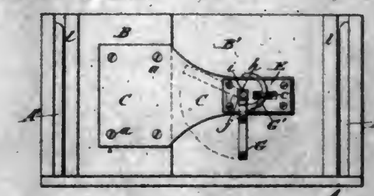
3. A wagon-axle having a wrought-metal core projecting at both ends of the skein, in combination with a cast-metal skein provided with re-enforcements projecting from the inner end of the skein and welded to the wrought-metal bar, substantially as set forth.

4. A wagon-axle formed of a wrought-metal bar having a vertical web, in combination with a cast-metal skein provided with forked re-enforcements welded to opposite sides of the vertical web, substantially as set forth.

5. A wagon-axle having a wrought-metal core and a shoulder, D, and provided with an oil-cup of cast metal welded to the upper surface of the wrought-metal core inside of the shoulder, and having also an oil-duct extending from the oil-cup through the shoulder to the skein, substantially as set forth.

6. A wagon-axle provided with a metal skein cast thereon and having at its inner end a shoulder to receive the wheel-hub, a metal oil-cup on the upper surface of the bar inside of the skein, and an oil-duct extending from the oil-cup to a point between the shoulder and the outer end of the skein, substantially as set forth.

398,235.



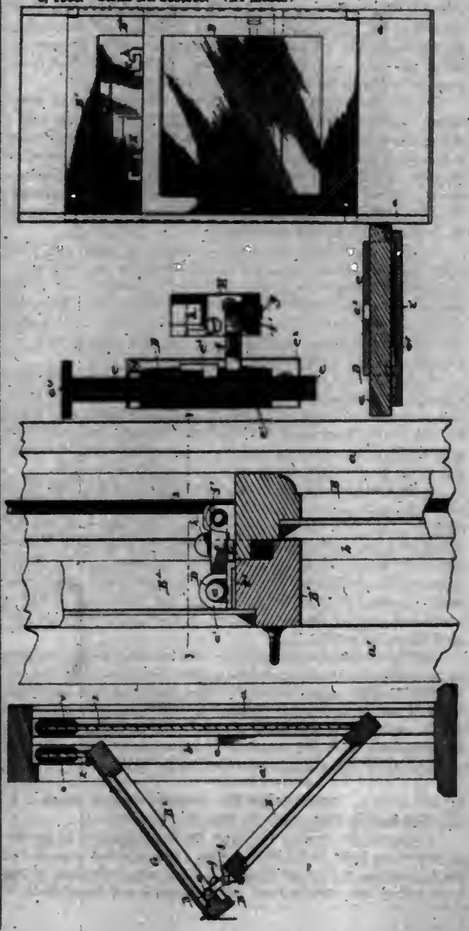
398,236. EGG-TESTER. NICHOLAS COUNT, Will's Creek, Ohio. Filed Aug. 6, 1888. Serial No. 282,067. (No model.)

Claim.—In an egg-tester, the combination, with the stationary bottom provided with set-screws passing through the openings in the same, of the adjustable bottom carrying a mirror mounted within the casing and engaging the said screws, whereby the said bottom may be moved to any desired angle, substantially as described.

398,237. END-GATE. WILLIAM H. CREED, Manilla, Ind., assignor of one-half to John T. Jones, same place. Filed Oct. 27, 1888. Serial No. 289,260. (No model.)

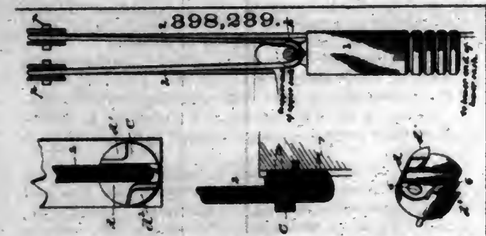
Claim.—1. In an end-gate, the combination of the tail-board consisting of hinged sections, the plate secured to one of said sections and overlapping the other, said overlapping end being slotted, a bolt on said other section entering said slot, and a catch on the plate adapted to engage said bolt for the purpose of securing this end of the plate to the tail-board, substantially as described.

2. In an end-gate, the combination, with the tail-board composed of two sections hinged together, of a plate suitably secured at one end to one of the hinged portions and provided at its other end with a wearing-plate and latch, said wearing-plate being provided with a slot coincident with a slot in the large plate, said slot adapted to receive the projecting end of the bolt on the end-gate, the whole being firmly secured together by means of the extension on the latch, which enters the eye of the receiving-bolt, substantially as described.



3. The combination of the sectional tail-board, the plate secured to one section thereof and overlapping the other, a bolt on the other section projecting through a slot in the overlapping end of the plate, and a fastener on the plate, consisting of a pivoted arm having the curved extension adapted to engage the receiving-bolt, substantially as described.

4. The combination of the end-gate having the hinged sections B B', plate C, secured to the section B, the wearing-plate E, secured to the overlapping end of the plate, said wearing-plate E and overlapping plate being slotted, the fastener on the wearing-plate, consisting of the looped and pivoted arm G, having a curved extension, G', and the receiving-bolt on the section B', having eye *k*, substantially as described.



398,238. DRAWER-PULL. CHARLES I. DAYTON, Meriden, Conn. Filed Dec. 24, 1888. Serial No. 294,533. (No model.)

Claim.—The herein-described drawer-pull, consisting of the plate A, made from sheet metal, constructed with recesses *b* from the inside outward, producing corresponding projections *a* upon the outside, combined with socket-eyes having a shank projecting therefrom, the said eyes of a shape corresponding to the recesses in the plate and set into said recesses, the metal of the plate closed upon the said eyes as a means for securing the said eyes to the plate, and with a U-shaped handle having pivots on the ends of its legs extending through the opening in the said projections into the eyes, substantially as described.

398,239. WINDOW. BENJAMIN F. DEITZ and GEORGE R. ROTH, Reading, assignors to William W. Lesher, Mossville, Pa. Filed Aug. 8, 1888. Serial No. 282,213. (No model.)

398,239.

Claim.—1. The combination, with a window-frame, of sashes mounted therein to slide past each other, and a detachable hinge-connection secured to the meeting-rails of the sashes, substantially as set forth.

2. The combination, with a window-frame, of sashes mounted therein to slide past each other, a weighted cord attached to each sash, and a detachable hinge-connection between the meeting-rails of the sashes, substantially as set forth.

3. The combination, with a window-frame, of sashes mounted therein to have a swinging movement and also to slide past each other, and a detachable hinge connecting the meeting-rails of said sashes, and consisting of a locking-plate secured to the meeting-rail of one sash and a sliding lug mounted in bearings secured to the meeting-rail of the other sash and adapted to be interlocked with said locking-plate, substantially as set forth.

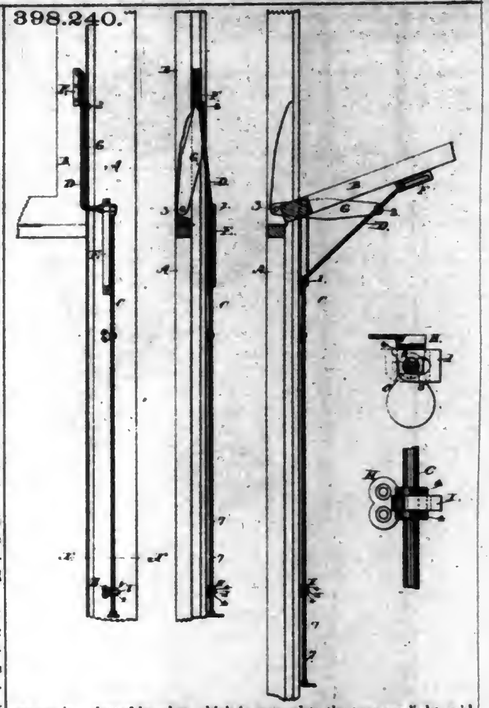
4. The combination, with a window-frame, of sashes mounted therein to have a sliding movement past each other, a detachable hinge-connection between the meeting-rails of said sashes, a cord attached at its ends to said sashes, and a weight supported by said cord at a point between its ends, substantially as set forth.

5. The combination, with a window-frame, of upper and lower sashes mounted therein to have a swinging movement and also to slide past each other, and a detachable hinge connected to the meeting-rails of the sashes, and consisting of a sliding bolt mounted on the meeting-rail of one sash, a locking-plate secured to the meeting-rail of the other sash, and a locking-lug carried by the bolt to engage the locking-plate, substantially as set forth.

6. The combination, with a window-frame, of upper and lower sashes mounted therein to have a swinging movement and also a sliding movement past each other, and a detachable hinge connected to the meeting-rails of the sashes, and consisting of bolts mounted on the meeting-rail of one sash and provided with locking-lugs, springs bearing against said bolts, and locking-plates secured to the meeting-rail of the other sash and adapted to be engaged by the locking-lugs on the bolts, substantially as set forth.

7. The combination, with a window-frame and upper and lower sashes mounted therein to have a sliding movement past each other, of detachable hinge-connections between the meeting-rails of the sashes, each hinge-connection consisting of a sliding lug, a spring for holding the lug against accidental displacement, and a locking-plate secured to the meeting-rail of the other sash and adapted to be engaged by the locking-lug, substantially as set forth.

8. In a window, the combination, with a frame, of an upper sash, a lower sash, weights flexibly connected to these sash to balance them, sash-cord clamps secured to the sash to produce pivotal centers therefor, and two duplicate sash-locks which are adapted to secure the sash from lateral and vertical movement, and also afford a hinged connection to the meeting-rails of the sash, substantially as set forth.

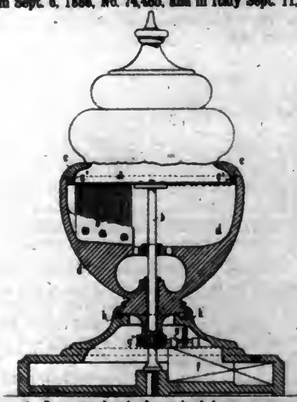


9. In a window, two duplicate sash-locks secured to the lower rail of the upper sash, having sliding bolts projecting beyond the side surfaces of the sash-frame, levers projecting from said bolts and furnished with locking-lugs, and two locking-plates attached to the top rail of the lower sash and provided with perforated ears for the reception of the locking-lugs of said levers, thus affording a hinged connection to the meeting edges of the upper and lower sash, as well as a means of securing the sash from vertical and lateral movement, substantially as set forth.

10. The combination, with a window-frame, sashes mounted therein to have sliding movement past each other, cord-clamps secured, respectively, to the upper side edges of the upper sash and lower side edges of the lower sash and forming trunnions on which the sashes can be swung outwardly, cords secured to said clamps, and weights attached to the cords, of a detachable hinge-connection secured to the meeting-rails of the sashes, substantially as set forth.

398,240. TRANSOM-LIFTER. GILBERT J. DICKSON, Albany, N. Y. Filed Sept. 18, 1888. Serial No. 285,729. (No model.)

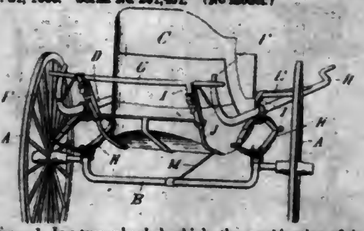
Claim.—1. In a transom-adjuster, the combination of an operating-rod whose upper end is fitted to slide on a guide that is secured to the door-casing, a joint-bar having its lower end articulated to the upper end of said operating-rod, and its opposite end being fitted to



398,240.

engage in a slotted bracket which is secured to the transom-light, said joint-bar being provided with a pivot-pin arranged intermediately between its ends, and a swinging arm having one end pivoted to a fixed point on the door-casing and the opposite end pivoted to the pivot-pin of said joint-bar, as and for the purpose herein specified.

2. In a transom-adjuster, the combination of an operating-rod having a series of notches formed therein, a bracket which guides said operating-rod and is provided with a locking-piece which moves in a direction transversely to the movement of said operating-rod, said locking-piece being provided with a slotted opening which has at one end an enlargement through which the body of said operating-rod can slide freely, and at the opposite end a lip which is fitted to engage in any one of said notches, as and for the purpose herein specified.

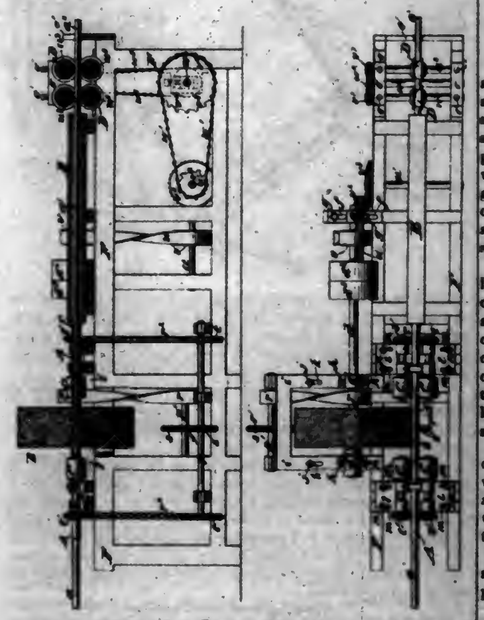


398,241. MUSICAL BOX. FRIEDRICH E. P. EHRLICH, Gohlis, near Leipsic, Saxony, and GUSTAV A. F. MÜLLER, Berlin, Germany, assignors to the Fabrik Leipziger Musikwerke, vormals Paul Ehrlich & Co., Gohlis, near Leipsic, Germany. Filed Jan. 17, 1887. Serial No. 224,629. (No model.) Patented in Germany June 16, 1885, No. 33,761; in France July 24, 1886, No. 180,196; in England July 28, 1886, No. 9,742; in Belgium Sept. 6, 1886, No. 74,465, and in Italy Sept. 11, 1886, XI, 376.

Claim.—1. In a mechanical musical instrument or musical box, the combination of a music-sheet having pins or projections, the comb of tuned tongues revolubly mounted in position, means for revolving said comb of tuned tongues, and the cover or lid having a circumferential-projecting rim resting upon said music-sheet, substantially as and for the purpose set forth.

2. In a mechanical musical instrument or musical box, the combination of a music-sheet having pins or projections with a cover or lid, *c*, having a circumferentially-projecting rim, *c'*, substantially as and for the purposes described.

398,242. ROAD-CART. SETH C. FELT, New Boston, Mich. Filed Nov. 21, 1888. Serial No. 291,481. (No model.)

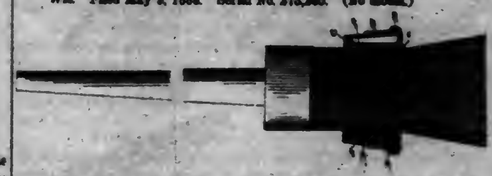


Claim.—1. In a two-wheeled vehicle, the combination of the shafts having front and rear cross-bars, the body suspended between springs connecting the shafts and axle, and direct draft connections to the axle substantially as described.

2. In a two-wheeled vehicle, the combination of the shafts having an upward and rearward extension and connected by front and rear cross-bars, a body suspended by thorough-braces upon said cross-bars; elliptical springs connecting the shaft and axle, a whiffletree suspended from the forward cross-bar, and a draft-bar connecting the whiffletree and the axle, substantially as described.

3. In a two-wheeled vehicle, the combination of the wheels connected by a crank-axle, springs clipped thereon at the straight end portions thereof at an angle to the line of draft, and shafts and a body supported upon said springs parallel therewith, substantially as and for the purpose described.

4. In a two-wheeled vehicle, the combination of the shafts D, having the upward and rearward extension F, the cross-bars E and G, the springs H, secured to the axle at an angle with the line of draft, the body C, the thorough-braces I, metallic straps J, whiffletree K, strap L, and draft-rod M, the parts being arranged to operate substantially as described.



398,243. MACHINE FOR FINISHING POLES OR RODS. HARRY FERGUSON, New York, N. Y. Filed July 11, 1888. Serial No. 279,650. (No model.)

Claim.—1. In a machine for finishing poles or rods, the combination, with a fixed holder guide-tube for the pole or rod, of a finishing-wheel on one side of said tube and driving-rolls for producing the rotary motion of said pole or rod, the said tube having lateral openings, through which the said finishing-wheel and driving-rolls may operate upon the pole or rod therein, substantially as described and set forth.

2. In a machine for finishing poles or rods, the combination, with the fixed holder guide-tube A, the finishing-wheel B, and the driving-rolls C, for producing the rotary motion of said pole or rod, of the grooved guiding feed-rollers distant the length of a rod or pole from the nearest driving-rollers, substantially as herein described, for the purpose of producing the feed of the pole or rod which is being turned by the pressure behind it of the following pole or rod, which is being pushed forward without turning, as herein set forth.

398,244. PAINT-BRUSH ATTACHMENT. JOHN B. PLANTZ, Sparta, Wis. Filed May 9, 1888. Serial No. 273,305. (No model.)

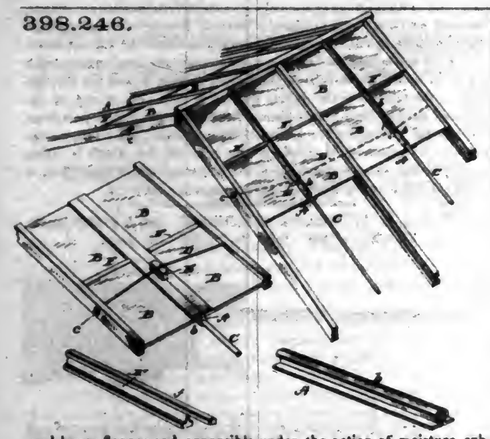
Claim.—1. The combination, with the combined drip-guard and bridle, of the flexible rim secured to the upper end of the outer wall and having its inner edge extending over the mouth of the guard, substantially as and for the purpose specified.

2. The hereinbefore-specified combined drip-guard and bridle, composed of the wall A, having parallel sides and an inner flange, *a*, the flaring wall B, united at its lower end to the wall A, and the flexible rim D, having its outer edge secured to the wall B, having the end of the wall bent over it, substantially as set forth.

398,245. VENDING-MACHINE. EDWARD S. FORD, Heaton, County of Middlesex, England, assignor to Oscar Uhlman, Bavaria, Germany. Filed Oct. 16, 1888. Serial No. 288,260. (No model.)

Claim.—1. In an automatic coin-freed or coin-actuated apparatus, a coin-slide comprising an inclined side against which the coin leans and a bottom ledge or flange upon which the edge of the coin runs, said inclined side having an opening of such height that a coin of smaller diameter than that of the prescribed coin will not be supported by the inclined side, but will fall into said opening, and of such width that its lower side shall form a shoulder beneath the center of gravity of the coin, over which shoulder the coin on falling into the opening shall rock, so that its lower edge will be thrust off the ledge and the coin will drop out on the side opposite to said opening, substantially as set forth.

2. In an automatic coin-freed or coin-actuated apparatus for delivering goods in exchange for coin, the combination, with a goods carrier or drum having radial goods-compartments around its periphery and caused to rotate to the extent of one compartment for each action of the apparatus, of a separator or divider which enters the goods-compartments as they successively reach or approach the delivery-outlet and separates the outermost article in the compartment from the other article or articles therein, whereby only one article is delivered from a compartment containing more than one article, substantially as set forth.



3. The combination, with the rotating drum *t*, having radial goods-compartments *v v*, formed with openings A A in their partitions, and with the fixed casing *w*, having an opening, *x*, of the stationary fingers *z*, arranged to enter the openings A in the sides of the compartments, whereby the latter are caused to clear or pass said fingers, substantially as set forth.

4. The combination of the plate B, having the fingers *z*, with the adjusting-screw C and distance-piece E, substantially as and for the purpose set forth.

398,246. METALLIC ROOFING. SAMUEL C. FREDERICK, Arcadia, Kans. Filed Sept. 22, 1888. Serial No. 286,671. (No model.)

Claim.—1. The roof comprising the series of roof-plates and the packing-bars placed between the edges of the same and having upper

398,246.

and lower flanges and expansible under the action of moisture, substantially as and for the purpose set forth.

2. The roof comprising the series of roof-plates and packing-bars placed between the edges of said plates and having upper and lower flanges, said packing-bars being expansible under the action of moisture and each having one end of its upper flange extending beyond its other portion, substantially as set forth.

398,247. PLANE. HENRY FRY, Eugene City, Oreg. Filed Sept. 13, 1888. Serial No. 285,311. (No model.)

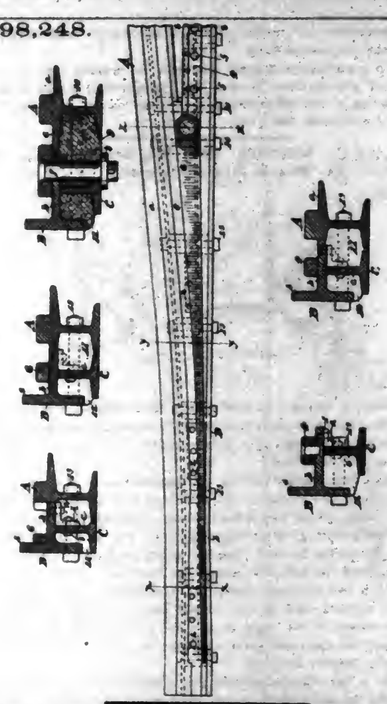
Claim.—1. In a plane, the combination, with a stock having a bit-well therein, of an elongated shoe hinged thereto and solid throughout with the exception of a slot therein for the passage of the bit therethrough, a screw-rod for adjusting said shoe, and a casting composed of a horizontal member secured to the bottom of the stock adjacent to the bit-well, and a front integral member arranged at an angle to said horizontal member, and against which the bit has bearing at its lower end, substantially as described.

2. A plane comprising a stock with a bit-well, an elongated shoe hinged to the rear end of the stock and having a flanged set-nut secured therein near the front end, a revoluble screw-rod in the stock engaging the set-nut, and a casting, F, having a horizontal member *f*, secured to the bottom of the stock, and integral oblique member *f'* bearing against the lower end of the bit, substantially as described.

398,248. STREET-RAILWAY SWITCH. NATHANIEL O. GOLDSMITH, Cincinnati, Ohio, assignor to the Weir Frog Company, same place. Filed May 24, 1888. Serial No. 274,921. (No model.)

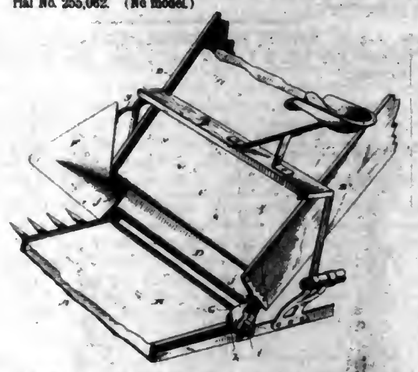
Claim.—1. A side guard-rail for a switch, composed of the irons B C, bolted together and to the girder-rail A, substantially as herein set forth.

2. In combination with the girder-rail A and switch-rail formed of the T-irons B C, the filling-blocks 11 12, and the through-bolts 13, for securing the said parts together, substantially as herein specified.



3. The combination, with the girder-rail A, of the switch-rail B C, built-up head 4, and the angle-arm 1, for joining the said parts together, substantially as specified.

4. In a switch-point, the guide-rail composed of the T-irons B and C, having their webs placed at right angles to each other, and the flange forming the guard-rail, and the flange *b*, forming the base for the built-up rail 4, substantially as herein specified.



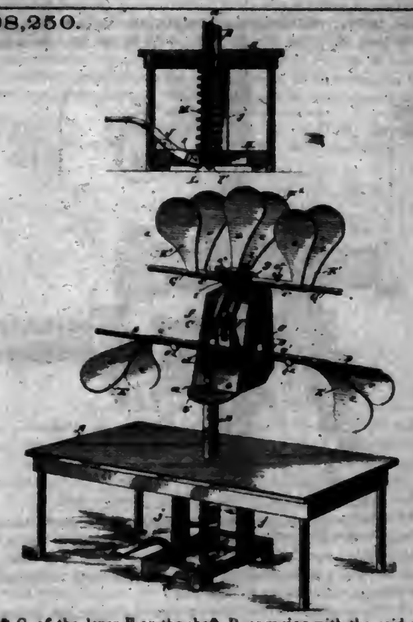
5. In a switch, the guard-rail composed of the T-irons B and C, secured together by means of the angle-iron 1, bolted to webs, filling-block 12, and the flange *s*, forming a guard for the tongue-rail 6, substantially as herein specified.

6. A switch-rail composed, substantially, of the T-irons B and C, placed at right angles to each other, the web of the iron B resting upon the web of the T-iron C, and secured together by angle-plates 1 and rivets and bolts and united to said girder-rails by filling-blocks and bolts, substantially as herein specified.

398,248.

398,249. HARVESTER. JAMES A. GRAHAM, CHARLES MARTINCOURT, and HENRY F. CRANDALL, Milwaukee, Wis., assignors to the Milwaukee Harvester Company, same place. Filed Nov. 14, 1887. Serial No. 255,062. (No model.)

Claim.—1. The combination of the front side timber of the elevator-frame of a harvester having the upper portion of its lower end above the plane of the grain-platform, and provided with a concavity in its grainward edge, with a guard formed at an angle to said side timber and fitting into said concavity at its rear end.

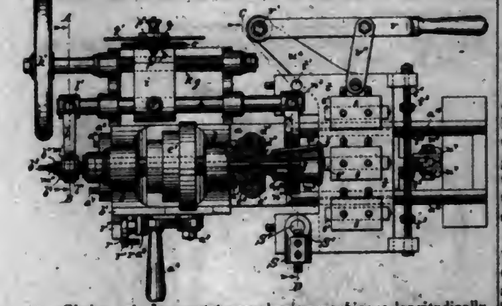


2. The combination, in a harvester, of the rear side timber of the elevator-frame and the rear sill of the grain-platform, with a casting having a concavity in its grainward edge above the plane of the grain-platform and connecting the said parts.

3. The combination, in a harvester, of the rear side timber of the elevator-frame, the grain-platform having a grain-apron and a driving-shaft therefor carrying a sprocket-wheel at its rear end, and a casting having a concavity in the grainward edge above the plane of the grain-platform and connecting the said rear side timber with the rear sill of the said grain-platform and provided with a rearwardly-projecting flange partially encircling and forming a guard for the said sprocket-wheel.

398,250. DINING-TABLE FAN. DAVID J. GREGORY, Scranton, Pa. Filed July 12, 1888. Serial No. 279,822. (No model.)

Claim.—1. In a fly-fan, the combination, with the supports, the shafts D and G, each having fans, and the arm projecting from the



398,250.

shaft G, of the lever F on the shaft D, engaging with the said arm, the rod *a*, and the treadle, substantially as described.

2. The combination of the table, the tubular standard having the block *b* on its upper end, the shaft D, journaled in brackets on the block, the uprights C, the shaft G, journaled in brackets on the said uprights, fans on the said shafts, the arm I, the bell-crank lever F, the rod *a*, the treadle J, the frame K, connected with the table, and the spring M, substantially as specified.

398,251. WATCH-CASE-SHAPING MACHINE. HENRI L. HALBY, Waltham, Mass., assignor of one-half to John Stark, same place. Filed Nov. 24, 1888. Serial No. 291,728. (No model.)

Claim.—1. In a watch-case-shaping machine, a longitudinally-movable head-stock having a rotary spindle journaled therein and the cup-shaped expansive work-holder, as described, combined with the longitudinally-adjustable shaft *A*, the lever *n*, secured to said shaft, and the ring n^6, connected to said lever for the purpose of compressing said work-holder, substantially as specified.

2. In a watch-case-shaping machine, a longitudinally-movable head-stock having a rotary tubular spindle journaled therein and the cup-shaped expansive work-holder, as described, combined with the longitudinally-adjustable shaft *A*, the lever *l*, secured to said shaft, and the central spindle, *m*, adjustably connected to said lever and having secured to it within the expansive work-holder the block or expander m^3, substantially as specified.

3. In a watch-case-shaping machine, a longitudinally-movable head-stock having a spindle journaled therein and provided with the expansive work-holder, as described, combined with the longitudinally-adjustable shaft *A*, and connecting mechanism, substantially as described, for expanding or contracting said work-holder, the block *i*, secured to said shaft *A*, and the screw-shaft *k*, substantially in a manner and for the purpose as specified.

4. In a watch-case-shaping machine, a longitudinally-movable head-stock having a spindle journaled therein and provided with the expansive work-holder, as described, combined with the longitudinally-adjustable shaft *A*, and connecting mechanism for clamping the work, and the indicator device, as described, consisting of the rack *o*, secured to the block *i*, the graduated dial q', secured to the head-stock *b* or its connections, and the pinion *p*, meshing into the teeth of said rack and having secured to it the index-pointer p^6, substantially as and for the purpose set forth.

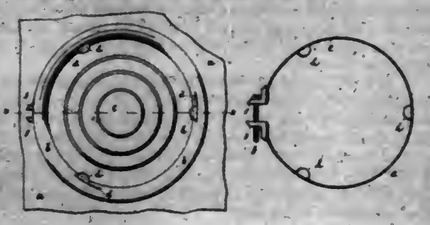
5. In a watch-case-shaping machine, a longitudinally-movable head-stock and a rotary work-holder spindle journaled therein, combined with the adjustable stop-screw b^2 on the said head-stock and the stop-screw carrying disk a^4 on the bed *a*, said disk being adapted to turn around its axis and to be locked in position, substantially as and for the purpose set forth.

6. In a watch-case-shaping machine, a longitudinally-movable head-stock and a rotary work-holder spindle journaled therein, combined with the stop projection a^5 on the said head-stock, and the adjustable disk r', mounted on a bracket secured to the bed *a*, and provided with adjustable stop-screws *r r*, substantially as and for the purpose set forth.

7. In a watch-case-shaping machine, a longitudinally-movable head-stock and a rotary work-holder spindle journaled therein, combined with the bed *u*, adjustably secured to the main bed *a*, and the tool-post carrier *t*, adapted to slide on the bed *u*, and provided with a series of shaping-tools adjustably secured to tool-posts on said carrier, substantially as and for the purpose set forth.

8. In a watch-case-shaping machine, the bed *u* and the tool-post carrier *t*, adapted to slide thereon and provided with a series of tools and tool-posts, combined with the lever *v*, connected to the said bed and tool-post carrier, as described, and the adjustable stop device consisting of the screws t^5 t^6, secured to the part *t*, and having adjustable stop-nuts t^8 t^9, and the notched levers u^7 u^8, pivoted to a bracket or extension of the bed *u*, substantially as and for the purpose set forth.

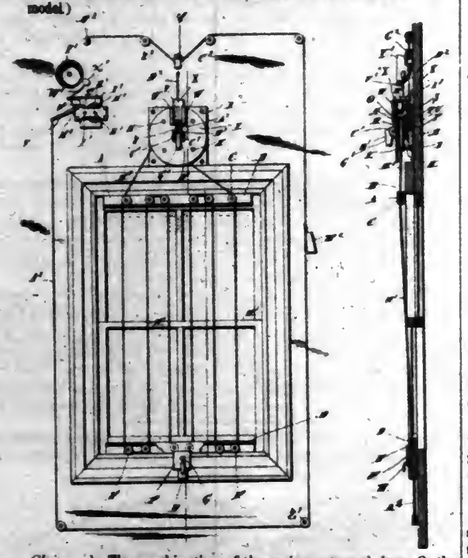
398,252. WAGON-SEAT. DALLAS F. HEAD, Arcadia, assignor of one-half to Nathaniel W. Warren, Mount Lebanon, La. Filed Sept. 19, 1888. Serial No. 285,804. (No model.)



Claim.—1. The combination, with the wagon-seat having the bottom frame provided with the countersunk recess F on its inner side, of the detachable bottom board, G, adapted to fit in said recess and having the cleats H on its lower side, and the steps or rungs I, secured to said cleats and to the bottom board, said cleats and steps being gradually reduced in width toward the upper end of the board, and the hook or catch secured to the upper end of the board and adapted to engage one side of the wagon-bed, for the purpose set forth, substantially as described.

2. The wagon-seat having the removable bottom board, G, provided on one side with the rungs or steps, and having the hook pivoted at its upper end adapted to engage one side of the wagon-bed and suspend the board therefrom, for the purpose set forth, said hook having the U-shaped end portions, L, the straight central portion, M, and the inwardly-extending pivotal arms N, substantially as described.

3. The combination, with the wagon-seat having the bottom frame provided with the countersunk recess F on its inner side, of the detachable bottom board, G, adapted to be inserted in the said recess and provided on one side with the steps or rungs I, and the hook K, pivoted to the upper end of the board G, substantially as described.



398,253. LENS-HOLDER FOR SIGNAL-LAMPS. CHARLES W. HELME, New York, N. Y., assignor to George C. Drumel, same place. Filed Aug. 1, 1888. Serial No. 281,830. (No model.)

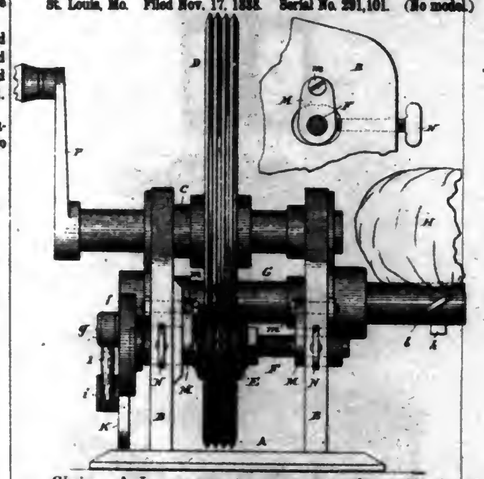
Claim.—1. The combination of a lamp having slotted hood *b* and lens *c*, with the elastic band *e*, having lugs *h* and eyes *f*, and with the screw *g*, passing through said eyes, substantially as specified.

2. The combination of a lamp having hood *b*, that is provided with inclined slots *d*, with an elastic band that surrounds the hood and is adapted to be tightened up, and with the lugs *h*, secured to such band and projecting through the inclined slots *d*, substantially as specified.

398,254. BURGLAR AND FIRE ALARM. CHARLES C. HENDERSON, Jamestown, N. Y. Filed Nov. 6, 1888. Serial No. 290,107. (No model.)

Claim.—1. The combination of the spring-actuated drum O, the detent operated by the drum, the cords attached to the drum and adapted to be wound thereon, the plate X, engaged by the detents, the alarm mechanism having detaining-arm V', and the cord A^3, connected to said arm and to plate X, and normally drawn taut by the latter, for the purpose set forth, substantially as described.

2. The combination of the alarm mechanism having the arm V', the cord A^3, attached to the said arm, the weight attached to the cord, the drum O, the spring to rotate the same in one direction, the cords H', attached to the drum and adapted to coil thereon in the opposite direction, the detent engaging the drum, the plate X, engaged by the detent, and connections between the said plate and the cord A^3, substantially as described.



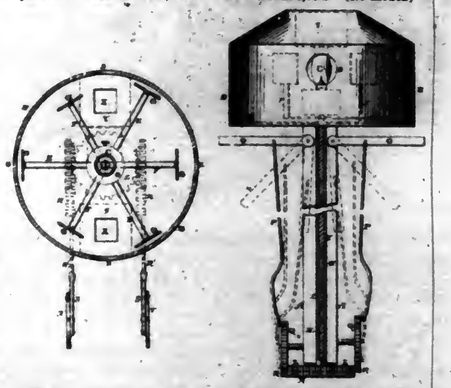
3. The combination of the drum O, having the teeth or serrations O^2, the spring and gears to rotate the drum in one direction, the slide-plate X, the detent having the arm E', engaging the teeth O^2, and the arm F', engaging the plate X, the cords H', attached to and adapted to be coiled on the drum, the alarm mechanism, and connections, substantially as set forth, between the plate X and the alarm mechanism, substantially as described.

4. The combination of the drum O, the spring to rotate the same in one direction, the detent to engage the drum, the plate X to trip the detent, the bar D, having the pulleys E, the pulleys C, journaled to a fixed point, the cords H', attached to the drum and connecting the pulleys E C, the alarm mechanism, and connections between the same and the plate X, substantially as described.

5. The combination, with the alarm mechanism, of the shaft M and bearings therefor, the spring to rotate the shaft, the wheel N, rigid with the shaft, the drum O, loose on the shaft, having the teeth or serrations O^2, and the pinion R, the shaft T, journaled in suitable bearings and having the wheel S, and pinion U, engaging the pinion R and wheel N, respectively, the plate X, the detent having the arm engaging said plates and the arm engaging the teeth O^2, the cords H', attached to the drum and adapted to be wound thereon, the alarm mechanism, and connections between the same and the plate X, substantially as described.

6. In a fire and burglar alarm, the bar A, secured at the top of the window, the bar D, secured at the bottom of window, the bar A, having the pulleys C, and the bar D, having the pulleys E, and the continuous cord H', passed backward and forward between the bars A D, around the pulleys C E, the spring-actuated revoluble drum to which the ends of the cord are directly attached, and the alarm mechanism, and connections, substantially as specified, between the same and the drum, substantially as described.

398,255. MOVEMENT-CURE MACHINE. MARY F. HENDERSON, St. Louis, Mo. Filed Nov. 17, 1888. Serial No. 291,101. (No model.)

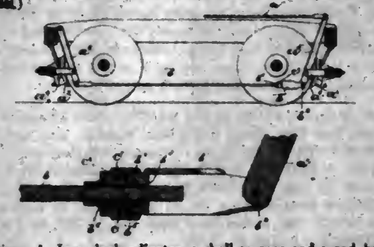


Claim.—1. In a movement-cure apparatus, the combination of the large and small friction-wheels and their respective shafts, the vibrator having a socket for the insertion of a rubber or other attachment, and a connection-rod for imparting a rapid oscillation to said vibrator, substantially as described.

2. The combination, with the vibrator and main shaft, of means, including a large and small friction-wheel, for transmitting motion from the latter to the former, the shaft of one of said friction-wheels having bearings adjustable toward and away from the other friction-wheel, substantially as described.

3. In a movement-cure apparatus, the combination of a portable supporting-frame, a main shaft having bearings at the middle part of the frame and carrying a large friction-wheel, a crank-shaft carrying a small friction-wheel engaging the large wheel, said crank-shaft having bearings in adjustable brackets, adjusting-screws for said brackets, a vibrator-shaft, a connection-rod for communicating motion thereto from said crank-shaft, and an adjustable connection between the end of said rod and an arm secured to said vibrator-shaft, substantially as described.

398,256. RAILROAD BLOCK-SIGNAL. JAMES M. HEVERLY, Coalport, Pa. Filed Nov. 22, 1888. Serial No. 291,554. (No model.)

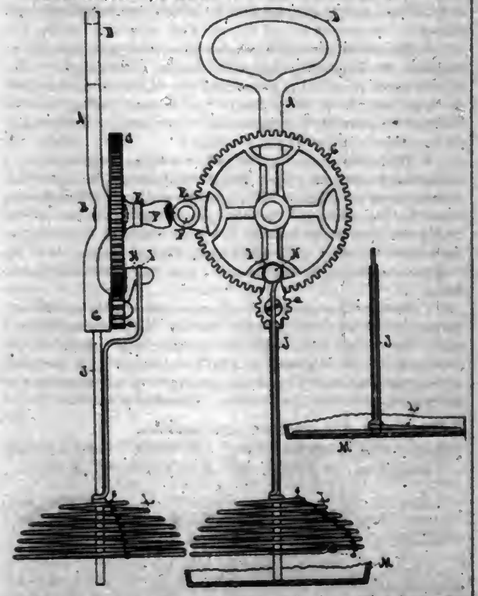


Claim.—1. The combination of the revolving frames carrying colored glasses placed inside of the signal-box, the operating mechanism connected thereto, wheels provided with wrist-pins, toothed slides which mesh both with the wheels and the operating mechanism of the revolving frames, connecting-rods, the signal-arms, and the levers for operating the slides, substantially as shown.

2. The combination of the signal-box, the revolving frames placed therein and provided with colored glasses, the shaft and the sleeve connected to these revolving frames, wheels connected to the sleeve and shaft, an operating-wheel placed at an angle to the said wheels, a slide which meshes with two of the wheels, a connecting-rod, signal-arms, and a lever for moving the slides, and thus operating both the signal-arms and the colored glasses at the same time, substantially as described.

3. The combination of the tower, the signal-arms pivoted thereto, and a mechanism for operating them, with the signal-box placed upon the top of the tower and provided with openings through its bottom, and reflectors placed in the top of the box, so as to reflect the light of the lamp downward upon the signal-arms, substantially as set forth.

398,257. SLACK-ADJUSTER FOR CAR-BRAKES. CHARLES C. HUBBAR, Rome, N. Y. Filed May 7, 1888. Serial No. 273,123. (No model.)



Claim.—1. In a slack-adjuster, a shell or case and a rod having its end threaded and extended into said shell or case, combined with an adjusting-nut mounted on said rod and by which the said rod is moved with relation to the said shell or case, and with a locking-nut to secure said rod in adjusted position, substantially as described.

2. In a slack-adjuster, a rod, *b*, having one end threaded, and a shell or case having a projecting flange or lip, b^4, and provided with an opening through which is extended the threaded end of the said rod, the said opening being of greater diameter than the threaded end of the said rod, combined with an adjusting-nut having a shoulder, and with a locking-nut, the shoulder of the adjusting-nut and a part of the said locking-nut bearing against the said flange or lip and by the rotation of the locking-nut seating the shoulder firmly against the said flange or lip, substantially as described.

3. In a slack-adjuster, a rod, *b*, having one end threaded, and a shell or case having a flange or lip, b^4, recessed to form a socket, and provided with an opening through which is extended the threaded end of the said rod, the said opening being of greater diameter than the threaded end of the said rod, combined with an adjusting-nut and with a locking-nut, substantially as described.

398,258. EGG-BEATER. FREDERICK W. HUDSON, Leominster, assignor to William S. Brown, Boston, Mass. Filed Nov. 26, 1887. Serial No. 256,350. (No model.)

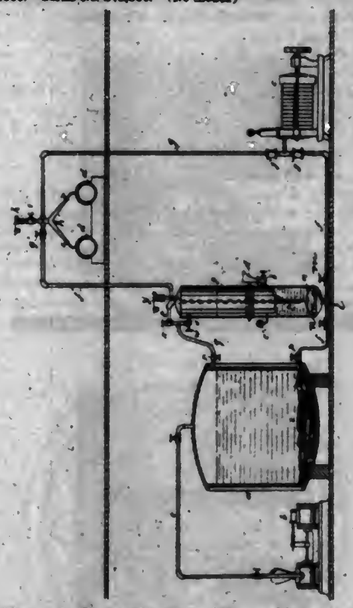
Claim.—1. An egg-beater consisting of a supporting-frame, the depending guide-rod J, connected thereto, the dasher mounted axially upon said guide-rod, composed of a helical coil of wire, and the pitman-rod attached to one end thereof, and adapted to reciprocate it thereon and cause its inner coils successively and respectively to pass to and fro through its outer coils by its reciprocation, substantially as described.

2. An egg-beater consisting of a supporting-frame, the depending guide-rod J, connected thereto, the dasher mounted axially upon said guide-rod, composed of a helical coil and the cross-struts 6 6, and the pitman-roll attached to one end of said coil, and adapted to reciprocate it upon said guide-rod and cause its inner coils successively and respectively to pass to and fro through its outer coils by its reciprocation, substantially as described.

3. An egg-beater consisting of a supporting-frame, the depending guide-rod J, connected thereto, the dasher mounted axially upon said guide-rod, composed of a helical coil of wire, and the pitman-rod attached to one end thereof, and adapted to reciprocate it thereon and cause its inner coils successively and respectively to pass to and fro through its outer coils by its reciprocation, and operative mechanism connected to said pitman-rod, adapted to reciprocate the same, substantially as described.

4. An egg-beater consisting of a supporting-frame, the depending guide-rod J, connected thereto, the dasher mounted axially upon said guide-rod, composed of a helical coil of wire, and the pitman-rod attached to one end thereof, and adapted to reciprocate it thereon and cause its inner coils successively and respectively to pass to and fro through its outer coils by its reciprocation, and the gear-wheels C *a*, the latter carrying crank-arm H, connected to said pitman-rod and adapted to reciprocate the same, substantially as described.

398,259. WIRE. PETER V. HUSTED, New York, N. Y. Filed Oct. 5, 1888. Serial No. 287,272. (No model.)



Claim.—A spirally-threaded wire in which the thread is made nearly parallel with the length of the wire, substantially as shown and described.

398,260. BARBED NAIL. PETER V. HUSTED, New York, N. Y. Filed Oct. 9, 1888. Serial No. 287,633. (No model.)

Claim.—A barbed or roughened nail provided with a smooth shank and a row of barbs or roughnesses arranged around the shank in a spiral direction, substantially as shown and described.

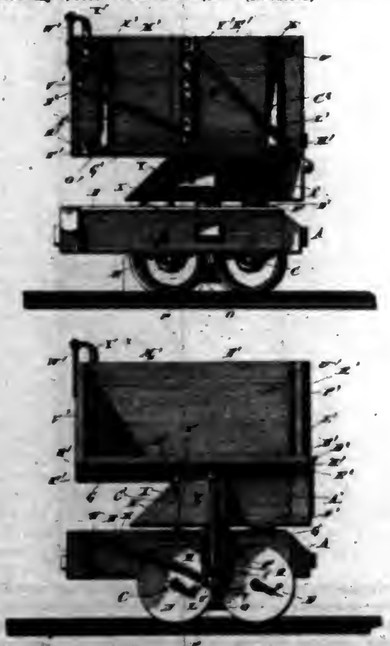
398,261. RACKING-OFF APPARATUS FOR BEER, WINE, AND OTHER LIQUIDS. JOHN JOHNSON, Brooklyn, N. Y. Filed Apr. 30, 1888. Serial No. 272,366. (No model.)

Claim.—1. The combination, with a racking-cask and filter, of the intermediately-placed filtering-material distributer connected with the delivery-pipe from the cask to the filter for discharging thereinto, and also connected with the cask for circulation of the compressed air above the beer-level, substantially as described.

2. The combination, with a racking-cask, air-compressor or force-pump, and filter, of the intermediately-placed filtering-material distributer connected with the delivery-pipe from the cask to the filter

for discharging thereinto, and also connected with the cask for circulation of the compressed air above the beer-level, substantially as described.

3. The combination, with a racking-cask, air-compressor or force-pump, and filter, of the intermediately-placed filtering-material distributer connected with the delivery-pipe from the cask to the filter for discharging thereinto, also connected with the cask for circulation of the compressed air above the beer-level, and the discharge-pipe of the filter connected with the cask or distributer for establishing back-pressure on the beer, substantially as described.



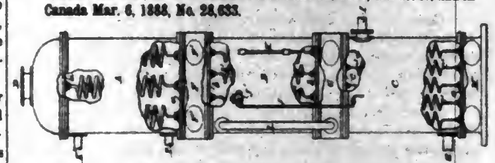
4. The combination, with the racking-cask, air-compressor or force-pump, and filter, of the intermediately-placed filtering-material distributer connected with the delivery-pipe from the cask to the filter for discharging thereinto, also connected with the cask by the dip-pipe for the inflow of air from the cask through the beer in the distributer, and also having direct connection with the cask above the beer-levels in the cask and distributer, substantially as described.

5. The combination, in apparatus for racking beer and other liquids, of the racking-cask, air-compressor or force-pump, filtering-material distributer, filter, discharge-pipe of the racking-cask and distributer connected with the filter, filter discharge-pipe, air-pipe connecting the distributer or cask and the discharge-pipe of the filter, safety-valve in said filter discharge-pipe, and the stop-valves in the racking-cask and distributer discharge-pipe and in the filter discharge-pipe safety-valve, substantially as described.

6. The combination, in apparatus for racking beer and other liquids, of the racking-cask, air-compressor or force-pump, filter, and filtering-material distributer, said distributer having the charging-hopper and foraminous false bottom, and being connected with and so as to discharge into the discharge-pipe from the racking-cask to the filter, and also connected with the racking-cask above the beer-levels in each, substantially as described.

7. The combination, in apparatus for racking beer and other liquids, of the racking-cask, air-compressor or force-pump, filter, and filtering-material distributer, said distributer being connected with and so as to discharge into the discharge-pipe from the racking-cask to the filter, also connected with the racking-cask above the beer-level in it by the dip-pipe discharging below the beer-level in said distributer, and having the relief or safety valve to accelerate the mixture of the filtering material with the beer in said distributer, substantially as described.

398,262. DUMPING-CAR. CARLOS G. KING, Montezuma, Ind. Filed July 6, 1888. Serial No. 279,167. (No model.)



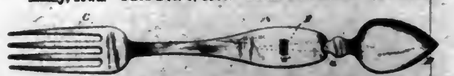
Claim.—1. The combination of the frame, the car box or body thereon and adapted to incline or tilt, the end-gate pivoted or hinged at its upper side to one side of the car box or body, and connections, substantially as described, between the said end-gate and the fixed portion of the frame, whereby when the box or body is tilted the end-gate will be automatically opened, substantially as described.

2. The combination of the frame, the car box or body hinged thereon and adapted to tilt or incline, the end-gate hinged or pivoted to one side of the car box or body, the lever Y', fulcrumed on the car box or body, the link-rod A^2, connecting the same to the end-gate, and the link-rod C^2, connecting the opposite end of the lever to a fixed point on the frame, for the purpose set forth, substantially as described.

3. The combination of the truck having the circle, the turn-table frame pivoted on the truck and having the rollers bearing on the circle, and the car box or body hinged to the turn-table frame and adapted to tilt or incline thereon, and the catch or lock for holding the car box or body from tilting, substantially as described.

398,263. FEED-WATER HEATER. JOHN KIRKALDY, 40 West India Dock Road, County of Middlesex, England. Filed Aug. 27, 1888. Serial No. 283,829. (No model.) Patented in England Apr. 3, 1886, No. 4,707; in France Dec. 4, 1886, No. 180,073; in Belgium Dec. 6, 1886, No. 75,497; in Italy Dec. 31, 1886, No. 20,949; in Victoria Jan. 12, 1887, No. 4,891; in South Australia Jan. 24, 1887, No. 763; in Queensland Feb. 2, 1887, No. 246; in New South Wales Mar. 31, 1887, No. 2,047, and in Canada Mar. 6, 1888, No. 28,633.

Claim.—1. The combination, substantially as hereinbefore set forth, of the feed-water heater, the condenser, the evaporator interposed between the feed-water heater and the condenser, and exhaust-steam pipes passing through the heater, the evaporator, and the condenser, the inlet and outlet openings for feed-water in the feed-water heater, the inlet and outlet openings for cooling-water in the condenser, and the pipes connecting the condenser with the evaporator.



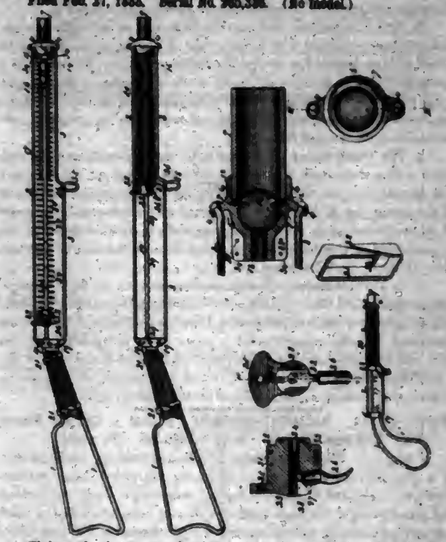
2. The combination, substantially as hereinbefore set forth, of the condenser, the evaporator arranged above the condenser and communicating therewith, the feed-water heater arranged above the evaporator, the exhaust-steam pipes extending through the heater, the evaporator, and the condenser, the inlet and outlet openings in the condenser for cooling-water, the inlet and outlet openings in the heater for feed-water, a pipe leading from the condenser to the evaporator conveying warmed water from the condenser to the evaporator, and the vapor-pipe leading from the top of the evaporator to the condenser.

3. The combination, substantially as hereinbefore set forth, of the condenser, the evaporator arranged above the condenser, the coiled exhaust-steam pipes in the evaporator, the vapor-pipe leading from the upper part of the evaporator to the condenser, and a pipe connecting the evaporator with the condenser, whereby water warmed in the condenser is carried to the evaporator.

4. The combination of a feed-water heater, an evaporator, and a surface condenser having pipes passing through each, through which exhaust-steam is passed successively, a feed-pipe leading from the condenser to the evaporator for supplying water which has become heated in the condenser from the condenser-casing to the casing of the evaporator, and a vapor-pipe passing from the upper part of the evaporator-casing to the interior of the condenser, substantially as set forth.

5. The combination of an evaporator and a surface condenser having pipes passing through each, through which exhaust-steam is passed successively, a feed-pipe for supplying water which has become heated in the condenser from the condenser-casing to the casing of the evaporator, and a vapor-pipe passing from the upper part of the evaporator to the interior of the condenser, substantially as set forth.

398,264. COMBINED FORK AND SPOON. DAVID P. KIEWER, Manly, Iowa. Filed Dec. 3, 1888. Serial No. 292,499. (No model.)



Claim.—1. The combination, with the handle A, having an article of table-cutlery, as C, formed on one end, and having the keepers *a* and *a'* at its other end, of the article D, having a shank, B, which is adapted to be inserted in the keepers *a* and *a'*, whereby the handle A is common to both of the said articles C and D, substantially as shown and described.

2. In an article of table-cutlery, the combination, with the handle having its end bent down to form the keeper *a*, and having a portion swaged therefrom to form the keeper *a'*, of the shank B, adapted to

be held in the said keepers, substantially as and for the purpose described.

398,265. SPRING-GUN. JOHN F. KLEINSCHMITT, St. Louis, Mo. Filed Feb. 27, 1888. Serial No. 265,396. (No model.)

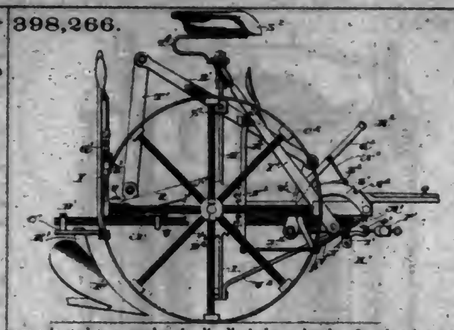
Claim.—1. A toy gun having a barrel provided with a flexible annular lip, 9, to prevent the accidental escape of the ball, as explained.

2. The combination, in a toy gun having a barrel, of a pin working through the breech of the barrel, a trigger-block arranged to impinge upon the rear end of the pin, a trigger in said block adapted to hold and release the block, and a spring forcing the trigger-block against the pin, substantially as set forth.

3. The combination, in a toy gun, of a barrel, a pin extending through the breech of the barrel, a trigger-block sliding on a guide-rod and arranged to impinge upon the pin, a spring arranged to force the trigger-block against the pin, and a trigger working in the block and adapted to engage the guide-rod, for the purpose set forth.

4. The combination, in a toy gun, of a pin working endwise and adapted by impinging upon the ball to force it from the gun, a trigger-block forced against the pin by a spring, a guide-bar on which the trigger-block slides, provided with recesses for the engagement of the trigger, and a trigger adapted to engage said recesses, substantially as set forth.

5. The combination, in a toy gun, of the movable pin 15, having a reduced end, 14, working through the breech of the barrel, the guide-rod 17, entering an axial bore of the pin and forming at once a guide and a back stop to the pin, a trigger-block having a trigger engaging the guide-rod, a spring forcing the trigger-block against the pin 15, and a stock to which the rear end of the guide-rod is attached.



6. The combination, in a toy gun, of the frame having a continuous bar having parts 1, 2, and 3, forming the frame of the stock and connecting it to the barrel, a guide-rod secured at the rear end to the stock, a pin passing through the breech of the barrel and having an axial bore receiving the forward part of the guide-rod, a trigger-block sliding on the guide-rod and the upper frame-bar, 2, a trigger working in the trigger-block and engaging the guide-rod, and a spring acting to force the trigger-block against the pin, for the purpose set forth.

398,266. SULKY-PLOW. IRA M. LINDERMAN, Elmira, N. Y. Filed Aug. 7, 1888. Serial No. 282,139. (No model.)

Claim.—1. The combination, in a sulky-plow, of the frame, the arms R, pivoted thereto, the plows supported by the said arms, the levers R', pivoted to the frame, the links T, connecting the rear ends of said levers to the plows, the rock-shafts V', having the arms X', the links U', connecting said arms to the front ends of the levers R', and the levers Y', attached to the rock-shafts, for the purpose set forth, substantially as described.

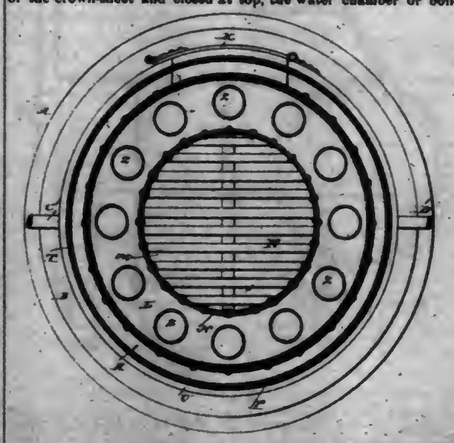
2. The combination, with the frame of a sulky-plow, of the pivoted arms R, the plows connected to and supported by said arms and adapted to play longitudinally independently of each other, means, substantially as set forth, to raise and lower the plows, and the clevis having the arms I' pivoted together and provided with openings or guides for the front ends of the plow-beams, and in which the latter

398,266.

are adapted to move longitudinally independently of each other, substantially as described.

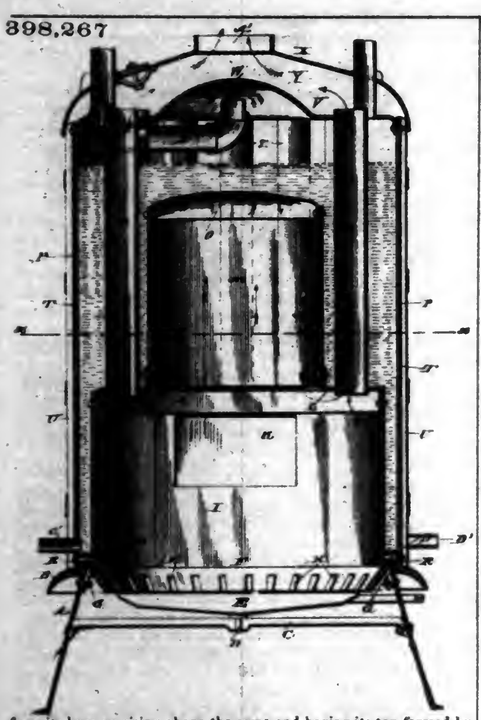
3. The combination of the plows adapted to move longitudinally independent of each other, and having the beams or bars A', and the arms I', pivoted together and having the guides through which the front ends of the beams or bars extend, and in which the latter are adapted to reciprocate, substantially as described.

4. The clevis having the arms I', pivoted together and adapted to rock independently of each other, in combination with the plow beams or bars having their front ends movable longitudinally and guided through said arms, and a draft hook or device pivotally connected to the fulcrum of said arms I', substantially as described.



5. The combination, with the frame of a sulky-plow, of the arms R, pivoted thereto, the rods S, connecting the rear ends of said arms in pairs, the frames U, having the longitudinal openings through which the rods S extend, whereby said frames are movable longitudinally, the plow-beams secured to the said frames and the clevis having the guides for the front ends of the guide-beams, the latter being adapted to move in a longitudinal direction in said guides independently of each other, substantially as described.

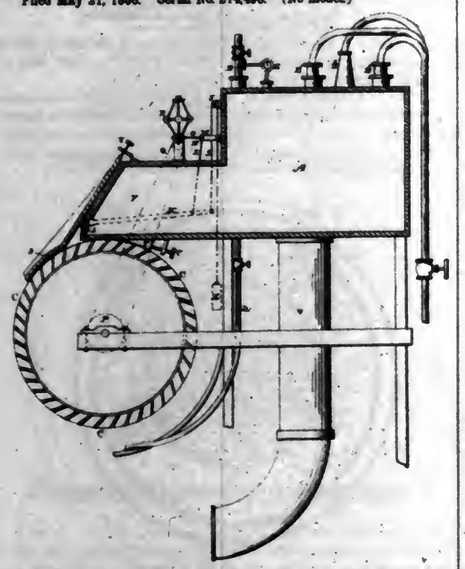
6. The combination, in a sulky-plow, of the levers R', connected to the plows and adapted to raise and lower the same, the gear-wheels D^4, revoluble with the supporting-wheels, and the links E^3, connected to the levers R' and adapted to engage the gear-wheels, the levers G^3, connected to the said links, and the springs to normally move the links out of engagement with the gear-wheels, substantially as described.



7. The combination, in a sulky-plow, of the gear-wheels, the levers to raise the plows, the links E^3, attached to said levers and adapted to engage the gear-wheels, the levers G^3, connected to said links, the plates Z', having the notches A^1, the levers Y', connected to and adapted to operate the elevating-levers, the spring-actuated bolts on said levers Y' to engage the notches A^1, the trip-levers K^3, pivoted to the plates Z', and the levers L^3, also pivoted to said plates and adapted to operate the trip-levers, said levers L^3 being connected to and operated by the levers G^3, substantially as described.

398,267. STEAM-GENERATOR. HARRY H. LINDENUTH, Mount Joy, assignor of one-half to Peter L. Kreiss, Florin, Pa. Filed May 18, 1888. Serial No. 274,296. (No model.)

Claim.—A steam-generator having a fire-box, I, the crown-sheet L of which has an upright flange around its central opening, the heated gas-chamber having its lower edge bolted within and to each flange of the crown-sheet and closed at top, the water chamber or boiler

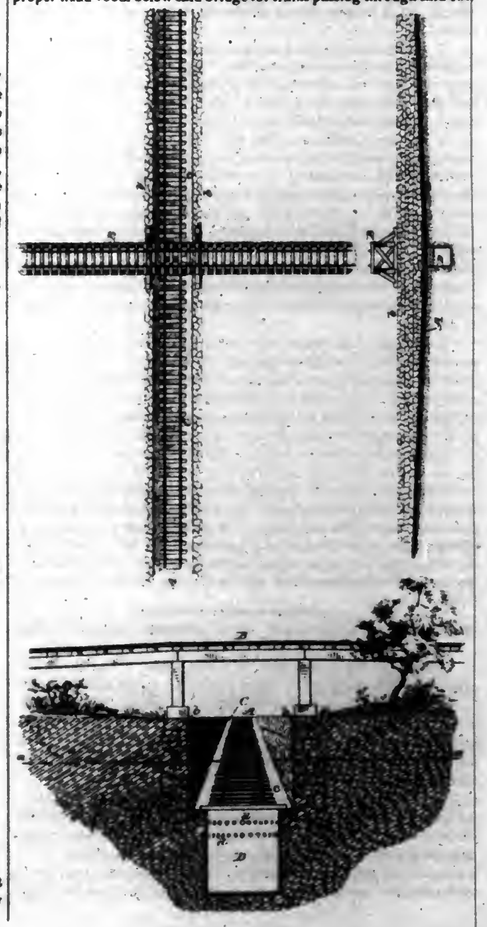


398,267

from its base up rising above the same and having its top formed by the flue-sheet V, provided at its center with the integral steam-dome W, the flues Z, extending between the crown-sheet and flue-sheet, the chamber Y, to receive the products of combustion from the said flues surrounding the steam-dome and discharging vertically above the same, so that there will be a constant passage of hot gases thereover, and the pipe B, receiving steam downward at its inner end from the central upper part of the steam-dome, passing thence downward into the boiler and horizontally therein, and thence extending upward through the top of the chamber Y at one side, substantially as specified.

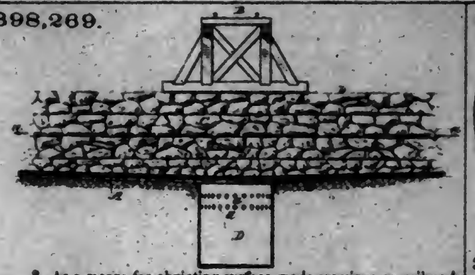
398,268. WATER-POWER. LOUIS LOEHAR, Jacksonville, Fla. Filed May 21, 1888. Serial No. 274,496. (No model.)

Claim.—1. In a water-motor, the combination, with an air-tight storage compartment provided with an opening for the outward flow of water, of a number of pipes conducting water to the compartment under varying pressures, whereby the flow of the water from the wells is automatically regulated according to the amount of water used, and a water-wheel which is operated upon by the water flowing from the compartment, substantially as shown and described.



2. In a water-motor, the combination, with an air-tight storage-compartment provided with a water-way, F, having an opening in its closed end, of a gate for closing the opening, a water-wheel which is operated upon by the flow of water from the compartment, a governor connected with the gate, and pipes conveying water from Artesian wells into the storage-compartment under varying pressures, substantially as shown and described.

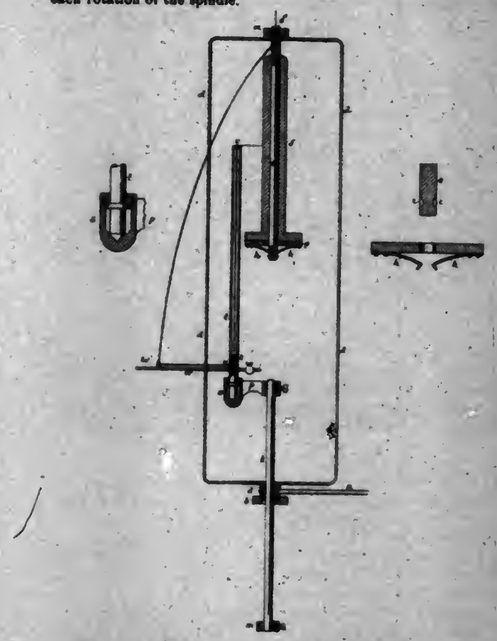
3. The combination of the air-tight storage-compartment provided with a water-way, the pipes B, extending from an Artesian well and discharging into the compartment, the gate G, applied to the end of the water-way F, the rods H, supported at their free ends by means of the weighted cords I, the connecting-rods L, pivoted levers M, rod O, connected to the governor, the pulley P, and the belt Q, substantially as shown and described.



4. In a water-motor, the combination, with an air-tight storage-compartment provided with the way F, having an opening in its closed end, of a gate for closing the opening, pipes leading from Artesian wells connected with the compartment, a water-wheel journaled under the way, and an apron secured at its upper end to the closed end of the way and its lower end extending down over a portion of the circumference of the wheel, substantially as shown and set forth.

398,269. RAILROAD-CROSSING. HARVEY C. LOWRIE, Denver, Colo. Filed Sept. 22, 1888. Serial No. 286,063. (No model.)

Claim.—1. The improvement in railroad-crossings, which consists in a gradually-developed cut or road-bed depression below surface-grade to a required depth, and having water-tight walls and bottom and also having a drainage tank or well, in combination with a road-way-bridge crossing said cut at such a point thereof as will best afford proper head-room below said bridge for trains passing through said cut.

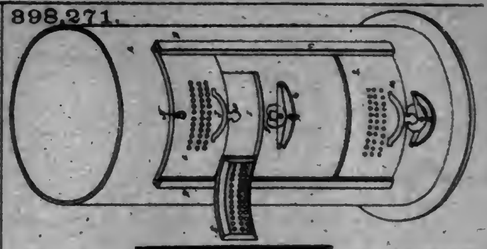


398,269.

2. As a means for obviating surface-grade crossings on railroads traversing low-level wet localities, a gradually-developed cut or road-bed depression, in combination with side walls and a bottom for said cut which exclude water from entering said road-bed depression from the adjacent ground, substantially as described.

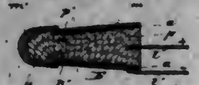
398,270. MACHINE FOR SPINNING AND TWISTING YARN. GEORGE B. LOCKE, Camden, N. J. Filed July 5, 1887. Serial No. 243,371. (No model.)

Brief.—The object of the invention is to provide simple and efficient means for effecting a double twist of the strands or fibers for each rotation of the spindle.



Claim.—1. The combination of the flier, the bobbin-carrier thereon, a tubular spindle located at one side of the axis of the flier and having an axial delivery-eye at its upper end, an arm projecting from said spindle and engaging with the flier, a bearing for the spindle, and a rod carrying said bearing and passing through one of the spindles of the flier, all substantially as specified.

2. The combination of the flier, the bobbin-carrier thereon, a tubular spindle located at one side of the axis of the flier and having an axial delivery-eye at the upper end, an arm projecting from said spindle and engaging with the flier, a guide-eye on said arm, a bearing for the spindle, and a rod carrying said bearing and passing through one of the spindles of the flier, all substantially as specified.



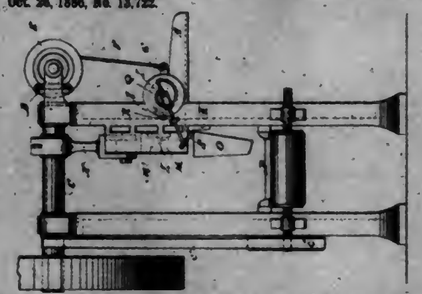
398,271. SAFETY-DOOR FOR HEATERS. JAMES H. MASON, Detroit, Mich. Filed May 3, 1888. Serial No. 272,991. (No model.)

Claim.—The combination, with a heater having an opening and closing door, of a vertically-sliding plate on the heater, which is supported in its elevated position by the door when the latter is open, and drops down in front of the door whenever the latter is closed, and an automatic locking device for holding the sliding plate in its lowest position when it drops down in front of the closed door, substantially as described.

398,271.

398,272. ELEMENT FOR THERMO-ELECTRIC BATTERIES. MAX MEITZER, Turin, Italy. Filed Nov. 22, 1888. Serial No. 291,545. (No model.) Patented in France Feb. 16, 1888, No. 183,764; in Belgium Feb. 16, 1888, No. 80,665; in Italy Apr. 12, 1888, XXI, 23,090, and in Spain June 30, 1888, No. 963/7,963.

Claim.—1. An element for thermo-electric batteries, comprising a positive and negative electrode in contact with each other, a metallic inclosing-casing of greater refractory power than that of the electrodes, and a fire-proof non-conductive lining arranged to isolate one of said electrodes from the casing, substantially as and for the purposes specified.



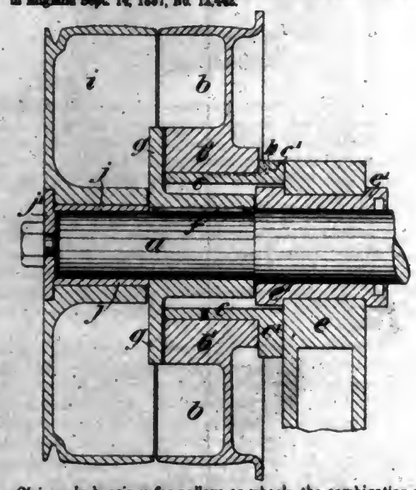
2. An element for thermo-electric batteries, comprising a positive and negative electrode in contact with each other, a metallic inclosing-casing of greater refractory power than that of the electrodes, a cap or plug of greater thickness than the casing for the smaller end of the element, and a fire-proof non-conductive lining arranged to isolate one of said electrodes from the casing, substantially as and for the purposes specified.

3. An element for thermo-electric batteries, comprising two electrodes composed of alloys of metals of varying refractory power, that electrode more directly exposed to the heat being formed of an alloy of greater refractory power than that of the other electrode, in combination with a conductive sheathing constructed of a metal of greater refractory power than either of the electrodes, and a fire-proof lining interposed between said sheathing and the more fusible electrode, substantially as and for the purposes specified.

4. An element for thermo-electric batteries, comprising two electrodes composed of alloys of metals of varying refractory power, that electrode more directly exposed to the heat being formed of an alloy of greater refractory power than that of the other electrode, in combination with a conductive sheathing constructed of a metal of greater refractory power than either of the electrodes, said sheathing being re-enforced at that point which is more directly exposed to the heat, and a fire-proof lining interposed between said sheathing and the more fusible electrode, substantially as and for the purposes specified.

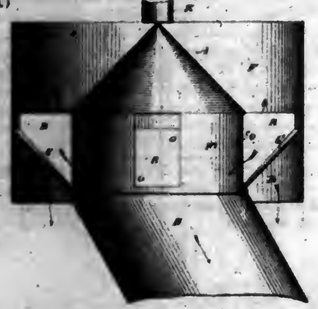
5. An element for thermo-electric batteries, comprising a positive electrode formed of an alloy of antimony and zinc, and a negative electrode formed of an alloy of copper and nickel, in combination with an inclosing-casing of a conductive metal of greater refractory power than that of either of the electrodes, and a fire-proof insulating-lining interposed between said casing and the positive electrode, substantially as and for the purposes specified.

398,273. MACHINE FOR CUTTING RAGS OR OTHER MATERIALS. JAMES NUTTALL, Bury, County of Lancaster, England. Filed Oct. 26, 1887. Serial No. 253,313. (No model.) Patented in England Oct. 26, 1886, No. 13,722.



Claim.—1. In a machine for cutting rags and other material suitable for the manufacture of paper, the combination, with the cutting-blades for dividing the material in one direction, of the hopper or

receiver into which the strips of material severed by the said blades fall, mechanism for vibrating the said hopper or receiver by which they are automatically deposited side by side, a second cutting device, which divides the strips in another direction, and a feed to conduct the strips to the second cutter, substantially as described.

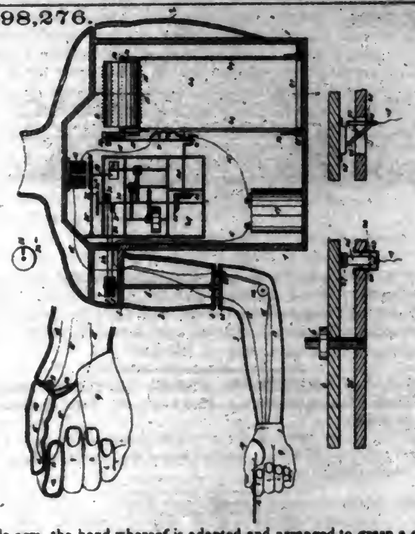


2. In machines for cutting rags or other materials suitable for the manufacture of paper, the combination, with the cutting-instrument for severing the material into strips, of the vibrating hopper, mechanism for moving the latter synchronously with the movement of the cutting device to deposit the cut pieces in a determined order, a traveling feed-belt on which they are deposited, and a second cutting device, which divides the strips in another direction, substantially as described.

398,274. BEARING FOR PULLEYS OR WHEELS. BENJAMIN ORMEROD and GEORGE HAWORTH, Blackburn, County of Lancaster, England, assignors to George Ashworth and Elijah Ashworth, both of same place. Filed Mar. 16, 1888. Serial No. 267,314. (No model.) Patented in England Sept. 14, 1887, No. 12,442.

Claim.—In bearings for pulleys or wheels, the combination of a cylindrical boss which surrounds the bearings of the shaft without touching the outer surface of such bearing, a pulley or wheel which revolves upon said boss, and the coupler engaging with the hub of the pulley and fixed on the shaft, substantially as set forth.

398,275. APPARATUS FOR SAMPLING ORES. CORTLANDT E. PALMER, Rico, Colo. Filed Sept. 13, 1888. Serial No. 285,708. (No model.)



Claim.—In a sampling apparatus, the combination, substantially as hereinbefore described, of an exterior cylinder open at the bottom, forming the outer walls of the sampler, an interior cylinder placed within the outer cylinder and concentric therewith, a cone surmounting said inner cylinder of equal diameter therewith, a supply-pipe for delivering ore on the apex of the cone, a series of inclined pockets of suitable size formed in the space between the two cylinders and opening into the interior of the inner cylinder, and a discharge-pipe for carrying off the material discharged by the pockets.

398,276. AUTOMATON. ARTHUR M. PIERCE, Lyndhurst, N. J. Filed Aug. 27, 1887. Renewed July 21, 1888. Serial No. 280,686. (No model.)

Claim.—1. An automaton having an electrically-controlled movable arm, the hand whereof is adapted and arranged to grasp a card or its equivalent and hold the hand in an extended position until the card is removed therefrom, when the contact is established and the electric circuit completed, substantially as shown and described.

398,276.

2. In an automaton representing a human being provided with a single movable arm, the hand thereon being adapted and arranged to grasp a card or its equivalent, in combination with a device located within said automaton for feeding the cards to said hand, substantially as shown and described.

3. In an automaton of the character herein specified, an actuating-motor, in combination with a fixed upper arm, a movable forearm the hand thereon being provided with a movable thumb, a card-holder located in the body of the figure, and a chute leading to a receiver grasped by the stationary hand of the figure, toward which said movable arm is carried when the electric circuit is completed and the motor set in operation, substantially as shown and described.

4. In an automatic card-distributer consisting of a figure provided with a swinging forearm, the combination, with a hand adapted and arranged to grasp and hold a card, of a card receiver and holder provided with an intermittently-moved feeding-roller, and a motor for imparting motion to the whole, substantially as shown and described.

5. In an automaton of the character herein specified, the combination, with a hand the thumb whereof is made movable, of a swinging arm, electrical conductors passing through the arm and hand to contact-pieces upon the thumb and forefinger, by means of which the electric circuit may be completed or broken, an electro-magnet and battery located in the circuit of which said conductors form a part, the armature of the magnet bearing an arm adapted and arranged to control the movement of the actuating mechanism of the automaton, substantially as shown and described.

6. In an automaton, the combination, with an actuating-motor provided with a regulating fly-fan, and the bar or lever 35, pivoted above the same and provided at its free end with an armature, 36, and with a downwardly-projecting arm, 38, of an electro-magnet arranged in juxtaposition to said armature, and a battery, 17, situated below the whole, and provided with conducting-wires 15, leading to contact-pieces 16 16, situated in the forefinger and thumb, respectively, of the figure, substantially as and for the purposes herein set forth.

7. In an automaton of the character herein specified, the combination, with the electric circuit and magnet controlling the movement of the actuating mechanism, of a switch located in said electric circuit and composed of an immovable contact-piece, 19, and swinging contact 20, provided with an arm, 21, on the same, whereby the circuit is automatically opened when the cards are exhausted from the holder, substantially as and for the uses and purpose shown and described.

8. In an automaton, the combination, with an actuating-motor the main shaft of which being provided at its upper end with a slotted disk, 32*, and an arm or lever pivoted above the same and provided with the two downwardly-projecting arms 37 and 38, and at its free end with an armature, 36, of an electro-magnet, 18, situated above said armature, and the battery located below said magnet and provided with conducting-wires 15 15, leading to contact-pieces 16 16 in the thumb and forefinger of the figure, substantially as described.

9. The combination, with the motor having a regulating fly-fan, 39, and the main driving-shaft bearing a slotted wheel, 32*, of a bar, 35, pivoted above the same and provided with inwardly-projecting arms 37 and 38 and with an armature, 36, on its free end, conductors 15, leading from the battery 17 to contact-pieces 16, situated in the thumb and forefinger, respectively, of the figure, and an electric switch composed of a fixed contact, 19, and swinging contact 20, the movement of which is controlled by the support 48 within the card-holder, substantially as shown and described.

10. The combination, with the hand 9, of the movable thumb 10, mounted upon a pivot, 11, and normally held against the forefinger 12 by a spring, 14, a cord or wire, 13, passing to a slide, 23, mounted in disk 25, the movement of said slide being controlled by a pivoted arm, 26, and a step, 27, fixed on disk 4, substantially as shown and described.

11. In an automaton, the combination, with the main driving-shaft, of the cranks 31 and 32, formed on the same, and the cords or wires 34, connecting said cranks with the wheel 7, rigidly attached to the shaft 6, to the extreme lower end of which is fastened the movable forearm, substantially as and for the purposes set forth.

12. In an automaton, the combination, with the main driving-shaft, of the actuating-motor provided with cranks 31 and 32, formed thereon, to which are attached the ends of the cords or wires 34, wound oppositely around the periphery of the wheel 7, rigidly attached to the upper end of the shaft 6, to the lower end of which is fastened the swinging forearm and hand provided with the vertically-movable thumb, substantially as and for the purposes set forth.

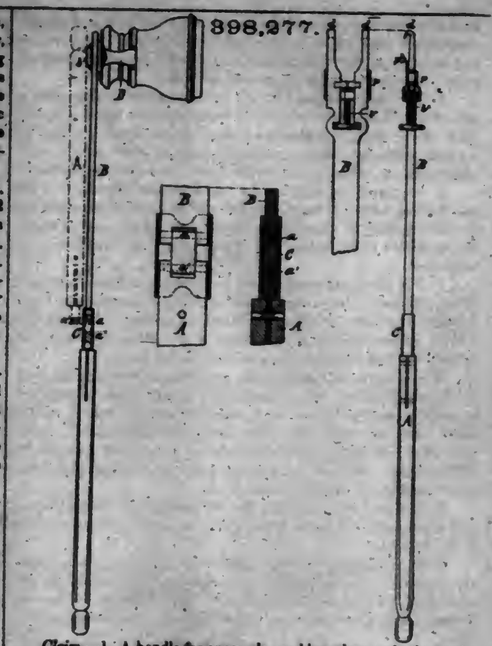
13. In an automaton of the character described, an actuating-motor, 29, the driving-shaft 30 of which is provided with the cranks 31 and 32, formed thereon, to which are attached the cords or wires 34, wound oppositely around the periphery of the wheel 7, attached to the upper end of the shaft 6, to the lower end of which is fastened the swinging forearm provided with an integral hand, 9, having a vertically-movable thumb normally held in a lowered position by means of a spring, 14, and to which is attached the cord or wire 13, leading therefrom to a slide, 23, the movements of which are controlled by means of a swinging arm, 26, and stop 27, substantially as described, and as herein set forth.

14. In an automaton of the character described, the combination, with the driving-shaft 30, provided near its lower end with a bevel gear-wheel, 43, meshing with a similar gear-wheel, 42, rigidly attached to one end of an axle, 40, near the other end of which is a crank, 41, of a pitman, 58, connecting this crank 41 with the ratchet-bar 57, to which is attached the separate ratchet 56, acting in conjunction with the ratchet-wheel 55, to the axle of which is rigidly fastened the feeding-drum 51, substantially as and for the purposes set forth.

15. An automaton representing a human being, and in combination with the same, a card-holder containing cards, a spur feeding-roller above and adapted to intermittently remove the cards from the same, and an actuating-motor within said automaton and adapted to operate said spur feeding-roller, substantially as described.

16. In an automaton of the character described, the combination, with the card-holder hopper 61, and chute 62, located near the same and leading to a card-receiver, from which the cards are removed by the hand 9 on the movable forearm, of a feeding-roller located above them and adapted to transfer the cards singly from said holder to said chute, with an intermittent movement corresponding with the motions of said hand 9, substantially as and for the purposes set forth.

17. The combination, with the card-receiver to which the cards are intermittently fed, of a hand mounted upon a swinging arm adapted and arranged to automatically remove the cards from said receiver, and mechanism for moving said arm, substantially as shown and described.

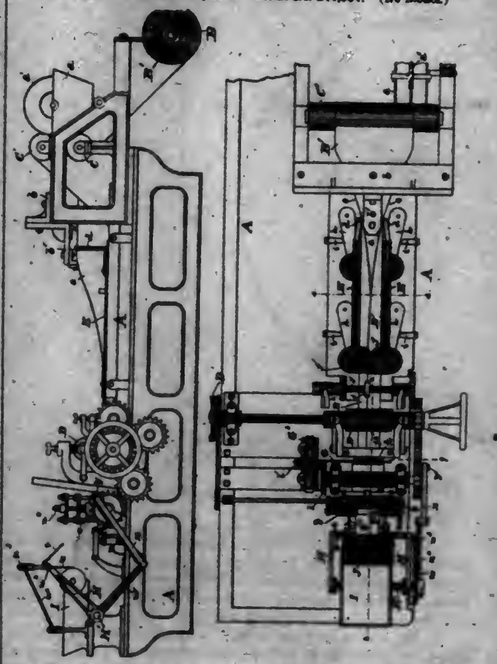


18. In an automaton, the combination, with the card-holder 44 and feed-roller 51, located above the same, of the hopper 61, with chute 62, leading from its lower end to a receiver, 63, provided with a screw-actuated adjustable back, 67, substantially as described, and for the purposes herein set forth.

19. In an automaton, a card-receiver located in the stationary hand, to which cards are intermittently fed as fast as removed by the other and swinging hand attached to an oscillating forearm, the whole being operated by a motor situated in the body of the device and adapted to be automatically stopped and started by electrical means, substantially as and for the purposes set forth.

20. The combination, with a card-holder, 44, a supporting-platform, 47, being mounted in said holder, and to which are attached springs 50, exerting a constant pressure upward, of the movable lining 45, inside of said holder, provided with adjusting-screws 46, substantially as shown and described.

398,277. HANDLE FOR OPERA-GLASSES. GABRIEL PLENEY, Paris, France. Filed Sept. 11, 1888. Serial No. 285,142. (No model.) Patented in France Aug. 3, 1888, No. 192,212.



398,277.

Claim.—1. A handle for opera-glasses, binoculars, and other articles or instruments, consisting of two parts with a double hinge, *a a'*, connecting the two parts, and a sliding piece to extend over and hold the double hinge when in use, substantially as described.

2. The combination of an opera-glass or like instrument with a handle having a clamp composed of hooks, a movable extension or jaw acting with said hooks to clamp the opera-glass, and a thumb-screw to fasten the clamp, as set forth.

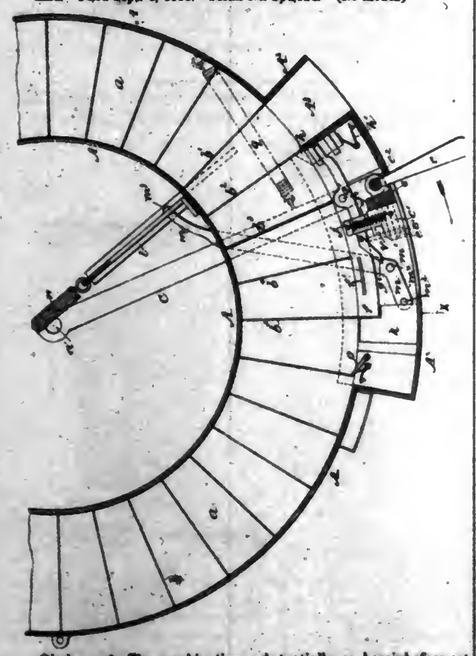
398,278. PAPER-BAG MACHINE. FREDERICK E. PORTER, Baltimore, Md. Filed June 19, 1888. Serial No. 277,537. (No model.)

Claim.—1. The combination of a paper-tube-former plate having tuck-grooves c^2 at each edge, two tucker-plates, E, the front end of

each of which is rounded off and thence to the rear end has a straight longitudinal edge which projects into one of said tuck-grooves, and two links or pivoted arms jointed to the table and to each tucker-plate, whereby the tucker-plates move parallel.

2. In a paper-bag machine, the combination of a cutter-plate, *k*, two rollers, F, the bite or space between which is higher than the plane of the said cutter-plate, an inclined board, *k*, between the cutter-plate and rollers, and a revolving breaker, G, which turns in an inclined plane at right angles with the plane of the said inclined board.

3. In a paper-bag machine, the combination of a breaker-bar and two holding-rollers, F, each provided with a longitudinal raised surface or grip-face, *m*, whereby the paper tube will be gripped during the revolution of the rollers only when the said two raised faces are coincident.



4. In a paper-bag machine, the combination of a breaker-bar, a folder, and paster-plate, and two holding-rollers, F, each provided with a longitudinal raised surface or grip-face, *m*, whereby the paper tube will be gripped during the revolution of the rollers only while the breaker-bar and folder-plate are at work on the paper.

5. In a paper-bag machine, the combination of two holding-rollers, F, each provided with a longitudinal raised surface or grip-face, *m*, a fixed bearing for the lower roller, a movable bearing for the upper roller, two screw-rods, *o*, connected by a bridge-bar, *o'*, a central rod, *n'*, attached to the upper bearing and passed through the said bridge-bar and having a nut, and a spring, p^3, pressing upon the upper bearing, for the purpose set forth.

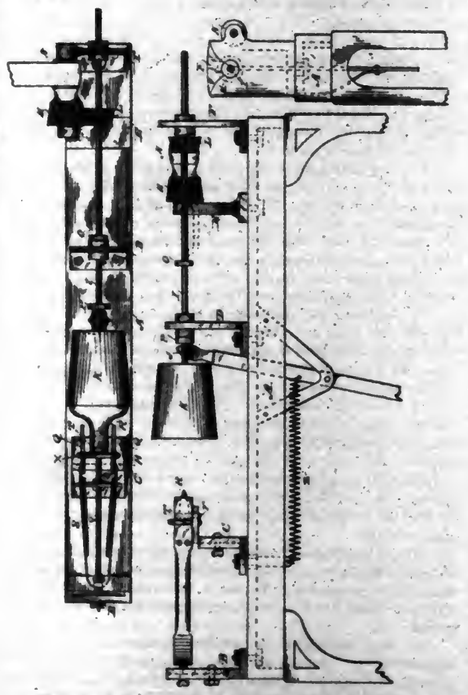
6. In a paper-bag machine, the combination of a folder-plate, *f*, and a paster-plate, *u*, both carried by the same pivoted arms or yoke, H, as set forth.

7. In a paper-bag machine, the combination of a paste-receptacle, I, roller J, a rock-shaft, H', arms or yoke H, carried on the said rock-shaft, a folder-plate rigidly fixed to the said arms or yoke, and a paster-plate, *u*, on a cross-bar which is pivoted on the same arms or yoke.

398,279. APPARATUS FOR DELIVERING GOODS IN EXCHANGE FOR COIN. EDWARD POWELL, Newtown, County of Montgomery, England. Filed Sept. 3, 1888. Serial No. 284,921. (No model.)

Claim.—1. The combination, substantially as hereinbefore set forth, of the casing, the goods-carrier having partitions or dividing plates, the operating-arm, the coin-holder carried thereby, and the locking mechanism operated by a coin in the coin-holder to engage with the goods-carrier and move it forward with the operating-arm.

2. The combination, substantially as hereinbefore set forth, of the casing, the goods-carrier having partitions dividing it into compartments, the operating-arm, the locking-lever carried thereby, the bolts operated by said lever and engaging at times to prevent the forward movement of the goods-carrier and at times to move it forward, and the coin-holder carried by the operating-arm and bringing the coin into engagement with the locking-lever to operate it.



3. The combination, substantially as hereinbefore set forth, of the casing, the goods-carrier contained therein and having the partitions or plates dividing it into a series of compartments, the operating-arm, the locking-lever carried by said arm, the coin-holder secured to the operating-arm, and the guide-plate secured to the casing opposite the coin-holder.

4. The combination, substantially as hereinbefore set forth, of the casing, the goods-carrier contained therein and having partitions or plates dividing it into a series of compartments, the operating-arm, the locking-lever carried by said arm, a coin-holder secured to the operating-arm, the guide-plate secured to the casing opposite the coin-holder, the pawl or dog engaging with the goods-carrier to prevent its backward movement, and the spring for drawing back the operating-arm to its original position.

5. The combination, substantially as hereinbefore set forth, of the casing, the goods-carrier having partitions dividing it into a series of compartments, the pusher, the operating-arm, and connections between the pusher and the operating-arm, whereby the pusher is forced into a compartment for the delivery of goods from the carrier.

6. The combination, substantially as hereinbefore set forth, of the casing, the goods-carrier, the operating-arm, the lever *m*, engaging with the pusher, and the forked arm on the handle *c*, pivoted to the operating-arm and engaging with the lever *m*.

398,280. MACHINE FOR FINISHING BOTTLES. MAURICE M. POWELL, Kerrtown, Pa. Filed Jan. 20, 1888. Serial No. 261,253. (No model.)

Claim.—1. In a machine for finishing open-mouth vessels, the combination of a holder for the vessel, suitable means for revolving the same, a stationary bearing for the end of the vessel, consisting of a disk mounted upon a spindle, and spring forming-plates for finishing the exterior of the neck of the vessel, substantially as described.

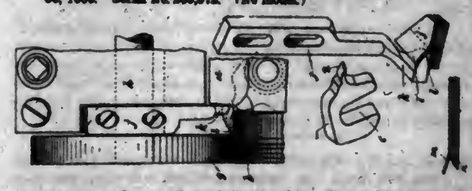
2. In combination, a clamp for holding the vessel to be finished, suitable means for revolving the same, a stationary bearing for the opposite end of the vessel, a centering-point on said bearing for directing the vessel to its seat thereon and for finishing the interior of the neck, and spring forming-plates, normally open, adapted to be compressed by hand to be brought into contact with the vessel to finish the same, substantially as described.

3. In a machine for finishing open-mouth vessels, a suitable base-plate, a shaft operated in suitable standards thereon, beveled gears in connection with a power device for rotating said shaft, a clamp for the articles to be acted on, secured to said shaft, a pivoted lever, J, for throwing said shaft out of connection positively, automatic means for engaging said shaft, a bearing-disk for the end of the vessel, and spring forming-plates to act upon the same.

4. In combination with a revolving clamp, a central spindle with its collar and the spring forming-arms, the arms and the spindle being mounted on vertical adjustable standards, all substantially as described.

5. In combination, a longitudinally-movable clamp for holding one end of the vessel to be finished, a bearing for the other end of said vessel situated opposite the clamp, and neck-forming mechanism situated at the bearing opposite the clamp, substantially as described.

398,281. FENCE-MACHINE. ROSS E. REX, Pueblo, Colo. Filed Dec. 3, 1888. Serial No. 292,845. (No model.)



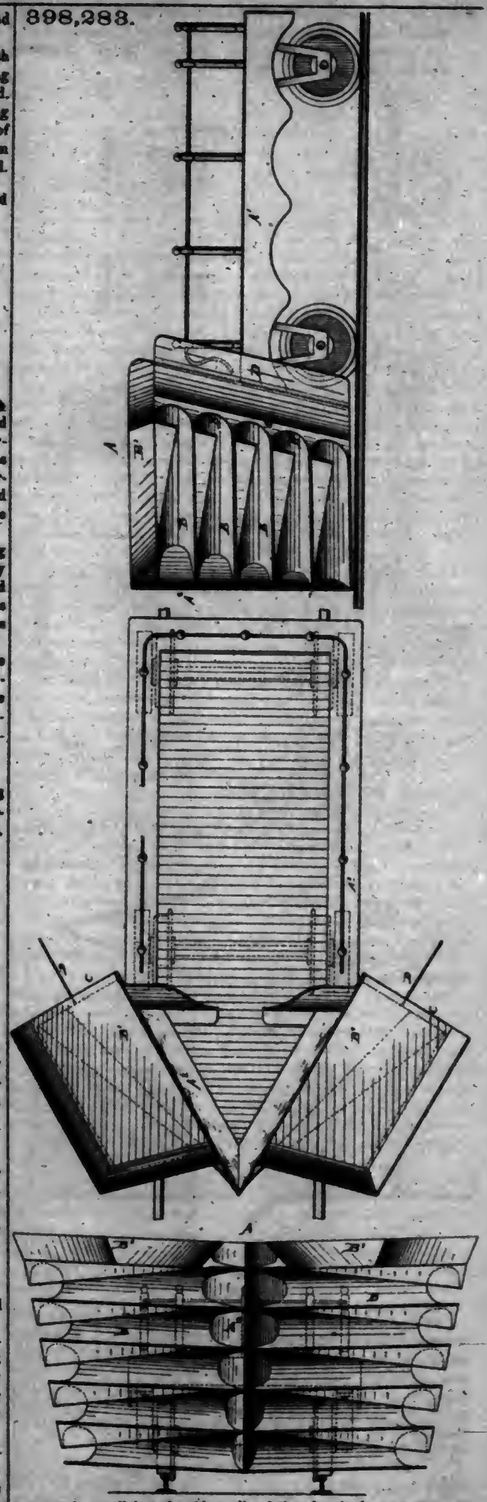
Claim.—1. A twisting-spindle for fence-making machines and analogous purposes, adapted to be revolved by suitable gearing, having an enlarged slotted tubular head, in combination with two plates removably held in said slotted head, one of which has a series of apertures therein opening out from one side thereof, and the other adapted to bear against said apertured side of the aforesaid plate and close the opening of the apertures, substantially as described.

2. A tension device for fence-making machines, comprising two parallel horizontally-arranged grooved rollers extending entirely across the machine-bed, and having adjustable blocks or strips located above and below said rolls and engaging with grooves near the ends thereof, adapted to regulate the tension of said rolls, substantially as described.

3. A winding-roll for fence-making machines, having a double ratchet on one end thereof, in combination with double levers or extended pawls having metallic plates on their front ends bent into shape from a single piece of sheet metal to form an extended guard to engage with the inside of each ratchet, and a downward-bent lip to engage the teeth of said ratchet, substantially as described.

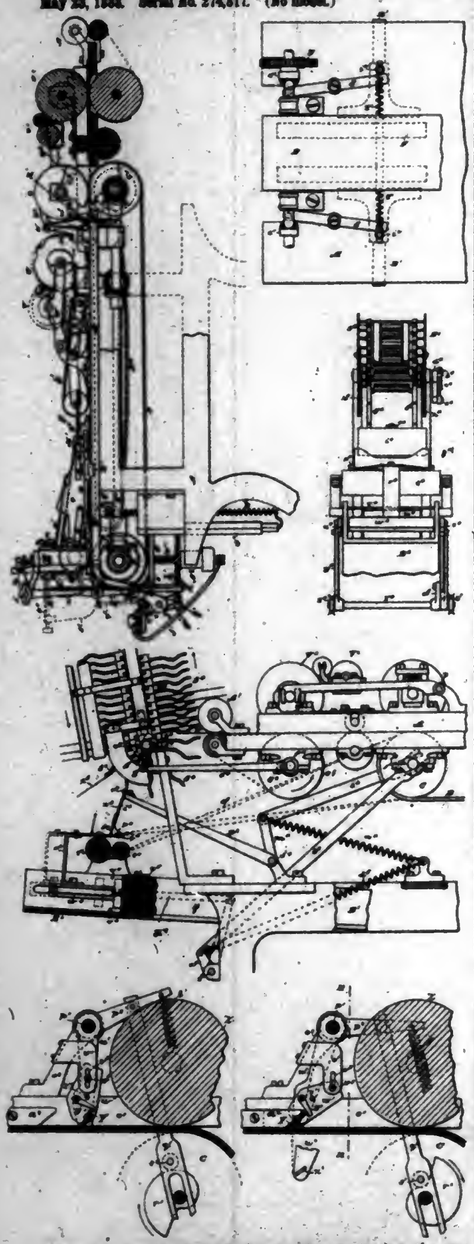
398,282. MACHINE FOR FEATHER-EDGING SOLES FOR BOOTS AND SHOES. AUSTIN B. RUDDOCK and EPHRAIM R. E. BAILEY, Haverhill, Mass., assignors to T. S. Ruddock & Son, same place. Filed Oct. 30, 1888. Serial No. 289,572. (No model.)

Claim.—1. In a feather-edging machine, the combination, with the work feeding and supporting rolls, of the guide formed to enter the channel cut in the edge of the sole and keep the channel-flap elevated and the curved or slanted knife arranged behind said guide and formed to cut from the bottom of the channel to and through the flesh side of the sole, and to remove a part of the outer edge of said flesh-sole, all arranged and operating as described.



2. In a feather-edging machine having suitable work supporting and feeding devices, the guide having a projection to enter the channel in the sole and elevate the flap thereof, combined with the knife having a curved and beveled cutting-edge, and arranged behind the guide and adapted to enter the work below the flap and feather-edge the sole, substantially as described.

398,283. SNOW-PLOW. JOSEPH REBHANN, Union, N. J. Filed Oct. 10, 1888. Serial No. 287,706. (No model.)



Claim.—1. A snow-plow for railways, consisting of a centrally-tapering cutter having a continuous vertical cutting-edge at its front end, and a number of superposed cutter-blades extending laterally from said cutter at an inclination to the axis of the cutter and being outwardly curved at their upper and rear ends, substantially as set forth.

2. A snow-plow formed of a supporting-frame having a centrally-tapering cutter, and a series of superposed cutter-blades that extend from the cutter laterally at a suitable angle of inclination to the axis of the same, said cutter-blades being bent over or curved at their upper rear ends and provided with guard-plates or wings at their outer ends parallel to the side walls of the plow-body or cutter, substantially as set forth.

398,283.

398,284. MACHINE FOR MAKING ENVELOPES OR SIMILAR RECEPTACLES. GERARD SICKELS, Jr., Brooklyn, N. Y., assignor of one-half to Abel T. Howard, same place. Filed Jan. 29, 1887. Renewed May 23, 1888. Serial No. 274,817. (No model.)

Claim.—1. In a blank or sheet separating mechanism, the combination, with a blank-platform, of two presser-feet, c c', mechanism, substantially as described, for imparting alternate oscillations or vibrations to same, a sucker, i, pivotally attached to presser-foot c' and connected to an air-exhausting mechanism, and said air-exhausting mechanism, substantially as described, the said pivoted sucker being arranged in the path of said presser-foot c, substantially as and for the purposes set forth.

2. In a blank or sheet feeding mechanism, the combination, with means, substantially as described, for lifting and separating the blank or sheet from the pile, of a vibrating frame, K, curved feeders s s, carried by said frame, a curved guide, u, carried by said frame and its free end resting on the carrying-belt, said carrying-belt, and means, substantially as described, for vibrating said frame K and for driving said carrying-belt, substantially as set forth.

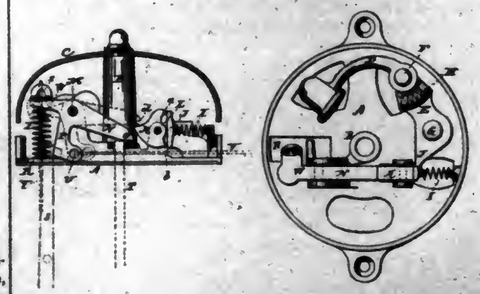
3. In a blank or sheet feeding mechanism, the combination of the blank-platform and means, substantially as described, for upholding it, the alternately-oscillating presser-feet and means, substantially as described, for actuating same, the sucker pivotally connected to one of said presser-feet and adapted to be raised by the other presser-foot, the air-exhausting mechanism, substantially as described, connected with said sucker, and the vibrating feeder and its operative mechanism, substantially as set forth.

4. The combination, with the main carrying-belt B and its drums C, of the shaft L, the pulley M, carried thereby, the frame O, connected to the main frame by links, the pulley M', mounted in frame O, the belt N, carried by pulleys M M', and the spring a', arranged to press belt N down upon the carrying-belt B.

5. The combination, with the main carrying-belt, the folding-blades F, and the lateral folders, of the two endless belts k', arranged over the carrying-belt and in line with the folding-blades, and the guides j' j', for leading the lateral folds of the envelope under the said belts k', substantially as set forth.

6. The combination, with the shaft g', provided with pendent arms u', and an arm, g^3, of means for imparting oscillating movements to said shaft, a tumbler, Y, mounted in slotted bearings in said arms u', the fixed brackets v', the plates w', connected to said brackets by studs and slots, as described, and said tumbler journaled in said plates w', and a latch, y', pivotally mounted on the plates w', and arranged to hook over the edge of the tumbler, substantially as set forth.

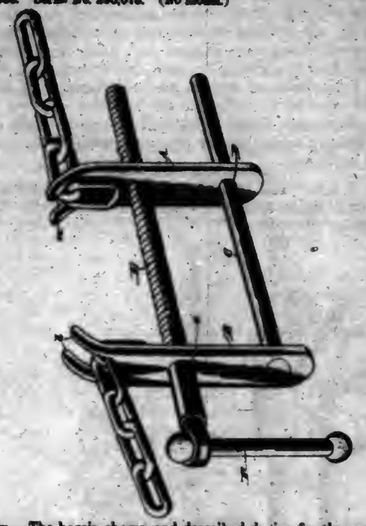
7. The combination, with the machine-bed, provided with grooves a^2 to receive them, of the endless chains D'', arranged under the carrying-belt, the sprocket-roller E'', over which said chains pass, the main carrying-belt B, and its drums C C, and gearing, whereby said belt and chains are driven in unison, substantially as set forth.



8. The combination of the frame K, provided with a bar, q, the frame K', mounted in frame K on rod p, and provided with concave feeders s s and rollers t, the spring or springs r, connecting frames K and K', the curved guide u, mounted in frame K', and its spring w substantially as set forth.

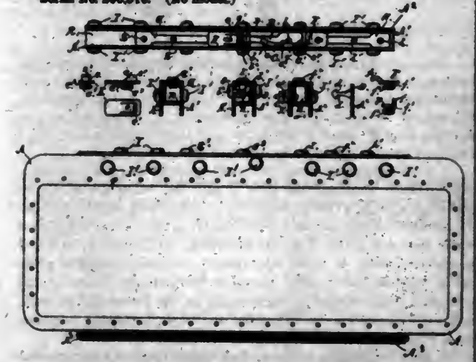
9. The combination, with the carrier B', of the side plates, A^4, lined with plush or similar soft material and arranged at each side of the carrier at the delivery-point, substantially as and for the purposes set forth.

10. The combination, with the carrier B', of the vibrating folder provided with a folder-blade, i^3, and a gage or pusher, o^4, of a reciprocating deflector arranged to deflect the flap of the envelope across the path of the folder-blade and rollers t^4, arranged substantially as set forth.



11. The combination, with the intermittently-moving carrier B', of the vibrating hoe-like folder, the reciprocating deflector, comprising the bar p^4 and plate o^4, the rotating rollers t^4, arranged under said deflector and the folder-blade, the box or receptacle E', arranged below said rollers, and the reciprocating ram n^4, arranged in said box, substantially as and for the purposes set forth.

398,285. GONG-BELL. WILLIAM E. SPARKS and HENRY J. LABOLT, New Haven, Conn., assignors to Sargent & Company, same place. Filed Dec. 24, 1888. Serial No. 294,595. (No model.)



Claim.—The combination of a base, a bell supported thereon, open side toward the base, an operating-lever hung upon the base and so as to swing in a plane at right angles thereto, the said operating-lever consisting of three arms, N P W, each of said arms being adapted to be engaged with mechanism for imparting the swinging movement to said lever, and a hammer mechanism between the hammer and said operating-lever, substantially as described, and whereby the swinging movement of the lever will impart a corresponding swinging movement to the hammer.

398,286. LOAD-BINDER. JOHN S. STARR, Dubois, Pa. Filed Nov. 6, 1888. Serial No. 290,073. (No model.)

Claim.—The herein shown and described device for the purpose specified, composed of the jaws A and B, having their ends slotted and curved inward or toward one another, the guide-bar projecting from the side of one jaw and working in an opening in the other jaw, and the screw passing loosely through one jaw and screwing in an opening in the other jaw, substantially as described, and for the purpose set forth.

398,287. LOCKING-CLASP FOR TRAVELING-BAGS, POCKET-BOOKS, &c. CHARLES A. STARK, Buffalo, N. Y. Filed Nov. 12, 1888. Serial No. 290,516. (No model.)

Claim.—1. In a locking-clasp, the recess R in the upper edge of the portion A', having in its faces or walls the slots a, a', a^3, and a^3, and the holes for the passage of the push-pins g' and k', and on its outer faces or walls the system of rosettes or bosses I and I', similar in size and form to the push-buttons b^3, c^3, c^3, and f^3, and its interior adapted to contain the following elements: the mainspring B, riveted to the top at b, adapted to engage and hold the catch-lug D, and operated by the pin b' through the slot a by means of the push-button b^3, the lever C, having the arms c and c' and the spring c^3, pivoted to the side at c^3, the arm c adapted to engage and hold the catch-lug D, the arm c' adapted by means of the spring c^3 to engage constantly the cam C', attached to the pin c^3, and through the second slot, a, operated by the push-button c^3, the central slide-bolt, E, adapted to lock the mainspring B to the catch-lug D, and operated by the pin c^2 through the slot a^2 by means of the push-button c^2, the slide-bolt F, having the side projection, f, adapted to engage the arm c', and the spring c^3, locking the arm c of the lever C to the catch-lug D, and operated by the pin f' through the slot a^3 by means of the push-button f^3, the locking-spring G, riveted to the top at g, adapted to lock the central slide-bolt, E, and operated by the push-pin g' from the outside, where it forms the center of a rosette, and the locking-spring H, riveted to the top at h, adapted to lock the slide-bolt F, and operated by the push-pin h' from the outside, where it forms the center of a rosette, with the right-hand portion, A^3, provided with the catch-lug D, having the notches d and d', adapted to engage, respectively, through the slot a', the mainspring B, and the arm c of the lever C, holding the portions A' and A^3 firmly together or closed, substantially as set forth, and for the purpose described.

3. The combination, in a locking-clasp, of the portions A' and A^3, as described, with the mainspring B, riveted to the top of the recess R at b, operated by the pin b' through the slot a by means of the push-button b^3, and adapted to engage the notch d in the upper edge of the catch-lug D, holding the portions A' and A^3 firmly closed, substantially as set forth.

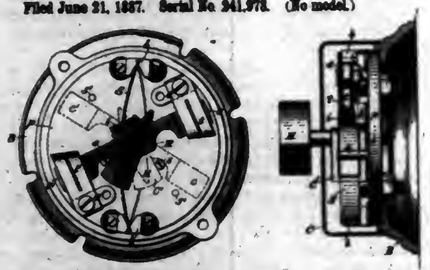
4. The combination, in a locking-clasp, of the mainspring B in the recess R, attached to the portion A' at b, and operated by the pin b' through the slot a by means of the push-button b^3, with the catch-lug D, having notches d and d' and attached to the portion A^3, and the notch d, adapted to engage the mainspring B, holding the portions A' and A^3, firmly closed, substantially as described.

5. The combination, in a locking-clasp, of the lever C, having the arms c and c' and the spring c^3, pivoted against a side of the recess R, as at c^3, the arm c adapted to engage the notch d' in the catch-lug D, the spring c^3 resting on the rear end of the mainspring B, adapted to keep the arm c constantly in the notch d', and the arm c' adapted to engage, and by means of the spring c^3 be kept constantly against, the cam C', with the catch-lug D, having the notches d and d', the notch d', adapted to engage and hold the arm c of the lever C, keeping the portions A' and A^3 firmly closed, substantially as set forth, and for the purpose specified.

6. The combination, in a locking-clasp, of the mainspring B and the catch-lug D, both as above described, with the lever C, having the arms c and c' and the spring c^3, and pivoted to a side in the recess R, as at c^3, the arm c adapted to engage the notch d' in the catch-lug D, the spring c^3 resting on the rear end of the spring B, adapted to keep the arm c constantly in the notch d', and the arm c' adapted to engage, and by means of the spring c^3 being kept constantly against, the cam C', together with the mainspring B, engaging the notch d, furnishing means for doubly securing or holding the portions A' and A^3 firmly closed, all substantially as specified, and for the purpose set forth.

7. The combination, in a locking-clasp, of the lever C, having the arms c and c' and the spring c^3, pivoted against a side of the recess R, as at c^3, said spring c^3 resting on the rear end of the spring B, adapted to keep the arm c' constantly against the cam C', with the cam C', attached to the pin c^3, furnished with the button c^3, adapted to be used either as a push or turn button to detach the arm c of the lever C either permanently or temporarily from the notch d' of the catch-lug D, substantially as set forth, and for the purpose described.

8. The combination, in a locking-clasp, of the mainspring B, riveted to the top of the recess R at b, furnished with mechanism to operate the same, and adapted to engage the notch d in the catch-lug D, and holding it with the slide-bolt E, having the projection e, furnished with the notch d', adapted to engage the forward end of the mainspring B, preventing it from being depressed or detached from the notch d in the catch D, and operated by the pin c^2 through the slot a^2 by the push-button c^2, substantially as set forth, and for the purpose specified.



9. The combination, in a locking-clasp, of the mainspring B, riveted to the top of the recess R at b, furnished with mechanism to operate it, and adapted to engage the notch d in the catch-lug D,

holding the same, the slide-bolt E, having the projection *e*, and in it the notch *e'*, adapted to engage the forward end of the spring B, preventing it from being depressed and supplied with mechanism to operate it, with the locking-spring G, riveted to the top of the recess R at *g*, its forward end adapted to engage the rear end of the slide-bolt E, and when behind it locking the same, and furnished with the push-pin *g'*, passing through the top of the recess R, its extremity rounded and adapted to form a nipple or center to a rosette, all substantially as described, and for the purpose set forth.

10. The combination, in a locking-clasp, of the lever C, having the arms *c* and *c'* and the spring *c³*, pivoted against a side of the recess R, as at *c²*, and furnished with mechanism to operate the same, with the slide-bolt F, having the downward and forward side projection, *f*, adapted to form a wedge between the arm *c'* and the spring *c³*, adapted to keep the arm *c* in engagement with the notch *d'* of the catch-lug D, and operated by the attached pin *f'* through the slot *e³*, and joined to the push-button *f³*, substantially as and for the purpose set forth.

11. The combination, in a locking-clasp, of the lever C, having the arms *c* and *c'* and the spring *c³*, and pivoted against a side of the recess R, as at *c²*, furnished with mechanism to operate it, and the slide-bolt F, having the downward and forward side projection, *f*, forming a wedge between the arm *c'* and the spring *c³* of the lever C, and adapted to keep the arm *c* of the lever C in engagement with the notch *d'* of the catch-lug D, and furnished with mechanism to operate the same, with the locking-spring H, riveted to the top of the recess R at *h*, its forward end adapted to engage the rear end of the slide-bolt F, and when behind it locking the same, and furnished with the push-pin *h'*, passing through the top of the recess R, its extremity rounded and adapted to form a nipple or center to a rosette, all substantially as set forth, and for the purpose specified.

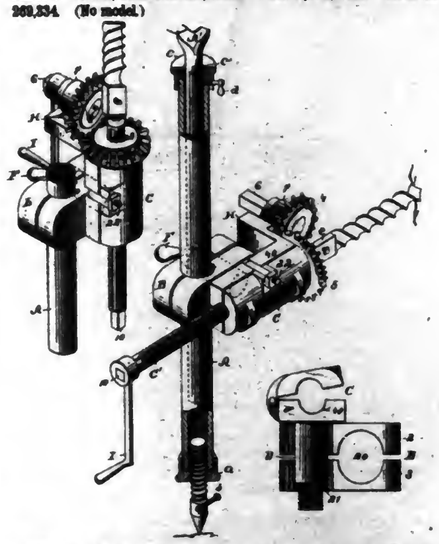
398,288. SWITCH FOR ELECTRIC CIRCUITS. CLARENCE C. STERLING, Hartford, Conn., assignor to Charles E. Dustin, same place. Filed June 21, 1887. Serial No. 241,973. (No model.)

Claim.—1. A switch for an electric circuit, embodying a spring plate secured at each end, a double crank embracing and directly acting upon said spring, and circuit-completing means operated by said spring for controlling electric terminals.

2. A switch for an electric circuit, consisting of a spring secured at each end and mounted upon an insulating-base, a double crank swiveled in said base and embracing said spring and acting directly upon it, circuit-completing means operated by the latter, and circuit-terminals arranged in co-operative position thereto and controlled by the aforesaid circuit-completing means.

3. A switch for electric circuits, embodying, essentially, an elastic spring secured at each end, circuit-controlling devices operated by said elastic spring, and a handle embracing and directly manipulating the latter to govern the electrical connections.

4. A switch for electric circuits, consisting of an elastic spring secured at each end, a handle embracing said spring, a circuit-completing arm actuated solely by the movements of said spring, and circuit terminals arranged in the path of said circuit-completing arm.



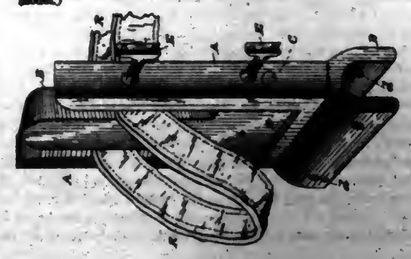
5. A switch for an electric circuit, consisting of an elastic spring secured at each end, a double crank swiveled in an insulating-base embracing and directly governing said spring, an arm carrying circuit-completing devices journaled on the pivot of said crank, directly actuated by the aforesaid spring, and circuit-terminals arranged in co-operative position to said circuit-completing devices upon the arm for controlling the circuit-terminals when the spring is manipulated.

6. A switch for an electric circuit, consisting of an elastic spring secured at each end, a handle embracing said spring, an insulating-arm carrying circuit-completing devices at the ends actuated solely by the movements of said spring, and two sets of circuit-terminals arranged in the path of said arm.

7. A switch consisting of an elastic spring secured at each end and mounted upon an insulating-plate upon a base, a double crank swiveled upon said plate and embracing said spring for directly operating the same, with a handle upon its outer end for manipulation, circuit-completing means controlled by said spring, electric terminals for co-operation with said circuit-completing means, and a casing for housing the apparatus.

8. A switch for electric circuits, consisting of an elastic spring secured at each end and mounted upon an insulating-plate upon a base, a double crank swiveled upon said plate and embracing said spring for directly operating the same, with a handle upon its outer end for manipulation, an arm carrying circuit-completing means at each end operated by said spring and journaled about the pivot of the aforesaid crank, electric terminals for co-operation with said circuit-completing means upon the arm, and a casing for the apparatus carried by the base.

398,289. COAL-DRILLING MACHINE. CHARLES O. SUMNER and JAMES J. PULLEN, Scammonville, Kans. Filed Apr. 2, 1888. Serial No. 269,534. (No model.)

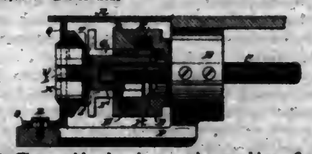


Claim.—1. In a drilling-machine, the internally-threaded feed-box attached to the externally-threaded wrist-bolt D, in combination with separated jaws 2 and 3, which are provided with passages 20 and 21, said passage 21 being located at right angles to the first-named passage, hand-nut F, which is located on said threaded wrist-bolt, and a suitable standard, substantially as specified.

2. In a drilling-machine, the combination of the two-part internally-threaded feed-box, one part of said box being provided with lateral extension H, which is formed integral therewith, shaft 6, mounted in a suitable bearing carried by said extension, bevel-wheel 4, mounted on the inner end of this shaft, the drill-stock, bevel-wheel 5, feathered on said drill-stock to mesh with wheel 4, externally-threaded wrist-bolt D, separate jaws 2 and 3, provided with passages 20 and 21, the passage 21 being located at right angles to the first-named passage, hand-nut F, located on said threaded wrist-bolt, a suitable standard, and a hand-crank, substantially as specified.

3. In a coal-drilling machine, the tubular standard A, constructed of piping and screw-threaded at opposite ends, in combination with perforated caps *a* and *c*, which are internally threaded and located on the threaded ends of said standard, extension-rod A', located in perforation *c'* in cap *c* and provided with a fish-tail at its outer end, set-screw *d*, which is threaded through said standard and engages said bar, and jack-screw *b*, located in the perforation of cap *a*, substantially as specified.

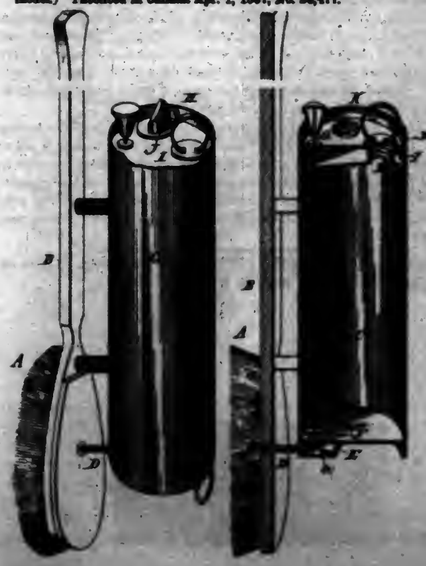
398,290. REIN-HOLDER FOR WAGONS. PETER S. TRAMBLE, Delaware Water Gap, Pa. Filed Jan. 23, 1888. Serial No. 261,811. (No model.)



Claim.—1. In a holder for reins, the combination, with the longitudinal prongs A A, having the transverse flat connection *a*, substantially at right angles thereto, of a tongue or wedge, B, pivoted between the prongs, with its lower end slightly above the connection *a*, the end and sides of the wedge being substantially parallel to the adjacent connection and sides of the prongs, whereby the reins are gripped when inserted and the wedge is kept accessible for use, as set forth.

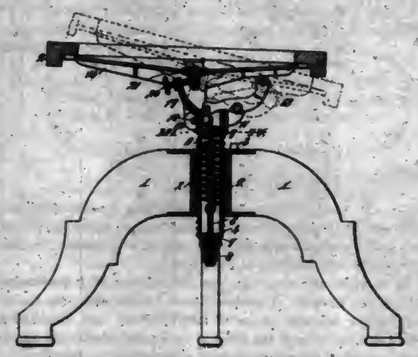
2. In a rein-holder, the combination, with the two jaws A, having a square connection, *a*, at bottom, of a tongue or wedge, B, having a head, *b*, with a square bottom, pivoted between the jaws, and slightly above and parallel to the connection *a*, by means of a pin passed through said jaws and wedge, whereby the wedge is free to move backward and forward until the square edges of the end contact with the connection between the jaws on each side to limit the forward and rearward movement, as explained.

3. The combination, with the parallel straight-sided prongs A, of the tongue or wedge B, having offsets, and a rivet passed through the prongs and end having offsets, whereby a space is left on each side for the reins, substantially as and for the purposes set forth.



398,291. SHUTTLE-OPERATING MECHANISM FOR SEWING-MACHINES. JAMES TRIPP, New York, N. Y. Filed May 31, 1888. Serial No. 275,642. (No model.)

Claim.—1. The combination, in a sewing-machine, of a shuttle-shaft, two plungers mounted upon the same and each provided with two or more pins to engage and carry the shuttle, with a shuttle provided with holes to receive the plunger-pins, a face-plate to hold the shuttle against the thrust of its carrying-pins, and a cam for alternately reciprocating the plungers to and from engagement with shuttle to permit the loop to pass, the plungers and the cam being arranged so that one of the plungers will at all times be advanced with its pins engaging and carrying the shuttle.



2. In a sewing-machine, the combination, with the shuttle-shaft carrying plungers which are each provided with two or more shuttle-supporting pins, a shuttle provided with holes to receive the plunger-pins, a shuttle face-plate, a cam constructed and arranged to alternately hold one of the plungers in engagement with the shuttle while the other plunger is being withdrawn from the shuttle to let the loop pass its pins and again inserted therein, and a cushion arranged between the shuttle and the plungers.

398,292. ATTACHMENT FOR FLESH OR BATH BRUSHES. WILLIAM J. TURRINGTON, Aurora, Ontario, Canada, assignor to William Stevenson, same place. Filed June 20, 1887. Serial No. 241,881. (No model.) Patented in Canada Apr. 1, 1887, No. 26,477.

Claim.—The convertible brush and sprinkler described, consisting of the brush, the water-reservoir connected therewith and provided at one end with openings L and cap K, the plug I, and rose J, all arranged and operating substantially as described.

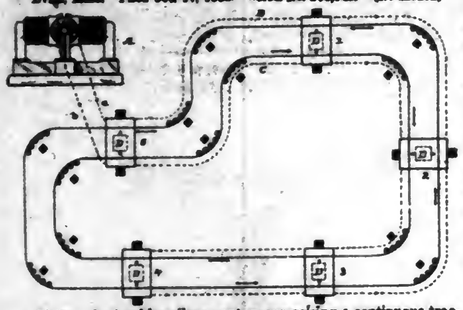
398,293. OFFICE-CHAIR. CHARLES H. TYLER, St. Louis, Mo. Filed May 3, 1887. Serial No. 236,979. (No model.)

Claim.—1. In a chair, the combination of a base, a hollow screw-stem supported thereon, a spider or support pivoted to said stem, a seat carried by said spider or support, a spring within the said hollow stem, and a lever pivoted to said stem, having one end bearing on the spider or support and its other end connected to said spring, substantially as set forth.

2. The combination of a chair-base, a hollow screw-stem supported thereon, a spider or support pivoted to said stem, a seat carried by said spider or support, an extensible spring within said hollow stem, having its lower end fixed to the stem, and a lever having one end connected to the spring and operated by the movement of the chair-seat, substantially as described.

3. The combination of a chair-base, a hollow screw-stem supported thereon, a spider or support pivoted to said stem, a seat carried by said spider or support, a lever pivoted to said stem and having at one end an anti-friction roller bearing against said spider or support, and an adjustable and extensible spring within the hollow stem connected to the other end of said lever and adapted to operate substantially as set forth.

4. The combination of a chair-base, a hollow screw-stem supported thereon, a spider or support pivoted to said stem, a seat carried by said spider or support, a spring within the hollow screw-stem, a lever having one end connected to the spring and operated by the movement of the chair-seat, a screw-rod secured to the lower end of said spring and projecting below the screw-stem, and a nut for adjusting said rod, and consequently the tension of the spring, substantially as set forth.



5. The combination of the chair-base, a screw-stem mounted thereon, an extensible spring connected to said stem, a seat, a spider supporting the seat and pivoted to the stem, a set-screw mounted on the stem and stopping the spider in one direction, and a lever pivoted to the stem, bearing under the spider at one end and connected to the spring at the other, and adapted to come in contact with the spider and stop it in the other direction, substantially as set forth.

6. The combination of the chair-base, a screw-stem mounted thereon, an extensible spring connected to said stem, a seat, a spider supporting the seat and pivoted to the stem, a set-screw mounted on the stem and stopping the spider in one direction, a lever pivoted to the stem, bearing under the spider at one end and connected to the spring at the other, and a strap on the spider, wherewith the spring end of the lever comes in contact to deaden the blow in the other direction of movement of the spider, substantially as set forth.

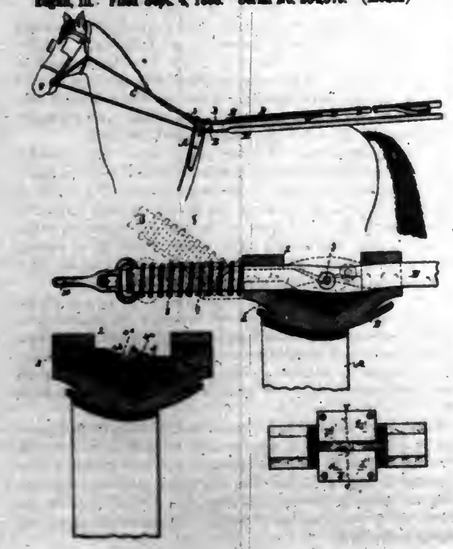
7. The combination of base 1, screw-stem 4, having arm 19, set-screw 20 in said arm, spider 14, pivoted to stem 4 and adapted to be stopped by set-screw 20, extensible spring 5, connected to stem 4, lever 12, pivoted to stem 4, connected to said spring at one end and supporting the spider at its other, and strap 21 on the spider, with which the spring end of said lever is adapted to contact, substantially as set forth.

8. The combination of base 1, screw-stem 4, set-screw 20 thereon, spider 14, pivoted to stem 4, adapted to be stopped by set-screw 20, and having notches 22, extensible spring 5, connected to stem 4, lever 12, pivoted to stem 4, connected to said spring at one end and supporting the spider at its other, and strap 21 in notches 22 on the spider, with which the spring end of the lever is adapted to contact, substantially as set forth.

398,294. CABLE-RAILWAY SYSTEM. CHARLES J. VAN DEPOELE, Lynn, Mass. Filed Oct. 17, 1888. Serial No. 288,343. (No model.)

Claim.—1. A cable-railway system comprising a continuous traction-cable and a plurality of power-stations located along the line of the cable, and a motive-power device at each of said stations for propelling the cable, substantially as described.

2. In a cable-railway system, the combination of a continuous traction-cable, a plurality of power-stations located along the line of the cable, and a separate source of motive power, and mechanism connecting said power with the cable at each power-station for simultaneously imparting movement thereto, substantially as described.



3. In an electric cable-railway system, the combination of a traction-cable, two or more separate sets of winding-drums engaging said cable at different points along its line, a source of electricity, and electro-dynamic motors in circuit with said source of electricity and connected to the winding-drums for supplying motive power to said drums to move the cable, substantially as described.

4. An electric cable-railway system, comprising a traction-cable, two or more power-stations located at suitable intervals along the line of said cable, winding-drums engaging the cable, and means for simultaneously operating said winding-drums located at each of said stations, substantially as described.

5. In an electric cable-railway system, the combination of a traction-cable, power-stations located at suitable intervals along the line of the cable, a conduit for the cable formed with openings along its bottom where it passes the power-stations, and winding-drums having grooved peripheries located below each downward opening in the conduit, substantially as described.

6. In an electric-railway system, the combination, with a traction-cable, of power-stations located at suitable intervals along the line of said cable, a conduit for the cable, said conduit being formed with an opening or slot along its bottom portion where it crosses each power-station, winding-drums G H, and guiding-sheaves *g f*, and a suitable motor, as D, mechanically connected to the winding-drums, substantially as described.

398,295. HARNESS ATTACHMENT. FRANCIS WAYLAND, Waukegan, Ill. Filed Sept. 4, 1888. Serial No. 284,579. (Model.)

Claim.—1. In a check-controlling device, the combination of a strap, D, for controlling the check, a fixed plate, B, having a socket which embraces the strap to guide it, a notched cam on the plate, and a projection on the strap which engages the cam and is deflected in opposition to the elasticity of the strap and opposes the forward movement of the strap by engaging behind the notch in the cam when drawn past it, substantially in the manner explained.

2. In a check-controlling device, the combination of a strap, D, for controlling the check, a fixed plate, B, having a socket, 1, the ends of which embrace the strap and prevent its movement transversely, a cavity, 3, where a portion of the strap has play transversely in at least one direction, and a cam located in the cavity of the socket, a projection or pin on the strap engaging the cam, whereby the projection and strap are deflected by the cam and the pin opposes forward movement by springing up and engaging behind a notch, 4^a, in the cam when drawn past it, and a spring for projecting the strap forward, substantially in the manner herein set forth.

3. In a check-controlling device, the combination of the strap D, connected to the check, a fixed plate, B, having a socket in which the strap engages, and a spring, 8, operating at one end on the strap, and having a fixed bearing for its other end, whereby it tends to project the strap forward, for the purposes explained.

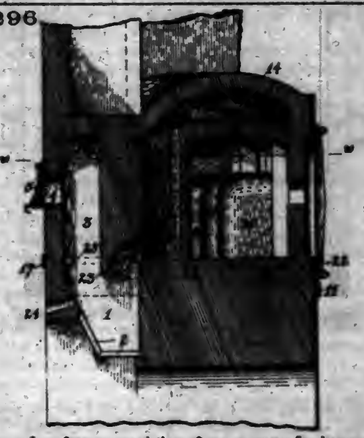
4. In a check-controlling device, the combination, with the saddle, of a socket on the saddle, a strap working in the socket and having a rivet or pin and a projecting spring, and a cam, 4, having a notch, said cam being located beneath the middle line of the socket, whereby the strap is deflected and its pin forced into engagement with the notch, as explained.

5. In a check-controlling device, the combination, with the saddle, of socket-plate B, having socket 1, side channels, 2, cams 4, strap D, and a projecting spring, 8, said cams being located in line with the strap and guides, and having beveled faces at an angle to the strap and guides, and the strap having projection 7 engaging the cams, whereby the strap is depressed and then raised, for engaging and releasing, as explained.

6. In a check-controlling device, the combination of the strap D, connected to the check C, and having a projection, 7, a fixed plate, B, having a socket in which the projection 7 engages by a rearwardly-opening notch, and a spiral spring, 8, carried by the strap and confined between the plate and check, whereby it tends to project the strap, and thereby keeps the strap in engagement in the socket, in the manner explained.

7. In a check-controlling device, the combination of the strap D for controlling the check, the plate B, having socket 1, cavity 3, and plates 6, carrying cams located in said cavity, a pin, 7, passing transversely through the strap and engaged by the cams, and a projecting spring, substantially as herein set forth.

8. In a check-controlling device, the combination of the strap D, attached to the check, a fixed plate, B, having a socket in which the strap engages, and a beveled end, 9, and a spring, 8, carried and confined at one end on the strap and seating at the other on the inclined end 9, said socket and strap having corresponding engaging notch and pin, whereby it gives an upward set to the check and affords an elastic tension on the animal's mouth, in the manner explained.

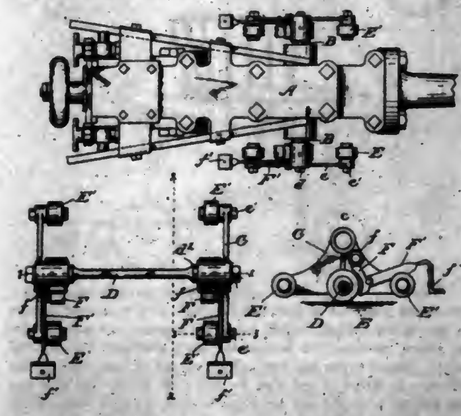


9. The combination, with the saddle, of the plate B, having socket 1, side channels, 2, hollow 3, and plate 6, carrying cam 4 over said hollow, said cam lying out of line with the socket, and having bevel-faces 4^b 4^c and notch 4^d, a strap, D, controlling check C, and having a pin, 7, guided by and engaging the cams 4, and a projecting spring, 8, all arranged substantially as set forth.

10. In a check-controlling device, the combination of the socket-plate, a check-controlling strap working in the socket-plate, a pin or projection on the strap, a two-sided cam in the socket adapted to guide the projection on one side when drawn in and on the opposite side when let out, said cam having an engaging-notch on one side, and a projecting spring, arranged in the manner and for the purpose explained.

398,296. GLASS-POT FURNACE. ADOLF WEYER, Atlanta, Ga. Filed May 30, 1887. Serial No. 239,906. (No model.)

398,296

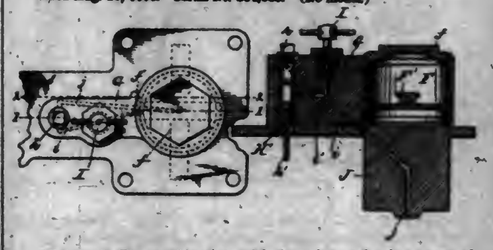


Claim.—In a furnace consisting of one or more fire-boxes and a reverberatory chamber, the combination of air-flues in the wall of the side opposite the fire-box, registers at the outer end of these flues, the heating-chamber over the arched roof of said furnace, the columns which extend from said chamber to the bench near the ducts from the fire-boxes, these columns containing hot-air ducts which open into the reverberatory chamber just above the bench, and the bench, substantially as shown and described, for the purpose specified.

398,297. IRONING-BOARD AND STEP-LADDER. JOHN H. WHELER, Broadway, Va. Filed July 21, 1888. Serial No. 280,623. (No model.)

Claim.—The combination of the legs or supports A, the cross-pieces B, which project at their ends beyond the sides of the legs, the side bars, between which the legs or support are pivoted, the ironing-board pivoted at one end between one of the pair of legs, the hooks I, the brace-rod fastened to the board at one end and hooked at the other, and the eyes in which the hook catches, substantially as shown.

398,298. MINING-MACHINE. ERWIN W. WHITCOMB, Chicago, Ill., assignor to George D. Whitcomb, same place. Filed Aug. 10, 1888. Serial No. 282,471. (No model.)

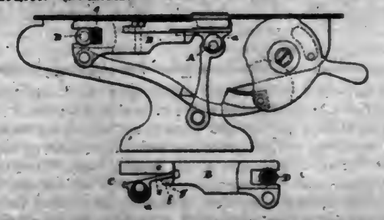


Claim.—1. The combination, with the mining-machine A and its central axle, B, of the brackets C, mounted loosely on said axle, and each provided with a central main supporting-roller, E, and with an auxiliary roller, E', at each end, said main roller projecting farther downward than the auxiliary rollers, substantially as and for the purposes specified.

2. The combination, with the mining-machine A and its central axle, B, of the brackets C, mounted loosely on said axle, the transverse rod D, connecting said brackets, the main supporting-rollers E, mounted on said rod, and the auxiliary supporting-rollers E', mounted at the ends of each bracket, said supporting-rollers having their axes of revolution in the same plane, and the auxiliary rollers being of smaller diameter than the main supporting-rollers, substantially as and for the purposes specified.

3. The combination, with the mining-machine and its supporting brackets and rollers, of the brakes F, pivoted on the brackets, springs *f* for holding said brakes normally away from the rollers, and operating-rods F', provided with treadles or foot-rests *f'*, substantially as and for the purposes specified.

398,299. LUBRICATOR FOR MINING-MACHINES. ERWIN W. WHITCOMB, Chicago, Ill., assignor to George D. Whitcomb, same place. Filed Aug. 28, 1888. Serial No. 284,060. (No model.)



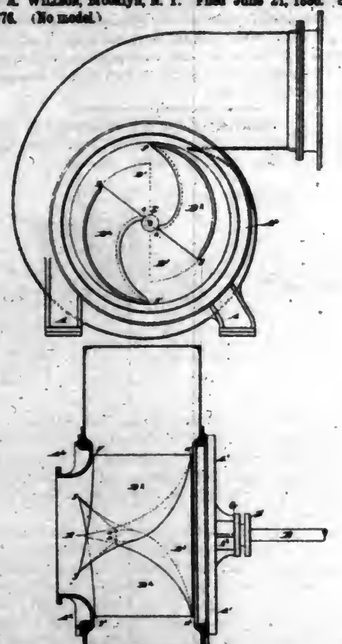
Claim.—1. The combination, with the valve and valve-motor of a pneumatic mining-machine, of a lubricator provided with an oil-chamber having a piston located therein, and with an air duct or passage to supply compressed air to operate said piston, and an oil duct or passage through which the oil is discharged, substantially as and for the purposes specified.

2. The combination, with the valve and valve-motor of a mining-machine, of a lubricator provided with an oil-chamber having a piston arranged therein, an air-duct leading from the valve-chest to said chamber on one side of the piston, a pump actuated by the valve-motor, an oil-duct leading from the oil-chamber to said pump, and a second oil-duct leading from the pump to the point of connection between the valve and valve-motor, substantially as and for the purposes specified.

3. The combination, with the valve and valve-motor, of the lubricator provided with an oil-chamber having a piston arranged therein, a duct to admit compressed air to one side of said piston, a pump actuated by the valve-motor, an oil-duct leading from the oil-chamber to said pump, a valve arranged in said oil-duct to control the passage of the oil, and a second oil-duct leading from the pump to the point of discharge, substantially as and for the purposes specified.

4. The combination, with the valve and valve-motor, the latter provided with the vertically-reciprocating gate D^2, of the lubricator provided with a pump-chamber, H, a piston, H', arranged in said chamber and having its rod or stem *h'* resting on the gate D^2, an oil-chamber, F, having piston F', an air-passage, *f'*, for admitting air above said piston, and suitable ducts or passages leading from the oil-chamber below the piston therein to the pump-chamber and from the pump-chamber to the point of discharge, substantially as and for the purposes specified.

398,300. FEED MECHANISM FOR SEWING-MACHINES. CHARLES H. WILSON, New York, N. Y., assignor to the Wilson & Gibbs Sewing Machine Company, same place. Filed Nov. 20, 1888. Serial No. 291,330. (No model.)



Claim.—1. The combination, with the feed-bar and feed-eccentric, of a shoe surrounding said eccentric and communicating motion therefrom to said feed-bar, said shoe having a tail-piece or extension resting upon a projection of said feed-bar, upon which it can rock sufficiently to permit the descent of said eccentric and shoe, leaving said feed-bar in the highest position, substantially as described.

2. The combination of the feed-bar, the feed-eccentric, and the shoe interposed between the two and having a tail-piece projecting into a recess or slot in said feed-bar, said recess or slot having a con-

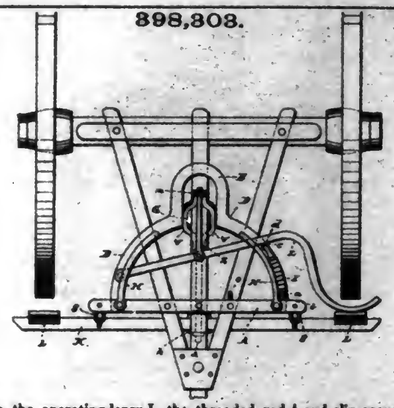
tracted portion about the width of said tail-piece, and having divergent walls on each side of said contracted portion, substantially as and for the purpose set forth.

398,301. COMBINED CENTRIFUGAL AND SCREW PUMP. ALBERT A. WILLSON, Brooklyn, N. Y. Filed June 21, 1886. Serial No. 205,776. (No model.)

Claim.—1. In a centrifugal and screw-pump, in combination with a suitable casing, the series of blades D^2, curved backward, as shown, and also screw-formed throughout, with the delivering-edge parallel to the axis and with the entering-edge at right angles to the axis, changing the form uniformly from the receiving-edge to the delivering-edge, as herein specified.

2. The casing A, with its bearing A^3 extended forward, in combination with a hollow conoidal wheel, D', having the series of blades D^2, curved backward, as shown, and also screw-formed throughout, with the delivering-edge parallel to the axis and with the entering-edge at right angles to the axis, changing the form uniformly from the receiving-edge to the delivering-edge, as herein specified.

398,302. SAW. WILLIAM T. WILSON, Marshfield, Oreg. Filed Aug. 23, 1888. Serial No. 283,536. (No model.)

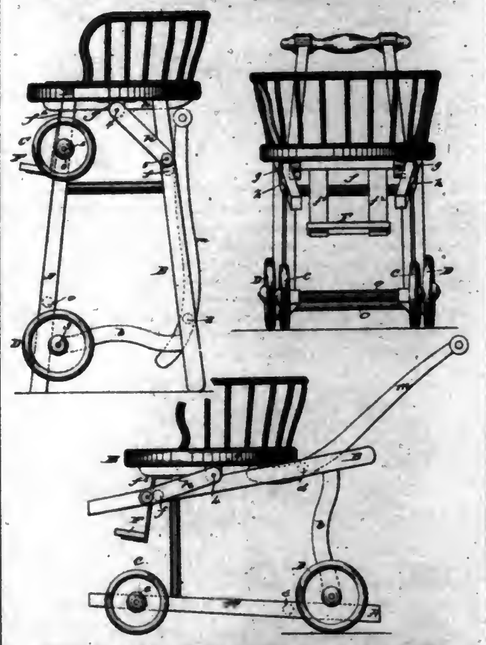


Claim.—In a saw, a central double tooth, A, having opposite cutting-edges *a*, in combination with a series of double teeth, A', having cutting-edges *a'* and rounded edges *b'*, and intervening clearing teeth B, occupying one part of the saw, and another series of double teeth, A^2, having cutting-edges a^2 and rounded edges b^2, and intervening clearing-teeth B', occupying another part of the saw, the teeth of the two series being constructed, respectively, to cut from the center in opposite directions, substantially as set forth and described.

398,303. WAGON-BRAKE. FREDERICK A. YOUNG, Aurora, Ind. Filed July 2, 1888. Serial No. 278,068. (No model.)

Claim.—1. A brake-lever attachment consisting of the transverse bar A and the loop-plate B, a pivoted link-lever spanning the coupling-pole, the rod *k*, the brake-bar, the main lever L, and the connection *z* from the main lever to the link-lever, substantially as specified.

2. The combination, with the rear bounds and the coupling-pole, of the plate B, carrying a pivoted link-lever spanning said coupling-



398,303.

pole, the operating-lever L, the threaded rod *k* and clip around the brake-bar, and the connection *z*, substantially as specified.

3. In a brake-lever attachment, the combination, with the lever L and the perforated plate B, having a ring, *b*, of the adjustable ratchet-catch I, engaging said ring at one end and provided at its other end with a stud, *c*, to engage the perforation of the plate B, substantially as specified.

398,304. CHILD'S CHAIR OR CARRIAGE. LUTHER J. ADAMS, Melrose, assignor to Thompson, Perley & Watts, Baldwinsville, Mass. Filed May 4, 1885. Serial No. 164,267. (No model.)

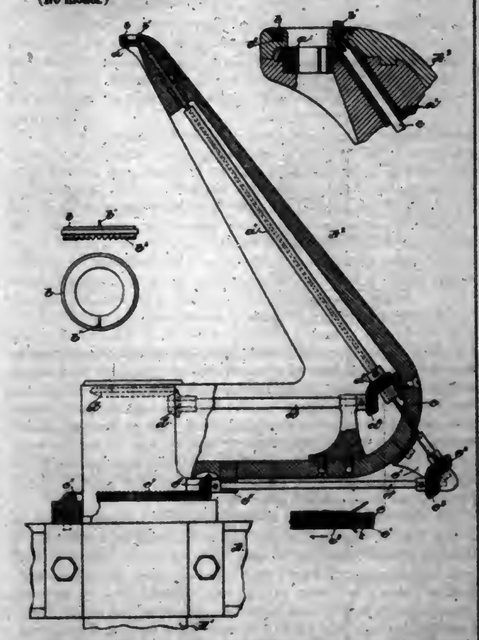
Claim.—1. A convertible child's chair and carriage comprising a base-frame composed of front and rear legs, A B, connected in pairs by rounds, and the pairs rigidly connected together, and one pair having rollers, combined with the seat, the ears *g*, secured to the seat, and links A, jointed to the said ears and to one pair of legs, whereby the seat may be shifted to rest upon the legs when upright and upon one side thereof when the legs are supported sidewise upon their rollers, substantially as described.

2. The combination of the two pairs of legs A B, rigidly connected by rounds, including rounds *e* and *f*, the seat E, the ears rigidly attached to the under side of the seat-bottom, the links A, pivoted to said ears and to the legs B, for adjusting the seat from the upper ends of the legs when upright to one of their sides when the base-frame is laid down lengthwise, and the foot-rest co-operating with the round *e* to hold the seat in position with the base-frame upright, and also co-operating with the round *f* and the ears *g* in the engagement of the

latter with the legs to hold the seat in position when the base-frame is horizontal, substantially as described.

3. A convertible high chair or carriage composed of a rigid base-frame provided at its front side with wheels or rollers and a seat and foot-rest, the seat being connected with the base-frame by links, whereby the seat may be turned into position to rest either directly upon the ends of the base-frame or upon the rear side of said base-frame placed uppermost by turning the base-frame over with the rollers at its front side on the floor, substantially as described.

4. The base-frame and the attached rollers and the seat, combined with the links connecting the seat with the rear part of the base-frame below its upper end, substantially as described.



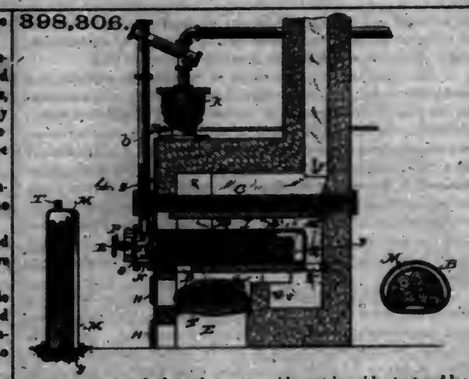
5. The base-frame, its attached rollers, and the seat provided with depending ears, combined with the links connecting the said ears with the base-frame, substantially as described.

6. The base-frame, its attached rollers, and the trundling-handle pivoted to the base-frame near its lower end, and the seat, combined with the links joining the seat and base-frame, the links being connected with the said base-frame at a point below its upper end, to operate substantially as described.

7. The base-frame having the rounds *e* and *f* and the seat and its attached arms f^3, combined with the links A, connecting the seat with the base-frame, the arms f^3, resting against the round *e* while the base-frame is upright and against the round *f* when the base-frame is turned over, substantially as described.

8. A convertible chair composed of a base-frame constructed of pairs of front and rear legs of substantially equal height rigidly connected, and a seat joined to said frame by links, and thereby adapted to be placed in position upon the upper ends of said base-frame when it is upright and to be turned over and supported upon one of the pairs of legs when said base-frame is turned down lengthwise, combined with wheels or rollers to support the base-frame when in this last-named position, substantially as described.

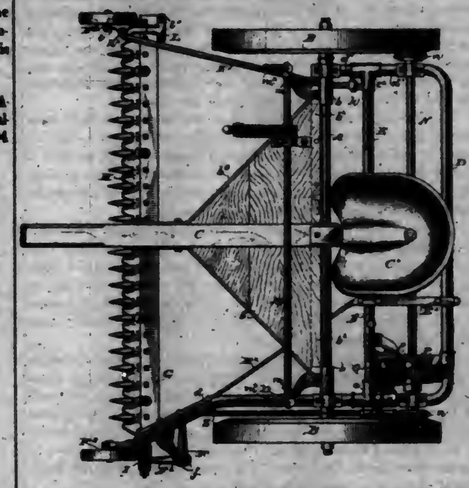
398,305. CHANNEL-CUTTING DEVICE FOR SOLE-SEWING MACHINES. EDWARD R. ALLEN, Portland, Me., assignor of one-half to Walter R. Sawyer, same place. Filed Nov. 24, 1888. Serial No. 291,794. (No model.)



Claim.—1. The combination, with a rotating horn, of a channel-cutter mounted in the tip of the horn, substantially as described.

2. The combination, with a rotating horn and a channel-cutter mounted in the tip of the horn, of gearing to rotate the said channel-cutter, substantially as described.

398,306. APPARATUS FOR THE MANUFACTURE OF GAS. JOHN D. AVERELL, Brooklyn, N. Y., assignor, by mesne assignments, to Joel F. Tevis, Philadelphia, Pa. Filed Oct. 23, 1886. Serial No. 216,993. (No model.)



Claim.—In a wood-gas-generating apparatus, the combination, with a closed retort, of an imperforate wood-cartridge case having an

398,306.

open inner end and adapted to removably rest in said retort and leave heating-spaces between the cartridge and inner wall of the retort, and a steam-supply pipe extending into said retort between its inner wall and the cartridge to discharge steam at or near the inner open end of the cartridge, for the purpose set forth.

398,307. MOWER. WILLIAM B. BAKER, Chicago, Ill., assignor to the McCormick Harvesting Machine Company, same place. Filed Mar. 12, 1883. Serial No. 153,631. (No model.)

Claim.—1. The combination, substantially as hereinbefore set forth, in a center-draft mower, of a main frame having one long arm connected to the rear of the finger-bar at its heel end by a universal joint, and a link or thrust-bar connected to the rear of the finger-bar at the other end by a hinge-joint, and to the main frame by a universal joint.

2. The combination, substantially as hereinbefore set forth, in a center-draft mower, of a main frame having one long arm connected to the rear of the finger-bar at its heel end by a universal joint, and a link or thrust-bar having an upwardly-treading pivotal connection with the finger-bar at its forward end.

3. The combination, substantially as hereinbefore set forth, in a center-draft mower, of a main frame having one long arm connected to the rear of the finger-bar at its heel end by a universal joint, and a link or thrust-bar having an upwardly-treading pivotal connection with the finger-bar at its forward end, and universally jointed to the main frame at its rear end.

4. The combination, substantially as hereinbefore set forth, in a center-draft mower, of a main frame having one long arm connected with the rear of the finger-bar at its heel end by a universal joint, and a casting in which the other end of the finger-bar is carried, a hinge-joint between said casting and the rear of the finger-bar at that end and a link or thrust-bar connected with said casting by a practically-upright pivot.

5. The combination, substantially as hereinbefore set forth, in a center-draft mower, of a main frame having one long arm connected with the rear of the finger-bar at its heel end by a universal joint, a casting in which the other end of the finger-bar is carried, a hinge-

joint between said casting and the rear of the finger-bar at that end, and a link or thrust-bar connected with said casting by a practically-upright pivot and with the main frame by a universal joint.

6. The combination, substantially as hereinbefore set forth, in a center-draft mower, of a main frame having one long arm connected with the rear of the finger-bar at its heel end by a universal joint, a bell-crank in bearings rigid with said arm adjacent to the finger-bar, and a short pitman connecting a ball-stud in one end of said bell-crank with a ball-stud on the heel of the cutter-bar, and a link or thrust-bar connected to the rear of the finger-bar at the other end by a hinge-joint and to the main frame by a universal joint, whereby the finger-bar is permitted to tilt or rock to follow the sinuosities of the ground and to rise and fall at the link-connected end irrespective of the motion of the main frame and without interfering with the driving of the cutter.

7. The combination, substantially as hereinbefore set forth, in a center-draft mower, of the main frame, thrust-bar, the castings connected, respectively, to the long arm of the main frame and to the thrust-bar, the finger-bar hinged at its rear to said castings, the subtending flanges or ledges on said castings upon which the toes of the shoes rest, and the lead-wheels secured to said castings in advance of the finger-bar.

8. The combination, substantially as hereinbefore set forth, in a center-draft mower, of the main frame, the thrust-bar, the castings connected, respectively, to the long arm of the main frame by a rigid joint and to the thrust-bar by a practically-upright pivot, and the finger-bar united at its rear with the first casting by a universal joint and with the second by a hinge-joint.

9. The combination, substantially as hereinbefore set forth, in a center-draft mower, of the main frame, the thrust-bar, the castings connected, respectively, to the long arm of the main frame by a rigid joint and to the thrust-bar by a practically-upright pivot, the finger-bar united at its rear with the first casting by a universal joint and with the second by a hinge-joint, and the subtending ledges or flanges from said castings upon which the toes of the shoes rest.

10. The combination, substantially as hereinbefore set forth, with the long arm of the main frame, of a casting having ears for the reception of the bell-crank and a forward-projecting ball to form a universal joint with the heel of the shoe, a subtending flange or ledge in front to support the toe of said shoe, and provision for the attachment of a lead-wheel in advance of said shoe.

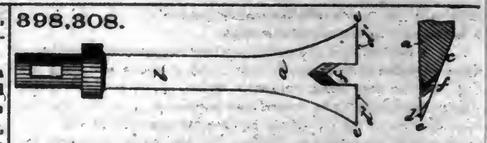
11. In a center-draft mower, the main frame formed of a single bar extending from the axle at one side toward the rear parallel with the wheel, then bent at right angles to itself and carried to the other side, and again bent and passing alongside the wheel on that side to its forward tread, and there flaring outwardly to its point of connection with the finger-bar, combined with a through-axle, to which both arms of the frame are bolted.

12. In a center-draft mower, the main frame, consisting of a single bar of pipe metal bolted to the axle at one side adjacent to the wheel and extending rearwardly parallel with said wheel to near its tread, then bent at right angles to itself and carried to the other side adjacent to the wheel on that side, and again bent and carried parallel with the inner side of that wheel past the axle, to which it is bolted, to near the front tread of the wheel, and finally flaring outwardly to its point of connection with the finger-bar.

13. The combination, substantially as hereinbefore set forth, in a center-draft mower, of the main-frame bar, of a single length of pipe metal bent into the form described, the tie-bar, also of pipe metal and having its ends respectively right and left screw-threaded, and the T-couplings which unite the frame-bar and the tie-bar.

14. The combination, substantially as hereinbefore set forth, in a center-draft mower, of the main-frame bar bent into the form described and a diagonal brace bolted to its flaring longer arm and to the rear arm.

15. The combination, substantially as hereinbefore set forth, in a center-draft mower, of the tubular main-frame bar bent into the form described, the tubular tie-bar and T-couplings, and the diagonal brace.



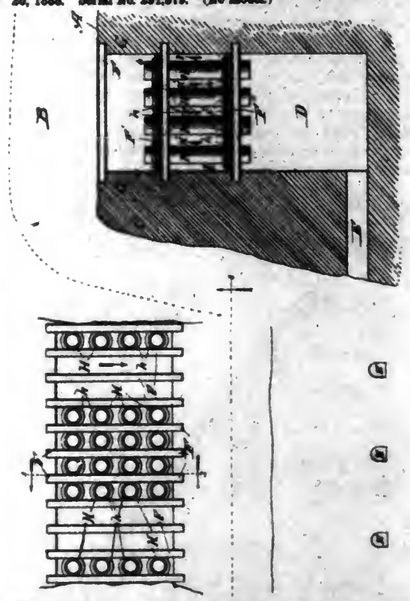
16. The casting F, having bearings *f* for the journal of the bell-crank, and slotted at its forward end to adjustably receive the shank of a stub-axle for the lead-wheel.

17. The casting F, having near its rear an outwardly-projecting ball-stud and at its front a subtending ledge or flange and cut away therebetween to form a bridge.

18. The casting F, formed, substantially as described, with bearings *f*, a ball-stud, *f'*, and subtending flange *f²*, and an upright slot for the reception adjustably of the shank of a stub-axle for the lead-wheel.

19. The T-coupling *c'*, formed with a web in one of its angles having a ball-socket for the rear end of the thrust-bar.

398,308. TOOL FOR MINING PURPOSES. GUSTAV A. BARTH, St. Louis, Mo., assignor to Pierre Chouteau, same place. Filed July 23, 1888. Serial No. 280,692. (No model.)

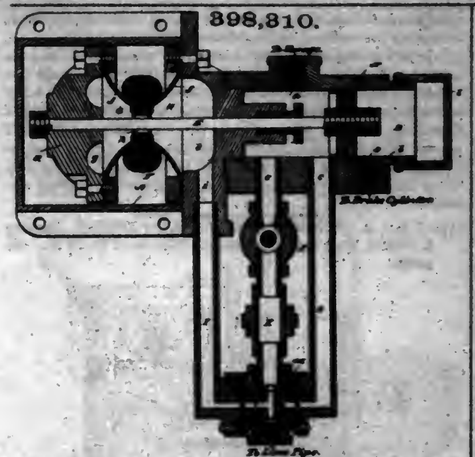


Claim.—1. A chipping or cutting tool of chisel form, or having only one side splayed, said tool having a longitudinal slot with parallel sides, which slot divides the cutting-face of the tool centrally, substantially as and for the purposes described.

2. A chipping or cutting tool of chisel form, or having only one side splayed, said tool having a flared cutting-edge and a longitudinal slot with parallel sides, which slot divides the cutting-face of the tool centrally, substantially as and for the purposes described.

3. A chipping or cutting tool of chisel form, or having only one side splayed, said tool having a flared cutting-edge, and a longitudinal slot which divides the cutting-edge centrally, said slot having parallel sides and a cutting-edge at its base, substantially as and for the purposes described.

398,309. WHEEL-PIT AND MECHANISM FOR THE ADMISSION OF WATER THERETO. CHARLES M. BARTLETT, Chicago, Ill. Filed Nov. 26, 1888. Serial No. 291,879. (No model.)



Claim.—1. The combination, in a wheel-pit placed underneath the bed of a river, lake, or pond, of a water-tight deck or flooring underneath a series of girders located at or near the level of the bottom of the said river, lake, or pond, whereby a pool is formed above said water-tight deck or flooring, a second deck or flooring placed underneath such water-tight deck or flooring, and vertical pipes or cylinders extending through and above said water-tight deck or flooring and through and below said second flooring and into the wheel-pit below the same, substantially as described.

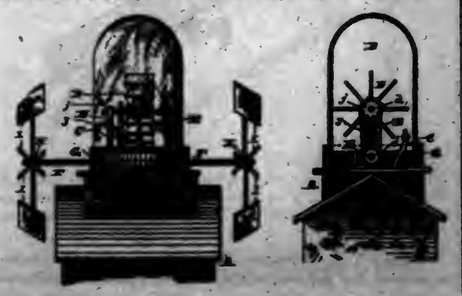
2. The combination, in a wheel-pit placed underneath the bed of a river, lake, or pond, of a water-tight deck or flooring underneath a series of girders located at or near the level of the bottom of said river, lake, or pond, whereby a pool is formed above said water-tight deck or flooring and below said girders, a second deck or flooring placed underneath such water-tight deck or flooring, and vertical pipes extending through and above said water-tight deck or flooring and through and below said second flooring and into the wheel-pit below the same, and valves or gates in said vertical pipes or cylinders, by which the admission of water through said vertical pipes or cylinders may be controlled, substantially as described.

398,310. AIR-BRAKE. ALFRED R. BOLDS, Norwood, Ohio, assignor to the Bolds Air Brake Company, Jersey City, N. J. Filed Aug. 27, 1888. Serial No. 283,690. (No model.)

Claim.—1. In a fluid-pressure brake, the combination of a cylinder having ports for attachment with a brake-cylinder and storage cylinder, respectively, a flexible diaphragm arranged in a case, a piston-rod having one end secured to a diaphragm and having its opposite end secured to a piston-head in the cylinder, a pipe connecting the case with the cylinder and carrying a three-way cock, and a pipe connecting the cylinder with the pipe leading from the cylinder to the diaphragm-case, and having a check-valve, substantially as specified.

398,310.

2. The combination, with a case, such as A, of a cylinder, such as B, the latter being of much less internal area than the former, the piston-rod working in the respective chambers, having at one end a head and at the opposite end within the case A a flexible device for driving the same, a pipe, such as K, having a check-valve, and a pipe, such as L, both leading from the cylinder B, and a pipe, such as I, connected with the main case A, the said pipes communicating at their outer ends and also communicating with the line-pipe, and a three-way cock arranged at the junction of the respective pipes, substantially as specified.



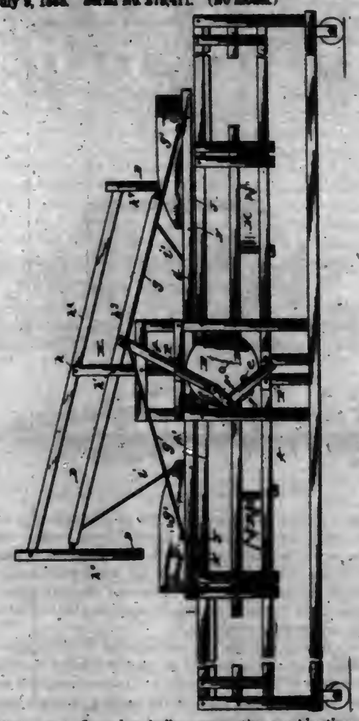
3. The combination, in a fluid-pressure brake, substantially as described, of the cylinder B, having the exhaust-ports at its outer end, and the port connecting with the brake-cylinder, the latter port having graduated apertures *s*, and the piston-rod having a head whereby the action of the brake in releasing will be rapid at the start and then gradual.

4. In a pneumatic brake, the combination, with the main case having a single communicating aperture, of the piston-cylinder having a less internal area than said case, a rigid piston-rod passing through a gland in the case, so that one end will extend into the cylinder, a flexible device, constructed as shown, secured to the end of the piston-rod within the case and a head secured to the opposite end thereof, a pipe leading from the only port of the case to the interior of the cylinder, so that fluid may be carried to and from the case by the same pipe, and a three-way cock arranged in the pipe at a point where the same connects with a line-pipe, substantially as specified.

5. In a fluid-pressure brake, a piston-cylinder, such as described, having an exhaust at its outer end and a port in rear of the exhaust to connect with a brake-cylinder, said port having a plurality of apertures which vary in size, whereby in the backward stroke of the piston or valve rod the largest port will be first uncovered to the exhaust, so that the action of the brake will be rapid at the start and then gradual, substantially as specified.

398,311. AUTOMATIC FAN. FRANKLIN T. BUSBY and ALFRED H. SNYDER, South Bend, Ind.; said Busby assignor to said Snyder. Filed May 4, 1888. Serial No. 272,770. (No model.)

Claim.—1. In a dispensing-fountain provided with a glass dome and a water-jet therein, the combination of a water-wheel in said dome driven by said jet, its shaft and supporting-brackets, with the

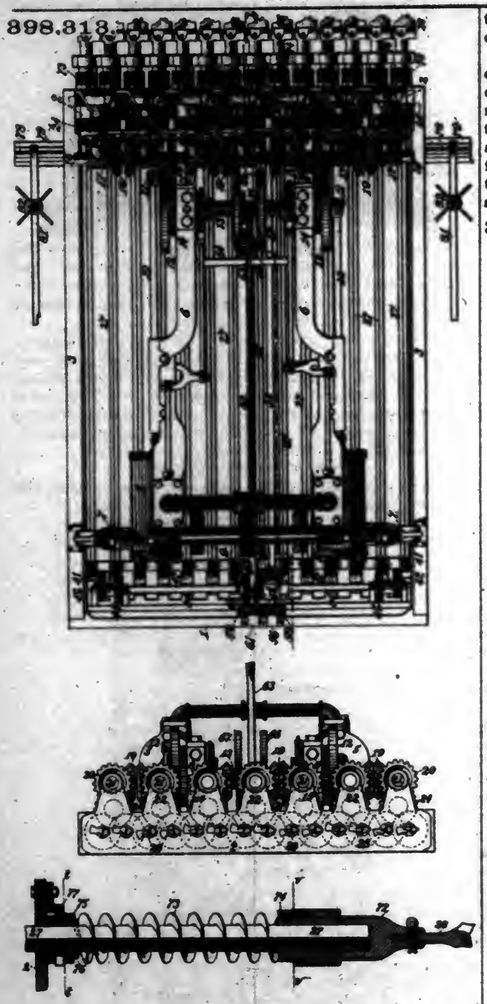


398,311.

horizontal shaft journaled in fixed bearings below said dome and wheel and extending outside the same, the fans on the ends of said shaft, and the mechanism, substantially as described, whereby motion is imparted from said water-wheel shaft to the fan-bearing shaft, all substantially as and for the purpose specified.

2. The combination of the casing A, the dome B and its supporting-rim G, and the water-jet and water-wheel D, its shaft *d*, and brackets E, supporting the same, arranged within dome B, with the horizontal shaft F passing through rim G and below dome B, the fans on the ends of said shaft, and the gearing and connections between shafts *d* and F within dome B, all constructed and arranged substantially in the manner and for the purpose described.

398,312. BALING-PRESS. JOSEPH K. BUTWORTH, Paris, Tex. Filed July 9, 1888. Serial No. 278,411. (No model.)



Claim.—1. In a hay-baling press, the combination, with the frame, of the crank-shaft, arms secured thereto, the plungers, the wheel mounted upon the shaft and carrying a wrist-pin, the levers pivotally secured to the frame, the link pivoted to the levers, the sliding frame and condensers, and means for connecting the lever *f* with the sliding frame, substantially as described.

2. In a hay-baling press, the combination, with the frame, of the crank-shaft, arms secured thereto, the plungers, the wheel mounted upon the shaft and carrying a wrist-pin, the levers pivotally secured to the frame, the link pivoted to the levers, the sliding frame and condensers, and means for connecting the lever *f* with the sliding frame, and the forcing device connected with and operated by the movement of the plunger-arms, substantially as described.

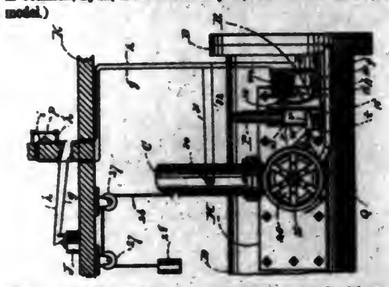
398,313. MINING-MACHINE. EDWIN R. CARTER, Pittsburg, Pa., assignor to John S. Scully, same place. Filed Oct. 26, 1888. Serial No. 289,209. (No model.)

398,313.

Claim.—1. In a mining-machine, the combination of a series of revoluble cutter bars or spindles, a movable cross-head or carriage having the bars or spindles connected thereto, a system of gearing at each end of said cross-head or carriage for moving the same, a central system of gearing engaging the systems of gearing at the ends of the carriage, and a frictional gearing for operating the central system of gearing, substantially as set forth.

2. In a mining-machine, the combination of an angular cutter bar or spindle, a gear-wheel having an angular opening therethrough for the reception of the bar or spindle, and rollers interposed between the bar or spindle and the sides of the opening through the gear-wheel, substantially as set forth.

3. In a mining-machine, the combination of a series of cutter bars or spindles, and a like series of gear-wheels for revolving such bars or spindles, said gear-wheels being arranged in different vertical planes and overlapping one another, whereby a practically-continuous cut may be formed with comparatively small cutters, substantially as set forth.

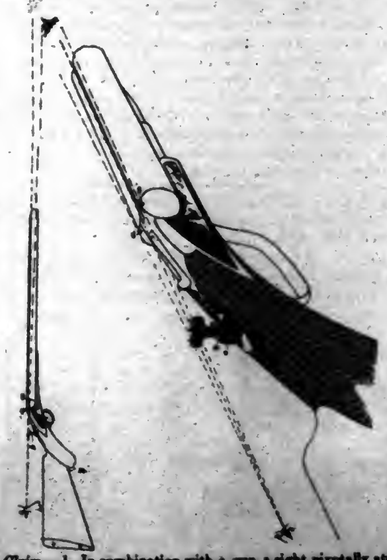


4. In a mining-machine, the combination of a revoluble and longitudinally-movable cutter bar or spindle and an extensible conveyer arranged in the rear of the cutter, substantially as set forth.

5. In a mining-machine, the combination of a revoluble and longitudinally-movable cutter bar or spindle and a flat strip of metal wound spirally around said bar or spindle and secured only at its ends to the cutter-bar, substantially as set forth.

6. In a mining-machine, the combination of a series of revoluble cutter bars or spindles, a cross-head or carriage for moving said bars or spindles longitudinally, rotating friction-disks, and a friction-wheel mounted on a horizontally-movable shaft arranged between the friction-disks and adapted through suitable gearing to shift the cross-head or carriage forward and backward, substantially as set forth.

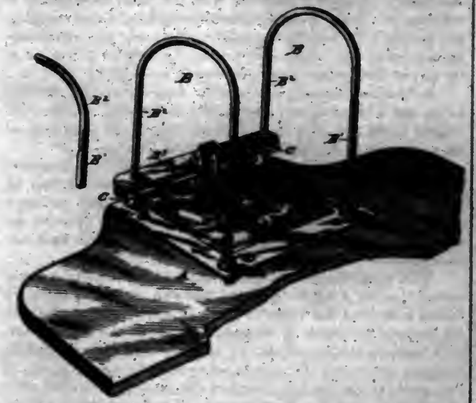
7. In a mining-machine, the combination of a series of revoluble cutter bars or spindles, a cross-head or carriage for moving said bars or spindles longitudinally, rotating friction-disks, and a friction-wheel mounted on a horizontally-movable shaft and longitudinally adjustable therealong, said shaft being arranged between the friction-disks and adapted through suitable gearing to shift the cross-head or carriage forward or backward at different speeds in accordance with the position of the friction-wheel as regards the axis of the friction-disks, substantially as set forth.



398,314. STOP MECHANISM FOR STEAM-ENGINES. HERBERT L. CURRIER, Lynn, Mass. Filed May 14, 1888. Serial No. 273,763. (No model.)

Claim.—1. The combination of a tube provided with a perforation, a weight within said tube, an electro-magnet in proximity thereto, an electric circuit in connection therewith, an armature provided with a stop-pin normally projecting through the perforation in said tube for sustaining said weight in elevated position, an automatic valve-closer, and adjunctive mechanism actuated by said weight for releasing the valve-closer.

2. In a device of the character described, the combination of the engine B, having the steam-pipe C, a throttle-valve for said pipe having the stem *z*, the reel 25, and wheel *x*, provided with the notch *b*, disposed on said stem, the cord 26, wound on said reel and provided with the weight 28, the tube *r*, provided with the slot *w*, the weight P, disposed in said tube, the pivotal pawl Q, having the arms *y* and *v*, the arm *v* being inserted in said slot and the arm *y* adapted to engage the notch in the wheel *x*, the spring 15 for the pawl Q, the pivoted lever R, having the arms 17 and 19, the armature 16, and stud 21, mounted on the arm 17, said stud being adapted to pass through a hole in the side of said tube and engage the weight P, the spring 20 for the lever R, the magnet *m*, the battery J, the wires *g h*, and push-button *i*, substantially as specified.



398,315. SIGHT FOR FIRE-ARMS. ERSK J. CUTLER, Cleveland, Ohio. Filed Nov. 17, 1888. Serial No. 291,113. (No model.)

Claim.—1. In combination with a gun, a sight pivotally attached to the stock and provided with three sighting-points, a center point on the normal sight-line of the barrel or barrels, and one sighting-point on either side of said normal sight-line, substantially as set forth.

2. In combination with a gun, a pair of sights at the breech of the gun at opposite sides of the normal sight-line of the barrel or barrels, and a sight pivotally attached to the stock and having a set of sighting-points, two of which are at the side of the normal sight-line, substantially as set forth.

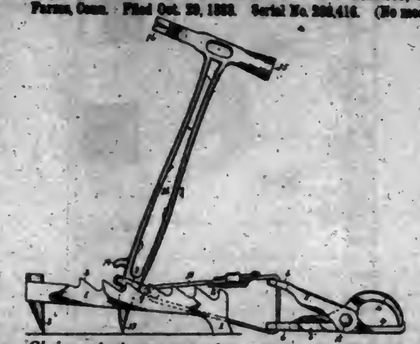
398,316. PAPER-FILE. MELVILLE E. DAYTON, Chicago, Ill., assignor to Carl F. Lamb, Rochester, N. Y. Filed Feb. 10, 1887. Renewed Oct. 27, 1888. Serial No. 289,342. (No model.)

Claim.—1. In a file having two severally-separable parallel wire arches, the combination, with a base and two receiving-wires, of two arched transfer-wires rigidly joined by a cross-piece, guides for the lower ends of the transfer-wires, which permit vertical movement of said transfer-wires, and which retain them in a vertical position at all points in their vertical movement, substantially as described.

2. In a file having two severally-separable parallel wire arches, the combination, with a base and two receiving-wires, of two arched transfer-wires rigidly joined by a cross-piece above their lower ends, and vertical guides on the base fitted to the lower ends of the transfer-wires below the cross-piece, substantially as described.

3. In a file having two severally-separable parallel wire arches, the combination, with a base and two receiving-wires, of two rigidly-connected arched transfer-wires, vertical guides for said connected transfer-wires, which retain the latter in an upright position, and a catch having two notches or corresponding points of engagement, and which is adapted to hold the connected transfer-wires in two positions, substantially as described.

4. The combination, with a base and two receiving-wires of a double-arch file, of two rigidly-joined arched transfer-wires, means for guiding said connected transfer-wires in a vertical direction, a spring or springs arranged to exert a lifting force on the transfer-wires, and a catch arranged to hold the transfer-wires down in opposition to the action of the spring, substantially as described.

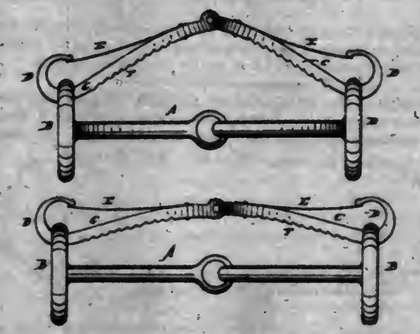


5. The combination, with a base and two receiving-wires of a double-arch file, of two rigidly-connected arched transfer-wires, means for guiding the connected transfer-wires in a vertical direction, a spring arranged to bear upwardly upon the connected transfer-wires, and a double-notched spring-catch constructed to retain the transfer-wires in two positions in opposition to the action of the spring, substantially as described.

398,317. PEN-HOLDER. FRANK H. DURELL, Bay City, Mich., assignor of one-half to John W. Cupit, same place. Filed July 9, 1888. Serial No. 279,408. (No model.)

Claim.—In a pen-holder, the combination of the central socket, *b*, provided with a closed outer end, the sleeve *d*, surrounding and rigidly secured by its inner end to the said socket and provided on its outer end with longitudinal slits *f*, and having the pieces *g* between the slits spring outwardly and away from the socket, and the movable band *i*, surrounding the sleeve for clasping and retaining the said spring-pieces *g* upon the pen and socket, substantially as set forth.

398,318. CARPET-STRETCHER. EVERETT C. ELLWOOD, Green's Farms, Conn. Filed Oct. 20, 1888. Serial No. 288,416. (No model.)



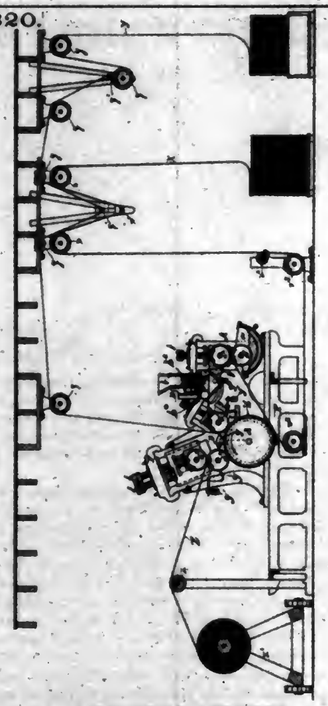
Claim.—1. A carpet-stretcher consisting, essentially, of a base having racks and a prong for engagement with the floor, jaws which engage the carpet, a link having lugs which engage the racks, a flexible connection between the jaws and the link, and a lever adapted to pass through the link, thereby stretching the carpet when the free end is forced forward.

2. The base having racks and a prong for engagement with the floor, and jaws which grip the carpet and are provided with shanks *b*, in combination with a link having lugs which engage the racks, a flexible connection engaging the link and the shanks of the jaws, and a lever adapted to pass through the link and engage the floor, whereby when said lever is forced forward the jaws are tightened upon the carpet and the latter is drawn forward, thereby stretching it.

3. The base having racks and the jaws having shanks, as shown, in combination with the links having lugs engaging the racks, a flexible connection engaging the link and the shanks of the jaws, and a pointed lever adapted to pass through the link, and having a lug, 14, on its face, which engages the link, as and for the purpose set forth.

4. The combination, with the base having racks, the jaws, and the link having lugs engaging the racks, of a flexible connection engaging the link and the shanks of the jaws, and a combined lever, tack-drawer, and hammer, acting as described, and for the purpose set forth.

398,319. BRIDLE-BIT. SAMUEL FISHER, Mount Washington, Md., assignor of one-half to William James Carthers, Purdham, N. Y. Filed Oct. 20, 1888. Serial No. 288,063. (No model.)

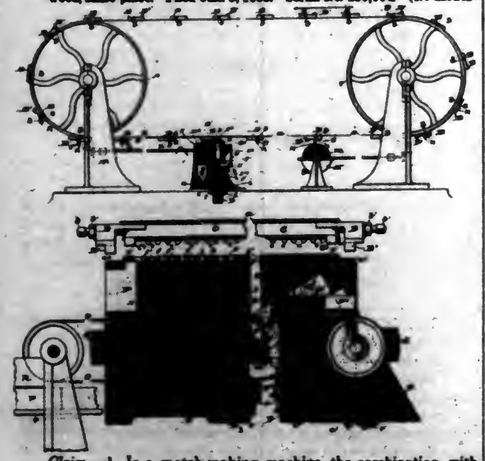


Claim.—The combination, with a bridle-bit composed of two end rings, and links pivoted on said end rings and to each other, of two rods or bars having serrations, and hinged to each other at the meeting ends and having snap-hooks on their outer ends, which snap-hooks engage the end rings of the bit, substantially as set forth.

398,320. MACHINE FOR MAKING COMPOUND FABRICS. GEORGE A. FULLERTON, Boston, Mass. Filed Apr. 3, 1887. Serial No. 234,102. (No model.)

Claim.—The herein-described combination of glue-distributing device A, powder-distributing device B, and compressing device D with two sets of guides, one set guiding material to the glue-distributing device and another set guiding material to the compressing device, the powder device being mounted between the glue-distributing device and the compressing device, and that set of guides which directs the material to the compressing device being mounted to direct the fabric to meet the powdered surface of the other sheet, substantially as and for the purpose set forth.

398,320.



398,321. METALLIC JOINT. FRANK FUNK, Decatur, Ill. Filed July 18, 1888. Serial No. 280,296. (No model.)

Claim.—The joint comprising the part *a*, having rim *a'*, the part *c*, riveted to the rim, the part *b*, bent over on part *a*, and the packing *c*, interposed between *a* and *b*, as and for the purpose set forth.

398,322. MATCH-MAKING MACHINE. WILLIAM GUEE, Kent, Ohio, assignor of two-thirds to James B. Miller and Vernon B. Underwood, same place. Filed Jan. 3, 1888. Serial No. 259,604. (No model.)

Claim.—1. In a match-making machine, the combination, with a suitable motor, wheel, or endless belt, as the case may be, of a knife-head pivotally connected with the motor, so as to fold against the motor or turn on its axis by gravity to a depending position perpendicular to the face of the motor, said knife-head having one or more knives adapted to cut match-splints from an opposing wooden block, with the knife-head in position folded against the motor, substantially as set forth.

2. In a match-making machine, the combination, with a motor and a knife-head pivotally connected with the motor, said knife-head having one or more knives, substantially as indicated, of inclines and a feed-box adapted to engage the passing knife-head and by such engagement fold and retain the knife-head against the motor during the cutting operation, substantially as set forth.

3. In a match-making machine, the combination, with a motor and folding knife-heads connected with the motor, substantially as indicated, of a feed-box having attached a spring-actuated clamping-jaw, the said knife-heads having attachments for engaging such clamping-jaw and by such engagement turning the latter on its axis out of the way of the passing knives, substantially as set forth.

4. In a match-making machine, the combination, with traveling knives and a clamping-jaw, substantially as indicated, of a feed-box inclined to the axis of the clamping-jaw, whereby the latter engages the wooden block diagonally, substantially as set forth.

5. In a match-making machine, the combination, with suitable feed mechanism, substantially as indicated, of a motor having attached a series of folding knife-heads, each knife-head bearing a series of separate knives, the knives of one knife-head following between the tracks of the knives of the next preceding knife-head, substantially as set forth.

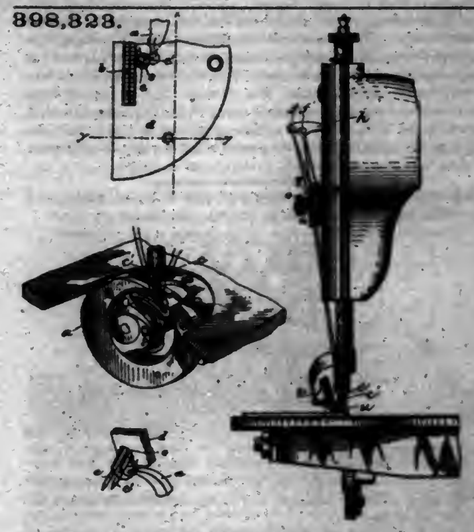
6. In a match-making machine, the combination, with a motor having a series of yokes connected therewith, each yoke bearing a folding knife-head, the knives of alternate heads following between the tracks of the knives of the intervening heads, of a feed-box having a clamping-jaw pivoted thereto, attachments of the knife-head for engaging and turning the clamping-jaw on its axis out of the way of the passing knives, and attachments of alternate yokes for still further depressing the clamping-jaw to actuate the feed mechanism, substantially as set forth.

7. In a match-making machine, the combination, with a motor, yokes, knife-heads, clamping-jaw, and mechanism, substantially as indicated, for giving the latter alternate longer and shorter movement on its axis, of feed mechanism connected with the clamping-jaw, such connection having a slip-joint, whereby the feed mechanism is actuated only with the longer movement of the clamping-jaw, substantially as set forth.

8. In a match-making machine, the combination, with a motor, of a series of folding knife-heads mounted on the motor, each knife-head having a series of transverse slits for receiving the knives, a series of jaws connected with the knife-heads, and a bolt extending longitudinally through a hole in the knife-head for clamping the series of jaws connected with a knife-head, substantially as set forth.

9. In a match-making machine, the combination, with a motor and folding knife-heads mounted on the motor, each knife-head having a series of transverse slits, substantially as indicated, of a series of substantially U-shaped knives mounted on each knife-head, the legs of the knives being inserted in the aforesaid slits with approximately equal lateral spaces respectively between and inside the knives, substantially as set forth.

10. In a match-making machine, the combination, with a motor and a folding knife-head having knives adapted to cut and retain match-splints, of apparatus, substantially as described, for applying chemicals to the match-splints, such apparatus being in the path of the depending splints, substantially as set forth.

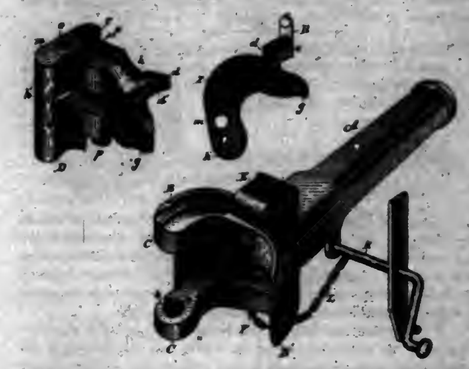


11. In a match-making machine, the combination, with a motor, folding knife-heads, and knives, the latter being adapted to cut match-splints and carry the splints in an upright position, substantially as indicated, of a container for chemicals, and a revolving wheel operating in such container for feeding the chemicals to the match-splint, the top portion of such wheel being located in the pathway of the depending match-splints, substantially as set forth.

12. In a match-making machine, the combination, with mechanism, substantially as indicated, for cutting match-splints, carrying the splints in contact with the chemicals, and discharging the dried matches from the cutting-knives, of an endless belt for carrying the matches from the machine, and a series of bars triangular in cross-section, with intervening spaces between the bars, such bars being arranged crosswise of the discharging-belt, substantially as set forth.

398,323. SEWING-MACHINE. JOHN H. GRIFFIN, Brockton, Mass., assignor of one-half to Churchill & Alden, same place. Filed Apr. 9, 1888. Serial No. 270,022. (No model.)

Claim.—1. The combination, in a sewing-machine, of a shuttle whose movement is substantially parallel with the feed, two undeflected needles arranged diagonally with relation to the movement of the said shuttle, one of the said needles being thus always nearer to the path of movement of the shuttle than the other, and suitable auxiliary stitch-forming devices co-operating with the said shuttle and diagonally-arranged needles, as set forth.



398,323.

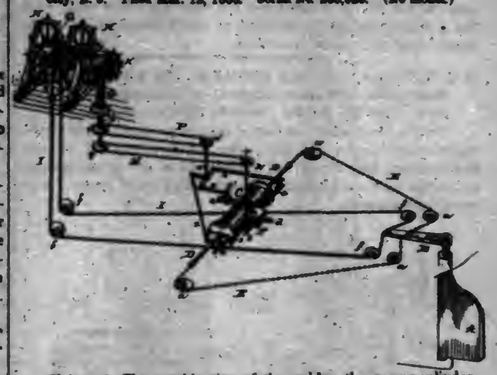
2. In a sewing-machine, the combination, with a shuttle whose movement is substantially parallel with the direction of the feed and with suitable auxiliary stitch-forming mechanism co-operating therewith, of two undeflected needles diagonally arranged with relation to the movement of the shuttle, and having their eyes arranged at different heights, as set forth.

3. In a sewing-machine, the combination of a shuttle whose movement is substantially parallel with the direction of the feed, two needles diagonally arranged, as described, one of said needles being nearer the path of the shuttle than the other, and two take-ups engaging the threads of the respective needles, the eye of the take-up which delivers thread to the needle farthest from the shuttle being farther from the fulcrum of its take-up lever than the other take-up eye, as set forth.

398,324. CAR-COUPLING. JAMES A. HINSON, Des Moines, Iowa, assignor to the Hinson Car Coupler Company, same place. Filed Sept. 26, 1888. Serial No. 286,431. (No model.)

Claim.—1. The combination, in a car-coupler, of the draw-bar, the hollow hood cast therewith, the enlarged head having the recess *e* therein, the latch pivotally suspended in said hood and having the projection *e*, the spring adapted to move said latch forward, the movable jaw having the branches *h h'* journaled to said enlarged head, and said branch *h* having the projection *d* cast integral therewith, substantially as described.

2. The combination, in a car-coupler, of the draw-bar having an enlarged head provided with the recess *e*, the arms B B', cast integral with said head, the latch pivotally suspended with said head and having the projection *a*, the movable jaw having the branches *h h'* journaled to one of said arms, and a spring for moving the latch forward, substantially as described.



3. The combination, in an automatic car-coupler, of the pivoted latch having the projection extending therefrom at an acute angle, and the movable jaw having branches *h h'*, the former having a projection, *d*, cast integral therewith, substantially as described.

398,325. CAR-WHEEL. ISRAEL HOOSLAND, Indianapolis, Ind. Filed Aug. 2, 1888. Serial No. 281,721. (No model.)

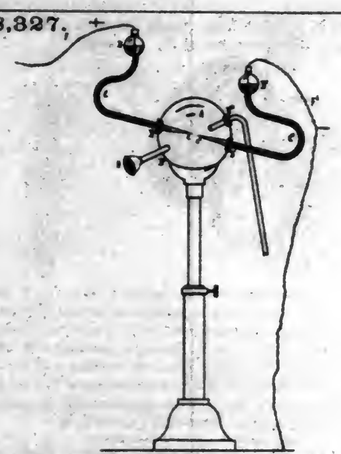
Claim.—In a car-wheel, the combination of the body A, formed with the shoulder *a*, having pins or projections around its periphery, and an annular flange, *a'*, extending out from its edge, the tire B, having an inwardly-extending annular flange, *b'*, provided with notches to receive the pins or projections around the shoulder *a* of the body, the ring of packing material interposed between said two parts, the ring C, arranged over the joint between said two parts, and the bolts *c*, for securing them together, substantially as set forth.

398,326. STEERING APPARATUS. JULIUS I. HORNIG, Jersey City, N. J. Filed Mar. 12, 1888. Serial No. 266,969. (No model.)

Claim.—1. The combination of the rudder, the power-cylinder, and piston for moving it, the hand steering-wheel connected with the rudder, the power steering-wheel, a bevel-gear on the shaft of said hand steering-wheel, a bevel-gear on the shaft of said power steering-wheel, a bevel-gear engaging with both said gears, a gear-wheel carrying said last-mentioned bevel-gear, another gear-wheel with which said carrying-wheel engages, and connections from the shaft of said last-mentioned gear-wheel to the valve of the power-cylinder, substantially as set forth.

2. The combination of the rudder, the power-cylinder, and piston for moving it, the power steering-wheel connected with the valve of said cylinder, the hand steering-wheel connected with the rudder, the epicyclic gearing between said wheels, the relief-cocks in the ends of said cylinder, a cock in the inlet of the cylinder, and connections from said cocks to a handle at the place where the steering is performed, substantially as set forth.

3. The combination of the rudder, the power-cylinder and piston for moving it, relief-cocks in the ends of the cylinder, and a valve in the inlet of the cylinder, whereby the use of hand steering apparatus is permitted, substantially as set forth.

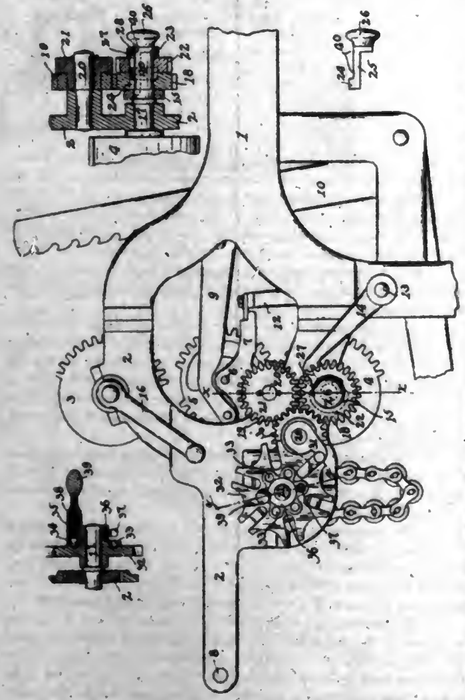


4. The combination of the rudder, the power-cylinder and piston for moving it, relief-cocks in the ends of said cylinder, a cock in the inlet of the cylinder, and connections from said cocks to a handle situated at the place where the steering is performed, whereby all said cocks may be operated simultaneously, substantially as set forth.

5. The combination of the rudder, the power-cylinder for moving it, the hand steering-wheel, the shaft *p*, connected with said wheel and with the valve of the cylinder, the relief-cocks for the cylinder, the hollow shaft inclosing shaft *p*, connections from said hollow shaft to said relief-cocks, and a handle for turning said hollow shaft, substantially as set forth.

398,327. ELECTRIC SPRAY-PRODUCING APPARATUS. HILARION A. B. HUGUET DE VARS, Paris, France. Filed Nov. 30, 1888. Serial No. 292,151. (No model.)

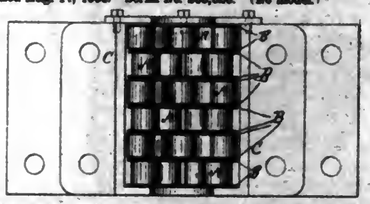
Claim.—In a spray-producing apparatus, a globe, A, provided with openings B B', in which are placed two tubes, C C, (terminating in capillary tubes *c c'* and containing wires F F' for conducting elec-



398,327.

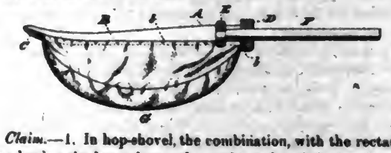
tricity,) and with openings B' B'', the one for receiving a ventilating-tube and the other a mouth-piece, the entire apparatus being fitted into a sliding support, substantially as above described, and represented in the accompanying drawing.

398,328. PATTERN MECHANISM FOR LOOMS. GEORGE F. HUTCHINS, Worcester, Mass., assignor to the Knowles Loom Works, same place. Filed Nov. 10, 1888. Serial No. 290,412. (No model.)



Brief.—The pattern mechanism may be reversed without reversing the cylinder-gears by simply pulling out the sliding key, and thus throwing into gear directly an idle member of the actuating-chain, and at the same time rendering idle the gears which formerly were operatively engaged.

Claim.—1. In a loom of the class described, the combination, with the cylinder-gears, vibrator-gear, connector, vibrator-lever, and harness-lever, and gears 18 and 22, loose on the lower cylinder-shaft, sliding key 25, compound gears 19 and 21, loose on a stud supported in the loom-frame, of a pin-wheel gear, and pin-wheel driven by said gears, and adapted to drive a star-wheel connected with the pattern-cylinder, and said star-wheel and pattern-cylinder, all constructed and arranged substantially as shown and described.



2. In a loom of the class described, the combination, with the pattern-chain cylinder, a star-wheel, 32, loose on said cylinder, hub 36, fast thereon, and a spring-actuated plunger supported in said hub and adapted to enter into and be withdrawn from sockets in said star-wheel, for the purpose stated, of a pin-wheel, 31, and gear 30, loose on a stud, compound intermediate gears, 19 and 21, loose on a stud, gears 18 and 22, loose on the cylinder-gear shaft, and said shaft, sliding key 25, cylinder-gears, connector, vibrator-gear, vibrator-lever, and harness-lever, substantially as shown and described.

398,329. ROLLER-BEARING. JOHN W. HYATT, Newark, N. J. Filed Aug. 17, 1888. Serial No. 283,020. (No model.)

Claim.—In a roller-bearing, two or more independently-rotating series of rolls held in position around the shaft by means of loose washers provided with suitable elevations adapted to fit into corresponding depressions in the rolls, and allowed to rotate independently of the other series, all arranged in a casing, substantially as and for the purposes described.

398,330. HOP-SHOVEL. BENJAMIN F. JACOBS, Milford, assignor of one-half to Marcus Luther, Hartwick, N. Y. Filed June 19, 1888. Serial No. 277,542. (No model.)

Claim.—1. In hop-shovel, the combination, with the rectangular frame having the lower inner edges rabbeted, and the handle, of the bag, of light close material, having its edges secured within the rabbeted portion, substantially as specified.

2. A hop-shovel consisting of the frame composed of the sides having the upwardly-curved ends, the transversely-beveled front bar, the rear bar and the bar E, the bag secured to the lower side of the said frame, and the handle, substantially as specified.

398,331. NECK-BAND-SHAPER AND SHIRT-BOSOM BOARD. WILLIAM H. JACOBY and CHARLES A. FULLER, Minneapolis, Minn.; said Charles A. Fuller assignor to Frank R. Fuller, same place. Filed Oct. 24, 1887. Serial No. 253,189. (No model.)

Claim.—1. The combination, with the bosom-board and the shoulder-clamps, of the expanding spring 44, arranged upon said board and secured by one end only to the board at the point in the spring that is nearest to the shoulder-clamps, whereby the distance between the front of the spring and the shoulder-clamps is varied as the spring is expanded and contracted, substantially as described.

2. The combination, with the bosom-board and the shoulder-clamps, of the expanding spring 44, having one end secured to the board at a point substantially central between the shoulder-clamps and having its other end free and arranged within said fixed end, and a clamp for securing said free end, whereby the distance between the front of the spring and the shoulder-clamps is varied as the spring is expanded and contracted, substantially as described.

3. The combination, with the bosom-board, of the frame 38, secured thereon, the expanding spring 44, having one free end and having the other end secured to said frame, the slide 48, arranged within said spring, and the eccentric lever 52, pivoted upon said frame and adapted to hold said slide in any position, substantially as described.

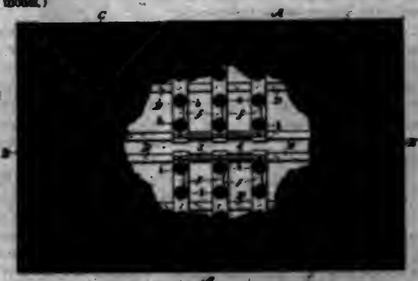
4. The combination, with a neck-band-shaper and a bosom-board having the recess 36, of a covering stretched over said recess to form a cushion, and the shoulder-clamps 16, arranged to be brought in contact with said cushion at either side of the neck-band-shaper and clamp the yoke of the shirt between them, substantially as described.

5. The combination, with the bosom-board having a recess, 36, at its forward end, of the shoulder-clamps 16 and the steady-pin 12, the said pin engaging the board upon its under side to hold it against the shoulder-clamps, substantially as described.

6. The combination, with a bosom-board having a recess and cushion at its forward end and having the recess 12 in its under side, of the steady-pin 10, adapted to enter said recess 12 and secure the said board in position, and the stretching device for the lower portion of the shirt, consisting of the cross-piece provided with a spring-clamp and held in position by the serrated plate 24 and pawl 26, all substantially as described.

398,332. MACHINE FOR COATING AND SANDING SHINGLES. JULIUS JAQUET, Milwaukee, Wis., assignor of one-half to John L. Mather, Lanark, Ill. Filed Sept. 24, 1888. Serial No. 286,200. (No model.)

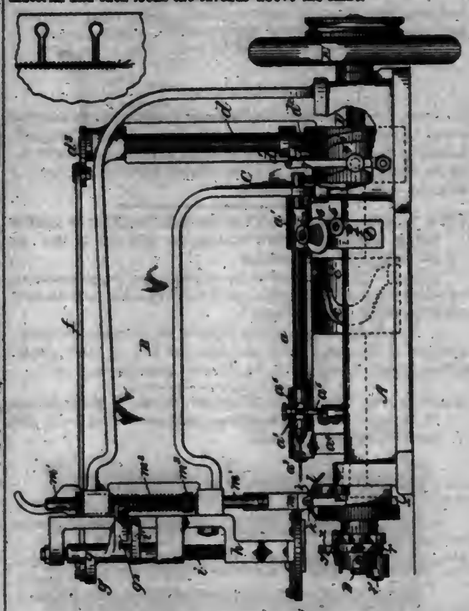
Claim.—1. The combination of one or more pairs of pressure-rollers and a pair of paint-distributing brushes located and adapted for the passage of shingles between them, with an endless apron traveling on rollers located and adapted to receive and carry forward a shingle after it leaves the pressure-rollers, and a sand-box located above the endless apron and provided with apertures in its bottom, substantially as described.



2. The combination of one or more pairs of pressure-rollers and a pair of paint-distributing bars or brushes located and adapted for the passage of shingles between them, with an endless apron located and adapted to receive such shingles from the pressure-rollers and carry them forward, a sand-box having an aperture for the discharge of sand therefrom, located above the apron, and a pressure-roller above and bearing yieldingly against a roller carrying the endless apron, between which rollers the shingles are carried on the apron after the shingles have received sand from the box, which rollers are adapted to distribute the sand and force it into the paint on the shingles, substantially as described.

398,333. DAMPENING-MACHINE. JOSEPH M. JOHNSTON, Allegheny, Pa. Filed Feb. 16, 1888. Serial No. 264,215. (No model.)

Claim.—In a dampening-machine, the combination of the body *a*, having the tanks *c c'*, one on each side of the same, belts *f* and *f'*, of some absorbent material, mounted on a triangular frame of rollers, so that the belts dip down into said tanks, and the adjustable rollers for pressing the excess of moisture from said belts, substantially as and for the purpose set forth.



398,334. SPRING BED-BOTTOM. JOHN R. JOHNS, Battle Creek, Mich., assignor to Benjamin S. Hollister, Loyal C. Kellogg, and Busk & Hoyt, all of same place. Filed May 31, 1887. Serial No. 239,771. (No model.)

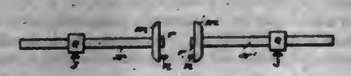
Claim.—The combination of the frame, the longitudinally-adjustable straps, the upper fabric continuous from one side of the frame to the other, the sets of spring-supporting slats located transversely and end to end on the straps, said ends disconnected and separated a little space from each other beneath the center of the fabric, and the staples or loops attached to the spring-supporting slats and loosely surrounding the straps upon which said slats rest, substantially as set forth.

398,335. BUTTON-HOLE FINISHING AND STAYING MACHINE. JOHN A. KNOX and THEODORE J. EISENDRATH, Lynn, Mass., assignors to P. P. Sherry, same place. Filed Oct. 17, 1887. Serial No. 252,573. (No model.)

Brief.—The presser-foot has a groove on the under side, which corresponds in shape with an upwardly-projecting rib on the work-plate. The button-hole piece is fed between these parts, so that the piece is bent just at the throats. The work-plate is raised at each alternate stitch made by the horizontal needle, which thus pierces the material and then locks the threads above the same.

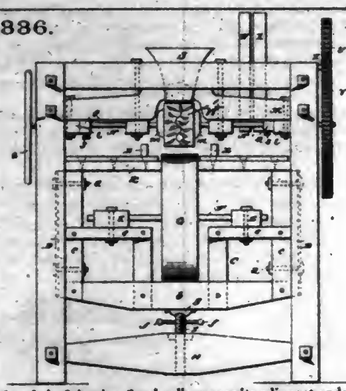
Claim.—1. The combination, with the shuttle, of a horizontally-reciprocating needle, a vertically-reciprocating work-plate provided with a rib, a presser-foot provided with a slot or groove into which the rib extends, and a feed mechanism, substantially as set forth.

2. The combination, with a horizontally-operating shuttle, of a horizontally-reciprocating needle, a feed mechanism, a vertically-reciprocating work-plate provided with a rib or raised portion, and a presser-foot provided with a slot or depression to co-operate with said rib or raised portion of the work-plate, substantially as set forth.



3. The combination, with a shuttle, a horizontally-reciprocating needle, a work-plate, a feed mechanism, and a presser-foot, of a shaft, D, and a cam on said shaft for intermittingly raising the work-plate as set forth.

4. The combination, with a shuttle, a work-plate, and feed mechanism, of a horizontally-reciprocating needle and needle-bar, a rotary shaft, a cam, *c*, on said shaft, means connecting said cam with said needle-bar to reciprocate the same, a cam, *c'*, also on said rotary shaft, and means connecting said latter cam, with the work-plate, whereby the latter may be raised and lowered intermittingly, as set forth.



398,336. WOOD-ENGRAVING MACHINE. WILLIS W. KNOWSON, Fort Scott, Kans., assignor of one-half to Samuel A. Van Buskirk, same place. Filed Oct. 3, 1888. Serial No. 287,453. (No model.)

Claim.—1. In a machine for the purpose described, the combination, with an engraving-roll having central journal-apertures and eccentrically-arranged apertures, of the sectional shaft for the said roller, having journals to enter the aperture and studs or pins to fix the said roller with respect to the shaft, substantially as specified.

2. In a machine for the purpose described, the combination, with the main frame, of the horizontal beam M, carrying journal-bearings,

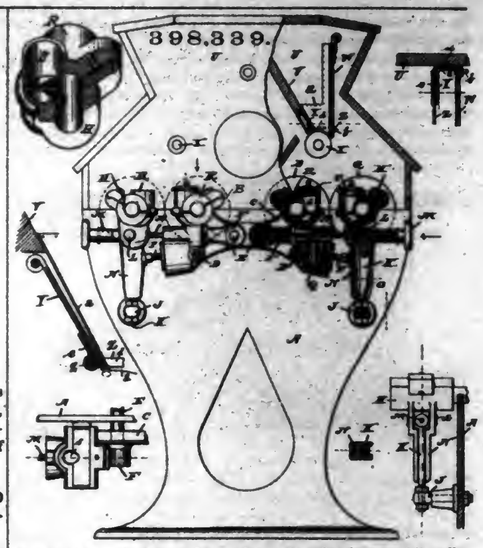
398,336.

the sectional shaft having fixed collars near its adjacent ends, and studs or pins on the said collars to receive interchangeably engraving-rolls, the sliding sleeves on the said collars, shaft, and thumb-screws for fixing the sleeves to the shaft, so as to prevent lateral displacement of the latter, substantially as specified.

398,337. COMPOSITION FOR THE MANUFACTURE OF TARRED PAPER. WILLIAM B. LUPTON, Pittsburg, Pa. Filed Apr. 23, 1888. Serial No. 271,577. (No specimens.)

Claim.—1. A composition for treating paper or felt in making tar-paper, composed of pine-tar and a coloring-matter, substantially as and for the purposes set forth.

2. A composition for treating paper or felt in making tar-paper, composed of pine-tar, a coloring-matter, and lime or other suitable stiffening agent, substantially as and for the purposes set forth.



398,338. FOLDING POULTRY-COOP. MICHAEL T. MALOY, Chicago, Ill., assignor to James H. Batchelder, same place. Filed Dec. 4, 1888. Serial No. 292,606. (No model.)

Claim.—1. In a folding coop, the combination, with the bottom, of the folding sides, the brace and hinge rods E E, the top, the brace or guide rods F F, secured to the under side of said top, the folding ends, and the brace and hinge rods H H, adjustably securing said ends to said bottom, whereby all the parts are adapted to fold in a horizontal position, substantially as and for the purpose set forth.

2. In a folding coop, the combination, with the bottom and the folding ends, of the brace and hinge rods H H, as described, and the ridge-bar a^7, provided at each end with a notch for the engagement of said ends, substantially as and for the purpose set forth.

398,339. ROLLER-MILL. JONATHAN D. MAWHOOD, Richmond, Ind., assignor to the Richmond City Mill Works, same place. Filed Apr. 2, 1888. Serial No. 269,311. (No model.)

Claim.—1. In a roller-mill, the combination, substantially as set forth, of a mill-frame, a pair of mill-rolls, a housing for the fixed roll, a lever pivoted to the frame and carrying a trunnion-pin, an adjusting-screw for adjusting such lever upon its pivot and altering the position of said trunnion-pin, a lever carrying a box for the movable roll and pivoted upon said trunnion-pin, and a spring arranged to act upon said levers at a point intermediate between said trunnion-pin and the pivot of said first-mentioned lever.

2. In a roller-mill, the combination, substantially as set forth, of a mill-frame, a pair of mill-rolls, a housing for the fixed roll, a lever pivoted to the mill-frame and carrying at its upper end a trunnion-pin, means, substantially as described, for adjusting the distance between the pivot of said lever and its trunnion-pin, an adjusting-screw for adjusting such lever, a lever pivoted upon said trunnion-pin and carrying a box for the movable roll, and a spring acting upon both said levers.

3. In a roller-mill, the combination, substantially as set forth, of a mill-frame, a pair of mill-rolls, a housing for the fixed roll, a lever pivoted to the mill-frame and carrying a trunnion-pin, a lever pivoted upon said trunnion-pin and carrying a box for the movable roll, a spring acting upon both said levers, a nut, and an adjusting-screw engaging said first-mentioned lever and said nut to move said trunnion-pin toward said nut against the resistance of said spring.

4. In a roller-mill, the combination, substantially as set forth, of a mill-frame, a pair of mill-rolls, a housing for the fixed roll, lever K, pivoted to the mill-frame, trunnion-pin I, journaled in said lever, adjusting-screw M, engaging said lever and a nut, lever N, provided with box H and pivoted to said trunnion-pin, spring Q, and spring-screw P.

5. In a roller-mill, the combination, substantially as set forth, of a mill-frame, a pair of mill-rolls, a housing for the fixed roll, lever K, pivoted to the mill-frame and carrying a trunnion-pin, an adjusting-screw for adjusting said lever, hollow lever N, inclosing said first-mentioned lever and pivoted thereto and carrying a box for the movable roll, and a spring arranged to act upon both said levers.

6. In a roller-mill, the combination, substantially as set forth, of a mill-frame, a pair of mill-rolls, a housing for the fixed roll, a wrist, J, in the mill-frame, lever K, carrying a trunnion-pin and provided at its foot with nuts engaging said wrist, an adjusting-screw to serve in adjusting said lever and altering the position of said trunnion-pin, lever N, carrying box H and pivoted to said first-mentioned lever, and a spring acting on both said levers.

7. In a roller-mill, the combination, substantially as set forth, of a mill-frame, a pair of mill-rolls, a fixed-roll housing, C, secured to the mill-frame and carrying a box for the fixed roll, and an outwardly-open cup, a pivoted lever supported by the mill-frame and carrying a box for the movable roll, an adjusting-screw connecting said lever and a nut at the fixed-roll housing, spring Q, seating in said spring-cup, and spring-screw P, reaching from said spring to said lever.

8. In a roller-mill, the combination, substantially as set forth, of a mill-frame, a pair of mill-rolls, boxes for said rolls provided with cap-receiving surfaces arranged in horizontal planes upon the non-wearing side of the journals and in angular planes upon the wearing side of the journals, caps secured to said boxes and engaging said surfaces, and tangential chambers 8, extending through the caps and past the non-wearing side of the journals into the boxes and below the level of the bottom of the journals.

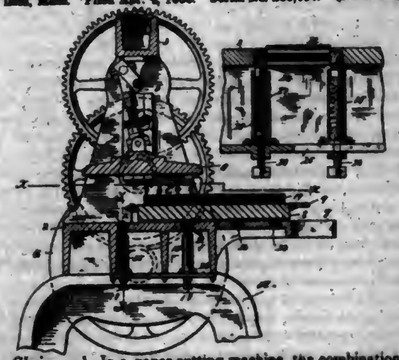
9. In a roller-mill, the combination, substantially as set forth, of a mill-frame, a pair of mill-rolls, boxes for said rolls provided with cap-receiving surfaces arranged in horizontal planes upon the non-wearing side of the journals and in angular planes upon the wearing side of the journals, caps secured to said boxes and engaging said surfaces, tangential chambers 8 in said caps and boxes at the non-wearing side of the bearing, and gaskets interposed in the horizontal joints between said boxes and caps and across said chambers.

10. In a roller-mill, the combination, substantially as set forth, of a mill-frame, a pair of mill-rolls, a feed-roll, a hopper, a spring-pressed feed-gate forming a wall of the hopper and arranged to have its edge act in conjunction with said feed-roll, a hopper-back, an agitator pivoted to such hopper-back, and having its lower edge contiguous to said feed-roll, and connecting-rods engaging said agitator and feed-gate.

11. In a roller-mill, the combination, substantially as set forth, of a mill-frame, a pair of mill-rolls, a hopper, a feed-roll, a hopper-back, a feed-gate with its lower free edge contiguous to said feed-roll and with its upper edge pivoted to the hopper, and a flexible packing at the ends of the hopper engaging the feed-gate and extending at the foot of the feed-gate from said feed-gate to said hopper-back.

12. In a roller-mill, the combination, substantially as set forth, of a mill-frame, a pair of mill-rolls, a hopper, a feed-roll, feed-gate W, hopper-back V, agitator Y, wire Z, engaging said agitator and feed-gate, and clip c, engaging such agitator and wire.

398,340. HAT-MEASURE. ALEXANDER B. MCDONALD, Brooklyn, N. Y. Filed July 23, 1888. Serial No. 280,965. (No model.)



Claim.—1. A hoop-like hat-measure or measuring device with two inwardly-projecting thumb-pieces, *b* and *b'*, on one of its ends and a thumb-piece, *d*, on its other end, arranged between said thumb-pieces *b* and *b'*, whereby the said measure may be conveniently expanded and contracted.

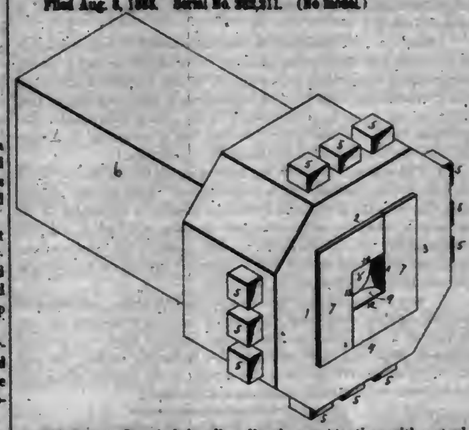
2. A hat-measure consisting of a band, as A, of suitable resilient material, having overlapping ends and suitable keepers, an outwardly-projecting flange, as *g*, on the band, having on its upper face numbered graduations *x*, and a pointer, as *c*, carried by one end of said band and arranged to play over the margin of the flange *g* when the loop of the band is expanded and contracted, substantially as set forth.

3. A hat-measure consisting of a resilient band, as A, having overlapping ends, one of which is embraced by keepers on the other, and said band provided with outwardly-projecting flanges *g* and A, the former bearing numbered graduations, and with a pointer, *c*, and thumb-pieces *d b b'*, substantially as set forth.

4. A hat-measure consisting of a resilient band having overlapping ends, one of which is embraced by keepers on the other, said band being provided with inwardly-projecting thumb-pieces for contracting and expanding the band, one of said thumb-pieces being constructed of two telescoping parts and hinged at its end to the band, as set forth.

398,341. PAPER-CUTTING MACHINE. ELISHA MORGAN, Springfield, Mass. Filed Apr. 4, 1888. Serial No. 269,637. (No model.)

Claim.—1. In a paper-cutting machine, the combination, with the bed provided with vertically-movable journal-bearings, of rollers supported in said bearings, the cutter-board resting and movable on said rolls, the reciprocating platen, and a cutter, substantially as and for the purpose described.



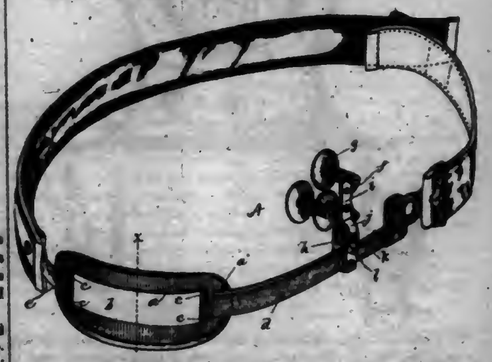
2. In a paper-cutting machine, the combination, with the bed provided with vertically-movable journal-bearings and sustaining-springs therefor, of rollers supported in said bearings, the cutter-board resting and movable on said rolls, the reciprocating platen, and a cutter, substantially as and for the purpose described.

3. In a paper-cutting machine, the combination, with the bed provided with vertically-movable journal-bearings, sustaining-springs therefor, and vertically-adjustable bearings for the lower ends of said springs, of rollers supported in said bearings, the cutter-board resting and movable on said rolls, the reciprocating platen, and a cutter, substantially as and for the purpose described.

4. In combination, the bed 2 of a paper-cutting machine, one or more cutter-board-sustaining rollers hung to rotate in said bed, whose peripheries project normally above the plane thereof, a cutter-board capable of a reciprocating horizontal movement on said rollers, and a brushing device, substantially as described, attached to one end of said board, having one end thereof in contact with the surface of said bed, substantially as set forth.

5. In combination with the bed of a paper-cutting machine, a cutter-board-sustaining roller, substantially as described, hung to rotate in said bed, the cylinders 15, supported vertically under said bed, the roller journal-bearings 14, having their lower ends entering said cylinders, the springs 17, constituting yielding supports for said bearings, and the screw-bolts 18, sustaining said springs, substantially as set forth.

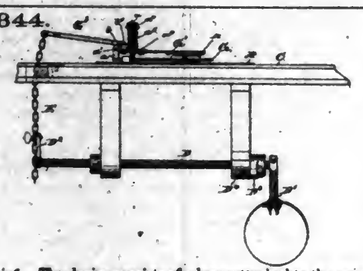
398,342. BOLT-HEADING TOOL. FREDERICK MOTHNER, Rockford, Ill., assignor of one-half to the Rockford Bolt Works, same place. Filed Aug. 8, 1888. Serial No. 282,211. (No model.)



Claim.—1. In a bolt-heading die, the combination, with a stock, of sections held in place in said stock and made endwise reversible, substantially as set forth.

2. In a bolt-heading die, the combination, with the stock, of rectangular sections arranged in said stock and made endwise reversible, and set-screws for holding said sections in place, substantially as set forth.

3. In a bolt-heading die, the combination, with a stock and rectangular sections removably and reversibly secured therein, of a block placed between said sections and provided with a concave face and set-screws for holding said sections in position, substantially as set forth.

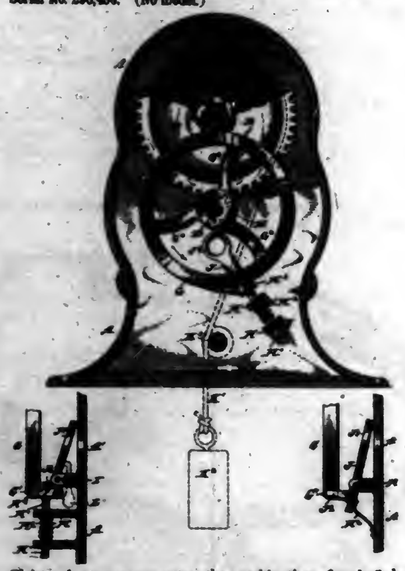


398,343. TRUSS. SHERMAN R. NYE, Chicopee Falls, Mass. Filed Dec. 24, 1887. Serial No. 258,899. (No model.)

Claim.—In a truss, the combination, with a short hip-pad, *a*, of a hernial-pad-supporting arm, *d*, hinged or pivoted thereto, substantially as and for the purposes set forth.

398,344. CLAMP-OPERATING MECHANISM FOR SUTTON-HOLE SEWING-MACHINES. FREELAND W. OSTRUM, Bridgeport, Conn., assignor to The Wheeler & Wilson Manufacturing Company, same place. Filed May 20, 1886. Serial No. 202,732. (No model.)

398,344.



Brief.—The device consists of a lever attached to the upper member of the clamp and extending rearwardly therefrom. A chain or other flexible connecting device is attached to this lever and to a lever below the work-plate, which can be operated by the knee or foot to raise the clamp.

Claim.—1. The combination, with the stitch-forming mechanism, of a button-hole sewing-machine and a cloth-holding clamp having reciprocating movements in opposite directions parallel to the length of the button-hole while the said button-hole is being stitched, an arm G^2, projecting from the cloth-holding clamp, a lever constructed to be operated by an operator's knee or foot, and a connector interposed between the arm and lever, substantially as described.

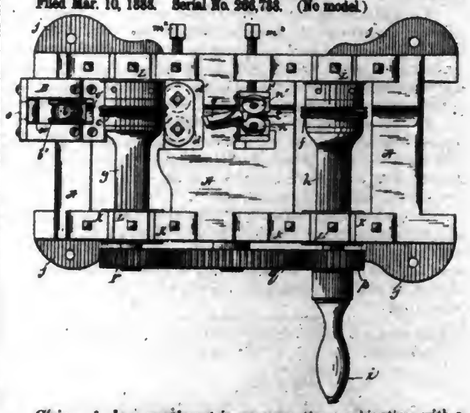
2. The combination, with the stitch-forming mechanism, of a button-hole sewing-machine and a cloth-holding clamp having reciprocating movements in opposite directions parallel to the length of the button-hole while the said button-hole is being stitched, an arm, G^2, pivoted to the cloth-holding clamp, a lever constructed to be operated by an operator's knee or foot, and a connector interposed between the arm and lever, substantially as described.

3. In a button-hole sewing-machine, the bed-plate, combined with the cloth-holding clamp and a button for securing it thereto, the arm G^2, hinged to the upper member of the clamp, a knee or foot lever arranged below the table, and a flexible connector uniting the arm and lever, and at the same time permitting of the tipping of the sewing-machine, substantially as shown and described.

398,345. CIGAR-CUTTER. FRANK A. PHILLIPPI, Reading, Pa., assignor of one-half to Samuel Lutz, same place. Filed Nov. 10, 1888. Serial No. 290,436. (No model.)

Claim.—1. In a cigar-cutter, the combination of a shaft having a gear and spring mounted thereon with a shaft provided with a pinion adapted to mesh with said gear, and having a cutter-wheel mounted at one side, and with devices for releasing the cutter-wheel to permit the spring and intermediate mechanism to rotate the same, substantially as specified.

2. In a cigar-cutter, the combination of a shaft having a gear and a spring mounted thereon, or its described equivalent, with a shaft provided with a pinion adapted to mesh with said gear, and having a cutter-wheel mounted at one side and provided with stops, and devices, substantially as shown and described, for releasing the cutter-wheel, substantially as specified.



3. In a cigar-cutter, the combination of a shaft having a gear and spring mounted thereon with a shaft provided with a pinion meshing with said gear, and having a cutter-wheel mounted at one side thereof provided with stops, and with a cam-lever pivoted near the wheel and adapted to project into the path of the stops, substantially as specified.

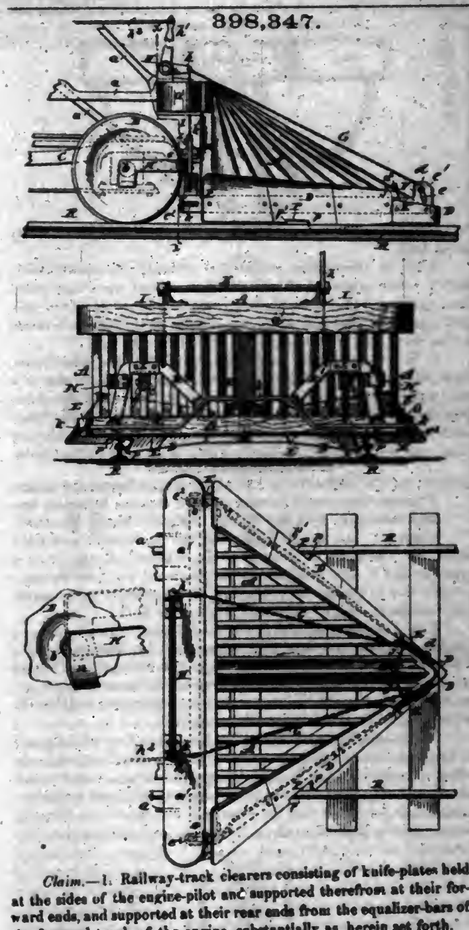
4. In a cigar-cutter, the combination of a shaft having a spring and gear mounted thereon, a shaft provided with a pinion adapted to mesh with said gear, and with a cutter-wheel provided with stops and cutter-arms, and with a cam-lever provided with a cigar-receiving opening in one end, and with a spring-bolt arranged below the cam end thereof and projecting into the path of the stops, substantially as specified.

5. The combination, with the case A, having the opening A', of the shaft B, carrying the spring C and gear D, the shaft E, carrying the pinion F and the cutter-wheel G, having cutting-arms G^2 and peripheral stops G', the cam-lever J, and the spring-bolt H', substantially as specified.

6. The combination of the cutter-wheel G and devices for actuating the same with the lever J, having the cam at one end adapted to come into contact with the stops on the wheel, and a spring for retaining the same in said contact, and provided with an opening at its opposite end and adapted to be thrown into surface contact with the cutter-arms of the wheel, substantially as specified.

398,346. MACHINE FOR MAKING WEATHER-STRIPS. JOSIAH POTTON, New York, N. Y., assignor to Charles R. Vincent, same place. Filed Mar. 10, 1888. Serial No. 266,788. (No model.)

Claim.—1. In a weather-strip machine, the combination, with a set of rolls for beading the metallic strips, of a set of wrapping-rolls comprising a vertical double-grooved roll and two diagonal single-grooved rolls for inclosing an elastic cushion in one of the beads of the strips, and the clinching-rolls for finally securing the bead upon the said cushion, substantially as and for the purpose set forth.



2. In a weather-strip machine, the combination, with a pair of feed-rolls for bending the metallic strips, of the revolving forming-rolls provided with double grooves, the horizontal forming-rolls for turning over the edges of the beads, the wrapping-rolls for inclosing an elastic cushion in one of the beads of the strips, and the revolving clinching-rolls for securing the cushion in said bead, substantially as and for the purpose set forth.

3. In a weather-strip machine, the combination, with a set of rolls for beading the metallic strips, of the vertical wrapping-roll *l* and diagonal wrapping-rolls *n n'*, the guide *c*, secured in front of the wrapping-rolls, whereby the elastic cushion is inserted in one of the beads of the strips, and the revolving clinching-rolls journaled behind said wrapping-rolls and securing the cushion in the bead, substantially as and for the purpose set forth.

4. In a weather-strip machine, the combination, with the supporting-frame, of the entering-roll *a* and feed-rolls *b b'*, journaled at the front end of the frame, the guide-plates *c* and *c'*, the forming-rolls *c* and *c'*, provided with toothed wheels for revolving them, the horizontal forming-rolls journaled behind the aforesaid forming-rolls, a set of wrapping-rolls for inclosing an elastic cushion in one of the beads of the strips, and the clinching-rolls journaled at the rear of the machine and provided with toothed wheels for rotating them, substantially as and for the purpose set forth.

398,347. TRACK-CLEANER. AUGUSTUS F. PRIEST, Fort William, Ontario, Canada. Filed July 3, 1888. Serial No. 278,094. (No model.)

398,347.

Claim.—1. Railway-track clearers consisting of knife-plates held at the sides of the engine-pilot and supported therefrom at their forward ends, and supported at their rear ends from the equalizer-bars of the forward truck of the engine, substantially as herein set forth.

2. Railway-track clearers consisting of knife-plates held at the sides of the engine-pilot and extending to the nose or front thereof clear across the track, and supported at their front ends from the pilot and at their rear ends from the equalizer-bars of the forward truck of the engine, substantially as herein set forth.

3. Railway-track clearers consisting of knife-plates hung at the sides of the engine-pilot and supported therefrom at their forward ends, and supported at their rear ends from the equalizer-bars of the forward truck of the engine, and said clearer-plates made vertically adjustable, substantially as herein set forth.

4. Railway-track clearers consisting of knife-plates hung at the sides of the engine-pilot and supported therefrom at their forward ends, and supported at their rear ends from the equalizer-bars of the forward truck of the engine, and said clearer-plates extending to the nose of the pilot or clear across the track and made vertically adjustable, substantially as herein set forth.

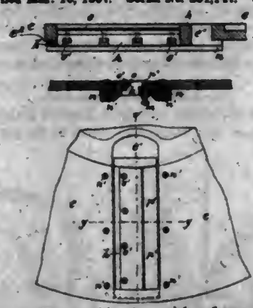
5. Railway-track clearers consisting of knife-plates held at the sides of the engine-pilot and guide bars or plates connected to the clearer-plate supports and overlapping the sides of the pilot truck-wheels or the ends of their axle, substantially as described, whereby the lateral position of the clearer-plates will be controlled by the forward truck of the engine, as set forth.

6. Railway-track clearers consisting of knife-plates held at the sides of the engine-pilot and supported therefrom at their forward ends and supported at their rear ends from the equalizer-bars of the forward truck of the engine, and guide bars or plates connected to the clearer-plate supports and overlapping the sides of the pilot truck-wheels or the ends of their axles, substantially as described, for the purposes set forth.

7. Railway-track-clearer knife-plates consisting of re-enforcing bars held to the sides of the engine-pilot and brittle or hard metal sectional plates secured to the re-enforcing bars, substantially as herein set forth.

8. The combination, in railway-track clearers and with the engine-pilot, of bars E E, having front slots, *c*, bolts *d*, passed through said slots into the pilot or a plate thereon, a shaft, H, on the engine, chains G, connecting the bars E to said shaft or arms thereon, a frame, K, supported on front extensions of the equalizer-bars of the forward truck of the engine and entering slots at the rear ends of the bars E, detents preventing lateral disengagement of the parts E K, chains I, connecting the frame K with the shaft H or its arms, and clearer-knives held to the bars E E and adapted when down to clear the track, substantially as herein set forth.

9. In railway-track clearers, the combination, with clearer-knife bars E E, hung at the front of the engine-pilot and provided with looped rear end parts, e^2, of a frame, as K, supported on front extensions of the equalizer-bars of the pilot-truck and entering slots in the ends e^2 of the bars E, and bolts or pins O, passed into the loops e^2 and into the frame K, substantially as herein set forth.

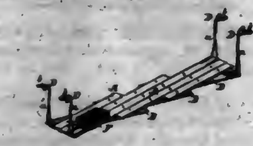


10. In railway-track clearers, the combination, with the clearer-knives or their re-enforcing bars and a frame suspending the rear ends of the clearers from front extensions of the equalizer-bars of the forward truck of the engine, of a wear plate or plates, as L M, held to the equalizer-bar or clearer-frame, one or both, and acting also to allow vertical adjustment of the back ends of the clearers relatively to the track to accommodate wear of the boxes of the pilot-wheel bearings of the engine, substantially as herein set forth.

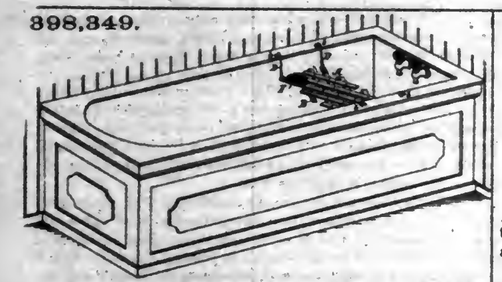
11. In railway-track clearers, the combination, with the clearer-knife-supporting bars and a frame, as K, hung from the equalizer-bars of the front pilot of the engine, and on which the rear ends of the clearers are supported, of arms N N, held to the frame K and provided with depending lugs *n n*, substantially as described, for the purposes set forth.

12. In railway-track clearers, the combination, with the engine-pilot and vertically-adjustable clearer-knives or their supporting-bars hung therefrom, of safety chains or devices, as J, connected to the clearers and to the pilot, substantially as herein set forth.

13. In railway-track clearers, the combination, with the engine-pilot, of vertically-adjustable clearer-knives or their supports, having slots *c*, bolts or pins *d*, entering the slots into the pilot or a plate thereon, and said slots having beveled or inclined lower end walls, substantially as herein set forth.



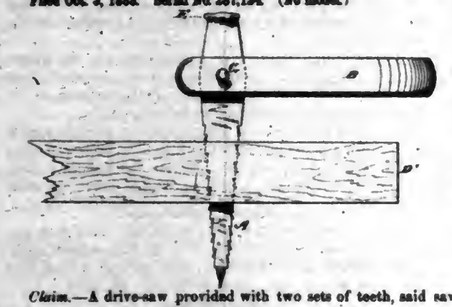
398,348. SUGAR-CANE-SLICING MACHINE. CARL RABE, Sangerhausen, Prussia, Germany, assignor to the Sangerhäuser Actien-Maschinen-Fabrik and Eisengiesserei, vorm. Hornung & Rabe, same place. Filed Mar. 16, 1887. Serial No. 231,147. (No model.)



Claim.—1. The combination, with a frame having a chamber provided with a covering-plate and a feed-hopper delivering the cane through said plate, of the rotary disk *c*, having a radial slot, *c'*, and a recess, c^2, at the under side of the periphery of the disk communicating with the slot, the side bars, *n*, the boxes *k*, carrying a cutter, *o*, resting on the side bars and having an outer reduced end or tenon, *k'*, entering the said recess and engaging under the peripheral portion of the disk, substantially as described.

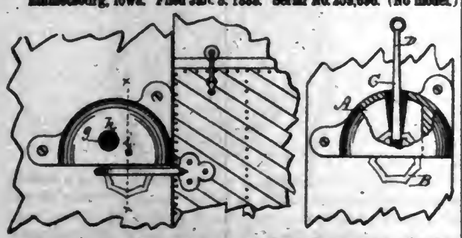
2. The combination of the cutting-disk *c*, having a radial slot, *c'*, and a recess, c^2, under the peripheral portion communicating with the slot, with the cutter-carrying box *k*, having a reduced outer end or tenon, *k'*, entering said recess and engaging under the peripheral portion of the disk, substantially as described.

398,349. BASIN-RACK FOR BATH-TUBS. LOUIS D. REYN, Philadelphia, Pa. Filed Nov. 22, 1887. Serial No. 256,867. (No model.)



398,349.

Claim.—1. The within-described supporting-rack for bath-tubs, said rack comprising two sets of bars crossing each other and pivoted together at the crossing-points, in combination with hangers each secured to the end of a bar of the rack, but free from connection with any of the adjacent bars, all substantially as specified.

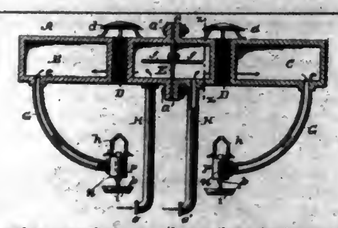


2. The combination of the rack comprising two sets of bars, crossing each other and pivoted together at the crossing-points, with hangers having projecting heads and flexible shanks, each hanger being secured to the end of a bar of the rack, but free from connection with any of the adjacent bars, all substantially as specified.

398,350. DRIVE-SAW. GRANVILLE T. SHEPLEY, Townsend, Mass. Filed Oct. 3, 1888. Serial No. 287,124. (No model.)

Claim.—A drive-saw provided with two sets of teeth, said saw coming to a point at its outer end and concaved upon both sides, the saw being movable upon a pivot within the handle thereof, substantially in the manner described and shown, and for the purposes set forth.

398,351. GATE-LATCH. ALEXANDER SIME and WILLIAM M. MOORE, Emmetsburg, Iowa. Filed Jan. 3, 1888. Serial No. 259,696. (No model.)



Claim.—1. A hollow metal case adapted to be fixed to a flat surface, having an open bottom, an opening in its top, and vertical grooves in the inside faces coinciding with the opening in the top, and a ring and a yoke combined therewith, to operate in the manner set forth for the purposes stated.

2. A hollow metal case, A, having perforated ears or flanges, an open bottom, an opening in its top, a ring, B, a yoke C, and a fixed stop, F, arranged and combined with a gate or door in the manner set forth, for the purposes stated.

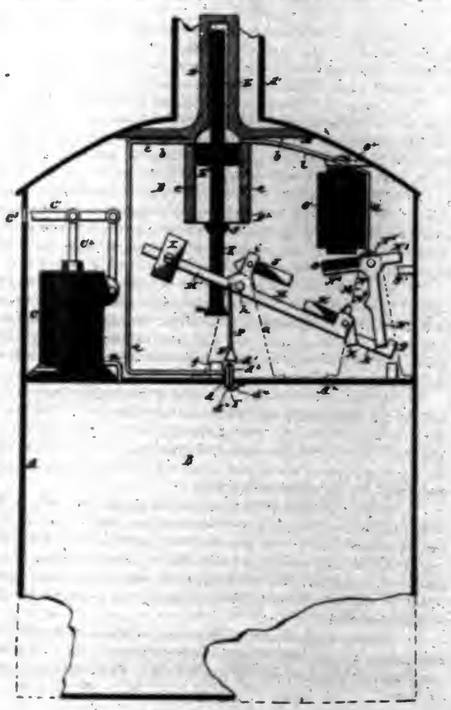
3. In a gate-latch, the combination of an adjustable screw and a ring with a case having a screw-threaded key-hole, to operate in the manner set forth, for the purposes stated.

398,352. PETROLEUM-BURNER. FREDERICK H. SMITH and JOHN W. WRIGHT, Kansas City, Mo., assignors of one-third to Samuel R. Strathan, same place. Filed Nov. 21, 1888. Serial No. 291,455. (No model.)

Claim.—1. The combination, with a retort having two joined chambers and a diaphragm-wall provided with two deflector-plates, as shown, of two curved depending oil and vapor conveying pipes,

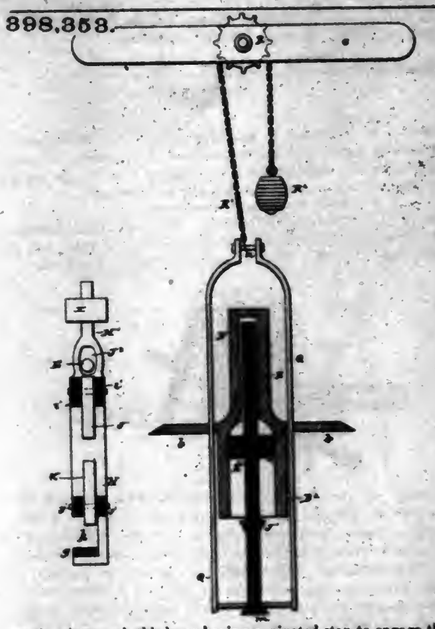
two aero-carbon-vapor burners, and two oil-supply pipes, substantially as set forth.

2. In an aero-carbon gaseous-fuel generator, the combination, with a retort composed of two chambers having open ends which abut against a joint-wall that is interposed between them, of two integral depending pipes and aero-carbon-vapor burners that are affixed to the lower ends of these pipes, substantially as set forth.



3. In an aero-carbon gaseous-fuel generator, the combination, with two chambers having open ends, a diaphragm-plate that is a joint-wall between these chambers, and bolts to connect the chambers detachably, of two oil-feed pipes that are formed on the lower walls of the chambers, two depending curved oil and vapor conveying pipes, and two aero-carbon-vapor burners, substantially as set forth.

398,353. SEMAPHORE-SIGNAL. FREDERICK STITZEL and CHARLES WEINEDEL, Louisville, Ky., assignors to the American Semaphore Company, same place. Filed Mar. 24, 1888. Serial No. 268,406. (No model.)



Claim.—1. In a signaling apparatus, the combination, with a cylinder and piston-rod, of a visual signal connected with the latter, a lever pivoted in close proximity to the piston-rod, this lever having a pivoted stop to engage the piston-rod, and mechanism to automatically release the pistop-rod, substantially as set forth.

2. In a signaling apparatus, the combination, with a cylinder, a piston, and piston-rod, of a signal-blade connected with the latter, a fluid-pressure supply-pipe communicating with the cylinder, a lever pivoted in close proximity to the piston-rod, this lever having a pivoted stop to engage the piston-rod, and mechanism to automatically release the piston-rod, substantially as set forth.

3. In a signaling apparatus, the combination, with a cylinder made in two parts, one of said parts being larger in circumference than the other, of a piston in the larger portion, a piston-rod secured to said piston and adapted to reciprocate in both sections of the cylinder, a signal-blade connected with the piston-rod, a fluid-pressure inlet-pipe communicating with the cylinder, a lever pivoted in close proximity

398,353.

to the piston-rod, this lever having a pivoted stop to engage the piston-rod, and mechanism to automatically move the stop to release the piston-rod, substantially as set forth.

4. In a signaling apparatus, the combination, with a cylinder having inlet and outlet ports, of a piston and piston-rod, enlargements on the rod, a lever pivoted in close proximity to the piston-rod, this lever having a pivoted stop to engage one of said enlargements, a signal-blade connected with the piston-rod, and mechanism to automatically release the piston-rod to display the signal, substantially as set forth.

5. In a signaling apparatus, the combination, with a cylinder and a piston and piston-rod, of a yoke or frame attached to the latter near its lower end and extending upwardly above the piston, a visual blade connected with the yoke, fluid-pressure inlet and outlet ports communicating with the cylinder, a pivoted stop to engage an enlargement on the piston-rod, and mechanism to automatically release said piston-rod and permit it and the yoke to rise and cause the signal-blade to be turned, substantially as set forth.

6. In a signaling apparatus, the combination, with a cylinder having perforated bosses on its exterior, and a piston and piston-rod, of a yoke or frame pivoted to the piston-rod near its lower end and passing through the perforated bosses on the cylinder, a visual-signal blade, a sprocket-wheel on the shaft of said blade, a chain carrying a weight at one end and connected at its opposite end to the yoke, and mechanism for actuating said piston to operate the signal-blade, substantially as set forth.

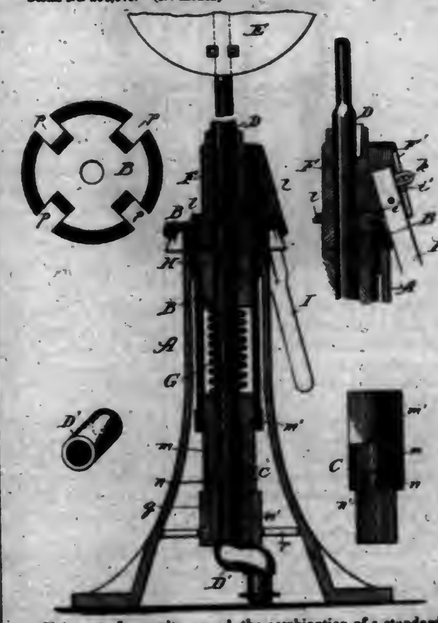
7. In a signaling apparatus, the combination, with a structure, a fluid-reservoir therein, and a pump for forcing fluid into said reservoir, of a cylinder, a pipe for connecting the reservoir with said cylinder, a valve in said pipe, a piston and piston-rod in the cylinder, a signal-blade connected with the piston-rod, and mechanism for operating the valve automatically just before the downward movement of the piston-rod to admit fluid to the cylinder, substantially as set forth.

8. In a signaling apparatus, the combination, with a fluid-reservoir, of a cylinder, a pipe connecting the reservoir and cylinder, a valve in said pipe, a piston and piston-rod in the cylinder, a visual signal connected with the piston-rod, a pivoted lever, a depending rod pivoted thereto, and mechanism for operating the lever to cause the depending rod to strike the valve and open the same, substantially as set forth.

9. In a signaling apparatus, the combination, with a fluid-reservoir, a cylinder, a piston and piston-rod, and a signal-blade connected with the latter, of a pipe connecting the reservoir and cylinder, a double valve communicating with the pipe, said valve being held open at one end by a spring, a pivoted lever carrying a depending rod, and mechanism to turn said lever and cause the depending rod to strike the valve to close one end and open the other, substantially as set forth.

10. In a signaling apparatus, the combination, with a cylinder, a piston and piston-rod therein, and a signal-blade connected with the latter, of a pivoted lever, a stop to engage an enlargement on the piston-rod, a T-lever to support one end of the first-mentioned lever and carrying an armature, and an electro-magnet to actuate said armature, substantially as set forth.

11. In a signaling apparatus, the combination, with a cylinder, a piston and piston-rod therein, and a signal-blade connected with the latter, of a lever carrying a counterbalance-weight, a stop pivoted to the lever to engage an enlargement on the piston-rod, a second pivoted stop near one end of the lever, a T-lever having an enlargement to engage this pivoted stop, an armature carried by the T-lever, and an electro-magnet to actuate the armature, substantially as set forth.



12. In a signaling apparatus, the combination, with a cylinder, a piston and piston-rod therein, and a signal-blade connected with the piston-rod, of a reservoir, a pipe connecting the cylinder and reservoir, a valve between the pipe and reservoir, a pivoted lever carrying a pivoted stop to engage an enlargement on the piston-rod, a pendulum-rod pivoted to the lever and adapted to strike the valve, an enlargement on the end of the piston-rod to strike the pendulum-rod to disengage the latter from the valve, a T-lever to support one end of the first-mentioned lever and carrying an armature, and an electro-magnet to attract said armature and retain the T-lever in place, substantially as set forth.

13. In a signaling apparatus, the combination, with a fluid-reservoir, a cylinder, a piston and piston-rod therein, and a signal-blade connected with the piston-rod, of a pipe connecting the reservoir and cylinder, a valve between the pipe and reservoir, a pivoted lever carrying an armature, an electro-magnet to attract said armature, a pipe connected with the cylinder and terminating above the lever, and a washer carried by said lever and adapted to close the end of the pipe, substantially as set forth.

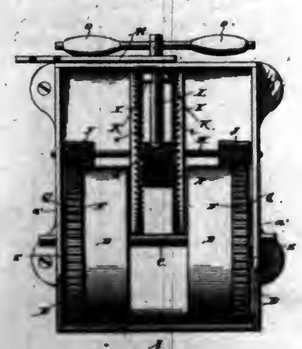
14. In a semaphore-signaling apparatus, the combination, with the railroad-tracks, of a battery and an electro-magnet connected with said tracks at opposite ends of a block, a lever carrying an armature, a fluid-reservoir, a cylinder, a pipe connecting the reservoir and cylinder, a valve between the pipe and reservoir, a piston and piston-rod in the cylinder, a signal-blade connected with the piston-rod, and mechanism for operating the valve to admit fluid to the cylinder when the magnet is energized, substantially as set forth.

15. In a signaling apparatus, the combination, with a fluid-cylinder, a piston and piston-rod therein, and a visual signal connected with said rod, of a vibrating lever having an armature, an electro-magnet to attract the armature, a pipe connected with the cylinder and terminating near the armature, and mechanism carried by said lever and adapted to open and close the pipe, substantially as set forth.

398,354. SWITCH-STAND. AXEL A. STROM, Austin, assignor to the Strom Manufacturing Company, Chicago, Ill. Filed Nov. 26, 1888. Serial No. 291,575. (No model.)

Claim.—1. In a switch-stand, the combination of a standard, A supporting the lower stationary part, n, of a clutch, C, a recessed annular table, E, having a sleeve, E', extending into the standard, the

upper part, *m*, of the clutch extending into the lower end of the sleeve B' and longitudinally but not axially movable therein, a spindle, D, extending through the standard and clutch, a crank, D', at the end of the spindle, a spring, G, surrounding the spindle in the sleeve B' and pressing on the clutch, a yoke, F, secured to the spindle and confining the spring at its upper end, and an operating-lever, I, substantially as described.



2. In a switch-stand, the combination of a standard, A, supporting a rectangular socket, *q*, a clutch, C, having a lower part, *n*, provided with a rectangular shank, *n'*, fitting into the socket *q*, a recessed annular table, B, having a sleeve, B', extending into the standard and rectangular on its interior near the lower end, the upper part, *m*, of the clutch having a rectangular shank, *m'*, fitting into the lower end of the sleeve B' and longitudinally movable therein, a spindle, D, extending through the standard and clutch, a crank, D', at the lower end of the spindle, a yoke, F, secured to the spindle, a spring, G, confined in the sleeve B' between the clutch and yoke, and an operating-lever I, substantially as described.

3. In a switch-stand having an annular peripherally-recessed revoluble table normally interlocked with the spindle and a clutch having a stationary part, and a rotary part actuated against the resistance of a confined spring, G, by turning the interlocked spindle, a yoke, F, secured to the spindle and provided with a flange, *l*, and extending below the flange into the opening in the table, and a lever, I, pivotally connected with the yoke and normally extending into a peripheral recess in the table, substantially as described.

4. A switch-stand comprising, in combination, a standard, A, having in its base a web, *r*, rigidly supporting a rectangular socket, *q*, a clutch, C, having a lower part, *n*, provided with a rectangular shank, *n'*, fitting into the socket *q*, a recessed annular table, B, having a sleeve, B', extending into the standard and rectangular on its interior near the lower end, the upper part, *m*, of the clutch having a rectangular shank, *m'*, fitting into the lower end of the sleeve B' and longitudinally movable therein, a spindle, D, extending through the standard and clutch and having a crank, D', at its lower end, a yoke, F, secured to the spindle and provided with a flange, *l*, and extending below the flange into the opening in the table, a spring, G, surrounding the spindle in the sleeve B', a sleeve, H, in the sleeve B' between the upper end of the spring and the yoke, and an operating-lever, I, substantially as described.

398,355. SPRING-MOTOR. HIRAM L. SUYDAM, Geneva, N. Y.

Filed Nov. 2, 1888. Serial No. 289,838. (No model.)

Claim.—1. The combination, in a spring-motor, of the frame, the main shaft journaled in the frame, the drive-wheels and springs arranged at the ends of the main shaft, the shaft H, carrying pinions meshing with the drive-wheels, and the scape-wheels mounted upon the said shaft H and provided upon their inner faces with teeth, substantially as described.

2. The combination, in a spring-motor, of the frame, the main shaft journaled in the frame, the drive-wheels and springs arranged at the ends of the said shaft, the shaft H, carrying pinions meshing with the drive-wheels, the scape-wheels mounted upon the shaft H, and the rock-shaft arranged between the scape-wheels and provided with the pallets adapted to be alternately engaged by the scape-wheels, substantially as described.

3. The combination, in a spring-motor, of the frame, the main shaft journaled in the frame, the drive-wheels and the spring arranged on said shaft, the shaft H, carrying the pinions meshing with the drive-wheels, the scape-wheels mounted upon the shaft H, the rock-shaft arranged between the scape-wheels and provided with pallets adapted to be alternately engaged by the scape-wheels, the lever, and the weighted arms, substantially as described.

398,356. CASH-CARRIER. MOSES C. SWEEZY, New Haven, Conn.

Filed Oct. 8, 1888. Serial No. 287,511. (No model.)

Claim.—In a store-service apparatus, a track-wire having near its termination a gradual enlargement formed by an overlay of wire wound thereon, said enlargement being adapted to gradually stop a car traveling on said track, all substantially as described.

398,357. SAW-SETTING DEVICE. WILLIAM TRAUDE, Louisville, Ky., assignor of two-thirds to W. W. Barnes and Guy C. Sibley, both of same place. Filed Nov. 12, 1888. Serial No. 290,601. (No model.)

Claim.—1. In a saw-set, the combination, with the crank, the cam on its shaft, and the pivoted notched thrower-plate for setting the teeth, of the intermittently-operating lever, the feed-pawl, and the adjustable devices regulating its stroke, substantially as specified.

2. The combination, with the side plate having the bearings, of the roller having the cam-groove, the pivoted plate N, having its end extended into said cam-groove, the pivoted set-disk, and the operating-crank, substantially as specified.

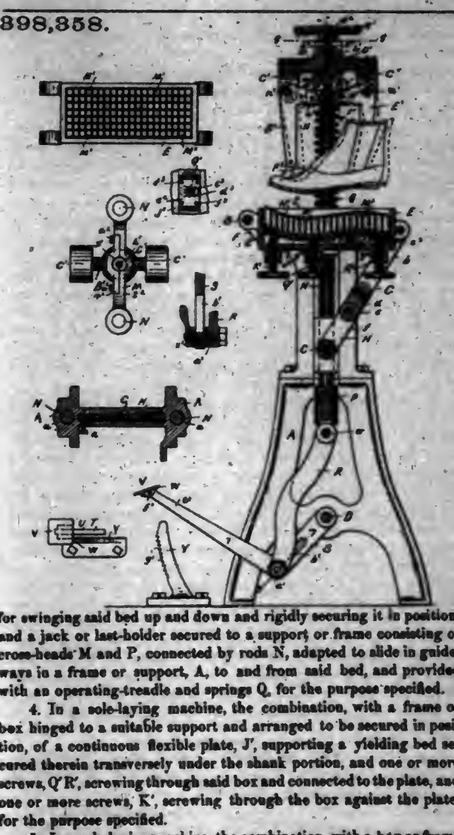
3. The combination of the side plate, A, having the bearings, the roller journaled in said bearings and having the annular cam-groove, the crank, the pivoted plate having the lug extended into the cam-groove, the pivoted set-disk secured to said plate, and the guide-plate D, having the bolt extended through an opening in the side plate, substantially as specified.

4. The combination, with the side plate, A, having the transverse bearing portion, the pivoted plate N, and the set-disk, of the roller having the cam-groove, the lugs on its extended journal, the pivoted lever M, having the eccentric within its ring end and the pin on its opposite end, and the graduated bar and the pawl pivoted thereon, substantially as specified.

5. In combination with the bearing-plate A, the cam-groove roller, the pivoted plate engaging the pivoted set-disk, and the pivoted lever M, the graduated bar seated in the grooved lateral bed-plate, the spring-controlled pawl pivoted to the bar, the yoke having the extension, the thumb-screw, and the returning spring, substantially as specified.

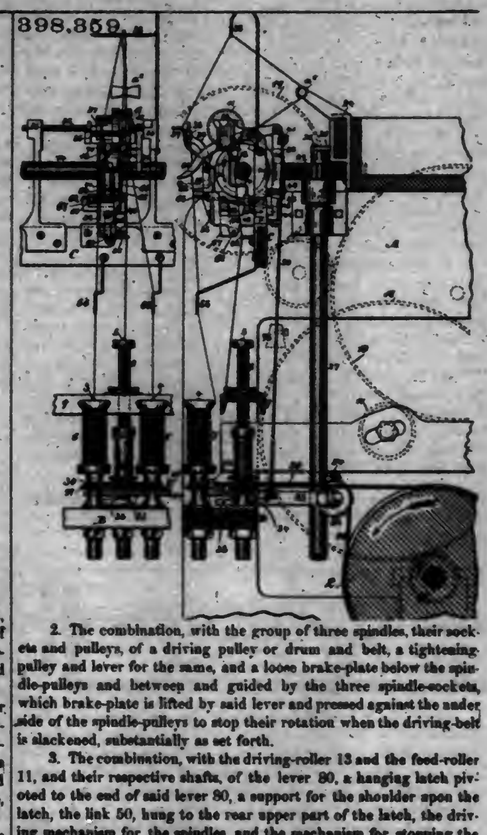
6. In a saw-set, the combination, with the slide-bar, the intermittingly-acting lever, and the operating mechanism, of the height-guide having the slot-opening and the inwardly-projecting portion, and the fastening-screw, substantially as specified.

7. In a saw-set, the combination, with a notched oscillating thrower-plate for setting the teeth, the adjustable height-guide, a slide-bar carrying a feeding-pawl, and an intermittently-acting stroke-lever, of a shaft having a turning-crank, and carrying devices to operate said thrower-plate and lever, substantially as specified.



398,358. SOLE-LAYING MACHINE. ALFRED T. TREGURTHA Everett, assignor to Henry A. Clark, Boston, Mass. Filed Oct. 20, 1888. Serial No. 288,634. (No model.)

Claim.—1. In a sole-laying machine, a molding or pressure bed hinged at the toe end to a suitable support and having a toggle-lever pivoted to its opposite end, and suitable means for operating said toggle-lever for swinging said bed up and down and rigidly securing it in position, and a jack or last-holder secured to and adapted to move up and down in suitable guideways in a suitable frame or support to and from said bed in the operation of the machine.



2. In a sole-laying machine, a molding or pressure bed hinged at the toe end to a suitable support and having a toggle-lever pivoted to its opposite end, and suitable means for operating said toggle-lever for swinging said bed up and down and rigidly securing it in position, and a jack or last-holder secured to a suitable frame or support by a ball-and-socket joint, and adapted to move up and down in suitable guideways in said frame or support to and from said bed in the operation of the machine.

3. In a sole-laying machine, a molding or pressure bed hinged at the toe end to a suitable support and having a toggle-lever pivoted to its opposite end, and suitable means for operating said toggle-lever

398,358.

398,359.

for swinging said bed up and down and rigidly securing it in position, and a jack or last-holder secured to a support or frame consisting of cross-heads M and P, connected by rods N, adapted to slide in guideways in a frame or support, A, to and from said bed, and provided with an operating-treadle and springs Q, for the purpose specified.

4. In a sole-laying machine, the combination, with a frame or box hinged to a suitable support and arranged to be secured in position, of a continuous flexible plate, J', supporting a yielding bed secured therein transversely under the shank portion, and one or more screws, Q' R', screwing through said box and connected to the plate, and one or more screws, K', screwing through the box against the plate, for the purpose specified.

5. In a sole-laying machine, the combination, with a box or frame hinged at one end to a suitable support and having a toggle-lever pivoted to its opposite end, and suitable means for operating said toggle-lever for swinging said bed up and down and rigidly securing it in position, of a continuous plate, J', secured and arranged to be adjusted in said box, a sheet of india-rubber, and separate independent and removable blocks of india-rubber inclosed within said box, for the purpose specified.

6. In a sole-laying machine, a jack or last-holder having levers D' E', pivoted thereto, and each arranged by one of its arms to engage with a last and by its other arm to engage with a block or nut operated by a screw in a suitable support to swing said levers on their pivots, for the purpose specified.

7. In a sole-laying machine, a jack or last-holder having pivoted levers D' E', each arranged by one arm to engage with the last and by its other arm with a slot or slots, *t'*, in a block or nut operated by a screw, G', in a suitable support, for the purpose specified.

8. In a sole-laying machine, a jack or last-holder having pivoted levers D' E', the arm of one, E', of which is provided with a pivoted pin, v^3, to engage with the socket in the last, and having ratchet teeth z^3, for engagement therewith of a pawl, N', on the lever-arm for the purpose specified.

398,359. MACHINE FOR THROWING SILK. JOSEPH R. TYRAN Paterson, N. J. Filed Dec. 2, 1887. Serial No. 256,728. (No model.)

Brief.—The invention is a modification of and improvement upon the device described in Letters Patent No. 364,784, dated June 14, 1887.

Claim.—1. The combination, with the spindles, their sockets and pulleys, of a driving pulley or drum and belt, a tightening-pulley, and a lever for supporting and moving the tightening-pulley, a suspending link and latch for holding up the pulley-lever, the fallers, and mechanism for moving the latch off its support and allowing the pulley to descend and slacken the belt when one of the threads is broken, and a loose brake-plate below the spindle-pulleys and between and guided by the spindle-sockets, which brake-plate is lifted by the lever of the tightener-pulley and pressed against the under side of the spindle-pulleys to stop their rotation when said belt is slackened, substantially as set forth.

2. The combination, with the group of three spindles, their sockets and pulleys, of a driving pulley or drum and belt, a tightening-pulley and lever for the same, and a loose brake-plate below the spindle-pulleys and between and guided by the three spindle-sockets, which brake-plate is lifted by said lever and pressed against the under side of the spindle-pulleys to stop their rotation when the driving-belt is slackened, substantially as set forth.

3. The combination, with the driving-roller 13 and the feed-roller 11, and their respective shafts, of the lever 80, a hanging latch pivoted to the end of said lever 80, a support for the shoulder upon the latch, the link 50, hung to the rear upper part of the latch, the driving mechanism for the spindles, and the mechanism for stopping the same and the fallers, and intermediate mechanism, substantially as specified, for moving the shoulder of the latch off its support when the stop mechanism is to be brought into action, substantially as set forth.

4. The combination, with the feed-roller 11 and the driving-roller 13, of the faller-stand, the fallers pivoted upon the stand, the rocking lever 65, against which the fallers act, and the lever 80 and latch, and the claw for the roller to act upon in giving motion to the latch, substantially as set forth.

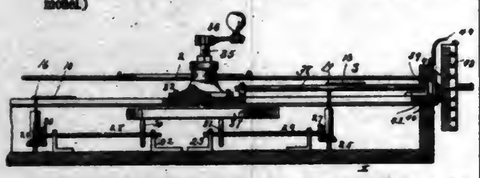
5. The combination, with the faller-stand and the feed and driving rollers, of the fallers pivoted to the faller-stand, the rocking lever and its claw, the detector having a finger that acts upon the rocking lever, the lever 80, and the latch 40, pivoted to said lever 80, substantially as and for the purposes set forth.

6. The combination, with the faller-stand, the feed and driving rollers, the rocking lever, lever 80, and latch, of pivoted fallers each having the hooked end projecting in one direction above the pivot and a nearly vertical counter-weight above and at the other side of the pivot, so that the hooked end bears with but little pressure on the thread and the power of the faller increases as it descends, substantially as specified.

7. The combination, with the starting-lever, of a latch pivoted at its upper end to the starting-lever, the link 50, pivoted to the latch at the rear portion thereof, so that the weight tends to move the latch toward its support, the fallers, feed and driving rollers, and intervening mechanism for acting upon the latch, substantially as set forth.

8. The combination, with the spindles, a driving drum and belt, a tightener-pulley, and its lever, of the lever 80, a link suspended from the starting-lever, a latch connected to the lever 80, a faller and a rocking lever with a claw and pushing-point acting against the latch, and a revolving roller acting against the claw to move the same endwise and disconnect the latch, substantially as specified.

9. The combination, with the spindles, a driving drum and belt, a tightener-pulley, and its lever, of the lever 80, a latch hanging from the end of the lever 80, and a link hung from its upper end and behind the latch, so as to limit the backward movement of the latch, and the mechanism, substantially as specified, for acting on the latch when a thread breaks, substantially as set forth.



10. The combination, with the feed-roller, the driving-roller, and the fallers, rocking lever, latch, and lever to raise the feed-roller, of a detector pivoted below the shaft of the driving-roller and the upper end bearing against the thread above the shaft of the driving-roller and below the feed-roller, so as to be brought into action when the angle of the thread is changed by said thread becoming entangled on the feed-roller, substantially as set forth.

11. The combination, with the fallers and stop mechanism, of a starting-lever and a rocking lever and feed-roller, the starting-lever being above and adjacent to the rocking lever, as specified, so that the fallers can be controlled by one hand applied to the rocking lever and the starting-lever can be simultaneously actuated by the same hand, substantially as set forth.

12. The combination, with the feed-roll, of the thread-support 35 in front of the feed-roll and over which support the threads pass from behind, of the stop-motion fallers in front of such thread-support and adjacent to each other, said fallers having projecting ends, so that the threads as guided by one hand will pass in below the hooked ends of the fallers as the threads are drawn taut by the feed-roll.

13. The combination, with the rocking-lever and lever 80, of a latch pivoted to the said lever 80 and having the flange or projection 45 extending over the rocking lever, and mechanism, substantially as specified, to give motion to the rocking lever and unlatch the latch, the flange 45 returning the rocking lever to a normal position as the latch falls, substantially as set forth.

398,360. CALCULATING-MACHINE. JOHANNES VERMEHREN, Copenhagen, Denmark. Filed Jan. 30, 1888. Serial No. 262,318. (No model.)

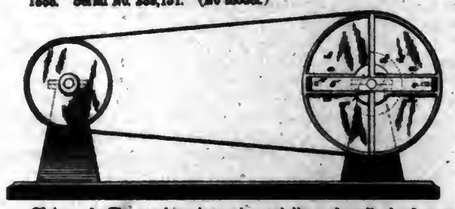
Claim.—1. In a calculating-machine, the combination of a friction-disk having means for adjusting its axis and having means for revolving it, disks having their peripheries in frictional contact with the face of the former disk, and registering mechanisms having corresponding registering-indicators and operated by the revolutions of the friction-disks, as and for the purpose set forth.

2. In a calculating-machine, the combination of a friction-disk having means for revolving it and having means for adjusting its center in a line at right angles to its axis, disks journaled at right angles to the disk and with their peripheries in contact with the face of the disk, and registering mechanisms having corresponding indicators and operated from the revolutions of the friction-disks, as and for the purpose set forth.

3. In a calculating-machine, the combination of a carriage adjustable in one line, a disk journaled in this carriage and having a handle for turning it, friction-disks journaled at right angles to the shaft of the disk and having their peripheries in frictional contact with the face of the disk, and registering mechanisms having corresponding indicators and operated by the friction-disks, as and for the purpose set forth.

4. In a calculating-machine, the combination of a carriage sliding horizontally in a slot, a screw and nut for adjusting the carriage in the slot, a disk having its shaft journaled in the carriage and having a handle for revolving it, friction-disks having their peripheries in frictional contact with the face of the disk, and registering mechanisms operated by the disks and having corresponding indicators, as and for the purpose set forth.

5. In a calculating-machine, the combination of a casing having a longitudinal slot in its top provided with a scale at one end, a carriage sliding in the slot and having an index pointing to the scale, a screw-threaded rod secured to the carriage and extending through the side of the casing, a graduated nut upon the rod bearing against the side of the casing and having an index pointing to its graduations, a horizontal disk journaled with its shaft in the carriage and having a handle for revolving it, friction-disks journaled with horizontal shafts under the disk in frictional contact with its face with their peripheries, and registering mechanisms operated by the friction-disks and having corresponding indicators, as shown, and for the purpose set forth.



6. In a calculating-machine, the combination of a laterally-movable horizontal disk having a handle for revolving it and means for determining its lateral adjustment, two diametrically-opposite friction-disks journaled with their peripheries in frictional contact with the disk, and registering mechanisms operated by the friction-disks and having corresponding indicators, as and for the purpose set forth.

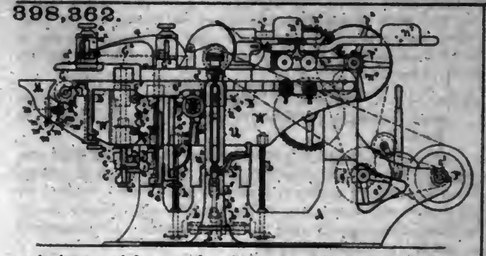
7. In a calculating-machine, the combination of a disk movable in a horizontal line and having means for determining its lateral adjustment, two diametrically-opposite friction-disks journaled with their peripheries in frictional contact with the disk and with their axes in line with the line of adjustment of the disk, and registering mechanisms operated by the friction-disks and having corresponding indicators, as and for the purpose set forth.

8. In a calculating-machine, the combination of a casing having a longitudinal slot in its top and a perforation in its side and having two sets of corresponding dials upon its top, a carriage sliding in the slot of the top and provided with an index pointing to a graduated scale at one edge of the slot, a screw-threaded rod extending from the carriage to the aperture in the side of the casing and through the same, a disk or nut turning with its threaded central bore upon the rod and with its hub in a bearing surrounding the aperture, a pointer projecting to the graduated periphery of the disk, a friction-disk journaled with its vertical shaft in a bearing in the carriage and having a handle for revolving it, two horizontal shafts journaled in a line with the slot in the top and having friction-disks upon their inner ends in contact with the horizontal disk, and registering mechanisms operated by the shafts and having hands pointing to the dials upon the top, as shown, and for the purpose set forth.

9. In a calculating-machine, the combination of a casing having a longitudinal slot in its top and a perforation in its side and having two sets of corresponding dials upon its top, a carriage sliding in the slot of the top and provided with an index pointing to a graduated scale at one edge of the slot, a screw-threaded rod extending from the carriage through the aperture in the side of the casing, a disk or nut with graduated periphery turning with its threaded central bore upon the rod and with its hub in a bearing surrounding the aperture, a pointer projecting to the graduated periphery of the disk, a friction-disk journaled with its vertical shaft in a bearing in the carriage and having a handle for turning it at its upper end, two diametrically-opposite horizontal shafts in a line with the slot having friction-disks upon their inner ends in contact with the horizontal disk and having conical pinions upon their outer ends, vertical shafts having hands upon their upper ends and revolving in the centers of the unit-dials and having conical pinions meshing with the pinions of the horizontal shafts, and suitable gearing and shafts having hands for the remaining dials of the top and operated by the former shafts, as and for the purpose set forth.

398,361. BELT-TIGHTENER. JOHN A. WIGAL, Tyler, W. Va., assignor of one-half to Thomas M. Wigal, same place. Filed Oct. 25, 1888. Serial No. 289,131. (No model.)

Claim.—1. The combination, substantially as described, of an automatically-expansible pulley, consisting of two semicircular sections having cam-slots centrally arranged in their meeting edges and united by sliding connecting-strips, and a shaft provided with a cam constructed to fit said cam-slots.



2. A pulley constructed in two sections having central ribs and cam recesses or slots, in combination with the connection-strips, the drive-shaft, and the cam engaging the cam recesses or slots for expanding said sections, substantially as described.

3. The combination, substantially as described, of a pulley composed of two equal independent sections having centrally-arranged cam-slots in their meeting edges, and on each side of said cam-slots ribs formed at right angles to said meeting edges, elongated slots arranged parallel with the ribs, connecting-strips seated between said ribs and united at their outer ends by pins passing through the elongated slots, a shaft, and a cam fixed on the shaft and shaped to fit the cam-slots in the meeting edges of the sections.

398,362. WOOD-PLANING MACHINE. SOLOMON A. WOODS, Boston, Mass. Filed Dec. 3, 1886. Serial No. 154,608. (No model.)

Claim.—1. In a wood-planing machine, the combination, with the rising-and-falling table B, having the upright U extending upward upon the front side of it, and formed of a lower section and an upper detachable section, and moving up and down upon guideways upon the frame on the rear side of it, of one or more screws, *b b*, provided with bevel pinion or pinions upon their lower end or ends, inclined shaft b^2, projecting upward and outward and downward and inward through the upright U, below its upper detachable section, in position to be within reach of the operator while observing the distance of adjustment of the table from above the latter frame, and carrying the crank b^4 on its outer and upper end, and the pinion b^3

398,362.

on its inner and lower end, and a gear mechanism connecting the gear or gears on the lower end or ends of said screw or screws, with the gear b^4, substantially as described.

2. In a wood-planing machine, the combination of the rising-and-falling table B, the inclined shaft b^2, having a bearing in the upright U and projecting outside of it, with the latter extending up and down outside of the path of the table and above the top thereof and having a joint, u^3, and its clamping mechanism above the shaft and below the table-top, whereby its upper part is adapted to be removed and replaced from in front of the table, substantially as described.

3. In a wood-planing machine, the combination of frame A, pulley P, rising-and-falling table B, provided with flanges W w' beneath the same, and the cutter-head C^2 and its shaft and pulley c^2, supported upon a yoke, adjustably attached by bolts to the opposite side of flange w' from the pulley P, said yoke being pivoted in substantially the same horizontal plane with pulley c^2 and upon one side thereof, substantially as described.

4. In a wood-planing machine, the combination of the pulley P, the rising-and-falling table B, provided with flanges W w' beneath the same, plate c^4, sliding inward and outward on flange w', plate c', sliding vertically upward and downward on plate c^4, and the cutter-head C^2 and its shaft and pulley c^2, supported upon a yoke pivoted to plate c' in substantially the same horizontal plane as pulley c^2 and upon one side thereof, the said plates and yoke being attached to flange w' and to each other, respectively, in the order named on their opposite sides from pulley P, substantially as described.

5. The combination of the table B, the lower horizontal cutter-head, C', mounted on bearings therein at one end and below the upper surface of the same, and the extension M m' of said table, in two parts adapted to be adjusted vertically one upon the other, pivoted thereto by the horizontal pivot m^4 below said cutter-head, and provided with clamping mechanism to secure said extension in position with its upper surface parallel to that of said table, substantially as described.

6. The combination of table B, having the slotted ear m^6 and swinging bolt m^7, and nut m^8, connected thereto, the lower horizontal cutter-head, C', mounted on bearings therein at one end below the upper surface of the same, and the extension M m' of said table in two parts adapted to be adjusted vertically one upon the other, pivoted thereto by the horizontal pivot m^4 below said cutter-head, and having part m', provided with the slotted ear m^5, substantially as described.

7. The combination of the table B, having the extension M m pivoted thereto, the horizontal cutter-head C', mounted in bearings below the table-surface and between its main part and extension M, and the supplemental bed m, adjacent to said cutter-head and mounted upon the vertically-sliding part M, having the adjusting-screw m^1, substantially as described.

8. The combination of the feed-roll shaft n', feed-roll shaft n^2, frame n^3, and frame n^5, pivoted to the main frame A, and provided with the projecting shoulder n^9, taking a bearing against frame n^5 outside the bearing of shaft n^2 therein, upon which the latter frame is pivoted, substantially as described.

9. The combination of the frame n^3, pivoted to main frame A shaft n^2, having pivotal bearings in frame n^3 and frame n^5, and the latter provided with slotted stud n^8, having friction-rollers n^{10} n^{10} in its slot, and the pivoted lever n^6, passing through between said rollers, substantially as described.

10. The combination of table B, arm *a*, provided at its outer end with vertical guideways, plate a^3, moving up and down on said guideways, and presser-foot a^5, connected to said vertically-moving plate by universal pivotal connections, substantially as described, adapted to incline its lower face at an angle to the table-surface either longitudinally or transversely thereof, and clamping mechanism to secure said plate in such inclined position, substantially as described.

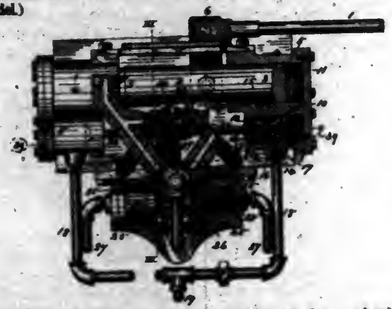
11. The combination of table B, arm *a*, provided at its outer end with vertical guideways, plate a^3, moving up and down on said guideways, and presser-foot a^5, pivotally connected to said plate by one or more bolts, a^7, and provided with one or more adjusting set-screws, a^8, substantially as described.

12. The combination of the table B, carrying a throat or mouth-piece for the lower cutter-head, C', on its feed-in side, the said cutter-head and its spindle and the cutter-head frame supporting the bearings thereof mounted on vertical guideways on the table and adjustable vertically with relation to the throat or mouth-piece of the latter, and a bar or mouth-piece arranged parallel with the cutter-head on the feed-out or delivery side thereof, provided with downwardly-projecting arms or brackets supporting said bar or mouth-piece at the ends, and connected by horizontal pivots with the cutter-head frame below the cutter-head, whereby provision is afforded for swinging said bar or mouth-piece on its feed-out side downward from its normal or operative position and away from the cutter-head in a plane transverse to the length thereof, and whereby any rising or falling movement of the cutter-head frame with relation to table B and its attached throat or mouth-piece on the feed-in side will produce a corresponding movement of the said bar or mouth-piece on the feed-out side, substantially as described.

13. The combination of the table B, carrying a throat or mouth-piece for the lower cutter-head, C', on its feed-in side, the said cutter-head and its spindle and frame supporting the bearings thereof, mounted on vertical guideways on table B and provided with a screw and hand-wheel for adjusting the same vertically with relation thereto, and a bar or mouth-piece arranged parallel with the cutter-head on the feed-out or delivery side thereof, provided with downwardly-projecting arms or brackets supporting said bar or mouth-piece at the ends and connected by horizontal pivots with the cutter-head frame below the cutter-head, whereby provision is afforded for swinging said bar or mouth-piece on its feed-out side downward from its normal or operative position and away from the cutter-head in a plane transverse to the length thereof, and whereby any rising or falling movement of the cutter-head frame with relation to table B and its attached throat or mouth-piece on the feed-in side will produce a corresponding movement of the said bar or mouth-piece on the feed-out side, substantially as described.

398,363. TREADLE. LEONIDAS G. WOOLLEY, Grand Rapids, Mich. Filed July 18, 1888. Serial No. 280,280. (No model.)

Claim.—1. The combination of two parallel shafts provided with cranks at each of their ends, two treadles, each one connected to the two cranks at one end of the two shafts, gear-wheels secured to the two shafts, a driven shaft, and a wheel secured to the driven shaft, and which meshes with the two gear-wheels, substantially as shown.



2. The combination of two driving-shafts provided with cranks set at different angles, two treadles mounted upon the four cranks, gear-wheels attached to the driving-shafts, and a driven shaft provided with a pinion which meshes with both of the gear-wheels, substantially as described.

3. The combination of a suitable frame-work provided with suitable bearings, the two driving-shafts C and the driven shaft D, the cranks secured to the ends of the two driving-shafts, the treadles which are mounted upon these cranks, the pinion secured to the driven shaft and meshing with the two gear-wheels, and a hand-wheel secured to the driven shaft, substantially as specified.

4. The combination of the driving-shafts, cranks secured thereto, and the treadles provided with bearings through which the cranks

pass, the bearings of the treadles being cut away, as shown at J, substantially as set forth.

398,864. PNEUMATIC SWITCH FOR RAILWAYS. MORRIS WUERPEL, St. Louis, Mo. Filed Apr. 30, 1888. Serial No. 272,356. (No model.)

Claim.—1. The combination, in a switch-actuating mechanism, of the piston 2, attached to the switch-rod, cylinders 8, in communication with cylinder 4, the piston-valves 12, actuating double-ended piston connected to the valve-stem 20, cylinders 25, and pipes 27 for the purpose set forth.

2. The combination, in a switch-actuating mechanism, of the double-ended piston 2, attached to the switch-rod and working in cylinders 4, valve-cylinders 8, in connection with the cylinders 4 by ports 10, piston-valves 12, working in the cylinders 8, the latter having exhaust-ports 39, double-ended piston 24, working in cylinders 25, and pipes 18, 19, and 27, supplying fluid under pressure to work the pistons 2 and 24, for the purpose set forth.

398,865. TAKE-UP MECHANISM FOR NARROW-WARE LOOMS. HORACE WYMAN, Worcester, Mass., assignor to the Crompton Loom Works, same place. Filed June 21, 1888. Serial No. 277,834. (No model.)

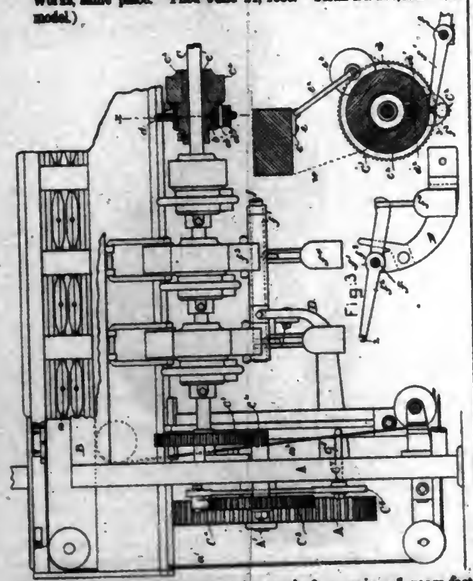


Fig. 3.

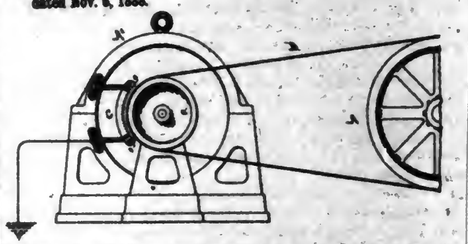
Claim.—1. In a loom, the take-up shaft, a series of gears fast thereon, a series of gears loosely mounted on the said shaft, and take-up or sand rolls attached to the said loose gears, combined with a series of hubs or hand-wheels loosely surrounding the said shaft, a pinion carried by each hub or hand-wheel and meshing with both the said gears, the teeth of the said gearing differing in number to constitute a differential gear, substantially as described, whereby or through the said loose hub or hand-wheel the said take-up or sand rolls may be freely rotated independently one of the other on the take-up shaft in either direction, substantially as described.

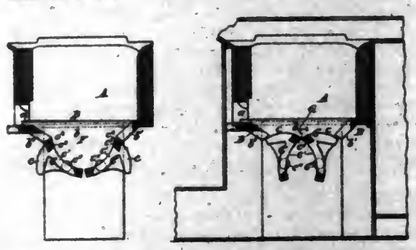


2. The take-up shaft C and a take-up roll loose thereon, a gear carried by the said take-up roll, a gear fast to the said take-up shaft next the end of the gear carried by the said roll, and having a different number of teeth, and means to engage and rotate the said shaft, combined with a hand-wheel having a pinion, d^3, to engage the teeth of the said gears carried, respectively, by the said take-up roll and by the said shaft, as described, whereby by the rotation of the hand-wheel and its pinion about the said gears the take-up roll may be rotated independently of the said shaft C in either direction, substantially as described.

398,866. METHOD OF PRESERVING WOOD. WILLIAM YOUNGLOOD, Jamaica, N. Y. Filed Feb. 7, 1888. Serial No. 263,226. (No model.)

Claim.—The herein-described method of preserving wood, consisting of first saturating the dried wood with a solution of saltpeter and water, and red-sanders or California red-wood bark, in about the proportions stated, and then drying the same, and, secondly, in subsequently saturating the wood in a bath of paraffine, all substantially as and for the purpose specified.

REISSUES.



10,986. ELECTRIC DISCHARGE DEVICE. REGINALD BELFIELD, Pittsburg, Pa., assignor to the Westinghouse Electric Company, same place. Filed Jan. 21, 1888. Serial No. 267,094. Original No. 382,400, dated May 6, 1888.

Claim.—1. The combination, with a driving-engine, of an electric generator, a belt connecting the generator with the engine, and discharge-points directed toward the pulley or belt-wheel of the generator and in electrical connection with the engine.

2. The combination, with an alternate-current electric generator, of discharge-points insulated therefrom and directed toward the belt-wheel of the generator.

10,987. GRATE FOR STOVES, &c. DENNIS G. LITTLEFIELD, Albany, N. Y. Filed Oct. 20, 1888. Serial No. 288,713. Original No. 360,242, dated Oct. 2, 1888.

Claim.—1. The combination, with the stationary bottom plate, B, constructed substantially as described, and having the clear opening b^2 relatively between the oppositely-located series of downwardly-inclined fingers b, alternating with slots, of the two oscillatory concavo-convex grates, suitably connected, mounted on trunnions, and suspended within the opening of said bottom plate and relatively below said inclined fingers, substantially as and for the purposes set forth.

2. The combination, with the fire-box A, stationary bottom plate, B, at the lower end of said fire-box and having the clear opening b^2, and the inclined grated bars or fingers b, projecting relatively inwardly from the bottoms of the oppositely-located sides of said fire-box, of the concavo-convex grates C, suitably connected, mounted on trunnions, and suspended within the opening of said stationary bottom plate and relatively below the slotted fingers b, substantially as and for the purposes set forth.

3. The combination, with the fire-box A, stationary bottom plate, B, at the lower end of said fire-box, and having the clear opening b^2, and the grated bars or fingers b, projecting relatively inwardly from the bottom of said fire-box, of the concavo-convex grates C, suitably connected, mounted on trunnions, and suspended within the opening of said stationary bottom plate and relatively below the slotted fingers b, substantially as and for the purposes set forth.

R. PETERS, Photo-Lithographer, Washington, D. C.

DECISIONS

OF THE

COMMISSIONER OF PATENTS

AND OF

UNITED STATES COURTS IN PATENT CASES.

DECISIONS OF THE U. S. COURTS.

Supreme Court of the United States.

MENENDEZ *et al. v.* HOLT *et al.*

Decided October Term, 1888.

1. TRADE-MARK—FLOUR.

Messrs. Holt & Co., New York, N. Y., adjudged to have acquired and to hold the exclusive right to the use of the words "La Favorita," registered by them February 28, 1882, as a trade-mark for flour.

2. INFRINGEMENT—DELAY IN BRINGING SUIT.

While there was such delay in bringing suit as to preclude recovery of damages for prior infringement, there was neither conduct nor negligence which could be held to destroy the right to prevention of further injury.

APPEAL from the Circuit Court of the United States for the Southern District of New York.

STATEMENT OF THE CASE.

Appellees, partners in business under the firm-name of Holt & Co., filed their bill of complaint July 17, 1882, against appellants, engaged in business under the firm-name of José Menendez & Brother, alleging that they were dealers in and bought and sold flour and grain; that Robert S. Holt had theretofore been for more than twenty-five years at the head of the firm of Holt & Co., which firm had from time to time been changed or dissolved by the retirement of various members, but in each such instance a new firm had been immediately formed and succeeded to the firm-name, good-will, brands, Trade-Marks and other assets of the preceding firm, so that there had been no interruption of the name and business identity of Holt & Co. for over twenty-five years, during which time said firm had had a high reputation in the trade; that complainants were now legally seized of the good-will and all the Trade-Marks ever at any time used by the firm; that they were the owners of a certain Trade-Mark for flour, which consisted of the fanciful words "La Favorita," which was originated by the firm and had been used by it for more than twenty years, to distinguish a certain flour of their selection and preparation; that said firm at all times exercised great care in the selection, packing and preparation of the flour packed and sold by them under the said brand, "La Favorita," and had carefully advertised the same, and by their care and efforts extensively introduced it to the trade, so that the said brand had come to be widely known and sought after by the trade, and the sale of flour so branded constituted an important part of the firm's business; that the brand was applied by stenciling it on the barrels; and that it had been duly registered by the firm in pursuance of law. Defendants were charged with having made use of the brand as a mark for flour of their own preparation or selection in violation of complainants' rights.

The answer admitted the existence of the Trade-Mark and that the defendants had used it, but denied that Holt & Co. were the owners, and averred that one Stephen O. Ryder was a member of Holt & Co. from 1861 to 1868, and had since used, and was entitled to use, said Trade-Mark as his own; that said Ryder put his own name on flour in connection with the name "La Favorita;" and that defendants had sold such flour as the special selection of said Ryder, and not as selected by complainants.

Evidence was adduced in relation to the connection of Ryder with the firm of Holt & Co., his retirement therefrom, and the ownership of the brand thereupon to establish the use of the Trade-Mark by Ryder and others without protest on complainants' part; also, subject to objection, to show a prior use of the same as a Trade-Mark for flour.

It appeared that Holt & Co. deposited *fac-similes* of the Trade-Mark October 17, 1881, in the Patent Office, and that it was duly registered February 28, 1882.

The circuit court refused an accounting, but held complainants entitled to the exclusive use of the words as a brand or Trade-Mark for flour, and that the defendants had infringed the rights of complainants in the use of the words on flour not prepared by complainants, and decreed a perpetual injunction. From that decree this appeal was prosecuted, and a reversal is asked on the grounds that the words "La Favorita" as used by the complainants cannot be protected as a Trade-Mark; that there has been no infringement; that the words had been used as a brand before being used by Holt & Co.; that the title of Holt & Co. was not superior to that of S. O. Ryder; and that whatever rights complainants may once have had had been forfeited by laches.

Mr. Rowland Cox for the appellees.

Mr. A. v. Briesen for the appellants.

Mr. Chief Justice FULLER delivered the opinion of the Court.

The fact that Holt & Co. were not the actual manufacturers of the flour upon which they had for years placed the brand in question does not deprive them of the right to be protected in the use of that brand as a Trade-Mark. They used the words "La Favorita" to designate flour selected by them, in the exercise of their best judgment, as equal to a certain standard. The brand did not indicate by whom the flour was manufactured, but it did indicate the origin of its selection and classification. It was equivalent to the signature of Holt & Co. to a certificate that the flour was the genuine article which had been determined by them to possess a certain degree of excellence. It did not, of course, in itself indicate quality, for it was merely a fancy name and in a foreign language, but it evidenced that the skill, knowledge and judgment of Holt & Co. had been exercised in ascertaining that the particular flour so marked was possessed of a merit

rendered definite by their examination and of a uniformity rendered certain by their selection. The case clearly does not fall within the rule announced in *Manufacturing Co.* v. *Trainer*, (101 U. S., 51, 55,) that "letters or figures which, by the custom of traders, or the declaration of the manufacturer of the goods to which they are attached, are only used to denote quality, are incapable of exclusive appropriation, but are open to use by any one, like the adjectives of the language;" or in *Raggett* v. *Findlater*, (L. R., 17 Eq., 29,) where an injunction to restrain the use upon a trade-label of the term "nourishing stout" was refused on the obvious ground that "nourishing" was a mere English word denoting quality. And the fact that flour so marked acquired an extensive sale, because the public had discovered that it might be relied on as of a uniformly meritorious quality demonstrates that the brand deserves protection rather than that it should be debarred therefrom, on the ground, as argued, of being indicative of quality only. (*Burton* v. *Stratton*, 12 Fed. Rep., 696; *Godillot* v. *Harris*, 81 N. Y., 263; *Ransome* v. *Graham*, 15 Law Jour., Ch. 897.)

Holt & Co. then, having acquired the exclusive right to the words "La Favorita" as applied to this particular vendible commodity, it is no answer to their action to say that there was no invasion of that right because the name of S. O. Ryder accompanied the brand upon flour sold by appellants, instead of the name of Holt & Co. That is an aggravation and not a justification, for it is openly trading in the name of another upon the reputation acquired in the device of the true proprietor. (*Gillott* v. *Esterbrook*, 47 Barb., 455; S. C., 48 N. Y., 374; *Coats* v. *Holbrook*, 2 Sandf. Ch., 586.)

These views dispose of two of the defenses specially urged on behalf of appellants, and we do not regard that of prior public use, even if it could be properly considered under the pleadings, as entitled to any greater weight. Evidence was given to the effect that from 1857 to 1860, the words "La Favorita" were occasionally used in St. Louis by Sears & Co., then manufacturing in that city, as designating a particular flour, but the witnesses were not able to testify that any had been on sale there under that brand (unless it were that of Holt & Co.) for upward of twenty years. The use thus proven was so casual and such little importance apparently attached to it, that it is doubtful whether Sears & Co. could at any time have successfully claimed the words as a Trade-Mark, and, at all events, such use was discontinued before Holt & Co. appropriated the words to identify their own flour, and there was no attempt to resume it. It is argued, however, that the title of Holt & Co. to the use of the mark was not superior to that of S. O. Ryder, because it is said that Ryder, upon leaving the firm, took with him his share of the good-will of the business, and consequently of the Trade-Marks, and hence that the defendants below rightfully sold flour under the brand "La Favorita" when selected by Ryder and so marked by him.

Good-will was defined by Lord Eldon, in *Cruttwell* v. *Lye*, (17 Vesey, 335, 346,) to be "nothing more than the probability that the old customers will resort to the old place," but Vice-Chancellor Wood, in *Churton* v. *Douglas*, (Johns. H. R. V., 174, 188,) says it would be taking too narrow a view of what is there laid down by Lord Eldon to confine it to that, but that it must mean every positive advantage that has been acquired by the old firm in the progress of its business, whether connected with the premises in which the business was previously carried on, or with the name of the late firm, or with any other matter carrying with it the benefit of the business.

It may be that where a firm is dissolved and ceases to exist under the old name, each of the former partners would be allowed to obtain "his share" in the good-will, so far as that might consist in the use of Trade-Marks, by continuing such use in the absence of stipulation to the contrary; but when a partner retires from a firm, assenting to or acquiescing in the retention by the other partners of possession of the old place of business and the future conduct of the business by them under the old name, the good-will remains with the latter as of course.

Holt & Co. commenced business in 1845, and had had an uninterrupted existence under that name since 1855; the Trade-Mark in question was adopted by the senior member of the firm in 1861, and had been thereafter in continuous use. Ryder became a partner in 1861, and retired February 1, 1869, when a circular was issued, in which he participated, announcing the dissolution by his retirement, the continuance of the business by the other partners under the same firm-name and the formation of another partnership by Ryder with one Rowland, to transact the flour and commission business at another place, under the name of Rowland & Ryder. In addition to these facts it is established by the preponderance of evidence that it was verbally agreed, at the time Ryder retired, that he surrendered all interest in the brands belonging to Holt & Co. Ryder attempts to deny this, but his denial is so qualified as to render it unreliable as against the direct and positive character of the evidence to the contrary. Indeed, when asked why the brands were not made the subject of appraisement when he went out, as it was conceded all the other property of the firm was, he says that it was because he "gave up all right, title and interest to those valuable brands to Robert S. Holt out of friendship, so there was no occasion for it." In our judgment, Ryder's claim to any interest in the good-will of the business of Holt & Co., including the firm's Trade-Marks, ended with his withdrawal from that firm.

Counsel in conclusion earnestly contends that whatever rights appellees may have had were lost by laches, and the desire is intimated that we should consider *McLean* v. *Fleming*, (96 U. S., 245,) so far as it was therein stated that even though a complainant were guilty of such delay in seeking relief upon infringement as to preclude him from obtaining an account of gains and profits, yet, if he were otherwise so entitled, injunction against future infringement might properly be awarded. We see no reason to modify this general proposition, and we do not find in the facts as disclosed by the record before us anything to justify us in treating this case as an exception.

The intentional use of another's Trade-Mark is a fraud. When the excuse is that the owner permitted such use, that excuse is disposed of by affirmative action to put a stop to it. Persistence, then, in the use is not innocent, and the wrong is a continuing one, demanding restraint by judicial interposition when properly invoked. Mere delay or acquiescence cannot defeat the remedy by injunction in support of the legal right, unless it had been continued so long and under such circumstances as to defeat the right itself. Hence, upon an application to stay waste, relief will not be refused on the ground that, as the defendant had been allowed to cut down half of the trees upon the complainant's land, he had acquired by that negligence the right to cut down the remainder, (*Att.-Gen.* v. *Eastlake*, 11 Hare, 205;) nor will the issue of an injunction against the infringement of a Trade-Mark be denied on the ground that mere procrastination in seeking redress for depredations had deprived the true proprietor of his legal right. (*Fullwood* v. *Fullwood*, 9 Ch. D., 176.) Acquiescence to avail must be such as to create a new right in the defendant. (*Rodgers* v. *Nowill*, 3 DeGex, M. & G., 614.) Where consent by the owner to the use of his Trade-Mark by another is to be inferred from his knowledge and silence merely, "it lasts no longer than the silence from which it springs; it is, in reality, no more than a revocable license." (Duer, J., *Amoskeag Mfg. Co.* v. *Spear*, 2 Sandf., 599; *Julian* v. *Hoosier Drill Co.*, 78 Ind., 498; *Taylor* v. *Carpenter*, 3 Story, 458; *Id.*, 2 Woodb. & M., 1.)

So far as the act complained of is completed, acquiescence may defeat the remedy on the principle applicable when action is taken on the strength of encouragement to do it; but so far as the act is in progress and lies in the future, the right to the intervention of equity is not generally lost by previous delay, in respect to which the elements of an estoppel could rarely arise. At the same time, as it is in the exercise of discretionary jurisdiction that the doctrine of reasonable diligence is applied, and those who seek equity must do it, a court might hesitate as to the measure of relief where the use by others for a long period under assumed permission of the owner had largely enhanced the reputation of a particular brand. But there is nothing here in the nature of an estoppel, nothing which renders it inequitable to arrest at this stage any further invasion of complainants' rights. There is no pretense of abandonment. That would require proof of non-user by the owner or general surrender of the use to the public. The evidence is positive that Holt & Co. continuously used the Trade-Mark, always asserted their exclusive right to it, and never admitted that of any other firm or person, and, in the instance of every party, including Ryder, who used this brand of flour not of Holt & Co.'s selection, that use, when it came to their knowledge, was objected to by the latter, and personal notice given, while publication was also made in the newspapers circulating where the flour was usually marketed, containing a statement of Holt & Co.'s rights and warning against imitations. It is idle to talk of acquiescence in view of these facts. Delay in bringing suit there was, and such delay as to preclude recovery of damages for prior infringement, but there was neither conduct nor negligence which could be held to destroy the right to prevention of further injury.

The decree of the circuit court will therefore be affirmed.

Supreme Court of the United States.

KENNEDY v. HAZELTON.

Decided December 17, 1888.

1. VALIDITY OF PATENT—APPLICATION—OATH.
   The patent law makes it essential to the validity of a patent that it shall be granted on the application, supported by the oath, of the original and first inventor.
2. SAME—SAME—WHEN VOID.
   A patent which is not supported by the oath of the inventor, but applied for by one who is not the inventor, is unauthorized by law, and void.
3. VOID PATENT NOT ASSIGNABLE.
   As a patent thus obtained confers no title or right upon the patentee, a court of equity will not order him to assign it.
4. ENFORCEMENT OF CONTRACT UNDER VOID PATENT.
   A court of chancery cannot decree specific performance of an agreement to convey property which has no existence, or to which defendant has no title.
5. SAME.
   A bill by vendee against vender for specific performance, which does not show any title in defendant, is bad on demurrer.
6. PATENT PRIMA FACIE EVIDENCE OF VALIDITY.
   A patent issued to an applicant is only *prima facie* evidence that he is the inventor.

APPEAL from the Circuit Court of the United States for the Northern District of Illinois.

STATEMENT OF THE CASE.

This was a bill in equity for specific performance, filed November 12, 1887, by a citizen of New York against a citizen of Illinois, and contained the following allegations:

On July 10, 1884, the defendant, in consideration of the sum of $10,000, paid by the plaintiff to him, made an assignment to the plaintiff of an interest of one-half in two patents previously obtained by the defendant for steam-boilers; and also made a written contract, acknowledged before a notary public and recorded in the Patent Office, by which the defendant agreed to assign to the plaintiff any and all patents which the defendant might thereafter obtain from the United States or the Dominion of Canada, for inventions in improvements in steam-boilers, and further agreed not to assign such inventions, or the patents obtained therefor, to any other person.

In 1885, the defendant publicly stated that he had invented such an improvement and explained its general plan and construction; and afterward combined and confederated with one Goulding to avoid and evade the effect of the contract of July 10, 1884; and for that purpose the defendant caused to be prepared at his expense, but in the name of Goulding, the necessary papers to procure Letters Patent for this invention; and Goulding, without any consideration received from the defendant therefor, assented to be used in that regard as the alleged inventor of the improvement, and, at the request and by the procurement of the defendant, filed an application under oath for a patent for it, which application was allowed; and Goulding, before the issue of the patent, assigned in writing to the defendant all his interest in the improvement and in the patent therefor; and on December 14, 1886, a patent was issued to the defendant accordingly as assignee of Goulding, a certified copy of which was made part of the bill.

The bill further alleged that the defendant was, and Goulding was not, the original and first inventor of the improvement so patented; that the defendant had engaged in the manufacture and sale of boilers under this patent, and had received and was receiving great benefits therefrom; that the patent was of value exceeding the sum of $5,000, exclusive of interest and costs.

The bill prayed for a decree that the defendant assign this patent to the plaintiff, for an adjudication that the title to it equitably vested in the plaintiff at

the date of its issue, for an account of profits received by the defendant from its use, for a preliminary injunction against transferring or incumbering the patent, or manufacturing or selling boilers containing the improvement described therein, and for further relief.

The defendant demurred to the bill, first, for want of equity; second, for multifariousness, in embracing two separate and distinct causes of action, one to enforce specific performance of a contract, the other for the infringement of a patent; third, because, as appeared by the allegations of the bill, the patent was absolutely void, and no suit could be maintained, either to compel its transfer, or for infringement thereof.

The circuit court sustained the demurrer, for the third reason, and dismissed the bill. (33 Fed. Rep., 293.) The plaintiff appealed to this Court.

Mr. C. A. Seward, *Mr. E. Banning*, and *Mr. T. A. Banning* for the appellant.

Mr. L. S. Bond and *Mr. E. A. West* for the appellee.

Mr. Justice GRAY, after stating the case as above reported, delivered the opinion of the Court.

The case, as stated in the bill and admitted by the demurrer, is shortly this: The defendant agreed in writing to assign to the plaintiff any patents that he might obtain for improvements in steam-boilers. He did invent such an improvement, and, with intent to evade his agreement and to defraud the plaintiff, procured a patent for this invention to be obtained upon the application under oath of a third person as the inventor, and to be issued to him as assignee of that person, and has made profits by manufacturing and selling boilers embodying the improvement so patented. The plaintiff seeks by bill in equity to compel the defendant to assign the patent to him, and to account for the profits received under it.

A court of chancery cannot decree specific performance of an agreement to convey property which has no existence, or to which the defendant has no title. A bill by vendee against vender for specific performance, which does not show any title in the defendant, is bad on demurrer. And if it appears, by the bill or otherwise, that the want of title (even if caused by the defendant's own act, as by his conveyance to a *bona fide* purchaser) was known to the plaintiff at the time of beginning the suit, the bill will not be retained for assessment of damages, but must be dismissed, and the plaintiff left to his remedy at law. (*Columbine* v. *Chichester*, 2 Phillips, 27; *S. C.*, 1 Coop. Temp. Cottenham, 295; *Ferguson* v. *Wilson*, L. R., 2 Ch. 77; *Kempshall* v. *Stone*, 5 Johns., Ch. 193; *Morse* v. *Elmendorf*, 11 Paige, 277; *Milkman* v. *Ordway*, 106 Mass., 232, 256.)

The patent law makes it essential to the validity of a patent that it shall be granted on the application, supported by the oath, of the original and first inventor, (or of his executor or administrator,) whether the patent is issued to him or to his assignee. A patent which is not supported by the oath of the inventor, but applied for by one who is not the inventor, is unauthorized by law, and void, and, whether taken out in the name of the applicant or of any assignee of his, confers no rights as against the public. (Rev. Stats., secs. 4886, 4888, 4892, 4895, 4896, 4920.)

The patent issued by the Commissioner to the defendant as assignee of Goulding is only *prima facie* evidence that Goulding was the inventor of the improvement patented; and the presumption of its validity in this respect is rebutted and overthrown by the distinct allegation in the bill, admitted by the demurrer, that the defendant, and not Goulding, was the inventor. This fact is not brought into the case by any answer or plea of the defendant, but it is asserted by the plaintiff himself as a ground for maintaining his bill.

As the patent, upon the plaintiff's own showing, conferred no title or right upon the defendant, a court of equity will not order him to assign it to the plaintiff—not only because that would be to decree a conveyance of property in which the defendant has, and can confer, no title; but also because its only possible value or use to the plaintiff would be to enable him to impose upon the public by asserting rights under a void patent. (*Post* v. *Marsh*, 16 Ch. D., 395; *Oldham* v. *James*, 14 Irish Ch., 81.)

The bill cannot be maintained for an account of profits received by the defendant from the use of this patent, because a decree for profits can only proceed upon the ground that the plaintiff is at least the equitable owner of the patent, and there can be neither legal nor equitable ownership of a void patent. The same reason is a sufficient answer to the suggestion of the plaintiff that the bill may be maintained as a bill to remove a cloud upon his title in this patent.

In *Ambler* v. *Whipple*, (20 Wall., 546,) cited by the plaintiff, the suit was based upon articles of partnership between Ambler and Whipple, by which it was agreed that all patents obtained by either partner should be owned by both in equal shares. The bill alleged that the two jointly had obtained a patent for a joint invention, and that another patent, afterward obtained by Whipple upon the application of a third person, embodied the same invention with only a colorable variation. Neither of the patents was in the record, and the questions now presented were not suggested by counsel or considered by the Court, but the decree for the plaintiff proceeded upon independent grounds. The result is that the present bill cannot be maintained, and that the plaintiff must be left to any remedy that he may have to recover damages in an action at law.

Decree affirmed.

The Chief Justice and Mr. Justice BRADLEY dissented.

U. S. Circuit Court—Eastern District of North Carolina.

FERNOLINE CHEMICAL COMPANY *v.* THE CAROLINA OIL AND CREOSOTE COMPANY.

Decided January 19, 1889.

1. STANLEY—APPARATUS FOR DISTILLING TURPENTINE, &c.
   Reissued Letters Patent No. 10,689, granted to James D. Stanley February 16, 1886, for an apparatus for distilling turpentine and for the purification of the crude products of the distillation thereof, *Held* to rest for its validity upon a very narrow margin of invention.
2. HANSEN AND SMITH—APPARATUS FOR DISTILLING WOOD.
   Letters Patent No. 333,750, granted to Hansen and Smith January 5, 1886, for sundry improvements, compared with said Stanley reissue patent and *Held* to cover substantial improvements.
3. EVIDENCE—TESTS.
   An *ex parte* test made by the defendant and a defective test made by the complainant *Held* to be entitled to no weight in evidence.

Mr. R. B. McMaster and *Messrs. Strong, Gray & Stamps* for the complainant.

Mr. Marcus S. Hopkins, *Mr. S. F. Phillips*, and *Messrs. Battle & Mordecai* for the defendant.

SEYMOUR, *J.*:

This is a bill in equity filed by the Fernoline Chemical Company to restrain the infringement of a patent and for an account.

The Letters Patent under which plaintiff claims are Reissued Letters Patent No. 10,689, granted to one James D. Stanly. The original patent bears date October 31, 1882, and is numbered 266,909. Reissue Patent No. 10,689 is for an apparatus for distilling turpentine and for the purification of the crude products of the distillation thereof. It relates to a process by which pine wood is placed in an oven or retort, subjected to heat, and the vapor thus caused to issue from the wood conveyed into receptacles, in which it is condensed and distilled. The apparatus consists of a heating structure, a retort for containing the wood, and the construction for condensation.

The controversy is with respect to the heating structure and the means adopted to convey the heat to and distribute it about the surface of the retort.

The defendant is engaged in the business of manufacturing oil from pine wood by distillation. Before the date of original Patent No. 266,909 Stanly had taken out two other patents for distilling turpentine and producing oil and other products from wood, numbered, respectively, 130,598 and 131,312, dated August 20 and September 10, 1872. On the 21st of February, 1882, and therefore earlier than the issuing of plaintiff's patent, he had sold to defendant's assignors, Hanson & Smith, the exclusive right to use said inventions (and all improvements that might be made thereon) in the State of North Carolina. The inventions so purchased not proving, as defendant alleges, practically satisfactory, by reason of the furnaces failing to heat the retort evenly, by too great a consumption of fuel, and by burning the bottom of the retort, Hanson & Smith devised sundry improvements, which were patented by Letters Patent No. 333,750, granted June 5, 1886. The apparatus used by defendant and alleged by plaintiff to be an infringement on its patent is constructed, as defendant claims, on the plan of the last-mentioned patent, which is itself an improvement on the patents which it holds under assignment from Stanly.

The claims made by Stanly in the specification forming part of Reissued Patent No. 10,689 are: a fire-box, an arch located over the fire-box and under the retort, a retort-chamber above the arch, in which is located the retort, and spaces above and below the retort separated for the greater length of the chamber but connected at one end.

The object of the arch over the fire-box and of the separation of the spaces above and below the retort containing the pine wood is to equalize as far as may be the heat applied to all parts of the retort. The products of combustion are kept from the retort by the arch, under which they pass to its rear beneath the arch, escaping from the latter at the rear end. Thence they pass horizontally along the under side of the retort, between the retort and the arch, to the front end, where they ascend through vertical passages at the sides of the retort into a space above the same. They then pass rearward along the top of the retort to the chimney, which is at the back end of the apparatus—that is to say, the heat passes backward under the arch before impinging upon the retort, thence forward over the arch and under the retort, and thence backward over the retort to the chimney. The original Stanly patent, No. 130,598, one of the two the right to use which was purchased by defendant's assignor, was, according to the specification, an improvement in the process and apparatus whereby spirits of turpentine are distilled from pine wood. It provides, as does plaintiff's patent, a process whereby pine wood is placed in a retort, subjected to heat, and its vapor conveyed in receptacles and condensed. The fire is placed directly under the retorts. The apparatus now used by defendant provides for an equalization of the heat applied to the retorts by means of forcing it to pass under an arch and through flues surrounding the retort.

Before considering what the court deems the substantial difference between the mode in which the heat is applied to the retort in the plaintiff's and defendant's inventions I will state the testimony shows that plaintiff's patent rests for its validity upon a very narrow margin of invention. Arranging spaces around vessels of various forms for the purpose of retarding and regulating the process of heating such vessels and the use of arches above fires to protect retorts from the action of flames were both old in the art at the time of the invention covered by plaintiff's patent. What it is entitled to protection in, if anything, is the manner in which the products of combustion are delayed in being carried around the retort—that is, its mode of equalizing the heat and its combination of contrivances for effecting its purpose. In defendant's apparatus the fire-box is, as in plaintiff's, covered by an arch. The retort is longer than that used by plaintiff, and is heated from opposite ends by two furnaces, each heating the retort from its end to the middle. In each furnace there is a space entirely around the retort between the outer surface and the surrounding masonry. In this space there are vertical partitions passing alternately over and under the retort. Each partition passes a little more than half-way around the retort and the ends terminate at the sides of the retort. These vertical partitions divide the space around the retort into an indirect flue or passage extending upward and downward repeatedly from the top to the bottom of the retort. At the rear end of each furnace—that is, under the middle of the retort—the arches are provided with openings extending outward into the chamber which contains the retort. The arch extends continuously to the rear wall. The openings through which the products of combustion escape into the chamber surrounding the retort are situated at the side and inner end of the arches and deflect them so that they do not directly impinge upon the retort, but are directed more immediately to the side walls of the furnace. The result of the mechanical arrangement described is that the products of combustion after passing along under the arch and through the flues into the chambers surrounding the retort and impinging upon the

side walls of the apparatus immediately ascend to the upper part of the chamber. On reaching it, being impelled forward by the draft, they meet a partition extending down from the roof of the chamber and are thrown down to the upper surface of the protecting-arch, where they come in contact with a surface heated by the direct action of the flames. Again impelled forward, they strike another partition, are thrown upward, and then, upon reaching the top of the chamber, are again directed downward and again upward until they escape through chimneys situated at the forward ends of the apparatus.

I do not place any stress upon the fact that two furnaces are used in defendant's and only one in plaintiff's apparatus; but, for other reasons, I cannot consider the former as substantially the same structure as the latter. The use of vertical instead of horizontal partitions has the effect of changing the method of heating the retort. The products of combustion in the case of the vertical partitions immediately surround the upper as well as the lower part of the retort, while under the Stanly patent they pass under the entire length of the retort before reaching its upper surface. Again, the heat in defendant's apparatus, after surrounding both the upper and lower part of the retort, is twice thrown down against the lower hot arch, where its temperature may be renewed. Again, the flames in defendant's furnace are diverted from the retort, where they first emerge from under the arch instead of directly impinging upon it—a fact which tends to increase its durability. These differences are, it would seem, sufficient to relieve defendant from the charge of infringing upon the plaintiff's method of producing the result aimed at, and are substantial improvements. The result itself I do not consider as covered by either patent.

I have laid no stress on the alleged tests to which so much testimony is directed. Defendant's trial was *ex parte*. In that of plaintiff the facts that no damper was placed in the smoke-stack of defendant's apparatus and that the wood used in it was 20 per cent. lighter than that used in plaintiff's retort deprive the tests of all title to confidence.

The bill is dismissed.

U. S. Circuit Court—Western District of Pennsylvania.

EMERSON, SMITH & CO., (LIMITED,) *v.* HUBBARD *et al.*

Decided March 2, 1888.

ASSIGNMENT OF A PATENT DOES NOT CARRY CLAIMS FOR PAST INFRINGEMENTS UNLESS SPECIFICALLY STATED THEREIN.

Mere intention, not signified in an assignment of Letters Patent, to include therein claims for infringements previously committed, will not suffice to invest the assignee with any equitable title to those claims, and such assignee, after bill filed, in a suit for infringement brought by him, having procured an assignment of said claims, will not be permitted in that suit to set up by a supplemental bill this post assignment.

SUR motion for leave to file a supplemental bill which is now shown to the court.

Mr. W. L. Pierce for the complainants.

Messrs. W. Bakewell & Sons for the respondents.

ACHESON, *J.*:

It seems to be quite plain that the assignments set up in the original bill transferred the title to the Letters Patent only and did not carry the claims for previous infringements. (*Moore* v. *Marsh*, 7 Wal., 515.) Now, giving to the allegations contained in the proposed supplemental bill the fullest effect, the plaintiffs' alleged equitable title to those claims rests upon the mere intention of the parties to those assignments thereby to transfer them; but no such intention appears on the face of the instruments. At best it is a case of naked intention verbally expressed but not carried out. No particulars are stated, or facts disclosed, from which the plaintiffs might deduce any equitable title. The assignment of the patents to the plaintiffs was for the nominal consideration of $5. In fine, it is not shown to the court that the plaintiffs had the shadow of right in or to the claims in question until nearly five months after this suit was brought, when assignments thereof were executed. These post assignments the plaintiff seeks, by means of a supplemental bill, to have "considered as included in the cause of action as set forth in the original bill, and more particularly as a part of complainant's title as set forth in paragraph 12 thereof." But a plaintiff cannot support a bad title by acquiring another after the filing of the original bill and bringing it in by supplemental bill. (Dan. Ch. Pr., 1594, note 2; *Tonkins* v. *Lethbridge*, Cooper's Ch. Cas., 43; *Pilkington* v. *Wignall*, 2 Mad., 240; Story's Eq. Pl., sec. 339.)

Being of opinion that this motion should be disallowed for the reasons above indicated, I do not think it necessary to consider the defendants' further objections to the motion.

The motion is denied.

THE
OFFICIAL GAZETTE
OF THE
United States Patent Office.

The Official Gazette.

THE OFFICIAL GAZETTE is published every Tuesday, simultaneously with the weekly issue of patents. From January 1, 1872, (the commencement of its publication,) to June 30, 1883, it was published and bound in semi-annual volumes; since July 1, 1883, in quarterly volumes. All subscriptions must commence with the beginning of a volume; none taken for less than three months. Terms: To all subscribers within the United States and Canada, $5 per annum; to foreign subscribers, $7; single copies, 10 cents; bound semi-annual volumes, (prior to June 30, 1883,) full sheep, $4 per volume; bound quarterly volumes, (subsequent to July 1, 1883,) full sheep, $2.75 per volume. No club rates. *Payment in advance.* All orders should be addressed to "The Commissioner of Patents, Washington, D. C."

Fraudulent Practices by Attorneys.

DEPARTMENT OF THE INTERIOR,
UNITED STATES PATENT OFFICE,
Washington, D. C., April 18, 1888.

The attention of this Office having frequently been called to circulars and communications of persons pretending to have access to the records of this Bureau, and claiming to possess information of the pendency of applications for patents, notice is hereby given the public that all such persons in so advertising themselves are acting under false representations and are guilty of unprofessional conduct, and should not be entitled to credit.

The Office has also received information that certain attorneys disbarred from practice under section 487 of the Revised Statutes are continuing to prosecute applications for patents under the names of other persons.

Hereafter a list will be published in the OFFICIAL GAZETTE containing the names and addresses of all such persons, and the public warned against employing them or intrusting applications or interests to their charge.

BENTON J. HALL, *Commissioner.*

The Office has information that *Isaac S. McGlehan, No. 155 Broadway, New York*, a disbarred attorney, has been practicing under the name of *Alexander Melhado.*

Publishers' Catalogues.

This Office would be pleased to receive from manufacturers and publishers such catalogues, circulars, price-lists, or other advertisements relating to the sciences and mechanical arts as are published by them for gratuitous distribution; but notice is hereby given such manufacturers or dealers who feel disposed to send their publications that not less than three copies should be forwarded in order that the subjects may be properly indexed, classified, and subclassified in the Scientific Library for convenient and ready reference.

Issue of February 26, 1889.

DESIGNS.

18,936.—PAPER-WEIGHT.—*George H. Benton*, Boonton, N. J. Application filed January 10, 1889. Serial No. 295,969. Term of patent 7 years.

18,937.—BELL.—*Alexis Fatoux*, Meriden, Conn. Application filed January 21, 1889. Serial No. 297,079. Term of patent 7 years.

18,938.—PATTERN FOR SHOES.—*William B. Hamilton*, Toronto, Ontario, Canada. Application filed January 22, 1889. Serial No. 297,209. Term of patent 7 years.

18,939.—MAIL-BOX.—*Henry C. Hart*, Detroit, Mich. Application filed January 16, 1889. Serial No. 296,551. Term of patent 7 years.

18,940.—TYPE.—*William W. Jackson*, Philadelphia, Pa., assignor to *The MacKellar, Smiths & Jordan Company*, same place. Application filed November 30, 1888. Serial No. 292,334. Term of patent 14 years.

18,941.—DECORATIVE FABRIC.—*Charles H. Koster*, Brooklyn, N. Y., assignor to *The Unexcelled Fireworks Company*, same place. Application filed June 12, 1888. Serial No. 276,882. Term of patent 7 years.

18,942.—BOTTLE.—*Francis H. Leggett, Albert H. Jones*, and *Lewis Wallace*, New York, N. Y. Application filed December 12, 1888. Serial No. 293,389. Term of patent 7 years.

TRADE-MARKS.

[Certificates of registration of Trade-Marks numbered 8,191 and upward are registered under the act of March 3, 1881.]

16,295.—ALL GOODS MADE FROM THE COCOA-BEAN.—*Bensdorp & Co.*, Amsterdam, Netherlands. Application filed January 9, 1889. Used since November 16, 1861.

"The words 'ROYAL DUTCH.'"

16,296.—PLOWS.—*Cealy Billups*, Norfolk, Va. Application filed January 11, 1889. Used since December 1, 1888.

"The word 'ALLIANCE.'"

16,297.—WHISKY.—*William Boyle* and *John McGlinn*, Philadelphia, Pa. Application filed January 17, 1889. Used since March 3, 1888.

"The words 'CLOVER CLUB.'"

16,298.—FURNITURE-POLISH.—*The P. Hanson Hiss Manufacturing Company*, Baltimore, Md., and Washington, D. C. Application filed January 16, 1889. Used since December 1, 1888.

"The word 'REX.'"

16,299.—SODA-WATER AND SIMILAR CARBONATED BEVERAGES.—*George C. Henry*, Burlington, Iowa. Application filed January 25, 1886. Used since June 1, 1886.

"The words 'WHIPPED CREAM.'"

16,300.—CIGARS.—*Hesslein Bros.*, Chicago, Ill. Application filed January 19, 1889. Used since 1875.

"The representation of a bell and the words 'LIBERTY BELL.'"

16,301.—MEDICATED POWDER FOR ANIMALS AND POULTRY.—*Herrman & McLean*, Cleveland, Ohio. Application filed November 17, 1888. Used since October 15, 1888.

"The words 'THE STOCKMAN'S FRIEND.'"

16,302.—CORN-SALVE.—*Miller Brothers*, New York, N. Y. Application filed June 30, 1888. Used since April 1, 1888.

"The word 'STOP-CORNS.'"

16,303.—AROMATIC LIQUID DENTIFRICE.—*Angeline Armstrong*, New York, N. Y. Application filed December 31, 1888. Used since May, 1888.

"The words 'IMPERIAL ROSE.'"

16,304.—CRACKERS, BISCUITS, AND KINDRED ARTICLES.—*C. D. Boss & Son*, New London, Conn. Application filed March 22, 1888. Used since 1864.

"The word 'LUNCHEON.'"

16,305.—VERMIN-EXTERMINATORS.—*John C. Bowe*, Syracuse, N. Y. Application filed January 19, 1889. Used since January 1, 1887.

"The words 'LIGHTNING PULVERIZER.'"

16,306.—SPECIFICS FOR HOG-CHOLERA AND SWINE-PLAGUE.—*Charles E. Clarke*, New York, N. Y. Application filed January 31, 1889. Used since August 1, 1888.

"The word 'HOBOZONE.'"

16,307.—SHOES HAVING SOLID INSOLES AND HEEL-COUNTERS.—*Durrell Bros.*, Cincinnati, Ohio. Application filed November 24, 1888. Used since November 23, 1888.

"The word 'PHŒNIX.'"

16,308.—NEW HYPNOTIC.—*Farbenfabriken, vormals Fr. Bayer & Co.*, Elberfeld, Germany. Application filed December 28, 1888. Used since December, 1888.

"The word 'TRIONAL.'"

16,309.—NEW HYPNOTIC.—*Farbenfabriken, vormals Fr. Bayer & Co.*, Elberfeld, Germany. Application filed December 28, 1888. Used since December, 1888.

"The word 'TETRONAL-BAYER.'"

16,310.—NEW HYPNOTIC.—*Farbenfabriken, vormals Fr. Bayer & Co.*, Elberfeld, Germany. Application filed December 28, 1888. Used since December, 1888.

"The word 'TETRONAL.'"

16,311.—NEW HYPNOTIC.—*Farbenfabriken, vormals Fr. Bayer & Co.*, Elberfeld, Germany. Application filed December 28, 1888. Used since December, 1888.

"The word 'TRIONAL-BAYER.'"

16,312.—WHISKY.—*Fred. J. Kiesel & Company*, Ogden, Utah Ter. Application filed November 23, 1888. Used since July 15, 1881.

"The word 'PAROLE.'"

16,313.—SOAPS AND DETERGENTS.—*Lever Bros.*, Warrington, county of Lancaster, England. Application filed November 13, 1888. Used since March 28, 1884.

"The word 'SUNSHINE.'"

16,314.—SOAPS AND DETERGENTS.—*Lever Bros.*, Warrington, county of Lancaster, England. Application filed November 13, 1888. Used since April 20, 1885.

"The word 'SUNBEAM.'"

16,315.—FANCY SOAPS AND TOILET PERFUMERY.—*Lever Bros.*, Warrington, county of Lancaster, England. Application filed December 18, 1888. Used since March 28, 1884.

"The word 'SUNSHINE.'"

16,316.—FANCY SOAPS AND TOILET PERFUMERY.—*Lever Bros.*, Warrington, county of Lancaster, England. Application filed December 18, 1888. Used since April 20, 1885.

"The word 'SUNBEAM.'"

16,317.—CEREAL PRODUCTS.—*The Muscatine Oat Meal Company*, Muscatine, Iowa. Application filed November 30, 1888. Used since June 1, 1887.

"The word 'HAWKEYE.'"

16,318.—BOOTS, SHOES, AND SLIPPERS.—*Packard & Field*, Brockton, Mass. Application filed January 9, 1889. Used since January 1, 1889.

"The representation of a human foot visible through the upper of the boot or shoe within which it is inclosed."

16,319.—LINIMENTS.—*Peter P. Prando*, St. Xavier Mission, (Fort Custer,) Mont. Ter. Application filed January 23, 1889. Used since 1887.

"The word 'ISTEUMATE.'"

16,320.—PHOTOGRAPHIC PAPER.—*Antoine Schaeffner*, Paris, France. Application filed November 13, 1888. Used since January 1, 1888.

"The representation of an anchor and the letters 'A' and 'S.'"

16,321.—REMEDY FOR CHILLS AND FEVER AND LIVER-PILLS.—*Von Vleet & Co.*, Memphis, Tenn. Application filed January 22, 1889. Used since June 1, 1885.

"The word 'PLANTATION.'"

16,322.—ADDING-MACHINES.—*Charles Henry Webb*, New York, N. Y. Application filed November 21, 1888. Used since December, 1888.

"The words 'THE ADDER.'"

16,323.—PREPARATIONS FOR CURING HEADACHE.—*Samuel Whitehall*, South Bend, Ind. Application filed January 12, 1889. Used since June 1, 1888.

"The word 'MEGRIMINE.'"

16,324.—ZINC POWDER AND COMPOUNDS CONTAINING ZINC FOR EXTERNAL USE.—*Lucy N. White*, New York, N. Y. Application filed January 26, 1889. Used since September 17, 1888.

"The word 'SPELTERINE.'"

16,325.—INSECTICIDE.—*Samuel Woods*, Montreal, Quebec, Canada. Application filed January 18, 1889. Used since March 27, 1888.

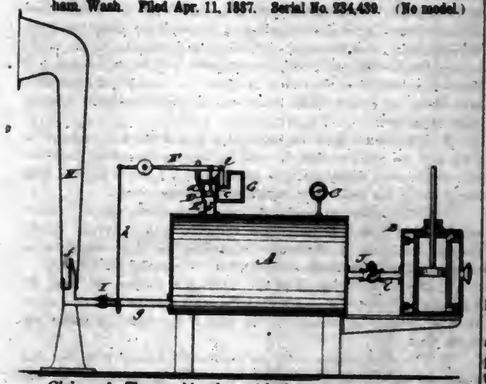
"The word "MOTHINE.'"

16,326.—STOMACH-TONIC.—*Zobel & Faltmesger*, Brooklyn, N. Y. Application filed February 4, 1889. Used since November 1, 1887.

"The picture of 'PROFESSOR DOCTOR G. JAEGER.'"

LABELS.

5,830.—Title: "COTTINGHAM'S STOMACH AND KIDNEY RENOVATOR." *William H. Cottingham*, Noblesville, Ind. Application filed January 30, 1889.



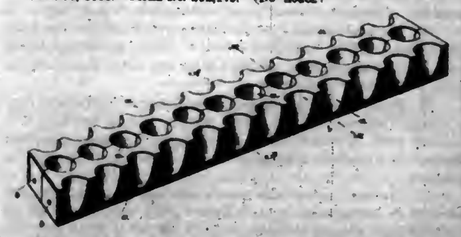
5,831.—Title: "RHEUMATISM AND GOUT" (FOR A MEDICINE.)—*Anthony Sieke*, New York, N. Y. Application filed January 4, 1889.

5,832.—Title: "COLLINGSWOOD" (FOR SPRING WATER.)—*David W. White*, Collingswood, N. J. Application filed January 29, 1889.

PATENTS

GRANTED FEB. 26, 1889.

398,367. AUTOMATIC FOG-HORN. AUGUST F. BAATZ, Bellingham, Wash. Filed Apr. 11, 1887. Serial No. 234,439. (No model.)



Claim.—1. The combination, with the reservoir A, the pump B, operating to charge said reservoir with compressed air, and the fog-horn H, of the valve-controlling piston D, the weighted lever F, attached to and operated by the piston D, and the way-cock I, connected with said lever and adapted to control the discharge of air from the reservoir to and through the horn, substantially as specified

2. In combination with the compressed-air reservoir A and fog-horn H, connected therewith, the valve-controlling piston D, with its box or casing and air-chamber G, said air-chamber being provided with a connecting-aperture, *c*, above the piston-head, leakage-aperture *d* about the piston-rod, the weighted valve-lever F, attached to the piston-rod, the connection *h* between said lever and the way-cock I, and the way-cock I, essentially as and for the purpose herein set forth.

3. The combination of the compressed-air reservoir A, the pump B, connected therewith, the check-valve J, located between the pump and reservoir, the valve-controlling piston D, with its casing E and air-chamber G, said air-chamber being provided with a connecting-aperture, *c*, above the piston-head, leakage-aperture *d* about the piston-rod, the weighted lever F, attached to and operated by the piston D, the fog-horn H, communicating with the air-reservoir through the pipe *g*, the way-cock I in said pipe, and the connection *h* between said way-cock and lever, substantially as shown and described.

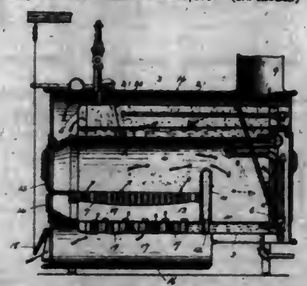
398,368. CANDY-MOLD. SAMUEL E. BALL, Dayton, Ohio. Filed Nov. 30, 1888. Serial No. 292,179. (No model.)

Claim.—1. The candy-mold consisting of the series of independent rubber bars provided with complementary cells, and each provided with a stiffening rod or strip to prevent flexion.

2. A section for a candy mold consisting of a rubber bar provided with suitable mold cells or cavities, and with a stiffening strip or rod applied permanently thereto.

398,369. CABLE RAILWAY. PINKNEY F. BARR, St. Paul, Minn. Filed Dec. 18, 1888. Serial No. 293,063. (No model.)

Claim.—1. A yoke for cable railways, provided with a lug near the running-rail to receive the tie-rod for the slot-rail, in combination with the slot-rail and a tie-rod attached to said running-rail and said lug, substantially as described.



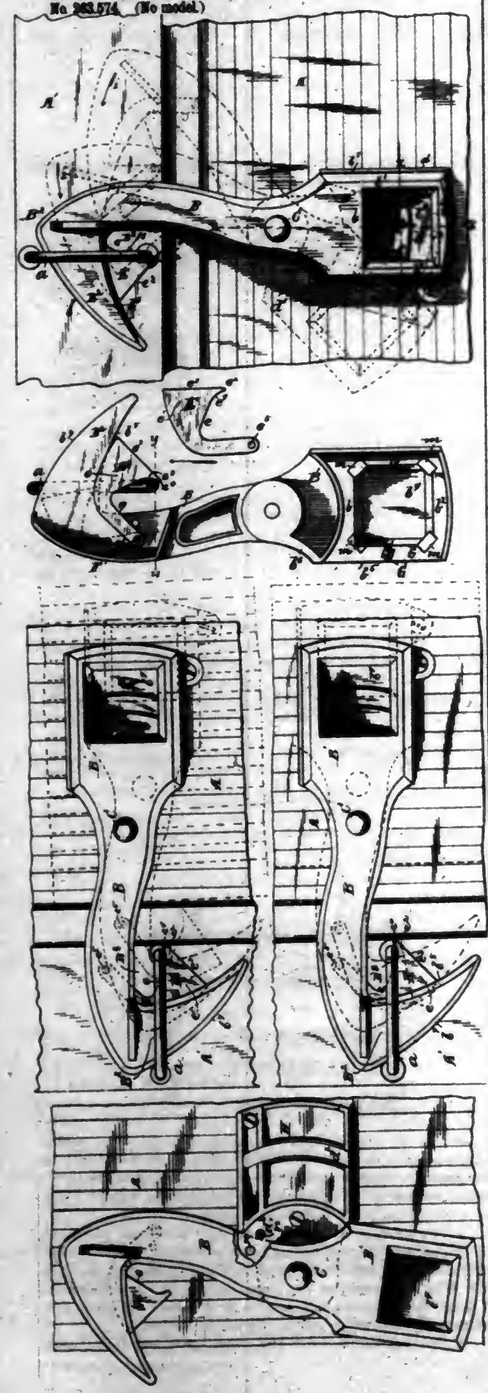
2. A yoke for cable railways, provided with recesses for the slot and running rails, and a lug substantially on the same horizontal plane with the running-rails, and having an aperture to receive the tie-rod holding the slot-rail, in combination with a tie-rod secured to the slot-rail and passing horizontally through the aperture in the lug, substantially as described.

3. The combination, with a yoke having seats for the slot and running rails and a lug projecting above the rail-seats therein, of said slot and running rails and two tie-rods, each running through one slot-rail, a running-rail, and said lug, substantially as described.

4. The combination of a yoke and a pulley-block, one of which is provided with a recess to receive the other and a key driven into the recess in the one and binding the two together, substantially as described.

5. The combination, with a yoke having a flange, *a'*, of a pulley-bracket having a recess embracing said flange and a key set between the wall of the recess and the flange, substantially as described.

398,370. STEAM-BOILER. ABDIAS I. BARRABOFF, Bangor, Me. Filed July 30, 1888. Serial No. 280,478. (No model.)



Claim.—1. The combination, in a steam-boiler having an annular water-space, of a hollow bridge-wall interiorly of said water-space, an ash-chamber exteriorly of said water-space, and air-passages 12, extending thereacross, which connect said ash-chamber with the chamber in the bridge-wall, substantially as specified.

2. In a steam-boiler having an annular water-space, with draft-flues 8 8 longitudinally therethrough, the combination, with said boiler, of the grate 7, the hollow bridge-wall 10, the air-passage 12, the draft-flues 19 19 transversely of the lower water-space, the ash-chamber 17 below the same, and the doors 14 18, the latter operating automatically, substantially as and for the purposes set forth.

3. The combination, with a boiler constructed with an inner shell,

4, an outer shell, 3, composing the water-space, and with the flues 8 8 therein, of the transverse draft-flues 19 19 exterior to and below the grate, the grate-bars 7-7, arranged above the lower water-space, and the plate 16, inclosing the outer shell, 3, and forming beneath the said shell the ash-chamber 17, and above and about said shell the flue 21, substantially as herein described.

398,371. SEAL-LOCK. EDWARD C. BARTLETT, Omaha, Nebr., assignor to John L. McCague, same place. Filed Feb. 10, 1888. Serial No. 263,574. (No model.)

Claim.—1. In a sealing device having a seal-cutting knife, a latch-bar provided with an automatically-operating catch, whereby the latch-bar engages with a fixed fastener when the door is being moved toward said fastener, substantially as set forth.

2. The latch-bar having a movable knife and an automatic catch adapted to engage with a fixed fastener and bear against the said fastener on lines transverse to the path of the knife, whereby said latch-bar automatically engages with said fixed fastener when moving toward it, and the knife must be moved automatically at the time when the latch-bar is being released from the fixed fastener, substantially as set forth.

3. In a sealing device, a latch-bar having a movable seal-cover connected with it, and an automatic catch whereby the bar engages with a fixed fastener when it is being moved toward the latter, substantially as described.

4. The latch-bar adapted to be engaged with a fixed fastener and having a seal-cover, in combination with a seal-holder, a stop for the latch-bar when the seal-cover is over the seal-holder, and a stop which prevents the latch-bar from carrying the seal-cover beyond a limited distance from the seal-holder, whereby the latch-bar always tends to hold the cover over the seal, substantially as described.

5. The pivoted seal-cover, the weighted arm for said cover, and the stops at the ends of the path of the seal-cover, whereby the weighted arm always tends to hold the cover over the seal-receptacle, substantially as set forth.

6. The pivoted latch-bar having the seal-cover at one side of its pivot and the catch or lock for said latch-bar arranged on the other side of the pivot, substantially as set forth, to act as a weight to hold the cover on the seal-holder, substantially as described.

7. The pivoted arm having the seal-cover on one side of its pivot and having the hook B^3, said hook and arm being of greater weight than the seal-cover, in combination with the stops for the arm and seal-cover situated in the path of their travel, substantially as set forth.

8. The combination, with the latch-arm having the hook B^3 formed with the cam b^7, and having the seal-cover secured thereto, of the fixed fastener a, arranged in the path of the cam b^7, substantially as set forth.

9. The combination, with the seal-holder formed with the stop d and the stop d', of the seal-cover and the weighted carrier for said cover, said cover and carrier engaging with the stop d when the cover is over the seal-holder and engaging with the stop d' before the center of gravity of the carrier reaches the vertical line passing through the axis about which the seal-cover and carrier move, substantially as set forth.

10. In a sealing device, the combination, with the seal-holder having the inclosing-walls d^3 d^4, and the retainer H, bearing against the outer surface of the seal, of the seal-passage at d^5, extended to or below the said retainer H, substantially as set forth.

11. In a sealing device, the combination, with the latch-bar, of the gravity-catch having a concave edge adjacent to the staple or fastener, substantially as set forth.

12. The combination, with the latch-bar, of the pivoted gravity-catch suspended from a pivot above the fastener, with which it engages, substantially as set forth.

13. In a sealing device comprising two parts, of which one rocks relatively to the other, the combination, with the rocking part and the fixed fastener a, of a gravity-catch suspended below a pivot other than the pivot about which moves the said rocking part of the sealing device, substantially as described.

14. The combination of the seal-receptacle and the cover, of which parts one rocks relatively to the other about a pivot, and a fixed fastener for said part, of a gravity-catch pivotally connected to the said rocking part on an axial line nearer to the fixed fastener than the axial line of the first aforesaid pivot, substantially as described.

15. The combination, with the sealing device and the hasp having a pivot, C, and a hook at its outer end, of the gravity-catch pivoted to the hasp between the hasp-pivot and the outer end of the hook, substantially as set forth.

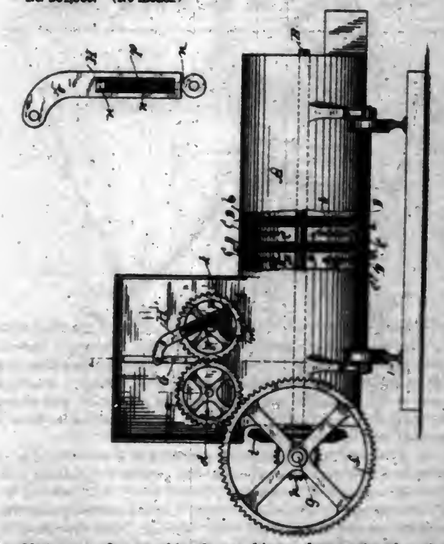
16. The combination, with the pivoted hasp or latch arm having a catch, B^3, to bear against a fixed fastener in one direction, of a movable catch, E, secured to the hasp and bearing against the fixed fastener in a direction transverse to that aforesaid, substantially as set forth.

17. The combination, with the pivoted hasp having a catch, B^3, adapted to engage with a fixed fastener, of a catch, E, having an inclined edge adapted to strike the fixed fastener to move the catch while the hasp approaches said fastener, substantially as set forth.

18. The combination, with the hasp or latch arm, of a catch, E, having the inclined edge e^3 and the recessed edge e^4, arranged substantially as set forth.

19. The combination, with the fixed fastener and sealing devices, of the hasp or arm, adapted when closed to lie above and out of contact with the fixed fastener, substantially as set forth.

20. The combination, with the seal-holder, the glass cover, and the support for the glass, of the metal fasteners m m, secured to the glass-support and engaging with the edges of the glass, substantially as set forth.



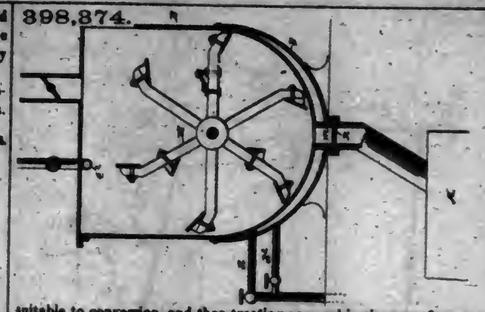
21. The combination, with the hasp and its pivot, of the re-enforcing dovetailed or wedge-shaped flanges, substantially as set forth.

398,372. HARNESS-BUCKLE. ISAAC E. BENNETT, Newton, Iowa. Filed Nov. 6, 1888. Serial No. 290,120. (No model.)

Claim.—The combination of the frame composed of side bars a and cross-bars b and c, said bar b provided with an aperture, and the frame composed of the side bars d, the end bar f, having a tongue on its under side, the bar and loop g, and a cross-bar, m, substantially as shown and described.

398,373. MACHINE FOR TEMPERING CLAY. MICHAEL BERLINE and JACOB BERLINE, Chaska, Minn. Filed Jan. 30, 1888. Serial No. 261,389. (No model.)

Claim.—1. In a machine for crushing and tempering clay, the combination of a horizontal tempering-cylinder, a horizontal blade-shaft in the said cylinder, and a pair of fluted clay-crushing and feed rolls mounted crosswise of the tempering-cylinder and over its forward end, substantially as and for the purpose herein set forth.



2. In a clay crushing and tempering machine, in combination with the upwardly and downwardly moving bar and crank-wheels for driving the same, the connecting rods or arms, made each in two parts, and a spring between the two parts adapted to act to draw the parts together and yield to a sufficient force tending to separate them, substantially as and for the purpose herein specified.

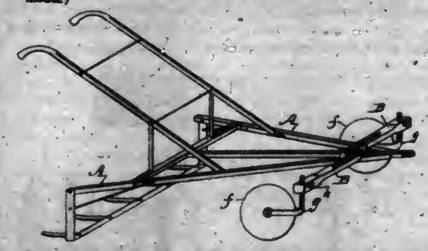
398,374. PROCESS OF MANUFACTURING BEER OR ALE. ANDREW W. BELLEMS, Brooklyn, N. Y. Filed Feb. 9, 1887. Serial No. 227,067. (No specimens.)

Claim.—1. The within-described improvement in the manufacture of beer, consisting in making a malt mash and also making a supplemental mash by mixing together malt and raw grain with water, raising the temperature not to exceed the coagulating point of diastase, and then mixing the supplemental mash with the main mash at a temperature varying between 140° and 170° Fahrenheit, and then conducting operations as in ordinary brewing, substantially as described.

2. In the manufacture of beer or ale, making a malt mash and making a supplemental mash by mixing together malt and corn with water, gradually raising the temperature by the injection of live steam to a point at which the diastase remains active, and then mixing the supplemental mash with the malt mash when at a temperature most

398,374.

suitable to conversion, and then treating as usual in the manufacture of ale or beer, substantially as described.

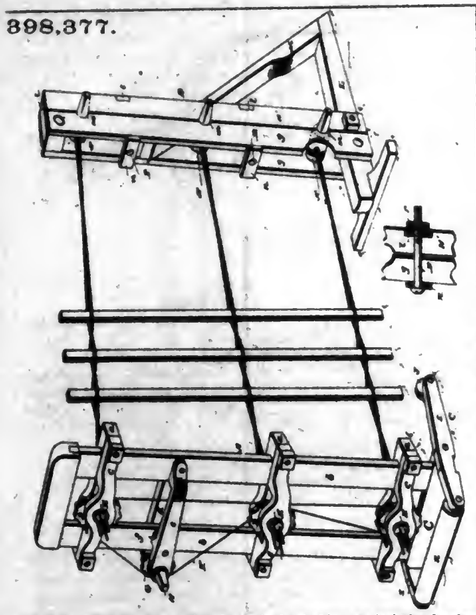


398,375. MANUFACTURE OF ULTRAMARINE. LIEUT. J. R. A. J. BOUILLET, London, County of Middlesex, England. Filed Mar. 25, 1887. Renewed Dec. 12, 1888. Serial No. 294,022. (No specimens.) Patented in England July 14, 1886, No. 9,176.

Claim.—1. The method of manufacturing ultramarine by first placing the powdered material in a fibrous bag or envelope containing calcareous or mineral matter while in constant motion, then placing a thin sheet of card-board over the material, and folding the paper bag or envelope over the card-board and sealing it with paste, the whole placed within a suitable retort and subjected to a proper degree of heat, substantially as described.

2. The combination, substantially as shown and described, of the fire-places A, flues B, fire-tiles C, hollow fire-bricks D, refractory bricks Z, blocks E, dampers E', arches F, flue-passages G, dampers G', flue H, fire-tiles I, iron bars K, brick piers L, layer of sand M, perforated incombustible pipe N, flue O, and apertures S, the whole adapted for the manufacture of ultramarine.

398,376. WEED-CUTTER AND HORSE-HOE. ANDREW CHENEY, Sergeant Bluffs, Iowa. Filed Sept. 28, 1888. Serial No. 286,636. (No model.)



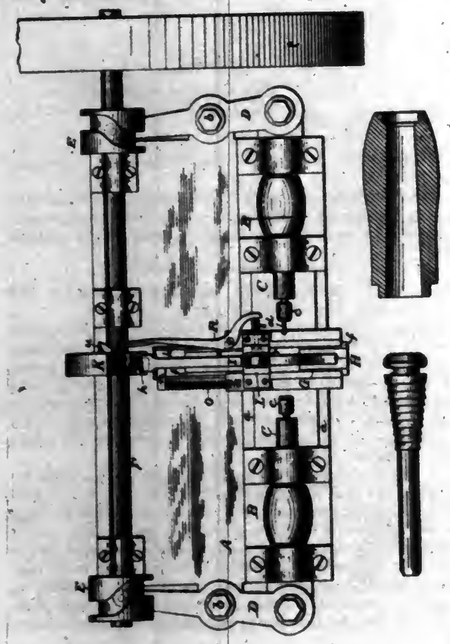
Claim.—The adjustable bars B, having longitudinal slots, and the bearers g, carrying rotary cutters f, in combination with the triangular frame A, to operate in the manner set forth, for the purposes stated.

398,377. FENCE-MACHINE. GEORGE J. CLINE, Goshen, Ind. Filed Nov. 3, 1888. Serial No. 290,272. (Model.)

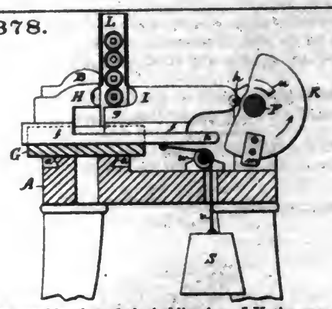
Claim.—1. The combination, with a roller-frame, of the uprights b, secured thereto, the cross-bars c, having the central extended portion, the cross-bars c, having the central recess or depressed portion and secured together at their outer ends, the twisting-heads having sprocket-wheels and journaled between the two cross-bars on one side of the uprights, the sprocket-wheel G, journaled in the arms d e, and the arm e, having the lug f, so as to form a passage for the endless chain, substantially as specified.

2. In a tension device for use in fence-making, consisting of a base-piece, I., a strut, M, two parallel vertical bars, g, having matched notches in one edge and each rigidly secured to the base and strut, the block secured to the upper ends of said parallel bars, the two parallel bars H', having notches corresponding with those of the bars g, united by cross-bars and pivoted at their lower ends to the base-piece and passing alongside but not secured to the top block, the cross-bars n, secured to the bars g, the cross-bars l, secured to the bars H', the threaded rods passing through the respective cross-bars,

398,377.



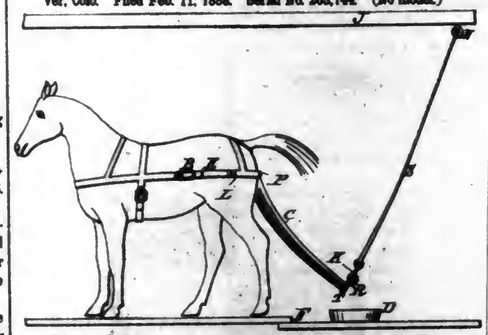
and tightening-nuts on said rods, and wire holders or bobbins having their spindles in the notched bearings, substantially as specified.



398,378. MACHINE FOR FINISHING CASTER-ROLLERS. ROBERT B. COOLING, Bristol, Conn. Filed June 20, 1888. Serial No. 277,623. (No model.)

Claim.—1. The combination of a pair of holding-jaws, the leveling-plunger and an opposing face for confining the work under lateral pressure when about to be grasped by the jaws, and mechanism for operating said plunger, substantially as described, and for the purpose specified.

2. The holding-jaws having holding-faces and arranged to move for bringing said faces to and from each other, and a weight or spring for holding the jaws together when gripping the work, and thereby determining the pressure of the jaws upon the work, substantially as described, and for the purpose specified.

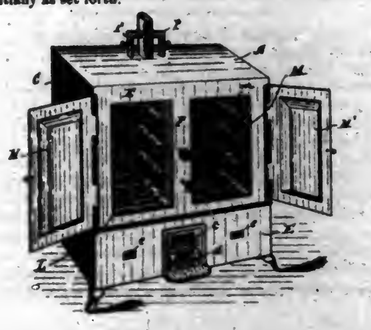


398,378.

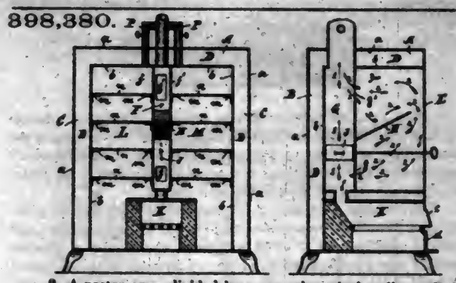
3. The combination of the holding-jaws I H, the cams K and *m*, acting, respectively, upon the jaws I and H to force them forward, and a pressing device for throwing the jaw I toward the cam, and another pressing device for throwing the jaw H toward the jaw I and the cams, substantially as described, and for the purpose specified.

4. The combination of a lathe spindle or spindles, the holding-jaws I H, the cams K *m*, acting, respectively, first on the jaw I and then on the jaw H, and pressing devices for returning said jaws, substantially as described, and for the purpose specified.

398,379. MANURE AND URINE CONDUIT. HENRY COLE, Denver, Colo. Filed Feb. 11, 1888. Serial No. 263,744. (No model.)



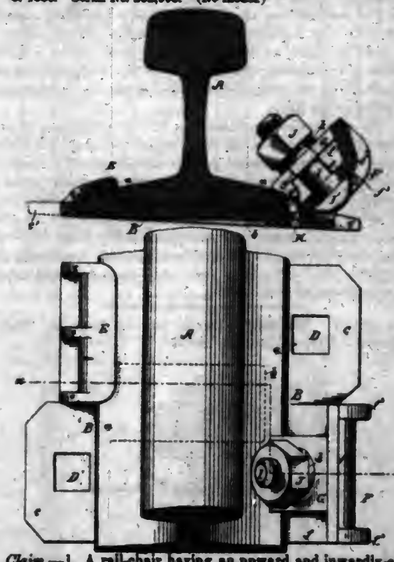
Claim.—1. In a manure and urine conduit, a chute, C, open at the top its entire length and provided with a spring, T, containing eyes R at its discharge-opening, in combination with a strap, S, attached at one extremity to said spring by means of a hook, K, and at the other extremity to the ceiling of the barn, substantially as shown and described, and for the purpose set forth.



2. A manure and urine conduit consisting of a chute, C, open at the top its entire length and provided with a spring, T, containing eyes R, in combination with a strap, S, provided with a suitable hook, K, said strap being connected with a spring, T, at one extremity and with a suitable support above at the other extremity, and two straps, E, one on each side, forming part of a suitable means of attachment, substantially as shown and described, and for the purpose set forth.

398,380. PASTRY-OVEN. JOHN P. CONNOR, Boston, Mass. Filed June 16, 1888. Serial No. 277,316. (No model.)

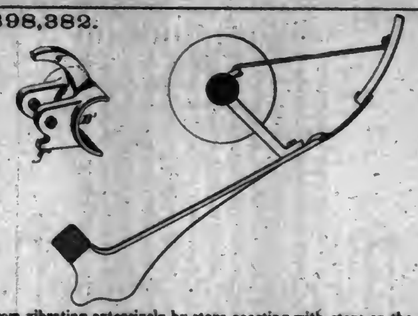
Claim.—1. In combination with a pastry-oven, the central vertical radiator, F, provided with the pipe G, having openings *g g'* and fitted with a damper, J, and the partition H, whereby the heat entering the radiator through the opening *g* is caused to pass to the front of the oven and thence back and through the opening *g'* to the flue, substantially as set forth.



398,380.

2. A pastry-oven divided by a central vertical radiator, F, into two compartments, L M, closed by separate doors, N N', in combination with the smoke-pipe G, having openings *g g'* and damper J, and the fire-pot K, substantially as shown and described.

398,381. RAIL-CHAIR. HENRY F. COX, Altoona, Pa. Filed Dec. 8, 1888. Serial No. 292,908. (No model.)



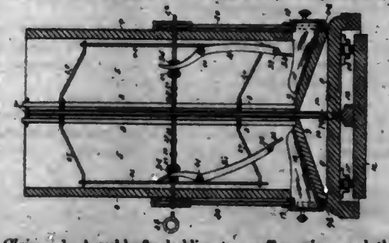
Claim.—1. A rail-chair having an upward and inwardly-extending lug at one corner, an upward and outwardly-extending lug with turned-up edge at the corner diagonal to the first, and plain outwardly-extending flanges pierced with spike-holes at the remaining two corners, in combination with a bolt passing through the outwardly-extending lug with its head beneath said lug, a clamping-piece adapted to rest against the turned-up end of the outwardly-extending lug and the edge of the base of a rail resting in the chair, said clamping-piece being perforated to permit the bolt to pass through it, and a nut screwing on said bolt, all substantially as and for the purpose specified.

2. A rail-chair having an upward and inwardly-extending lug at one corner, an upward and outwardly-extending lug with turned-up edge at the corner diagonal to the first, and plain outwardly-extending flanges pierced with spike-holes at the remaining two corners, in combination with a bolt passing through the outwardly-extending lug with its head beneath said lug, a clamping-piece adapted to rest against the turned-up end of the outwardly-extending lug and the edge of the base of a rail resting in the chair, said clamping-piece being perforated to permit the bolt to pass through it, a downwardly-extending lug at the lower edge of the clamping-piece extending beneath the rail-base, a perforation in the base of the chair to admit the said lug, and a nut screwing on the end of the bolt aforesaid and against the clamping-piece, all substantially as and for the purpose specified.

398,382. GRAIN-BINDER. HENRY F. CRANDALL, Milwaukee, Wis., assignor to the Milwaukee Harvester Company, same place. Filed Jan. 28, 1887. Serial No. 225,835. (No model.) Patented in England Dec. 6, 1887, No. 16,741.

Claim.—1. In a grain-binder, the combination, with the compressing-fingers and the bell-crank to which they are hung, of a spring-catch for engaging the inner end of the bell-crank, and a frame in which the shank of said spring-catch slides, said frame being prevented

398,382.



from vibrating extensively by stops coacting with stops on the main frame, having a bend which, acting on the lower end of the shank of the spring-catch, serves to tilt the catch and permits it to maintain its engagement with the bell-crank as it is drawn up by the action of the pressure of the gavel on the compressing-fingers, as set forth.

2. In a grain-binder, a spring-catch for the compressor-fingers mounted in a swinging frame, said frame being kept from extensive vibration by suitable stops, but having curved guides for the catch, so that the end of the latter may travel in the arc of a circle in spite of the restrictive action of the stops, substantially as and for the purpose set forth.

3. In a grain-binder, a bracket secured to a supporting-bar of the machine and provided with an upper and lower stop, a frame pivoted to the bracket, a spring-catch mounted in the frame to engage the compressor-fingers, and means, substantially as described, for actuating said frame at predetermined intervals, as set forth.

398,383. COMBINED SPICE-CADDY. ROBERT CROSMER, Philadelphia, Pa. Filed Jan. 5, 1888. Serial No. 259,857. (No model.)

Claim.—1. A caddy for holding tea, coffee, spices, and the like, comprising separable sections, the said sections resting on a movable base, in combination with means, substantially as shown and described, for rotating the said caddy, and scoops of different capacities in each of the said sections, the said scoops entering the said sections at an oblique angle.

2. The caddy herein shown and described, comprising separable sections, the said sections having false bottoms 9 and resting on a movable base, 11, in combination with the rollers 15 for rotating the said caddy, and the scoops 17 18, which enter the said sections at an oblique angle, as shown.

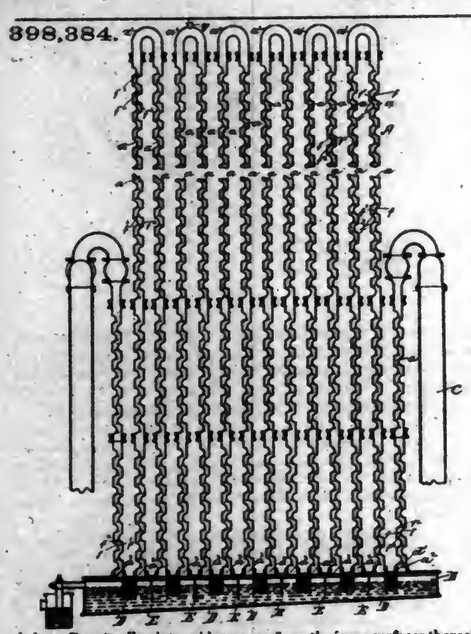
3. In combination, a caddy composed of separable compartments, the rods 3, running through the said compartments, and the supports 7, through which the rods 3 run.

4. A caddy composed of separable sections, the said sections resting on a movable base between flanges 16 and inclining toward the vertical axis of the caddy.

5. A caddy composed of compartments having the agitator 24 25 26 42 in the said compartments, all substantially as shown and described.

6. A caddy comprising compartments having the agitator 24 25 26 in the said compartments, all substantially as shown and described.

7. A caddy comprising compartments having the agitator 24 25 26 42 3 in the said compartments, all substantially as shown and described.

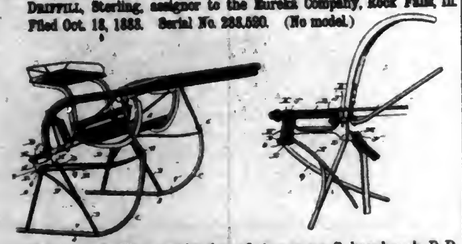


8. A caddy composed of compartments having the agitator 24 25 26 42 and the shovel-lever 37 and the shovels 38 in the said compartments, all substantially as shown and described.

9. The agitator 24 25 26 42 3, in combination with the shovel-lever 37 and the shovels 38, all substantially as shown and described.

398,384. COAL-GAS CONDENSER. FREDERICK J. DAVIS, Waltham, Mass. Filed July 1, 1887. Serial No. 243,108. (No model.)

Claim.—1. A gas-condenser consisting of a series of sections, the side walls of which are formed with concave portions *f*, diagonally opposite to each other, whereby a sinuous passage is formed, and the



398,384.

ledges f^2, extending into said passages from the inner surfaces thereof, the sections being connected together alternately at top and bottom, substantially as described.

2. The condenser having the walls or cases A, having sinuous passages *a*, connected with each other, as specified, the tar-well B, the plates or partitions E, and the breakers D, placed alternately with said partitions, as and for the purposes specified.

398,385. RUNNER FOR WHEELED VEHICLES. FREDERICK DRIFFILL, Sterling, assignor to the Eureka Company, Rock Falls, Ill. Filed Oct. 18, 1888. Serial No. 288,520. (No model.)

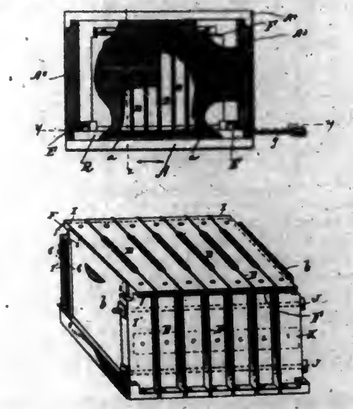
Claim.—1. The combination of the runner C, bench-rods D D, rails E and G, brace-rod F, provided with pintle P, box N, the head H, provided with clips K K, journal M, and opening O, and the axle E, substantially as shown, and for the purpose described.

2. The combination of the runner C, provided with the tread S and central vertical flange, V, bench-rods D D, having their lower ends suitably supported on said tread and attached to said flange, the rail E, supported on said runner and bench-rods, the axle B, and means, substantially as shown, for removably seating said axle on said rail, for the purpose described.

398,386. CARTRIDGE. STEPHEN H. EMMENS, London, England. Filed Feb. 8, 1888. Serial No. 263,372. (No model.)

398,386.

Claim.—1. A cartridge containing a propelling charge or charges of a high explosive and having a yielding cushion which incloses the same, so that the elastic or compressible material of said cushion is interposed between said charge or charges and the walls of the chamber of the gun in which such cartridge is used.



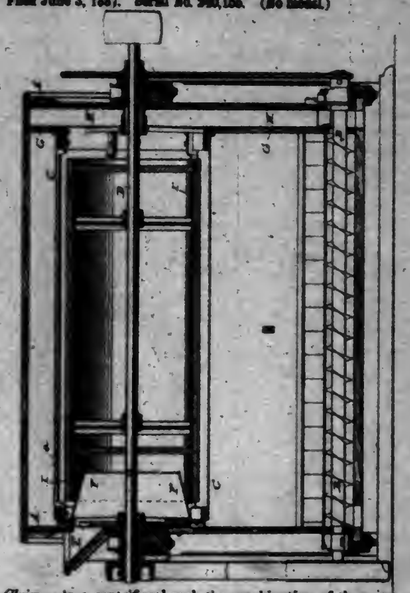
2. A cartridge containing a starting-charge, preferably of a low explosive, and one or more accelerating-charges of high explosive, and having a yielding cushion which incloses all the charges, so that its elastic or compressible material is interposed between said charges and the walls of the chamber of the gun in which such cartridge is used.

3. A cartridge containing a starting-charge, preferably of a low explosive, and two or more accelerating-charges of a high explosive inclosed within longitudinal chambers in an elastic or yielding cushion, and having a wad carrying plugs of different lengths, which close the front ends of said chambers and open them successively, substantially as hereinbefore specified.

4. The combination, in a cartridge, of a propelling charge or charges of a high explosive, a yielding cushion which incloses the same, a firing-primer at the initial firing-point, and at a distance therefrom a re-enforcing detonator in contact with each charge of high explosive to insure the full explosion of the latter, substantially as hereinbefore set forth.

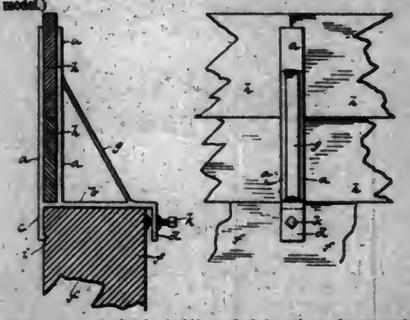
5. The combination, in a cartridge for heavy ordnance, of an annular wooden cushion provided with longitudinal chambers charged with a high explosive, a central metallic tube closed at its breech end and provided with an external recess containing a firing-primer and with a bore connected with said recess by a flame-hole and charged with a low explosive, a wooden plug fitted to the front end of said bore, a superposed metallic wad carrying wooden plugs which close the front end of said high-explosive chambers, and re-enforcing detonators within the front ends of the chambers last named, substantially as hereinbefore specified.

398,387. BEE-HIVE. JOSEPH I. FOOT, San Diego, Cal. Filed Apr. 13, 1887. Serial No. 234,682. (Model.)



Claim.—1. The combination, with the bottom and the rim having bee-entrances, of the frames mounted upon the rim and having a space between them and the bottom, and having bee-entrances between their bottom bars, and the cut-off slide fitted against the bottom bars of the frames and located in said space and adapted to be moved therein to cut off any required number of the frames, substantially as and for the purpose described.

2. The combination, with the series of comb-frames the end ones of which have their sides extended and vertically grooved, of the slides *b* and glass *h*, fitted in the said grooves, and means, as described, for securing the said frames together, substantially as set forth.



3. The herein shown and described bee-hive, composed of the bottom, the rim secured thereto, the brood-frames placed upon the rim, cleats fastened to the ends of the rim and embracing the lower edges of the frames, the wire holding the upper edges of the frames from spreading, the slides at each end of the series of brood-frames, and thin plates interposed between the brood-frames, the cut-off slide, the case rabbeted on its lower edge and fitted to the rim, and the supplemental top and the top proper, substantially as and for the purpose set forth.

398,388. ROTARY BOLT. JOHN M. FINCH and WILLIAM D. GRAY, Milwaukee, Wis., assignors to Edward P. Allis & Company, same place. Filed June 3, 1887. Serial No. 240,155. (No model.)

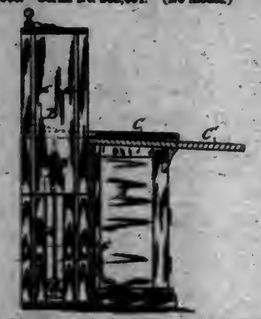
Claim.—In a centrifugal reel, the combination of the outer reel, the inner cylinder having a smooth surface and a recessed head, and the conical screen F, extended into the end of the cylinder, as described.

398,389. SPLASH-BOARD HOLDER FOR BOATS. ALBERT J. GOULD, Pittsburg, Pa. Filed Nov. 30, 1888. Serial No. 292,318. (No model.)

Claim.—1. A device for holding splash-boards on the gunwale of a vessel, consisting of a horizontal base, *b*, provided with two depending arms, one having a clamping-screw and the other a tooth or prong, and two vertical parallel arms, *a*, made integral with the base, said arms being separated laterally of each other to provide a space corresponding to the thickness of the splash-boards and of sufficient length to accommodate two or more boards, substantially as described.

2. In a device for holding splash-boards on the gunwale of a vessel, a bracket consisting of a flat horizontal base having means for attaching itself to a vessel, and two vertical parallel arms, *a*, spaced laterally of each other on said base to provide an intervening space substantially equal in width to the thickness of the splash-boards, said arms being of sufficient length to accommodate two or more boards, in combination with two or more splash-boards fitted between the arms of said bracket and resting on edge on the base thereof, substantially as described.

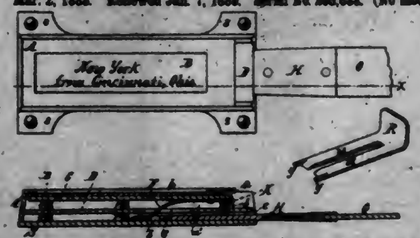
398,390. COMBINED FUNNEL AND CAN-TOP. HARVARD GREELY, Ellsworth, Me. Filed Dec. 12, 1888. Serial No. 292,376. (No model.)



Claim.—1. A combined funnel and can-top consisting of the cone-shaped funnel-body D and the spout F, with the enlarged portion L, adapted to fit and be secured to the neck of a can, in combination with spout-cap *g*, substantially as shown, and for the purpose described.

2. As a new article of manufacture, an attachable funnel can-top consisting of the cone-shaped funnel-body D, provided with corrugations *f*, having the spout F, with an enlargement, and with fastening devices requiring a rotary movement of the funnel-body to the neck of a can, and a cap to fasten over the open end of the spout, substantially as shown and described.

398,390.



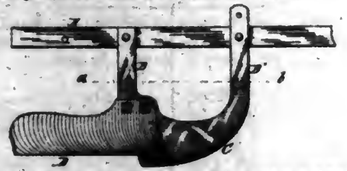
398,391. WRITING-DESK OR SECRETARY. FRANK HAMMOND, Homer, N. Y., assignor of one-half to Martha Faulkner, same place. Filed Aug. 6, 1888. Serial No. 282,091. (No model.)

Claim.—In combination with the desk provided with the usual open space at its under side and the secretary arranged to move vertically in said desk, a pivotal spring-catch arranged in the lower portion of the back of the aforesaid open space and provided with a foot-piece, whereby it is adapted to retain the secretary in its depressed position and be readily released by the foot, substantially as described and shown.

398,392. SPRING-LOCK. HENRY K. HARKER, Cincinnati, Ohio, assignor of fifty-one one-hundredths to L. A. Harris, same place. Filed Mar. 2, 1888. Renewed Jan. 7, 1889. Serial No. 295,952. (No model.)

Claim.—1. A lock of the class described, composed of the base-plate S and a casing or shell, A, the plate C, slotted plate D, secured in the case and forming compartments therein, and a locking-spring secured in one compartment, passing through the slot or slots in the plate D into the adjacent compartment, the said compartments being open at one end, substantially as described.

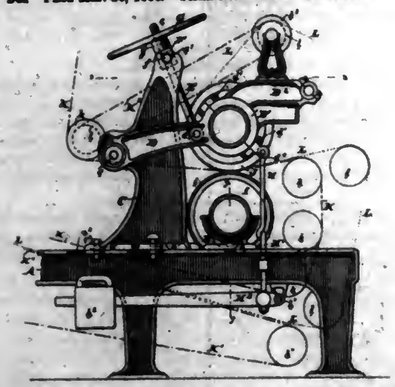
2. In a lock of the class described, the case composed of the base-plate S and casing or shell A, having an opening, A, at its upper side for exposing a tag or card, the plates C and D, located and secured in said casing or shell to form compartments open at one end for the insertion of a tag or card, a locking and unlocking device, and the locking-spring F, substantially as described, combined with the movable bolt K, extending across the openings at the end of the casing, substantially as shown, and for the purpose described.



3. In a lock of the class described, the combination of a casing

or shell, A, the plate C, and the slotted plate D, secured in the case and forming compartments therein, the said compartments being open at one end, a locking-spring secured in one compartment and extending through the slot in the plate D into the adjacent compartment, and a locking-tongue, H, to be engaged by the locking-spring, as set forth.

4. In a lock of the class described, the combination of a casing or shell, A, the plate C, and the slotted plate D, secured in the casing or shell and forming chambers therein, the said chambers being open at one end, and a locking-spring secured in one chamber and projecting through the slotted plate D, adapted to engage the end of a locking-tongue, H, and to be disengaged by a key inserted at the end of the chamber in which it is secured, in the manner set forth.

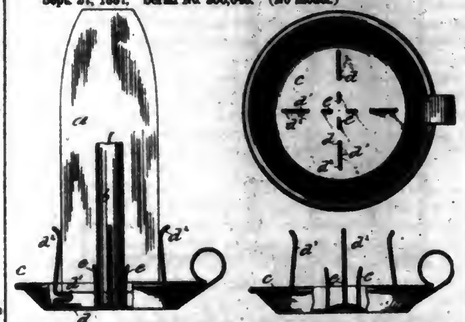


5. In a lock of the class described, composed of the casing having three compartments or chambers open at one end—to wit, one for the reception of a latching-tongue, H, a second in which the locking-spring is secured, but projecting into the tongue-receiving chamber, as described, and a third for containing a direction or address card—a movable bolt or pin extending across the openings to the chambers, adapted to be operated by the locking-tongue when the latter is inserted to close the opening through which the card is passed and to open the same when the locking-tongue is withdrawn, as set forth.

398,393. CULTIVATING-PLOW. GEORGE B. HART, Viola, Iowa. Filed Aug. 23, 1888. Serial No. 283,506. (No model.)

Claim.—The combination cutter and scraper consisting of the standard B B', having the downwardly and rearwardly extending cutter part C, sharpened on the under edge, and one or more shares, D, secured to the rear lower corner of the standard, substantially as shown and described.

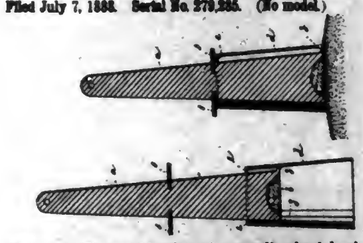
398,394. PAPER-MACHINE. VINCENT G. HAZARD, Wilmington, Del. Filed Mar. 20, 1888. Serial No. 267,806. (No model.)



Claim.—1. In combination with the frame of a paper-machine having holes *a* formed in its upper face to receive the pedestals of the lower roll, removable pedestals B for the lower rolls, provided with projections *b*, formed to fit in the holes *a* of the frame, standards situated on the frame on one side and at each end of the press-rolls, arms D, pivoted at one end to said standards and having journal-bearings at their outer ends, and press-rolls journaled on the pedestals and in the journal-bearings of the arms D, all substantially as and for the purpose specified.

2. In combination with the press-rolls of a paper-machine, standards C, situated at each end and to one side of the rolls, arms pivoted at one end to said standards, journal-bearings for the upper roll secured at the other ends of said pivoted arms, lifting-rods E, secured to said pivoted arms at one end and threaded at their other ends, nuts *g*, with hand-wheels G, screwing into said threaded ends of the lifting-rods, and supporting-shoulders on the upper ends of the standards C to hold the nuts *g* stationary, all substantially as and for the purpose specified.

3. In a device for supporting and adjusting the upper press-roll of a paper-machine, substantially as shown and described, standards C, situated at each end and to one side of the rolls, in combination with crotches *d'*, formed in the top of said standards, double arms D, pivoted on both sides of the standards and having journal-bearings for the upper roll formed in their outer ends, lifting-rods E, pivoted at their lower ends to arms D and having a screw-thread formed on their upper ends, sleeves F, having trunnions *f f*, resting in the crotches *d'* of the standards, and nuts *g*, having hand-wheels G, screwing onto the threaded ends of rods E and resting on the sleeve F, all substantially as and for the purpose specified.

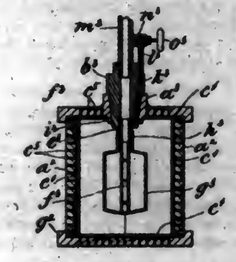


4. In a device for supporting and adjusting the upper press-roll of a paper-machine, substantially as shown and described, the combination of the standards C, arms D, pivoted to the standards at one end, journal-bearings for the upper roll at the outer end of said arms, the removable bearing-plate D', lugs *d*, and brackets D^2, attached to said bearing-plate, and the weight-rods and lever, said rods being secured to the lug *d*, all substantially as and for the purpose specified.

398,395. CANDLESTICK. JACOB W. HINEY, Albany, N. Y. Filed Sept. 27, 1887. Serial No. 250,843. (No model.)

Claim.—The candlestick herein described, consisting of the base *c*, provided with the spring candle-supports *c'*, and the chimney-supports composed of wires formed with a foot, *d*, a chimney-rest loop, *d'*, arranged below the top of the side of the base, and the uprights d^2, and the chimney *a*, all arranged as specified.

398,396. SOUNDING-LEAD. HORACE HOLDEN, East Orange, N. J. Filed July 7, 1888. Serial No. 279,285. (No model.)

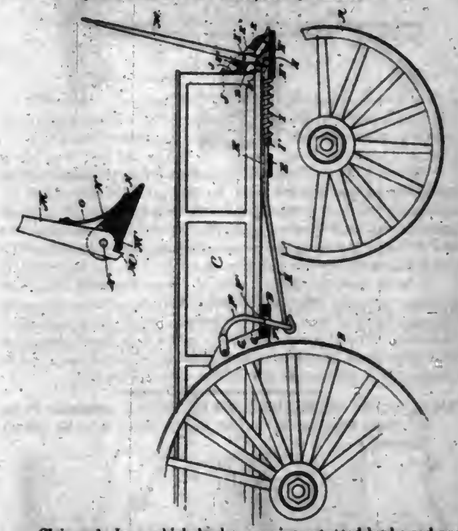


Claim.—1. The combination of a sounding-lead having a cavity in its base for the reception of the arming with a sliding sleeve surrounding the lead and adapted to be projected beyond its base, substantially as specified.

2. The combination of a conical sounding-lead with a sleeve embracing said lead and having flange *c*, and with the stop *f*, substantially as specified.

3. The combination of a sounding-lead, *a*, with a surrounding sleeve, *d*, having flange *c*, and with the stop *f* above sleeve *d*, and with the laterally-projecting flange *g* at the lower end of the lead *a*, substantially as specified.

398,397. APPARATUS FOR MANUFACTURING HOLLOW WARE FROM PULP. FRANK B. HOWARD, Montreal, Quebec, Canada. Filed July 21, 1887. Serial No. 244,862. (No model.)



Claim.—In an apparatus for the manufacture of articles from pulp, the combination, with a perforated mold and filter-lining, of an elastic bag within said mold and a pipe for conveying air to the inside of said bag for expanding the same, said pipe being further provided with a passage forming a connection between the inside of the said pipe and the inside of the mold and provided with a stop-valve, by which the passage may be opened and closed, the whole substantially as described, for the purposes set forth.

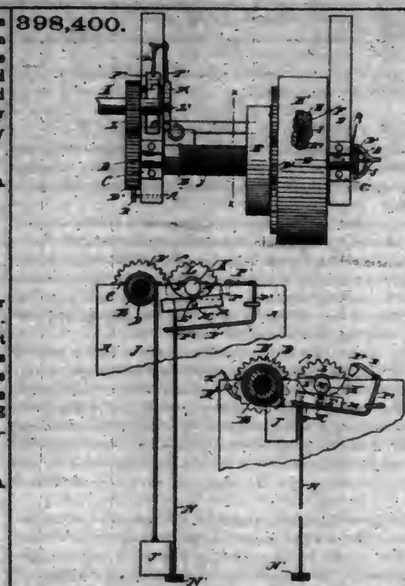
398,398. TIRE-FASTENER. GEORGE W. HUNKABAY, Garfield, Ia. Filed Sept. 13, 1888. Serial No. 285,208. (No model.)

Claim.—As an improved article of manufacture, the tire-fastener described, comprising in a single element a shank, G, and two elongated plates, E F, both of said plates extending at substantially right angles to the axis of the shank, the plate E extending upon both sides of the shank and the plate F extending upon one side equal to the thickness of the tire, and the opposite side flush with the under side of the shank, and the downwardly-extended portion of the plate E formed with suitable holes, substantially as and for the purpose specified.

398,399. VEHICLE-BRAKE. GEORGE W. HUNKABAY, Garfield, Ia. Filed Sept. 12, 1888. Serial No. 285,208. (No model.)

Claim.—1. In a vehicle-brake, a spring-actuated brake-rod provided with notches, and a hand-lever provided with a dog and pawl for engaging said notches, substantially as specified.

2. In a vehicle-brake, a spring-actuated brake-rod provided with notches, and a hand-lever provided with a dog and pawl for engaging said notches, in combination with the lever F, notched brake-shoe G, and a block for engaging the notch in said shoe, substantially as specified.



3. In a vehicle-brake, a spring-actuated brake-rod provided with notches, a bracket provided with a pawl, the pawl being provided with an opening, a lever in said opening, a pin fixed to the bracket and extending through the pawl and lever aforesaid, and a dog jointed to said lever, substantially as specified.

4. In a vehicle-brake, a spring-actuated brake-rod provided with notches, a bracket provided with a spring-actuated pawl, the pawl being provided with an opening, a lever in said opening, a pin fixed in the bracket and extending through the pawl and lever aforesaid, the said lever being provided with a projection, M^3, a recessed dog jointed to the lower end of said lever, and a spring for holding the dog in engagement with the notches aforesaid, substantially as specified.

398,400. MECHANICAL MOVEMENT. GEORGE W. HUNKABAY, Garfield, Ia. Filed Sept. 12, 1888. Serial No. 285,204. (No model.)

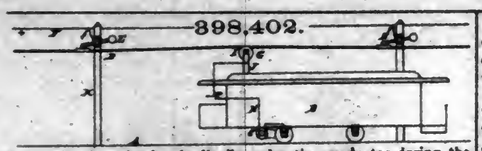
Claim.—1. In a mechanical movement, two shafts, D K, each provided with a gear, D' I, a sliding bearing for shaft K, an arm provided with a locking-plug for holding the two gears in engagement, a rocker-arm connected to the sliding block, a rod, N, provided

398,400.

with a block, N', said rod being connected to the rocker-arm aforesaid, in combination with the drum E and a cord connected to said drum, the outer end of said cord being provided with a weight, substantially as described.

2. In a mechanical movement, the shaft D, provided with gears D', D^2, and D^3, a drum, E, and flange E', loosely mounted on said shaft, a plate, F, fixed to the flange E' by cross pins or studs F', gears G G' G^2, journaled between said plate and flange, said gears G G' G^2 being in engagement with the gear D^2, a wheel, H, provided on its inner face with ratchet-teeth, and also provided with a rim, H, having teeth on its inner side, said teeth being in engagement with the gears G G' G^2 aforesaid, the face of the plate F being provided with a pawl, I, for engaging the ratchet on the wheel H, and an escapement, S, for regulating the speed of the parts, substantially as specified, and for the purpose set forth.

398,401. CANE-MILL. GEORGE W. HUNKABAY, Garfield, Ia. Filed Sept. 12, 1888. Serial No. 285,207. (No model.)



Claim.—1. The combination, with the grooved blocks A B, connected at one end by a block, *a*, and at the other end by an H-shaped block, *b*, of the rollers C D, one having its journal adjustably located in its bearings, the sliding blocks G H, the rabbeted block I, bearing against the outer ends thereof, the cam-levers J K, bearing against the block I and fulcrumed to the block *b*, and the weighted lever L, connected to the levers J K by means of links M N, substantially as and for the purpose specified.

2. The combination, with the sliding block I, the blocks G H, and shaft D', of the notched cam-levers J K and notched lever L, and the links M N, connecting said notched levers, substantially as specified.

398,402. CURRENT-COLLECTING DEVICE FOR ELECTRIC RAILWAYS. RUDOLPH M. HUNTER, Philadelphia, Pa. Filed June 7, 1888. Serial No. 276,262. (No model.)

Claim.—1. In an electric railway, the combination of the rails, a flexible and suspended bared working-conductor arranged above the rails, insulated supports therefor, a traveling electrically-propelled vehicle, an electric motor on said vehicle, and a current-collecting device carried by the vehicle, over which the working-conductor passes, consisting of a single upwardly-extending arm arranged above the car and carrying upon its end a loosely-journaled grooved contact-roller, the said collector-roller and its arm being substantially in the plane of

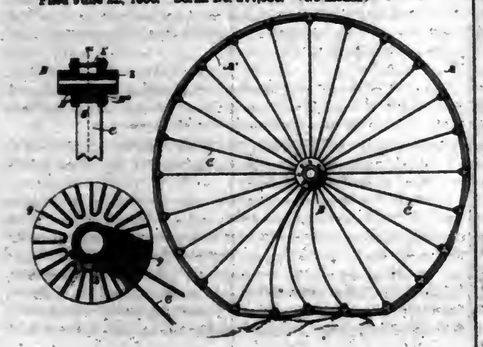
398,402.

its travel and passing longitudinally under the conductor during the travel of the vehicle, the distance from the road-bed to the collector-roller being greater than the normal distance from the road-bed to the conductor.

2. In an electric railway, the combination of a flexible and suspended bared working-conductor, insulated supports therefor, a traveling electric vehicle, an electric motor on said vehicle, and a current-collectiog device consisting of a grooved wheel carried by the vehicle over which the working-conductor passes and by which it is guided, the said collector-wheel raising the conductor and passing longitudinally under it during the travel of the vehicle.

3. In an electric railway, the combination of a flexible and suspended bared working-conductor, insulated supports therefor, a traveling electric vehicle, an electric motor on said vehicle, a current-collecting device carried by the vehicle over which the working-conductor passes, the said collector raising the conductor and passing longitudinally under it during the travel of the vehicle, a supply-conductor to supply electric current to said working-conductor, and branch conductors connecting the supply and working-conductors at intervals.

4. In an electric railway, a suspended and movable working-conductor, in combination with suitable counterbalancing devices to counterbalance the weight of the conductor, whereby it may be easily raised or lowered, a traveling vehicle, an electric motor on said vehicle, and a collecting device carried by said vehicle and making contact with said working-conductor and adapted to raise the working-conductor as it passes longitudinally beneath the same.



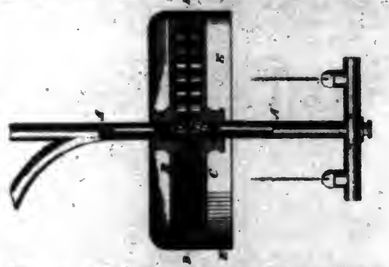
5. In an electric railway, a suspended working-conductor, in combination with suitable counterbalanciog devices to counterbalance the weight of the conductor, whereby it may be easily raised or lowered, a traveling vehicle, an electric motor on said vehicle, and a collecting-wheel carried by said vehicle and running in contact with the under side of the working-conductor.

6. In an electric railway, the combination of the rails, a suspended bared working-conductor formed of a continuous rod, wire, or cable, supported at intervals by auxiliary insulated supports, a traveling vehicle, an electric motor to propel said vehicle, and a current-collecting device between said vehicle and continuous conductor, consisting of a long upwardly-extending arm connected to the vehicle at its bottom, and supporting at its top a grooved collecting-wheel adapted to run in contact with the under side of the conductor.

7. The combination of a railway, a suspended cable or conducting-wire at a distance above the roadway, a traveling electrically-propelled vehicle, a grooved roller-contact pressing upon the under side of the cable or wire guiding said wire in its groove, and a support for said grooved roller carried by the car and extending upwardly, whereby the collector and car are located at a lower level than the conductor and the latter is guided by the collector and retained in position thereon by its weight.

8. The combination of a suspended conductor located above the railway-bed, an electrically-propelled vehicle, a grooved collector-wheel pressing upon the under side of the conductor, and an arm or support extending from the vehicle rearward and supporting a grooved collector-wheel or contact device in contact with the conductor

398,403. VEHICLE-WHEEL. CAMPBELL R. JAMES, Frankfort, Ky. Filed June 22, 1888. Serial No. 277,260. (No model.)

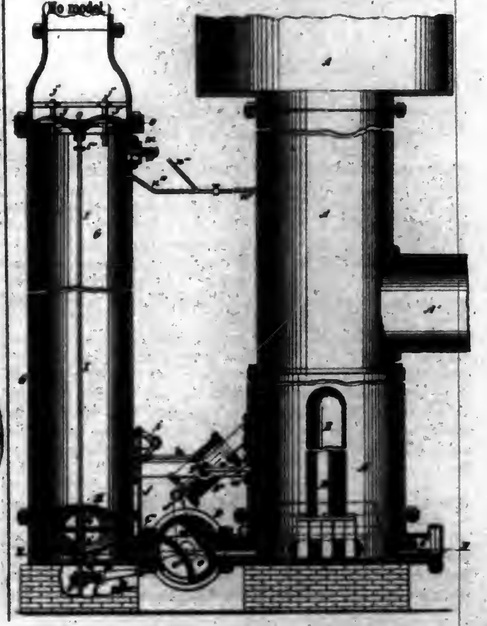


Claim.—1. In a vehicle-wheel, the combination, with the hub, of a sectional rim and elastic spokes, the rim-sections being pivotally connected at their ends and the spokes secured in the hub and to the rim, for the purpose set forth.

2. In a vehicle-wheel, the combination, with the hub, of a sectional rim and elastic spokes of a length greater than the radius from the hub to the rim, the rim-sections being pivotally connected at their ends and the spokes rigidly secured in the hub and pivotally connected to the rim, for the purposes set forth.

3. In a vehicle-wheel, the combination, with the hub, of a rim constructed of rigid sections pivotally connected at their ends, and curved spring-metal spokes rigidly secured in the hub and pivotally connected to the rim, for the purposes set forth.

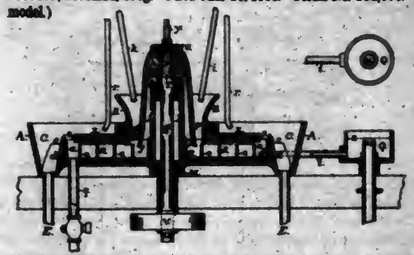
4. In a vehicle-wheel, the combination, with the hub, grooved as described, of a rim constructed of rigid metal sections pivotally connected at their ends, and curved flat spring-metal return-spokes rigidly secured in the grooves in the hub and pivotally connected to the rim at the junction of the sections, substantially as described, and for the purposes set forth.



398,404. REGENERATIVE GAS-BURNER. FRANK G. JOHNSON, New York, N. Y. Filed Feb. 15, 1888. Serial No. 264,118. (No model.)

Claim.—1. In an illuminating-gas heater, the combination of the corresponding right and left parts, B and C, provided with a continuous tortuous rib from center to circumference, forming a corresponding continuous tortuous gas-passage from center to circumference, and the diaphragm D, having the communicating opening *d*, substantially in the manner and for the purposes set forth.

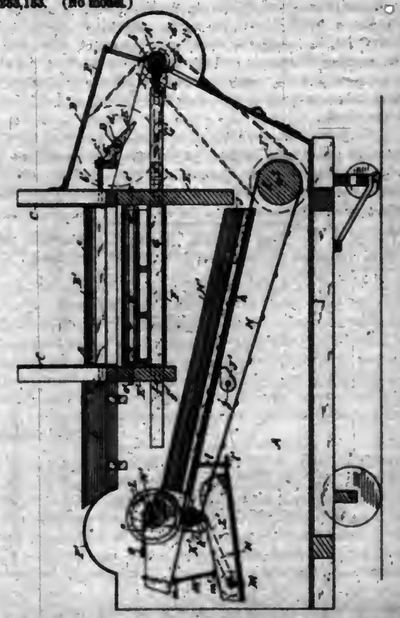
2. In an illuminating-gas heater, the combination of the corresponding right and left parts, B and C, provided with a continuous tortuous rib from center to circumference, forming a corresponding continuous tortuous gas-passage from center to circumference, and the diaphragm D, having the communicating opening *d* and cap E E, substantially in the manner and for the purpose described.



398,405. HYDRAULIC AIR-PUMP. FRANK R. JOHNSON and FRANK G. JOHNSON, New York, N. Y. Filed Mar. 12, 1888. Serial No. 266,990. (No model.)

Claim.—1. An air-condensing apparatus consisting of the water-pressure cylinder A, condensing-cylinder G, and rotary water-gate D, in combination with the water-engine F, connected by pipe with cylinder A, float H, and connections, as described, with engine F, whereby the said water-gate is actuated by the pressure of water within the cylinder A independently of the simultaneous flow of water through the gate D, and the said engine and gate are automatically operated by the rise and fall of the water, in the manner and for the purpose set forth.

2. An air-condensing apparatus consisting of the water-pressure cylinder A, condensing-cylinder G, and rotary water-gate D, in combination with the water-engine F, connected by pipe with cylinder A, float H, and connections, as described, with engine F and rod I, having the collars i' and i'', whereby the rise and fall of the water in the condenser automatically operates the valves of the engine F and water-gate D, substantially in the manner and for the purposes described.



398,406. AMALGAMATOR. WILLIAM JOHNSON and GARRY W. JOHNSON, Portland, Oreg. Filed Jan. 23, 1888. Serial No. 261,671. (No model.)

Claim.—1. The combination, with the stationary rings R and the revolving turret-disk, of the outwardly-flaring ferrule *j* on the lower end of the shaft-holder *h* of said disk and extended below the bottom of the level face *l* of said disk into the space between two of said rings, substantially as shown and described.

2. The combination, with the bowl A and rotary turret-disk, of the rings R, secured within the inner chamber, *a*, of said bowl, and provided near their lower edge with apertures *e*, and the cross-bars S, dividing the space between said rings into separate compartments and arranged with the two adjacent bars out of line, substantially as shown and described.

398,407. BAND-CUTTER AND FEEDER. CHARLES C. KING and ALONZO D. TRIMBLE, Fort Worth, Tex. Filed Aug. 20, 1888. Serial No. 283,163. (No model.)

Claim.—1. In a band-cutter and feeder, the combination, with a reciprocating cutter-bar provided with blades, of a shaft journaled in the machine-framing and having a tappet-arm secured upon it, a receiving-table secured upon the shaft above the said bar, and tappet mechanism for actuating the said arm and tilting the table at intervals, substantially as and for the purpose set forth.

2. In a band-cutter and feeder, the combination, with a reciprocating cutter-bar provided with blades, of two receiving-tables supported above the said bar, and tappet mechanism for tilting the tables alternately at intervals, substantially as set forth.

3. In a band-cutter and feeder, the combination, with a reciprocating cutter-bar provided with blades, of the continuously-revolving rollers on each side of the blades, the guide-rollers journaled above the revolving rollers and placed wider apart than the said rollers, the receiving-tables above the guide-rollers, and tappet mechanism for tilting the tables alternately at intervals, substantially as set forth.

4. In a band-cutter and feeder, the combination, with the receiving-tables, of the vertical guide-boards at the sides of the tables, the shafts secured to the inner edges of the tables and having short arms secured on their ends, and the continuously-revolving shaft provided with tappets projecting upon opposite sides of it for depressing the said short arms and tilting the tables alternately, substantially as set forth.

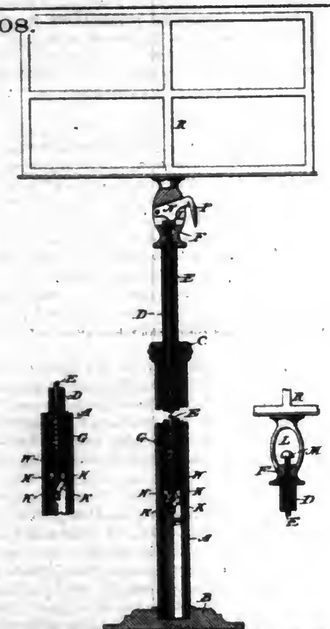
5. In a band-cutter and feeder, the combination, with the transverse partitions, of the longitudinal reciprocating cutter-bar supported by said partitions and provided with vertical double-edged blades, and the cutter-blocks secured to the inner faces of said partitions and provided with slots open at their lower ends, into which the blades may enter at the extremities of the travel of the cutter-bar, substantially as set forth.

6. In a band-cutter and feeder, the combination, with the cutter-bar provided with vertical blades, of the feed and guide rollers mounted on shafts on each side of the blades, said guide-rollers being above the feed-rollers and wider apart, the beveled pinions secured to the feed-roller shafts, the revolving main shaft provided with a crank, the beveled pinions secured on the main shaft for revolving the feed-rollers, and the connecting-rod connecting the crank with the cutter-bar for reciprocating it and the blades, substantially as set forth.

7. In a band-cutter and feeder, the combination, with the tilting receiving-tables, of the guide and feed rollers below the table, said guide-rollers being above the feed-rollers and wider apart, the reciprocating cutter-bar provided with blades between the said rollers, a traveling conveyer-belt below the cutter-bar, and a barrel provided with disks and journaled at the head of the conveyer for evening the straw before delivering it, substantially as set forth.

8. In a band-cutter and feeder, the combination, with an inclosing-case, of a conveyer pivoted to the case at one end, a barrel provided with disks and journaled at the delivery end of the conveyer for evening the straw, the revoluble shaft provided with cams for raising the conveyer, a ratchet-wheel also secured upon said shaft, and a pawl pivoted to the casing and engaging with the ratchet-wheel for holding the conveyer and evening-barrel at any desired elevation, substantially as set forth.

9. In a band-cutter and feeder, the combination, with the conveyer pivoted at its receiving end and provided with an endless traveling belt, of a barrel provided with disks and journaled above the delivery end of the conveyer, and a shaking delivery-shoe supported from the side frames of the said conveyer below the evening-barrel, substantially as set forth.



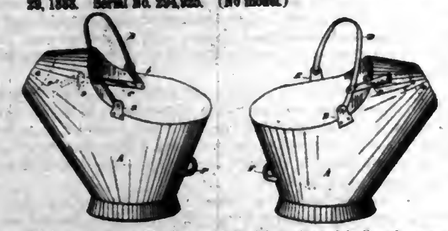
10. In a band-cutter and feeder, the combination, with the inclosing-case, of the conveyer driving-roller journaled in the said case, the conveyer sides provided with a solid bottom below the belt and guide-ledges above the belt, the roller journaled between said sides at the delivery end of the conveyer, the pivots at the receiving end of the conveyer, the conveyer-belt passing around said rollers, and the evening-barrel provided with disks and also journaled between the sides of the conveyer above the delivery-roller, substantially as and for the purpose set forth.

11. In a band-cutter and feeder, the combination, with the conveyer pivoted at its receiving end, of the barrel provided with disks and journaled above the delivery end of said conveyer, the shaking-shoe provided with a central rearwardly-projecting pin, the bent arms, and the straight links suspending the shoe from the conveyer sides, a crank operated by the motion of the conveyer, and a connecting-rod, and an arm connecting said crank with the shoe, substantially as and for the purpose set forth.

398,408. ADJUSTABLE STANDARD FOR MUSIC-RACKS. ALFRED KOEHN, New York, N. Y. Filed Sept. 21, 1888. Serial No. 286,008. (No model.)

Claim.—The combination, in an adjustable standard, as described, with a tubular upright secured to a supporting-base, an adjustable tube moving longitudinally within said standard, and a movable catch-rod extending through said tube, of the two catch-bars hinged to the lower end of the adjustable tube to swing outwardly into contact with the inner side of the inclosing-standard, and the links coupling the

398,408.



free end of each catch-bar with the lower end of the rod, substantially in the manner and for the purpose herein set forth.

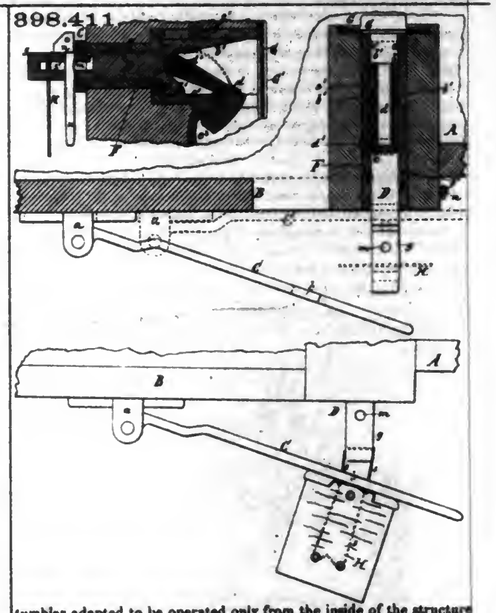
398,409. ELECTRODE FOR SECONDARY BATTERIES. EDWARD M. LAMB, Falmouth, Me. Filed Oct. 29, 1888. Serial No. 289,479. (No model.)

Claim.—The electrode for accumulators or electric storage-batteries, consisting of fine threads of lead compressed into the desired form, substantially as described.

398,410. COAL-HOD. GODFRIED LAUBE, Huron, Dak. Filed Dec. 29, 1888. Serial No. 294,925. (No model.)

Claim.—1. A coal-hod provided with a pivoted bail and a movable poker within its spout having a connection with the bail, substantially as described.

2. The combination, with a coal-hod and its pivoted bail, of a movable poker having one end pivotally connected to the hod-bail and the other end supported free to move within the hod-spout, and a guide on the hod-spout for retaining the free end of the poker in its proper position, substantially as described.



398,411. SEAL-LOCK. EDWIN H. LEA and WALTER B. MARSH, Richmond, Va. Filed Sept. 24, 1888. Serial No. 286,187. (No model.)

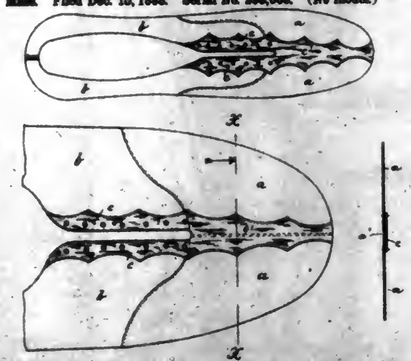
Claim.—1. In a seal-lock, in combination, the protection-casing having an access-opening at its rear end and formed with a fixed retaining-stop and adapted to be applied to the framing of a structure, the staple-bolt having an open loop, and a locking-tumbler adapted to be operated only from the inside of said structure, substantially as and for the purpose described.

2. In a seal-lock, in combination, the protection-casing having an access-opening at its rear end formed with internal and external shoulders and a fixed retaining-stop, the supporting-frame, the staple-bolt having an open loop, and a locking-tumbler adapted to be operated only from the inside of the structure to which it is applied, substantially as described.

3. In a seal-lock, in combination, the protection-casing provided with a retaining-stop, a vertical open guide-plate, and a vertical slide, the sliding staple-bolt having an open loop and provided with a locking-

398,411.

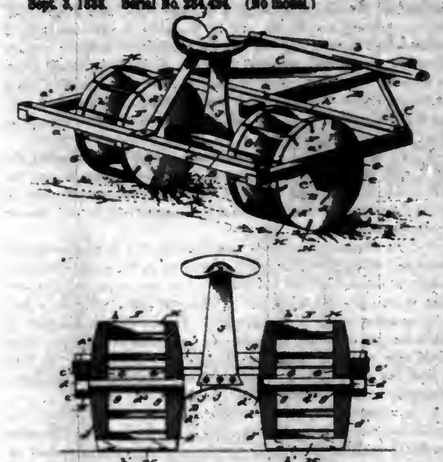
tumbler adapted to be operated only from the inside of the structure to which it is applied, substantially as and for the purpose described.



4. In a seal-lock, in combination, the protection-casing having a fixed retaining-stop, the sliding staple-bolt having an open and perforated loop for a sealing-tag and a retaining-pin, and a locking-tumbler adapted to be operated only from the inside of the structure to which it is applied, the frame, sliding door, the hasp, and the retaining-pin of such structure, substantially as described.

5. In a seal-lock, in combination, a sealing-tag having an opening through it, a sliding staple-bolt having an open loop and provided with a locking-tumbler adapted to be operated only from the inside of the structure to which it is applied, the protection-casing having a fixed retaining-stop, the frame, the sliding door, and the hasp of such structure, substantially as and for the purpose described.

6. For a seal-lock, the sealing-tag formed of paper or other equivalent fragile material on both its front and rear sides, and having an opening through it, and provided at one or more of its edges with a narrow metallic clasping re-enforce, which in the main leaves both the paper surfaces uncovered, substantially as and for the purpose described.



7. For a seal-lock, the sealing-tag formed of paper or other fragile material, and having an opening through it, and provided with a metallic clasping re-enforce at one or more of its edges, and with a wire-loop re-enforce inclosed and secured within the sealing-tag substantially as described.

398,412. BOOT OR SHOE. WOODBURY P. LEFAVOUR, Beverly, Mass. Filed Dec. 15, 1888. Serial No. 293,666. (No model.)

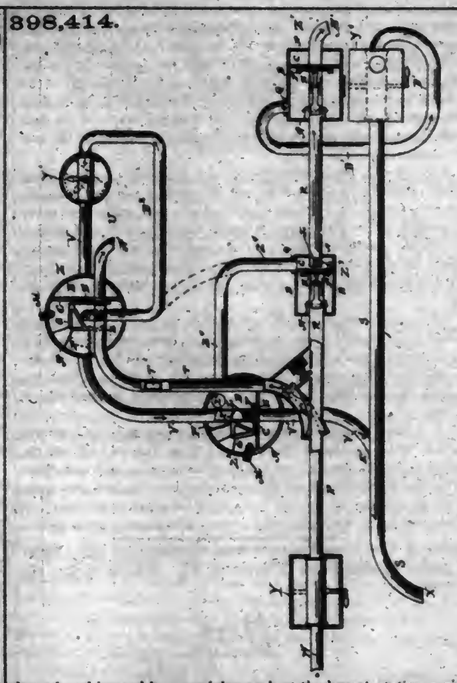
Claim.—The improved laced boot or shoe, as described, having the quarters *b b*, and the divided vamp *a a*, combined with the side stays, *c c*, having in one piece therewith the tip or stay *d*, extending centrally to the toe part of the boot or shoe, as set forth.

398,413. COTTON-STALK CRUSHER. JAMES LAUDS, Prosperity, S. C., assignor of one-half to Hardeen C. Mooney, same place. Filed Sept. 3, 1888. Serial No. 284,434. (No model.)

Claim.—1. The combination, with the frame comprising the transverse rear beam, and with the axle fixed or locked against rotary movement and provided with a dovetailed recess in the front face of its central portion, of the upright front standard formed by a plate having a dovetailed lower end corresponding to said recess, the rear standard secured upon the rear beam and projecting upwardly and forwardly, and the seat mounted upon and connecting said standards, substantially as and for the purpose set forth.

2. The combination, with the frame comprising the side beams, and the axle having an enlarged central portion forming shoulders and having its ends rigidly connected to the side beams, the portion of the axle between said shoulders and fixed ends being cylindrical, of the wheels mounted upon said cylindrical bearing portion and comprising transverse blades or knives connecting the end bearing-disks, the outer face of the latter being convexed, substantially as and for the purpose set forth.

3. A cotton-stalk crusher comprising the frame having the front and rear beams and side beams, the tongue or pole secured to the front beam, and rearwardly-divergent braces secured to the pole and side beams, the transverse stationary axle comprising a central portion forming shoulders d^3, the cylindrical portion d^2, and having its ends fixed in brackets upon the side beams, the wheels comprising disks mounted upon said cylindrical portions and connected by radially-disposed blades or knives having their cutting-edge about on the plane of the periphery of the wheel, and standards projecting from the central portion of the axle and rear beam of the frame and supporting the seat, substantially as and for the purpose set forth.



4. The herein-described cotton-stalk crusher, comprising a rectangular frame, a tongue projecting centrally from the center of the front beam thereof and braced by rods connecting it with the frame, an axle rigidly mounted upon the latter and provided with a central enlarged portion forming shoulders and with cylindrical end portions, wheels loosely mounted upon the cylindrical portions, consisting of two disks having convex outer faces connected by radially-disposed knives, the transverse cutting-edge of the latter being about on a plane with the periphery of the disks, and a seat mounted upon standards, the front one of which being provided with a dovetailed lower end adapted to be received by a corresponding recess in the central enlarged portion of the axle, while the latter one is connected with the rear beam of the frame, said standards being adapted to brace the axle, all arranged and adapted to operate substantially as and for the purpose set forth.

398,414. PNEUMATIC DISPATCH-TUBE. CHARLES A. LIEB, New York, N. Y. Filed Nov. 23, 1888. Serial No. 291,943. (No model.)

Claim.—1. In a pneumatic-tube system, the combination of an outgoing tube, an automatically-acting valve constructed and arranged to allow the passage of the carrier through and beyond it, a return-tube, a receiving-cock placed in the return-tube, and a connecting-pipe between the automatic valve and the receiving-cock, substantially as set forth.

2. In a pneumatic-tube system, the combination of an outgoing main-line tube and a return-tube, an outgoing branch tube, a switch adapted to shunt the carrier from the main-line outgoing tube into the branch tube, an automatically-acting valve in the outgoing branch tube, constructed and arranged to allow the passage of the carrier

398,414.

through and beyond it, a receiving-cock at the branch station, a pipe connecting the automatic valve at the branch station with the receiving-cock, and a return-tube which joins the main-line return-tube, provided with an automatic valve, substantially as shown, and an automatic valve in the main-line outgoing tube and a delivery-valve at the end thereof, and connecting-tubes between the valve in the branch return-tube and the valve in the main-line outgoing tube and between the valve at the end of the main-line outgoing tube and the receiving-cock in the main-line return-tube, substantially as set forth.

3. The combination, in a pneumatic-tube system, of outgoing and returning main-line tubes and outgoing and returning branch tubes with a switch and automatic valves, substantially as set forth, in the branch return and in the main-line tubes, and a connecting-tube between the valve in the branch return-tube and the main-line tube, whereby the circulation of the air is maintained, and receiving-cocks at the several stations, substantially as set forth.

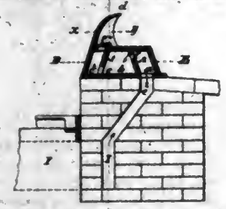
4. The combination, in a pneumatic-tube system, of outgoing and returning main-line tubes and a branch tube provided with a switch, valves, substantially such as described, in the outgoing main-line tubes near the branch tube and in the outgoing branch tube, and a tube connecting the valve in the branch tube with the main-line outgoing tube beyond the valve therein, substantially as set forth.

5. In a pneumatic-tube system having outgoing and returning main-line tubes and outgoing and returning branch tubes, a valve, substantially as described, interposed in the return branch tube, whereby the current is deflected through a connecting-tube to the main-line tube beyond the junction of the outgoing branch tube with it, and another valve placed in the outgoing main-line tube adjacent to the junction of the branch tube with it, whereby the air is caused to circulate to the branch station before continuing down the main-line tube, substantially as set forth.

6. The combination, in a pneumatic-tube system, of outgoing and returning main-line tubes, outgoing and returning branch tubes, a switch placed at the junction of the outgoing branch and main tubes, constructed and arranged to be automatically shifted by the passage of the carrier over it, and automatic valves, substantially such as shown, in the main and branch tubes, whereby the circulation of the air is maintained, substantially as set forth.

7. A valve for pneumatic-tube systems, comprising a case having an opening in one side and divided crosswise by an apertured diaphragm, a gate adapted to cover the aperture in the diaphragm, inwardly-extending tube ends coincident with the aperture in the diaphragm and provided with necessary openings for the passage of the air, and a lever attached to the gate, one end whereof lies in the path of the carrier, whereby the carrier will automatically open the gate, substantially as set forth.

8. A valve for pneumatic-tube systems, comprising a case having

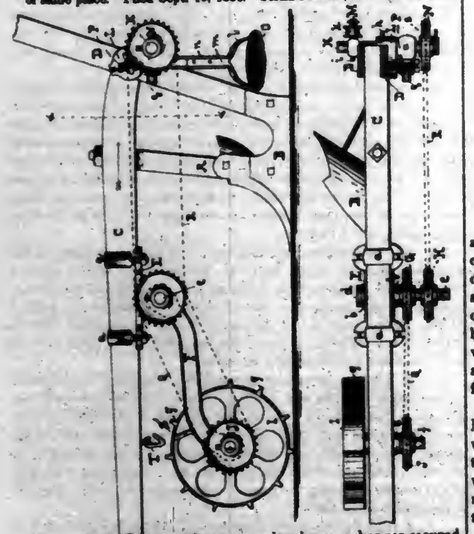


an opening in one side and divided crosswise by an apertured diaphragm, a gate adapted to cover the aperture in the diaphragm, inwardly-extending tube ends coincident with the aperture in the diaphragm and provided with necessary openings for the passage of the air, and a lever attached to the gate, one end whereof lies in the path of the carrier, and a retractile spring for the gate, whereby the gate will be automatically opened and closed upon the passage of the carrier, substantially as set forth.

9. A valve for pneumatic-tube systems, comprising a case having one side removable and provided with an opening, the case being divided crosswise by an apertured diaphragm, a gate adapted to cover the aperture in the diaphragm, inwardly-extending tube ends coincident with the aperture in the diaphragm and provided with necessary openings for the passage of the air, and a lever attached to the gate, one end whereof lies in the path of the carrier, substantially as set forth.

10. A gate constructed and arranged to be used in the closing of openings in pneumatic tubes, consisting of a piece of sheet metal having a depression made therein within the area of the hole which the gate closes, and lugs riveted to the reverse side of the gate from the gate-seat, the rivet-head lying within the depression, substantially as set forth.

11. A valve for pneumatic-tube systems, comprising a case divided crosswise by an apertured diaphragm, a gate adapted to cover the aperture in the diaphragm, inwardly-extending tube ends coincident with the aperture in the diaphragm and provided with necessary openings for the passage of the air, and a lever attached to the gate, one end whereof lies in the path of the carrier, substantially as set forth.

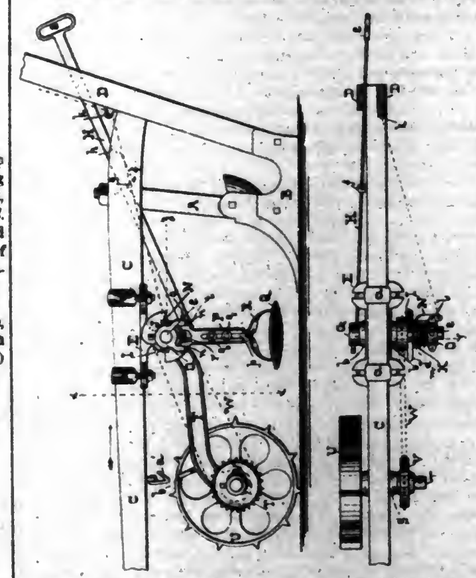


398,415. SMOKE-CONSUMING BRIDGE-WALL CAP. HENRY LIEBER, Des Moines, Iowa. Filed Oct. 29, 1888. Serial No. 289,453. (No model.)

Claim.—1. In a smoke-consuming furnace, the bridge-wall cap having circulating-chambers *a b c*, with partitions 1 and 2, connecting with each other by openings *f f* and *g g* through partitions 1 and 2, in combination with openings *h h h* and hollow tubes or teeth *d d d d*.

2. In a smoke-consuming furnace, the bridge-wall cap provided with hollow tubes or teeth for diffusing the heated air, the form of teeth as shown, with open back and curved cavity to deflect the outflowing current to a horizontal direction, all substantially as shown.

398,416. COTTON-CHOPPER. WILLIAM R. LINDSAY, Baltimore, Md., assignor to John M. McClintock and William H. Richardson, both of same place. Filed Sept. 10, 1888. Serial No. 284,990. (No model.)



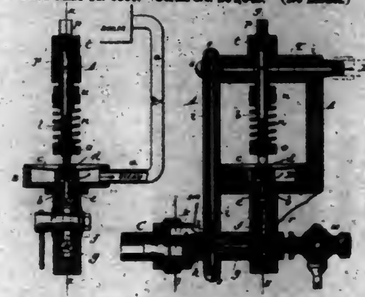
Claim.—1. In a cotton-chopper, a plow-beam, a hanger secured to the said beam, an arm connected to the said hanger by means of a shaft carrying sprocket-wheels, a shaft which passes through the lower end of the arm supporting a driving-wheel, and a sprocket-wheel, a vibratory hoe in the rear of the plow, a shaft carrying a sprocket-wheel having lugs on its face adapted to come in contact with a roller on the said vibratory hoe to move the same in one direction, a spring to move the said hoe in the other direction, and chain belts to connect the said sprocket-wheels together and effect the movement of the sprocket-wheel last named, all combined substantially as and for the purpose specified.

2. In a cotton-chopper, the combination of the beam having the hook T, with the hanger E, the pivoted arm F, having eye S', and the wheel I, whereby the said arm may be held in an elevated position and the driving-wheel made inoperative, substantially as and for the purpose specified.

3. In a cotton-chopper, the combination of a bracket attached to some part of the plow-frame, a shaft secured within the said bracket, to which is fastened a stud, a vibratory arm seated on the said stud having at its lower end a hoe and at its upper end a roller or projection, a sprocket-wheel with lugs on its face which are adapted to come in contact with the said roller or projection and thereby force the said arm in one direction, and a spring which connects the said arm with the bracket to move the said arm in a contrary direction, substantially as and for the purpose specified.

4. In a cotton-chopper, a vibratory hoe which is moved in one direction by means of a wheel carrying projections and in the other through the medium of a spring, combined with a chain attached to the said arm, whereby the same may be drawn from the said wheel and held thereat and inoperative, substantially as and for the purpose specified.

398,417. COTTON-CHOPPER. WILLIAM R. LINDSAY, Baltimore, Md., assignor to John M. McClintock and William H. Richardson, both of same place. Filed Sept. 10, 1888. Serial No. 284,991. (No model.)



Claim.—1. In a cotton-chopper, a plow supported from a beam, a hanger fastened to the said beam, a shaft sustained by the hanger carrying a loose sprocket-wheel, a loose cam, a loose sliding clutch on the hub of the cam, and a tight collar, to which collar is attached a vibratory arm having at its end a hoe, and adapted to be moved in one direction by the action of the said cam and in the other direction by means of a spring, combined with a driving-wheel, a sprocket-wheel having a movement in common with the said driving-wheel, and a chain belt to connect the two sprocket-wheels, substantially as and for the purpose specified.

2. In a cotton-chopper, the shaft *c*, carrying the sprocket-wheel I, cam J, clutch K, situated on the hub of the said cam, and collar O, which supports the hoe-arm P, the said clutch having pins which pass through the cam and enter holes in the side of the sprocket-wheel, whereby in the movement of the said sprocket-wheel motion is communicated to the said cam, which in turn operates the arm, substantially as and for the purpose specified.

3. In combination with the shaft which carries a collar to which the hoe-arm is hung, a crank on the said shaft and a bar connected to the pin of the said crank, whereby the said hoe-arm may be elevated so as to be inoperative, substantially as and for the purpose specified.

4. In combination with the shaft *c*, sprocket-wheel I, cam J, clutch K, and a collar, O, which carries the hoe-arm, a spring situated between the said collar and the end of the said clutch, substantially as and for the purpose specified.

398,418. MEANS FOR AUTOMATICALLY REGULATING THE FLOW OF LIQUID FUEL TO INJECTOR-BURNERS FOR STEAM-BOILERS. ALLEN D. LEIN, Racine, Wis., assignor to THOMAS KANE, Chicago, Ill., and the Racine Hardware Manufacturing Company, Racine, Wis. Filed June 11, 1886. Serial No. 204,845. (No model.)

Claim.—1. The combination of the steam-boiler, the oil-supply pipe, its nozzle for delivering oil to the fire-box, the second nozzle arranged concentric with the first and connected by a pipe with the steam-space of the boiler, so that the steam is caused to effect the delivery of the oil to the fire-box, the valve in the steam-passage, the valve in the oil-passage, and the diaphragm connected with both valves and communicating with the steam-space of the boiler, whereby variations in the steam-pressure are caused to positively vary the flow of oil by the oil-controlling valve, and further vary the flow by regulating the steam-jet.

2. In an oil-burning boiler, and in combination with the steam oil-atomizing jet, two valves, one in the steam-passage and the other in the oil-passage, and the steam-actuated diaphragm connected with and operating both valves, whereby the oil-passage and the steam-passage are both diminished by increase in the steam-pressure, so that the delivery of oil is positively limited to correspond with the diminution of the steam-jet.

3. In combination with the frame or body having the distinct steam and oil passages therethrough, the intermediate steam-chamber B, with a flexible wall or diaphragm, the internal valve, *e*, attached to the diaphragm and controlling the flow of steam through the steam-passage, and the spindle *l*, seated at one end against the diaphragm and acting at its opposite end as a valve to control the flow through the oil-passage.

4. In an apparatus for automatically feeding liquid fuel to a boiler, and in combination with the boiler, an oil-supply pipe, and a delivery-nozzle attached thereto, a concentric nozzle, and a steam-conductor leading thence to the steam-space of the boiler, so that the steam-jet is applied to feed the oil, a steam-actuated diaphragm, two valves connected to and operated by the diaphragm and located one in the oil and the other in the steam-passage, and two independent valves, *q v*, for arbitrarily controlling the oil and steam delivery.

5. In combination with the oil pipe or passage *i*, the valve-spindle *l*, and the diaphragm connected therewith, the independently-adjustable spindle *p*, arranged in opposition to the first-named spindle, as described and shown.

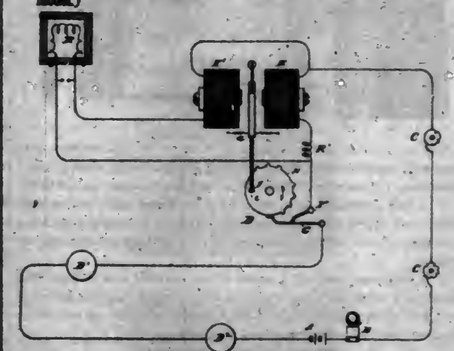
6. In an oil-burning boiler, the combination of a steam oil-atomizing jet, a valve controlling the oil-delivery therethrough, a second valve controlling the steam-delivery therethrough, and valve-operating devices, substantially as shown, connecting with the boiler and subject to the steam-pressure therefrom, whereby an increase in pressure is caused to diminish the oil-supply and also to diminish the flow of the steam acting to propel the oil.

7. In combination with a frame or body having the passage *i* therethrough, the tubular body *t*, inserted through the body and provided with the two valve-spindles entering from opposite sides.

398,419. SHIFTING SEAT FOR VEHICLES. JOHN L. MASON, Davenport, Iowa. Filed Oct. 1, 1888. Serial No. 286,886. (No model.)

Claim.—1. In a vehicle-body provided with two or more seats for constant use, the combination of the permanent seat-frame with the hinged seat-carriers and seat hinged thereto, for the purpose of temporarily increasing the distance between adjacent seats by shifting such seat from one position of support upon said frame to another position of support thereon, substantially as described.

2. In a vehicle-body, a seat hinged upon its under side to two parallel cross-bars, the ends of said cross-bars bent downward, each terminating in elbows crosswise to said vehicle-body and hinged thereto, in connection with a permanent seat-frame attached to said body and arranged to support said seat when such horizontal bars are swung forward or backward, so the point of hinging with said seat is not in the same vertical line with the point of hinging said elbows to the body of said vehicle, substantially as described.



3. In a vehicle-body, the combination, with a permanent seat-frame attached thereto, of a seat hinged to seat-carriers, such carriers hinged in sill-sockets having threaded apertures to receive the threaded ends of the carriers for the purpose of swinging the seat from one position of support upon the frame to another position of support thereon, substantially as described.

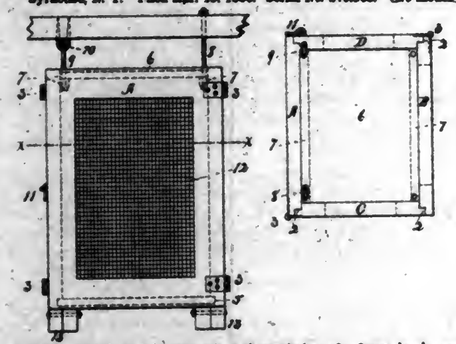
4. The herein-described seat-carrier, consisting of two horizontal and parallel cross-bars, their ends bent downward, each end terminating in elbows of similar direction of extension as said horizontal cross-bars, hinged to the body of a vehicle, with a seat hinged upon the two horizontal and parallel cross-bars, substantially as described.

5. The herein-described seat-carrier, consisting of two horizontal and parallel cross-bars, their ends bent downward, each end terminating in screw-threaded elbows of similar direction of extension as said horizontal cross-bars, each hinged in the threaded aperture of a sill-socket, with a seat hinged upon the two horizontal and parallel cross-bars, substantially as described.

6. In a vehicle shifting seat, two L-shaped rods, their tops connected by a horizontal cross-rod, their bottoms hinged to opposite sides of the vehicle-body to permit the cross-rod to swing over forward and backward, arranged in pairs at suitable distances apart, and a seat hinged at a similar distance to each of said horizontal cross-rods, substantially as described.

398,420. ELECTRIC BURGLAR-ALARM. LAURENCE A. MCCARTHY, Brooklyn, N. Y. Filed Apr. 18, 1888. Serial No. 271,040. (No model.)

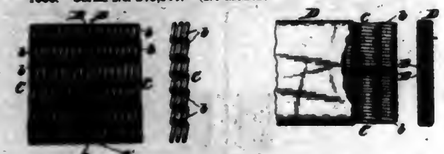
Claim.—1. In an electric signaling apparatus, the main circuit divided into two parts or paths, the current normally flowing through both of them and always flowing through one of them, a magnetic coil and an artificial resistance in each part or path, the total resistance in each part or path being equal, an automatic definite signaling apparatus, an armature normally balanced in a vertical position between the coils, and a clock-work for operating said signaling apparatus, a revolving portion of said clock-work having upon its face a projection opposite to and abutting against the end of the armature in its balanced position, and adapted to unlock said signaling apparatus by an excess of attraction of either of said coils and to lock said apparatus when the energization of the deflecting-magnet becomes normal.



2. In an electric signaling apparatus, the main circuit divided into two parts or paths, the current normally flowing through both of them and always flowing through one of them, a magnetic coil and an artificial resistance in each part or path, the total resistance in each part or path being equal, an automatic definite signaling apparatus, an armature normally balanced in a vertical position between

the coils, and a clock-work for operating said signaling apparatus, a revolving portion of said clock-work having upon its face a projection opposite to and abutting against the end of the armature in its balanced position, and adapted to unlock said signaling apparatus by an excess of attraction of either of said coils and to lock said apparatus when the energization of the deflecting-magnet becomes normal, all in combination with one or more of the same elements in the same circuit and one or more manual circuit-breakers, as set forth.

398,421. PAVING COMPOSITION. ELIJAH S. MCCAUGHEY, Sioux City, Iowa. Filed Oct. 19, 1888. Serial No. 288,612. (No specimens.)



Claim.—The herein-described composition for brick, consisting of clay, sand, carbonate of lime, and silica, substantially as hereinbefore set forth.

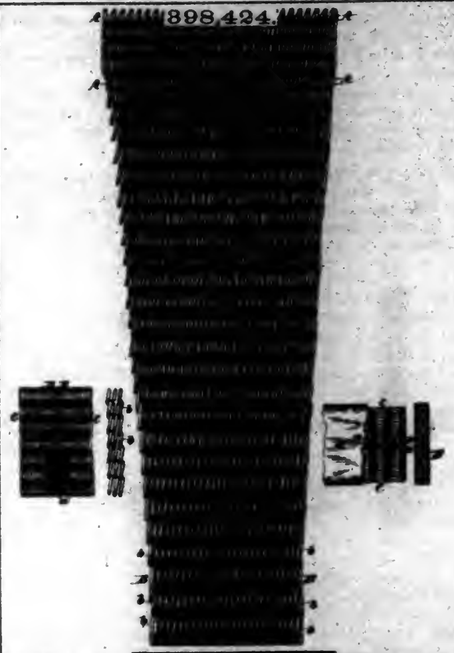
398,422. KNOCKDOWN CUPBOARD. SEYMOUR V. MERRIMAN, Syracuse, N. Y. Filed Apr. 13, 1888. Serial No. 270,565. (No model.)

Claim.—A knockdown cupboard consisting of a front, back, and sides, all rabbeted upon their vertical edges and hinged together by hinges alternately inside of and external to the cupboard and one of the sides forming the door, and a top and bottom fitting with a rabbet-joint into the vertical walls, and means for suspending the whole cupboard, substantially as described.

398,423. WIRE BELTING. THOMAS MIDGLEY, Beaver Falls, Pa., assignor of one-half to James R. Emerson, same place. Filed May 31, 1888. Serial No. 275,579. (No model.)

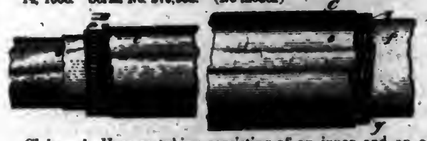
Claim.—1. A belt composed of a series of intertwined wire helices with doubled-over edges, forming a substantially central longitudinal seam on one side of the belt, as and for the purpose set forth.

2. A belt composed of a series of intertwined wire helices with doubled-over edges, forming a substantially central longitudinal seam on one side of the belt, and secured in the manner substantially as described.



3. A belt composed of a series of intertwined wire helices with doubled over edges, forming a substantially central longitudinal seam on one side of the belt, and provided with a covering of rubber or equivalent material, substantially as described.

398,424. MANUFACTURE OF WIRE BELTING. THOMAS MIDGLEY, Beaver Falls, Pa., assignor of one-half to James R. Emerson, same place. Filed June 22, 1888. Serial No. 277,866. (No model.)

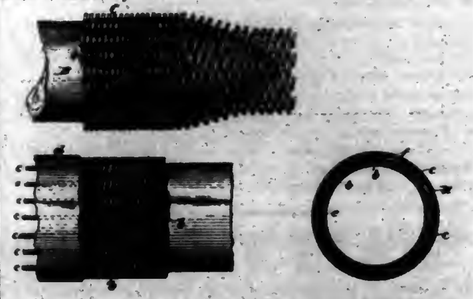


Claim.—1. The method herein described for making wire-belting, which consists in forming a metallic sheet or body by intertwining transverse sections of coiled wire, heating the sheet, stretching and flattening the helices into elongated links while heated, then folding the sheet transversely and bringing the ends of the sections together on one side of the belt, then tempering the belt, then securing the ends of the sections, and finally rolling the belt, substantially as described.

2. The method herein described for making wire belting, which consists in forming a metallic sheet or body by intertwining transverse sections of coiled wire, heating the sheet, stretching and flattening the helices into elongated links while heated, then folding the sheet transversely and bringing the ends of the sections together on one side of the belt, then tempering the belt, then securing the ends of the sections, and finally coating the belt with rubber or its equivalent and rolling the rubber into the interstices, substantially as described.

398,424.

398,425. HOSE OR TUBING. THOMAS MIDGLEY, Beaver Falls, Pa., assignor of one-half to James R. Emerson, same place. Filed July 14, 1888. Serial No. 279,932. (No model.)



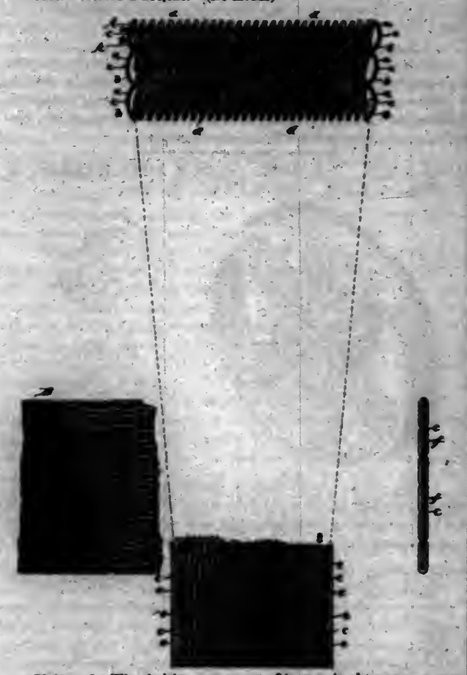
Claim.—1. Hose or tubing consisting of an inner and an outer tube in which the intertwined links or helices run at right angles to each other, and one of said tubes is coated or covered with rubber or equivalent material, substantially as described.

2. Hose or tubing composed of an inner tube, in which the intertwined links or helices run in the direction of the length of the hose and are covered with rubber, and an outer tube, in which the intertwined links or helices run in the direction of the circumference of the hose, substantially as described.

3. Hose or tubing composed of an inner tube of intertwined helices and a covering on both sides of rubber or equivalent material, and an outer tube of intertwined helices which run at a right angle to the helices of the inner tube and are covered with rubber or equivalent material, substantially as described.

398,426. HOSE OR TUBING. THOMAS MIDGLEY, Beaver Falls, Pa., assignor of one-half to James R. Emerson, same place. Filed July 18, 1888. Serial No. 280,283. (No model.)

Brief.—Improvements on Letters Patent Nos. 386,306 and 386,307, dated July 17, 1888.



Claim.—1. Hose or tubing composed of a body formed of intertwined sections of coiled wire having the helices expanded into links

running in the direction of the circumference of the tube, and provided with a longitudinal re-enforcement, the links and the re-enforcement being embedded in and covered with rubber or equivalent material.

2. Hose or tubing composed of a body formed of intertwined sections of coiled wire having the helices expanded into links, and provided with a longitudinal re-enforcement within or between the links, the whole embedded in and covered with rubber or its equivalent material, substantially as described

398,427. WIRE BELTING. THOMAS MIDGLEY, Beaver Falls, Pa., assignor of one-half to James R. Emerson, same place. Filed Oct. 20, 1888. Serial No. 288,626. (No model.)

Claim.—1. Wire belting composed of intertwined transverse sections of coiled wire having the helices elongated, and the ends of the wires forming adjacent sections welded together to form an edge for the belt, substantially as described.

2. Wire being composed of intertwined transverse sections of coiled wire having the helices elongated, and the ends of the wires forming adjacent sections welded together, and a covering of rubber or equivalent material, substantially as described.

398,428. WIRE TUBING. THOMAS MIDGLEY, Beaver Falls, Pa., assignor of one-half to James R. Emerson, same place. Filed Oct. 20, 1888. Serial No. 288,627. (No model.)

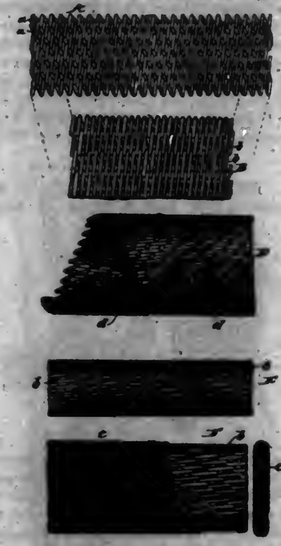
Claim.—As an improved article of manufacture, a tubular wire body for hose, consisting of intertwined helices stretched to their full extent and running diagonally around the tube, substantially as described.

398,429. WIRE BELTING. THOMAS MIDGLEY, Beaver Falls, Pa., assignor of one-half to James R. Emerson, same place. Filed Oct. 20, 1888. Serial No. 288,628. (No model.)

Claim.—1. Wire belting consisting of a double thickness or layers of intertwined elongated helices crossing the belt diagonally and presenting folded edges and a continuous and unbroken surface, substantially as described.

398,429.

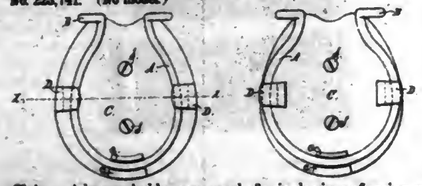
2. Wire belting composed of a double thickness or layers of intertwined elongated helices crossing the belt diagonally and presenting folded edges and a continuous and unbroken surface, and provided with a covering of rubber or equivalent material.



398,430. HOSE OR TUBING. THOMAS MIDGLEY, Beaver Falls, Pa., assignor of one-half to James R. Emerson, same place. Filed Oct. 20, 1888. Serial No. 288,629. (No model.)

Claim.—1. Hose or tubing composed of a body consisting of intertwined helices stretched to their full extent and running diagonally around the tube, and a lining of fluid-repellent material, substantially as described.

2. Hose or tubing composed of a body consisting of intertwined elongated helices running at an angle to the length, and also at an angle to a cross-section of the tube, a lining, and a covering of fluid-repellent material, substantially as described.



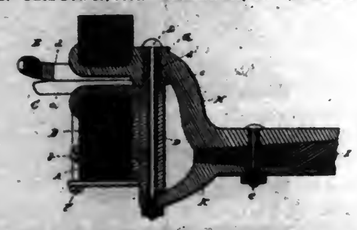
398,431. MANUFACTURE OF WIRE BELTING. THOMAS MIDGLEY, Beaver Falls, Pa., assignor of one-half to James R. Emerson, same place. Filed Oct. 20, 1888. Serial No. 288,630. (No model.)

Claim.—1. The method of manufacturing wire belting herein described, which consists in forming a sheet or body by intertwining sections of coiled wire, then heating the sheet or body so formed and elongating, flattening, and seating the helices by subjecting said body to longitudinal tension only while heated.

2. The method of manufacturing wire belting herein described, which consists in forming a sheet or body by intertwining sections of coiled wire, then wrapping the body diagonally around a mandrel and securing the adjacent edges by a separate section of coiled wire, then heating the tube so formed and elongating the helices by subjecting the tube to longitudinal tension while heated, then flattening the tube, and finally covering it with rubber.

398,432. BROOM-HOLDER. SIMON B. MIERLEY, Landisville, Pa., assignor to Jacob M. Grader, same place. Filed Jan. 8, 1887. Serial No. 223,741. (No model.)

Claim.—A broom-holder composed of a single piece of spring-wire having the center resting in a channel, each side secured above said channel by a cleat, and a plate to which the flanges forming the channel and the cleats are secured, the ends of the wire rising upward from said cleats and having their extremities bent outward therefrom to form arms, substantially as specified.

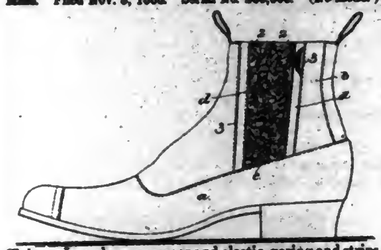


398,433. COMBINED THREAD TENSION AND LUBRICATING DEVICE FOR SEWING-MACHINES. DANIEL A. MOONEY and JAMES IRELAND, Troy, N. Y. Filed Aug. 13, 1887. Serial No. 246,917. (No model.)

Claim.—1. In a thread-lubricating device for sewing-machines, the combination, with a thread-tension wheel that is attached to the needle-arm thereof, of a tube that is also attached to said needle-arm adjacent to said tension-wheel, a lubricating-pencil within said tube, a spring within said tube above said pencil, and a set-screw at the top of said tube constructed to control the downward movement of said pencil to contact with the thread, substantially in the manner as and for the purposes set forth.

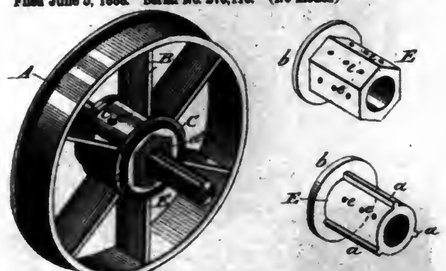
2. The combination, with the thread-tension wheel of a sewing-machine which is attached to the needle-arm of the latter and regulated by means of a spring and set-screw arranged on the same shaft as the tension-wheel, of a lubricating-pencil arranged within a tube that is attached to said needle-arm adjacent to said tension-wheel, said lubricating-pencil being constructed with a spring and set-screw that control the downward movement of said pencil to contact with the thread, substantially in the manner as and for the purposes set forth.

398,434. VEHICLE FIFTH-WHEEL. HOLLIS W. MOORE, Olean, N. Y. Filed Feb. 13, 1888. Serial No. 263,916. (No model.)



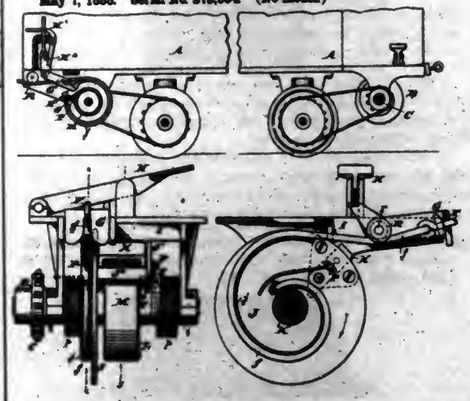
Claim.—The fifth-wheel consisting of the main branch C, having the segmental plates at its ends, the integral centrally-depending plate *c'*, the screwing-bolts *b*, passing through opening in the wooden portion of the axle near its junction with the iron portion, the integral vertically-bored sleeve, having the annular bearing-shoulder on a plane with the top of the branch C, the branch E, having the segmental plates at its ends, and the vertically-bored lug enlarged at its lower end, and the brace-arm, in combination with the reach, the axle, and the brace K, substantially as specified.

398,435. REMEDY FOR DIPHTHERIA. CONRAD H. A. HOCHSTWICK, Berlin, Germany. Filed Aug. 13, 1888. Serial No. 282,633. (No specimens.)



Claim.—The herein-described composition of matter to be used as a useful reliable remedy against diphtheria, consisting of sulphuret of potassium, anhydrous alcohol, tar from resinous fir wood, birch-tar, and Siberian castor, in the proportions specified.

398,436. BOOT OR SHOE. CHARLES H. NELSON, North Grafton, Mass. Filed Nov. 3, 1888. Serial No. 289,868. (No model.)



Claim.—In a shoe, an upper and elastic goring and strips or welts *d*, attached along one edge to the cut edge of the goring by one line of stitches, the opposite edges of the strips or welts being connected to the upper by another line of stitches not passing through the goring, substantially as and for the purpose described.

398,437. CAR-WHEEL. JAMES M. NORRIS, Wilkes-Barré, Pa. Filed June 5, 1888. Serial No. 276,110. (No model.)

Claim.—As an improvement in wheels for mine-cars, the combination of a wheel having a chambered hub, with a bushing inserted in said hub and forming the axle-bearing, said bushing being polygonal in cross-section to prevent rotation in the hub, substantially as specified.

398,488. CAR-STARTER. JOHN H. PALMER, Rockaway, N. J. Filed May 7, 1888. Serial No. 273,004. (No model.)

Claim.—1. In a car-starter, the combination of an extensible draw-bar, a wheel operated thereby, a friction-clutch wheel, and a friction-clutch band encircling said friction-clutch wheel, a band-tightening connection between the band and wheel operated by the draw-bar, and a power-connection for connecting the friction-clutch wheel and axle of the vehicle.

2. In a car-starter, the combination of an extensible draw-bar, a wheel operated thereby, a friction-clutch wheel, a friction-clutch band encircling said friction-clutch wheel, a band-tightening connection between the band and wheel operated by the draw-bar, a power-connection for connecting the friction-clutch wheel and axle of the vehicle, and a spring to return the draw-bar and its wheel to their normal position after the vehicle has started.

3. In a car-starter, the combination of an extensible draw-bar, a lock to prevent said draw-bar being drawn out except when desired, a wheel operated thereby, a friction-clutch wheel, and a friction-clutch band encircling said friction-clutch wheel, a band-tightening connection between the band and wheel operated by the draw-bar, and a power-connection between the friction-clutch wheel and axle of the vehicle.

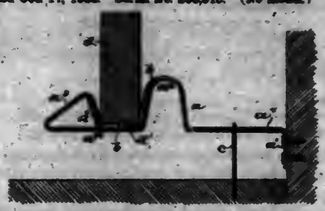
4. In a car-starter, the combination of an extensible draw-bar, a lock to prevent said draw-bar being drawn out except when desired, a wheel operated thereby, a friction-clutch wheel, and a friction-clutch band encircling said friction-clutch wheel, a band-tightening connection between the band and wheel operated by the draw-bar, a power-connection for connecting the friction-clutch wheel and axle of the vehicle, and a spring acting upon the band-tightening connection to make it unclutch the band-wheel and return the draw-bar and its wheel to their original and normal position.

5. The combination, in a car-starter, of a power-shaft having a friction-wheel secured thereto, a loose wheel supported concentric with said shaft, a draw-bar, a connection between said draw-bar and loose wheel, a lock to hold said draw-bar from being pulled out except when desired, a friction-band encircling the friction-wheel, and a band-tightening device carried by the loose wheel.

6. The combination, in a car-starter, of a power-shaft having a friction-wheel secured thereto, a loose wheel supported concentric with said shaft and having a spirally-formed rope or chain surface, a draw-bar, a flexible connection between said draw-bar and loose wheel, a lock to hold said draw-bar from being pulled out except when desired, a friction-band encircling the friction-wheel, and a band-tightening device carried by the loose wheel.

7. The combination, in a car-starter, of a power-shaft having a friction-wheel secured thereto, a loose wheel supported concentric with said shaft, a draw-bar, a connection between said draw-bar and loose wheel, a lock to hold said draw-bar from being pulled out except when desired, a friction-band encircling the friction-wheel, a band-tightening device carried by the loose wheel, and a spring to return the draw-bar and loose wheel to their normal position after being put in motion.

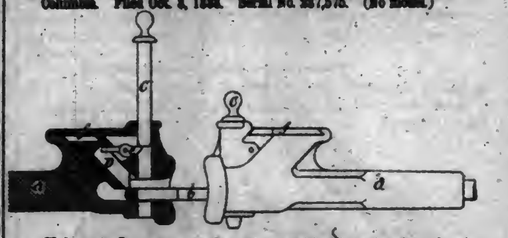
8. The combination, in a car-starter, of a power-shaft having a friction-wheel secured thereto, a loose wheel supported concentric with said shaft and having a spirally-formed rope or chain surface, a draw-bar, a flexible connection between said draw-bar and loose wheel, a lock to hold said draw-bar from being pulled out except when desired, a friction-band encircling the friction-wheel, a band-tightening device carried by the loose wheel, and a spring to return the draw-bar and loose wheel to their normal position after being put in motion.



9. The combination, in a car-starter, of a power-shaft having a friction-wheel secured thereto, a loose wheel supported concentric with said shaft, a draw-bar, a connection between said draw-bar and loose wheel, a lock to hold said draw-bar from being pulled out except when desired, a friction-band encircling the friction-wheel, a band-tightening device carried by the loose wheel, consisting of a frame pivoted to the loose wheel at its inner end and having connections with the two ends of the friction-band and at different distances from the pivot-connection of the frame, and a spring connected to the inner of said band-connections to release the friction-band and return the loose wheel to its normal position.

10. The combination, in a car-starter, of a power-shaft having a friction-wheel secured thereto, a loose wheel supported concentric with said shaft, a draw-bar, a connection between said draw-bar and loose wheel, a lock to hold said draw-bar from being pulled out except when desired, a friction-band encircling the friction-wheel, a band-tightening device carried by the loose wheel, consisting of the pivoted frame N, having a hinge-connection at *n* with the loose wheel and having rods O P connecting with the ends of the friction-band, and a spring acting upon the rod P to release the friction-band and return the loose wheel to its original position.

11. The combination, in a car-starter, of a power-shaft having a friction-wheel secured thereto, a loose wheel supported concentric with said shaft, a draw-bar, a connection between said draw-bar and loose wheel, a lock to hold said draw-bar from being pulled out except when desired, a friction-band encircling the friction-wheel, a band-tightening device carried by the loose wheel, consisting of the pivoted frame N, having a hinge-connection at *n* with the loose wheel and having an extension, U, and having rods O P connecting with the ends of the friction-band, a spring acting upon the rod P to release the friction-band and return the loose wheel to its original position, and a stop, S, in the path of said extension U, to automatically release the friction-band when the loose wheel has made a given portion of a revolution.



12. The combination of the axle of the car, a car-starter having a spirally-arranged groove or surface, a draw-bar and chain or rope therefor, a sprocket-wheel on the axle and the shaft of the car-starter and of different diameters, and a chain connecting said sprocket-wheels and in which the smallest radius of the spiral groove is substantially equal to the radius of the smallest sprocket-wheel which is secured to the car-starter shaft.

398,439. DOOR-CHECK. FRANK PARSONS, Russell Springs, Kans. Filed Oct. 17, 1888. Serial No. 288,315. (No model.)

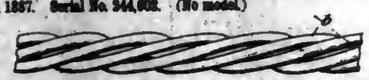
Claim.—The herein-described door-check, composed of the elastic arm a^4, the check-loop a^3, and the latch a^2, having its inner arm, a^5, movable on the shank of the check, substantially as and for the purpose described.

398,440. CAR-COUPLING. THOMAS W. PATERSON, Victoria, British Columbia. Filed Oct. 3, 1888. Serial No. 287,575. (No model.)

Claim.—1. In a car-coupling, the combination of a draw-head having a vertically-inclined guide in rear of the vertical pin-aperture thereof, an endwise-movable block fitted in said guide to slide freely therein, a coupling-pin, and a pivoted dog or catch arranged between said block and coupling-pin and having one of its ends arranged in the path of the block to be tripped by the same, substantially as and for the purpose described.

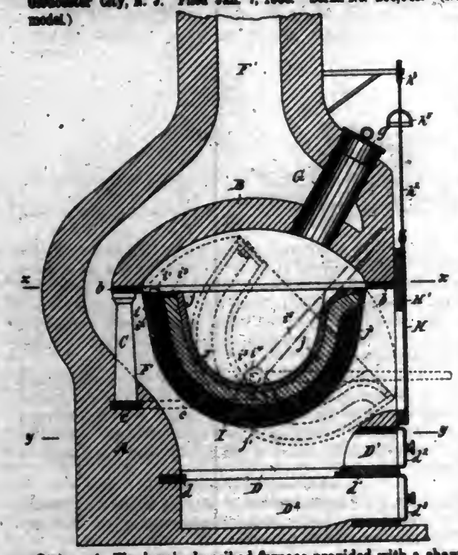
2. In a car-coupling, the combination of a draw-head having a vertically-inclined guide in rear of the vertical pin-aperture thereof, an endwise-movable gravity-block fitted in said guide and having a longitudinal groove, a coupling-pin, and a pivoted dog or catch having its heel fitted in the groove of said gravity-block, substantially as described.

398,441. TELEGRAPH-CABLE. WILLIAM R. PATTERSON, Chicago, Ill., assignor to the Western Electric Company, same place. Filed May 24, 1886. Serial No. 203,117. (No model.)



Claim.—1. The combination, with a core of insulated conductors, of an impervious serving wound thereon, the outside lead pipe, and the filling of coal-tar, or its equivalent, between the pipe and serving, substantially as described.

2. The combination, with the core *a* of separately-insulated elec-



trical conductors, *of* a serving wound thereon and a winding of lead tape, *d*, a serving wound upon the lead tape, the filling *g* and the lead pipe A, substantially as described.

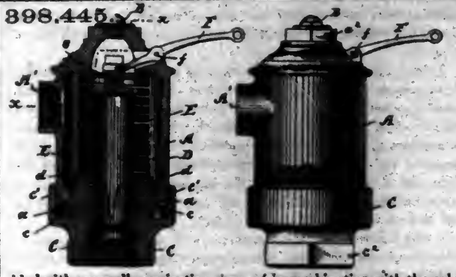
398,442. TELEGRAPH-CABLE. WILLIAM R. PATTERSON, Chicago, Ill., assignor to the Western Electric Company, same place. Filed July 18, 1887. Serial No. 244,003. (No model.)

Claim.—As a new article of manufacture, a cable consisting of an unserved core of separately-insulated conductors slightly and loosely twisted together, an exterior pipe inclosing said core, and a filling of insulating material forced into the pipe among and around the conductors of the core, said insulating filling being solidified when cold, like paraffine.

398,443. FURNACE FOR HEATING METALS. CLEMENT PAYNE, Philadelphia, Pa., assignor to the Electric Storage Battery Company, Gloucester City, N. J. Filed Jan. 7, 1888. Serial No. 260,041. (No model.)

Claim.—1. The herein-described furnace provided with a chamber having an arched roof, an incased crucible pivotally supported within said chamber, and said roof forming a cover for said crucible, and a lever operated from the outside of the furnace for tilting said crucible, substantially as and for the purposes set forth.

2. The herein-described furnace provided with a chamber having an arched roof, a chute extending downward into said chamber, a crucible pivoted to trunnions supported within said chamber, and a lever actuated from the outside of the furnace for tilting the same, substantially as and for the purposes set forth.

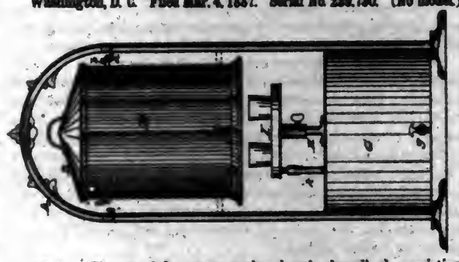


398,444. STEAM-ENGINE. ANDREW J. PIERCE, Racine, Wis. Filed July 20, 1888. Serial No. 280,503. (No model.)

Claim.—The upright tubular main frame having midway of its length the internal rigid cross-bar, *a'*, in combination with the cylinder fixed rigidly on the top of the frame, the piston, and the piston-rod extended through the guide a^3, the crank-shaft mounted in the base of the frame, and the longitudinally-divided pitman straddling the bar *a'* and connected at one end to the crank and at the opposite end to a cross-head, *e*, on the piston-rod.

398,445. POP SAFETY-VALVE. ROSWELL F. PRATT, Boston, Mass. Filed Apr. 16, 1888. Serial No. 270,913. (No model.)

Claim.—1. In a pop safety-valve, the body A, provided at its lower end with an inwardly-projecting flange, *a*, cap or cover C, pro-



vided with upwardly-projecting rims *c c'*, in combination with the valve D and spring E, substantially as and for the purposes set forth.

2. In a pop safety-valve, a valve, D, consisting of a hollow cylinder closed at the top and provided with a flange, *d*, in combination with the spring E and body A, the spring being placed between the flange *d* and top of body A, whereby the valve is held to its seat in the cap C, substantially as and for the purposes set forth.

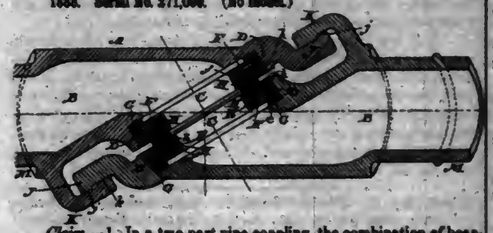
3. In a pop safety-valve, the body A, provided on its outside with a graduated scale, in combination with a cap or cover, C, provided with two upwardly-projecting rims, *c c'*, so that the body A is connected by a screw-thread to the rim *c*, while the rim *c'* acts as a pointer to indicate the pressure at which the valve will blow off, substantially as shown and described.

4. A pop safety-valve consisting of the following elements: an outer casing provided on its outer side with a graduated scale and at its lower end with an inwardly-projecting screw-threaded flange, a cap or cover provided with a steam-inlet and two upwardly-projecting rims, the inner one being screw-threaded to connect with the casing and the outer one serving as a pointer on the graduated scale, a hollow cylindrical valve provided on its outside with a flange near its lower end, and a spiral spring, all arranged and operating substantially as set forth.

398,446. STAND FOR WATER-COOLERS. CONSTANTINO P. RALLO, Washington, D. C. Filed Mar. 4, 1887. Serial No. 229,730. (No model.)

Claim.—The stand for water-coolers herein described, consisting of the arched frame A, provided with hooks *b* on its uprights for suspending a water-cooler, in combination with the receptacle G, secured to said frame, and said receptacle provided with the stand H, upon which the glass-holder I, having flange *i*, can be adjusted, and the flexible tube *k*, all arranged as shown, and for the purpose set forth.

398,447. CHUCK. CHARLES H. REID, Danbury, Conn. Filed Jan. 23, 1886. Serial No. 189,482. (Model.)



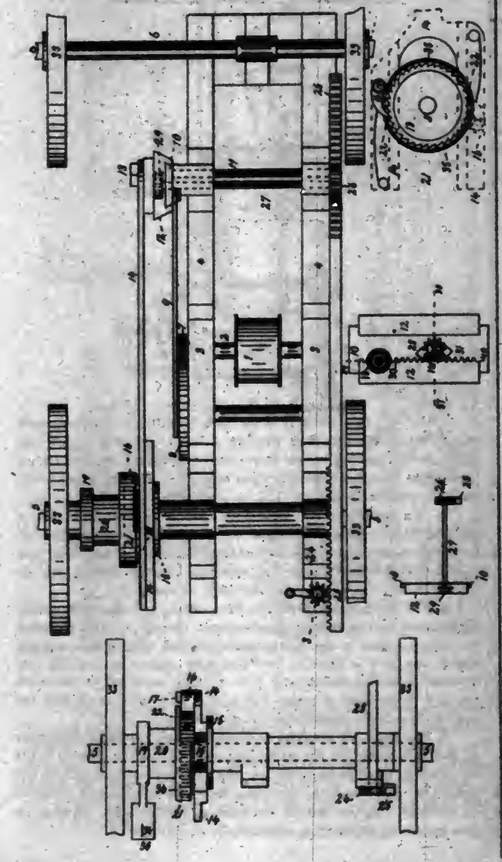
Claim.—1. In a chuck, the jaws arranged to slide freely within the chuck-body, in combination with an operating screw or bolt passed through said jaws independently of the body, substantially as shown and described.

2. In a drill-chuck, the combination, with two jaws and a screw for closing the same, of a new means for imparting a differential speed to the jaws for the purpose of centering the drill, consisting of a spring-actuated cone interposed between said jaws, as and for the purpose set forth.

3. In a drill-chuck, the male and female jaws adapted to slide in the body of the chuck, in combination with an actuating-screw passed through said jaws and a spring-actuated centering-pin having a conical end adapted to be forced between the jaws, and thereby deter-

mine the relative speed of the travel of said jaws, substantially as shown and described.

398,448. PIPE-COUPLING. WILLIAM G. RICHARDS, New York, N. Y., assignor of one-half to George H. Benjamin, same place. Filed Apr. 18, 1888. Serial No. 271,060. (No model.)



Claim.—1. In a two-part pipe-coupling, the combination of bearing-faces consisting of elastic packing material with an annular spring consisting substantially of two separated parallel annular leaves joined together at their inner edges to support the packing material, substantially as set forth.

2. In a two-part pipe-coupling, the combination of a chamber in each part of the coupling, packing material in the chamber, and an annular spring consisting of two separated parallel annular leaves joined together at their inner edge, substantially as set forth.

3. In a two-part pipe-coupling, the combination in each part of a ring of packing material, an annular spring for supporting the packing material, and an annular cylinder containing the same, all united and secured to the coupling, substantially as set forth.

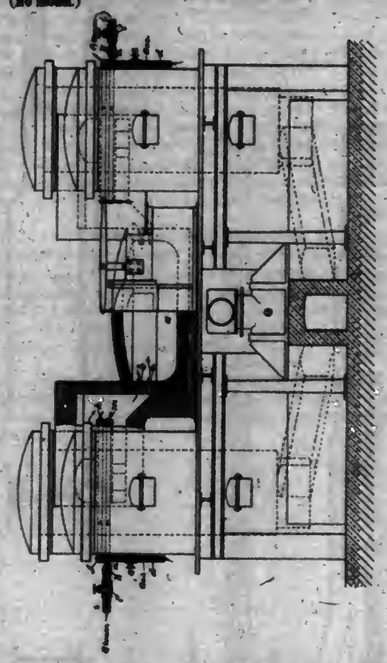
4. In a two-part pipe-coupling, the combination at each part of a bearing-faced packing-ring and supporting-rings beneath the packing-ring with an annular cylinder containing and supporting the same, and a threaded ring adapted to screw into the body of the coupling for holding the parts together, substantially as set forth.

398,449. MOTOR FOR RAILWAY-CARS. IRA ROGERS, Camden, N. J. Filed Aug. 20, 1888. Serial No. 283,178. (Model.)

Claim.—1. In a car-motor, the combination of a pulley, 1, or other imparting mechanism, a shaft, 2, gears 7 8, a connecting-rod, 9, and a vibrating arm, 10, for the purpose shown and described.

2. In a car-motor, the combination of a vibrating arm, 10, an adjusting-head, 12, a forked rod, 14, an idle-wheel, 15, a shaft, 5, and a means for actuating the same, for the purpose shown and described.

3. In a car-motor, the combination of a shaft, 5, a forked rod, 14, an idle-wheel, 15, one or more pawls, 16, a ratchet-wheel, 18, and means for actuating the same, for the purpose shown and described.



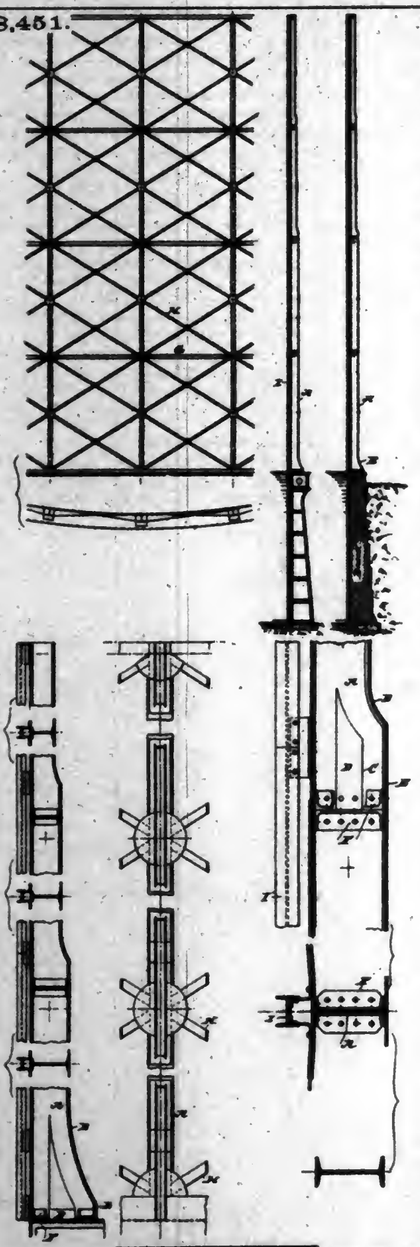
4. In a car-motor, the combination of a shaft, 5, an idle-wheel, 15, a forked rod, 14, one or more pawls, 16, a ratchet-wheel, 18, a weighted collar, 19, a shut-off wheel, 21, and means for actuating the same, for the purpose shown and described.

5. In a car-motor, the combination of a pinion, 24, a rack, 25, a pinion, 26, a shaft, 27, a pinion, 29, a rack, 30, and means for actuating the same, for the purpose shown and described.

6. In a car-motor an opening, 28, formed through a vibrating arm, 10, for the purpose shown and described.

7. In a car-motor, the combination of a gear-wheel, 29, with a rack, 30, in a head, 12, the gear and rack so arranged that the point of contact of the pitch-lines of their teeth is in a vertical plane passing through the center of shaft 11 of an arm, 10, for the purpose shown and described.

398,450. ART OF PROTECTING THE INTERIOR WALLS OF FURNACES. HENRY ROSSER, Pittsburg, Pa., assignor of one-half to George T. Oliver, same place. Filed Oct. 16, 1887. Serial No. 252,422. (No model.)



Claim.—The improvement in the art of protecting furnaces against the cutting action of flame, especially of fluid fuel, consisting in surrounding or enveloping the flame with steam, which acts as a cushion between the flame and the walls of the furnace, substantially as described.

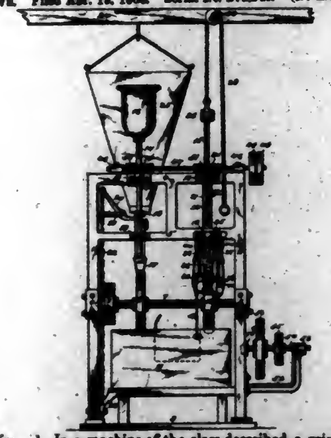
398,451. IRON COLUMN. THOMAS F. ROWLAND, New York, N. Y. Filed June 26, 1888. Serial No. 278,204. (No model.)

Claim.—1. A column composed of angle-beams or bars which vary in width from the top to the bottom of the column, the ends of the narrower beams where two beams of different widths are united being spread out or expanded to substantially the width of the unexpanded ends of the larger beams, substantially as and for the purpose set forth.

2. A column composed of angle-beams A, which vary in width from the top to the bottom of the column, the webs of the ends of the smaller beams where two beams of different widths are united being split, and the flange E thereof spread out to substantially the width of the top of the beams below, and the pieces D inserted in the said expanded ends, substantially as and for the purpose set forth.

898,451.

head of said vertical spindle, a pair of governor-arms, O, pivoted to said pivots and crossing each other above the planes of said pivots, and provided with cams Q, engaging the top of said valve-stem, weights upon the governor-arms, stops to limit the movement of the governor-arms, angularly-disposed springs S, engaging spring abutments upon the head of the vertical spindle, and adjusting-screws upon the governor-arms between the pivot and weight of said arm.

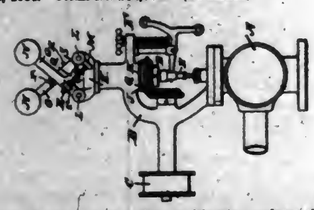


2. In a governor, the combination, substantially as set forth, with a governor-valve and stem and a spindle carrying the centrifugal mechanism, of the head K, carried by said spindle, pivots L, carried by said head, curved governor-arms O, carried by said pivots and carrying weights N, and lying close alongside each other at a point of crossing, and provided with cams Q, engaging the top of said valve-stem, and with lugs P, engaging each the opposite arm, and springs acting between said head and arms to furnish centripetal force.

898,453. SHANK-PROTECTOR. HENRY SCHRADER, New Springs, Iowa. Filed May 26, 1887. Serial No. 239,455. (No model.)

Claim.—As an improved article of manufacture, the herein-described shank-protector comprising the convex-concave plate B, adapted to be secured to the shank of a boot or shoe, and provided along the center with a series of parallel V-shaped ribs, said plate being solid throughout, and the corrugations being projected from the rest of the plate formed integral with the same and arranged in a continuous straight line transversely to the length of the plate, but not extending entirely across the same, the said plate having the front ears, *b*, as set forth.

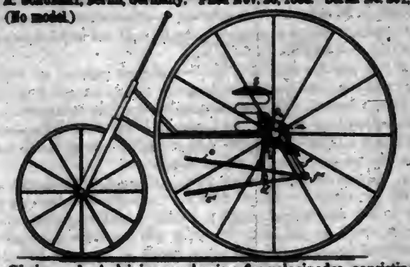
898,454. PUNTING-MACHINE. HENRY C. SCHRADER, Wheeling, W. Va. Filed Apr. 19, 1888. Serial No. 271,346. (No model.)



Claim.—1. In a machine of the class described, a grinding-wheel and a vertical rotating shaft bearing a chuck mounted above said wheel, in combination with a sleeve surrounding said shaft and arms attached to said sleeve and provided with glass-receiving chucks, substantially as described.

2. In a machine of the class described, the combination, with a grinding-wheel rotatably mounted upon a shaft, of a shaft mounted for reciprocation in a sleeve and adapted for rotation therewith and provided with oppositely-pivoted rotatable spindles having glass-receiving chucks at their ends, substantially as specified.

3. The combination, with the frame-work, of a sleeve longitudinally slotted and carrying a gear mounted thereon, a shaft mounted for reciprocation in the sleeve and provided with glass-receiving chucks mounted in spindles provided with pulleys, an endless belt mounted over the pulleys and over a pulley mounted on the shaft, and of a power-shaft provided with a gear adapted to mesh with the gear on the sleeve, substantially as specified.

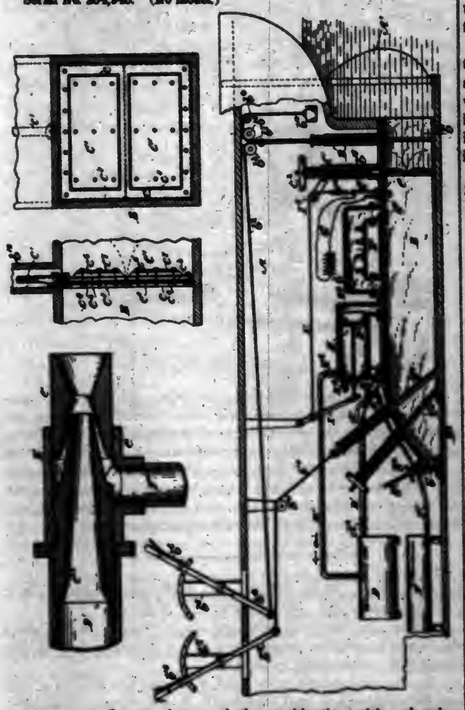


4. The shaft 15, mounted as described, and having pivoted arms 37 and twin pulley 35, the depending arms 38, having pivoted bends 39, carrying spindles 40, provided with pulleys 41 and chucks 42, the pulleys 44, mounted on the depending arms, and the chuck 36, mounted on the shaft, and the belt 43, mounted as described and adapted to give motion to the chucks, substantially as specified.

898,452. GOVERNOR. WILLIAM H. RUMELY, La Porte, Ind. Filed Sept. 10, 1888. Serial No. 284,972. (No model.)

Claim.—1. In a governor, the combination, substantially as set forth, with the governor-valve and stem and the spindle carrying the centrifugal mechanism, of a pair of horizontal pivots, L, carried by the

898,455. DRIVING MECHANISM FOR VELOCIPEDES. CONRAD A. SCHLUMPF, Berlin, Germany. Filed Nov. 26, 1886. Serial No. 291,636. (No model.)



Claim.—1. A driving mechanism for velocipedes, consisting of treadle-levers *e e'*, disks or drums *c c'*, cord or chain *d*, pulleys *g*, levers *h i*, links *k l*, pawls *m*, and ratchet-toothed wheels *n*, combined, arranged, and operating substantially as herein described.

2. In a driving mechanism for velocipedes, the combination, with the sleeve or hub $a^{\times}$, carrying the riding-wheel F and the ratchet-toothed wheel *n*, of the toothed pawl *m*, links *k l*, levers *h i*, disk or drum *c* or *c'*, cord or chain *d*, and treadle-levers *e* or *e'*, arranged and operating substantially as herein described.

3. In a driving mechanism for velocipedes, the combination, with the riding-wheel and its sleeve or hub, the pawl-and-ratchet mechanism, and the lever-and-link mechanism, of a treadle-lever, a cord or chain, a disk or drum, and a spring, arranged and operating substantially as herein described.

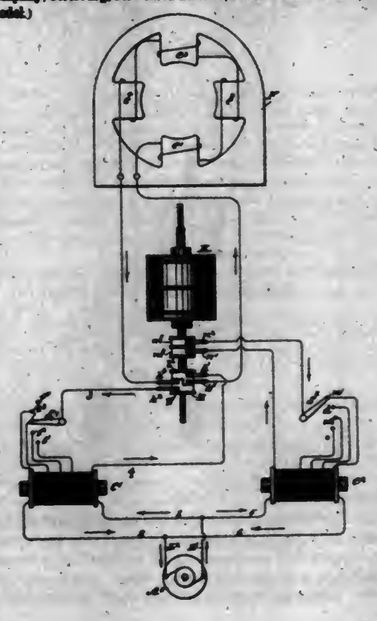
4. In a driving mechanism for velocipedes, the combination, with the lever *h*, carried by the box or sleeve *b*, the lever *i*, working loosely on the axle *a*, and the ratchet-toothed wheel *n*, carried by the sleeve or hub $a^{\times}$, of the links *k l*, and the pawl *m*, carried by the link *l*, substantially as herein described.

898,456. ENGINE. JOHN A. SIBUR, Brooklyn, assignor to the Secor Marine Propeller Company, New York, N. Y. Filed Nov. 11, 1887. Serial No. 254,940. (No model.)

Claim.—1. In a marine vessel, the combination, with a chamber opening to the water, of a compressed-air reservoir communicating therewith, a receptacle for a hydrocarbon, also communicating with the chamber, a cylinder communicating at one end with the chamber and at the other end with the compressed-air reservoir, a piston in the cylinder, and an apparatus for igniting the contents of the chamber, substantially as specified.

2. In a marine vessel, the combination, with a chamber opening to the water, of a compressed-air reservoir communicating therewith, a receptacle for a hydrocarbon, also communicating with the chamber, a cylinder communicating at one end with the chamber and at the other end with the compressed-air reservoir, a piston in said cylinder, an electric apparatus for igniting the contents of the chamber and comprising two electrodes, one of which is movable, and a connection between the movable electrode and the said piston, substantially as specified.

3. The combination, with a chamber opening to the water, of an air-inlet therefor, a receptacle for hydrocarbon communicating with the chamber, an air-compressing engine communicating at one end with said chamber, an electric apparatus for igniting the contents of the chamber, and comprising two electrodes, one of which is movable, and a connection between the movable electrode and the air-compressing engine for moving said electrode, substantially as specified.



4. The combination, with a chamber, of a compressed-air reservoir, an injector communicating with the compressed-air reservoir and with the chamber, and a receptacle for hydrocarbon communicating with the injector, the said injector having an outlet having two reversely-arranged communicating tapering cavities, one receiving a nozzle which receives air from the compressed-air reservoir and the other opening into the said chamber, the diameter of the outlet of said nozzle being less than the smallest diameter of said outlet for the injector, substantially as specified.

5. In a marine vessel, the combination, with a chamber opening to the water, of an air-inlet, a hydrocarbon-inlet, igniting apparatus, an air-pump open at one end to the chamber, and a valve located at one end of the chamber and controlling communication with the water, said valve being capable of opening outwardly when subjected to excessive pressure within the chamber, and of closing inwardly under pressure of the water, substantially as specified.

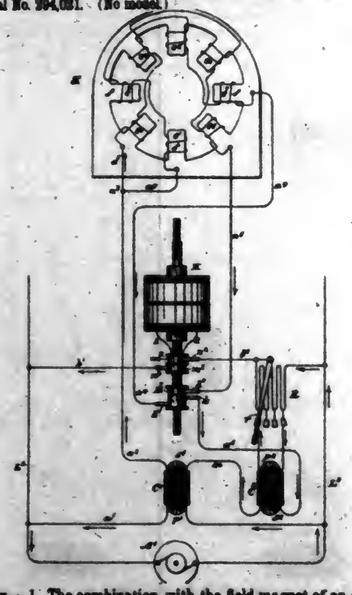
6. In a marine vessel, the combination, with a chamber opening to the water, of a compressed-air reservoir, an inlet from the compressed-air reservoir to the chamber, a hydrocarbon-inlet, igniting apparatus, openings for establishing communication between the said chamber and the atmosphere, and valves which will open upon a reduction of pressure below atmospheric pressure inside the chamber to allow atmospheric air to enter the chamber, substantially as specified.

7. In a marine vessel, the combination, with a chamber opening to the water, of a valve located at one end of the chamber and operating to exclude water from the chamber, an air-inlet for the chamber, valves connected with said air-inlet and opening inwardly under the influence of atmospheric pressure when pressure within the chamber is reduced below atmospheric pressure, a hydrocarbon-inlet, and igniting apparatus, substantially as specified.

898,457. ALTERNATE-CURRENT ELECTRIC MOTOR. OLIVER B. SHALLENBERGER, Rochester, assignor to the Westinghouse Electric Company, Pittsburg, Pa. Filed Mar. 20, 1888. Serial No. 267,843. (No model.)

Claim.—1. In a marine vessel, the combination, with a chamber opening to the water, of a compressed-air reservoir communicating therewith, a receptacle for a hydrocarbon, also communicating with the chamber, a cylinder communicating at one end with the chamber and at the other end with the compressed-air reservoir, a piston in the cylinder, and an apparatus for igniting the contents of the chamber, substantially as specified.

Claim.—1. The combination, with the field-magnet and armature of an electric motor, of a converter having its primary coil supplied with alternating, intermittent, or pulsatory electric currents and its secondary coil connected with the armature-coils, and a second converter having its primary coil connected with a source of alternating, intermittent, or pulsatory electric currents and its secondary coil connected with the field-magnet coils of the motor.



2. The combination, with the field-magnet and armature of an electric motor, of a converter having its primary coil supplied with alternating, intermittent, or pulsatory electric currents and its secondary coil connected with the armature-coils, a second converter having its primary coil connected with a source of alternating, intermittent, or pulsatory electric currents, a rectifying-commutator upon the armature-shaft of the motor, and circuit-connections from the secondary coil of the second converter through said rectifying-commutator with the field-magnet coils.

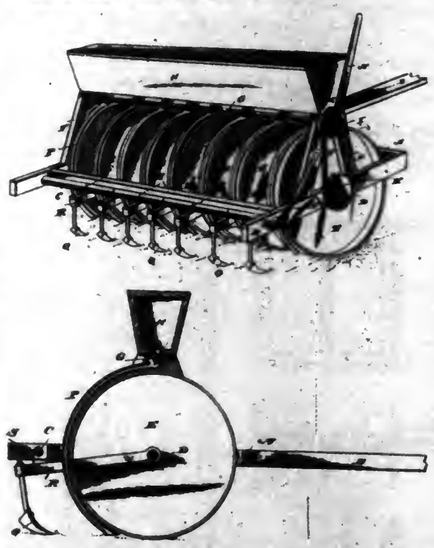
3. The combination, with the field-magnet and armature of an electric motor, of a converter having its primary coil supplied with alternating, intermittent, or pulsatory electric currents and its secondary coil connected with the armature-coil, a second converter having its primary coil connected with a source of alternating, intermittent, or pulsatory electric currents and its secondary coil connected with the field-magnet coils of the motor, and means for varying the ratio of conversion of one of said converters.

4. The combination, with the field-magnet and armature of an electric motor, of a converter having its primary coil supplied with alternating, intermittent, or pulsatory electric currents and its secondary coil connected with the armature-coils, a second converter having its primary coil connected with a source of alternating, intermittent, or pulsatory electric currents, a rectifying-commutator upon the armature-shaft of the motor, circuit-connections from the secondary coil of the second converter through said rectifying-commutator with the field-magnet coils, and means for varying the ratio of conversion of both of said converters.

5. The combination, with a source of alternating, intermittent, or pulsatory electric currents and a circuit therefor, of an electric converter having its primary connected in said circuit, a revolving armature having its coils connected in the circuit of the secondary coil of the converter, a second converter connected with said source of currents, a field-magnet applied to the armature included in the secondary circuit of the second converter, and a rectifying-commutator interposed in said secondary circuit between the field-magnet and the converter.

398,458. ALTERNATE-CURRENT ELECTRIC MOTOR. OLIVER B. SHALLENBERGER, Rochester, assignor to the Westinghouse Electric Company, Pittsburg, Pa. Filed Dec. 9, 1887. Renewed Dec. 13, 1888. Serial No. 294,031. (No model.)

Claim.—1. The combination, with the field-magnet of an electric motor and a source of current therefor, of a converter having its primary coil supplied with alternating electric currents and its secondary coil connected to assist the field-magnet current, and means for supplying more or less current to the primary coil of the converter.



2. The combination, with the field-magnet coils of an electric motor, of a converter having its secondary circuit connected through said coils, a second converter assisting in effect the first-named converter, and connections through the armature of the motor independent of the field-magnet connections.

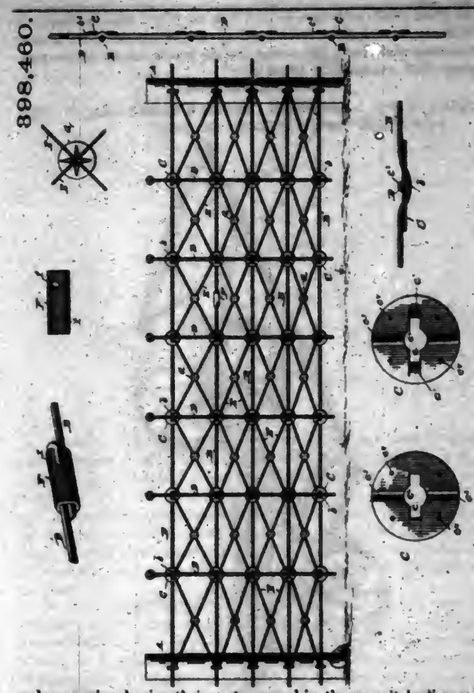
3. The combination, with the field-magnet coils of an electric motor, of a converter having its secondary circuit connected through said coils, a second converter assisting in effect the first-named converter, connections through the armature of the motor independent of the field-magnet connections, and means for cutting the primary coil of the second converter out of circuit.

4. The combination, with the field-magnet coils of an electric motor and the armature applied thereto, of a converter supplying currents to the field-magnet coils, a circuit-transferring commutator through which the secondary circuit of said converter is completed, an artificial resistance included in the circuit of the armature, means for including more or less of said resistance in circuit, and a second converter having its primary coil connected in shunt upon said resistance and its secondary coil in series with the secondary coil of the first-named converter, substantially as described.

5. The combination, with the field-magnet of an electric motor having multiple poles, of branch conductors including the coils applied to the alternate poles, a commutator upon the armature-shaft of the motor, means for completing the circuit-connections through said branch circuits alternately, and a source of alternating electric currents supplying said branch circuits.

398,459. SEED-DRILL. JOHN S. SHERIDAN, Columbia, Dak. Filed Sept. 26, 1888. Serial No. 286,436. (No model.)

Claim.—In a grain-drill, the combination, with the main frame, of the shaft D, journaled thereto, the rollers secured to the shaft, said rollers having broad peripheries as distinguishable from a tapering periphery and bound with tires, the hopper supported above the rollers, the seed-tubes having a sweeping curvature and leading from the base of the hopper to the earth in close relation to the respective rollers, and the covering-shovels journaled on the shaft and connected with a rock-shaft by chains, substantially as specified.

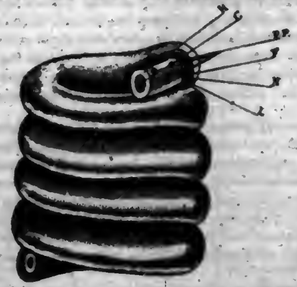


398,460. WIRE FENCE. JOHN G. SCHILLER, Washington, D. C. Filed June 5, 1888. Serial No. 276,115. (No model.)

Claim.—1. The herein-described disk for fences, provided with a slot having a central enlargement and with perforations near the edge of said disk, substantially as set forth.

2. The combination, with the line and upright wires of a fence and disks disposed at each intersection thereof provided with perforations, of cross-wires secured through the oppositely-disposed perforations, substantially as set forth.

3. The herein-described fence, consisting of the upright posts, line-wires secured thereto provided with bends, disks provided with slots adapted to receive said bends and having a central enlargement, perforations in said disks, upright wires disposed under the bends of the line-wires and adapted to be struck or forced in the enlargement.



398,460.

and cross-wires having their ends secured in the oppositely-disposed perforations, substantially as set forth.

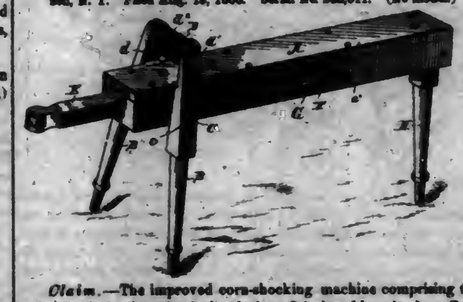
4. The combination, with the disks provided with perforations, of cross-wires secured at their ends through the oppositely-disposed perforations of two disks and at their point of intersection by staples, substantially as set forth.

398,461. STEAM OR WATER PACKING. JOHN T. SMITH, San Francisco, Cal. Filed Mar. 31, 1888. Serial No. 269,108. (No model.)

Claim.—A packing having a central core of suitable fibrous material saturated with a mixture of pulverized soapstone and flour, as above described, the core being wrapped with perforated rubber or cork to allow the lubricant to pass from the central core to the outer covering, which is composed of a fibrous material saturated as above described, and the whole plaited with a slack-twisted cord of suitable fibrous material, substantially the same as above described.

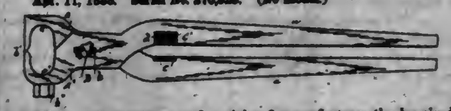
398,462. HORSE-POWER FOR HAY-STACKERS. ROBERT J. SMITH, Cascade, Iowa. Filed Aug. 20, 1887. Serial No. 247,994. (Model.)

Claim.—1. In a horse-power, the combination of the base-frame having the vertical standard, the drum or pulley journaled thereon and having the annular shoulder, the power-lever L, loose on the standard, the shaft K, journaled in said power-lever, the friction-band around the shoulder of the pulley and having one end connected to a fixed part of the power-lever and the other end connected to the shaft K, and the lever to rotate the said shaft, substantially as described.



2. In a horse-power for hay-stackers, the base-frame having a vertical standard, the drum or pulley journaled thereon and having the annular shoulder, the power-lever also loose on said standard, the shaft K, journaled in said power-lever, the friction-band around the shoulder of the drum or pulley and having one end connected to a fixed part of the power-lever and the other end connected to the

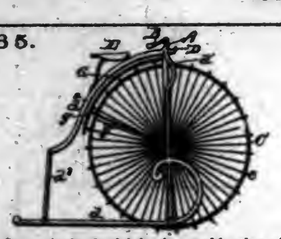
398,462.



shaft K, the ratchet-wheel fast on said shaft, the pawl pivoted to the power-lever and engaging said ratchet-wheel, and the lever to rotate the shaft K, all combined and arranged to operate substantially as described.

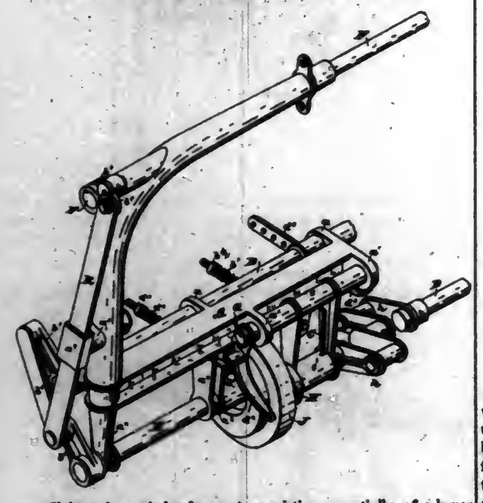
398,463. CORN-SHOCKING MACHINE. ALBION W. SMITH, Addison, N. Y. Filed Aug. 13, 1888. Serial No. 282,611. (No model.)

Claim.—The improved corn-shocking machine comprising the hollow body having the inclined slots G in its sides, the legs B B, secured to the body at one end, the spool mounted between the upper ends of said legs, the bolt C, securing the legs to the body and passing transversely through the body, the handle sliding in the body and having a notch, I, in its lower side fitting over the bolt C, the said notch having a recess, J, in its top adapted to engage said bolt when the handle is pushed inward, and the arms F, fitting in the slots G, and having their inner ends pivoted to the end of the handle, as specified.



398,464. NIPPERS. JOHN SPRINGLER, Fort Apache, Ariz. Filed Apr. 11, 1888. Serial No. 270,326. (No model.)

Claim.—As an improved article of manufacture, the herein-described tool, comprising the two jaws or levers, the stud or post having a T-shaped end and formed integral with one of said jaws or levers and designed to be projected through a correspondingly-shaped slot of the other jaw or lever, the nippers formed at the outer ends of said jaws or levers, the hammer, and the oppositely-disposed grooved lugs, all constructed and arranged substantially as shown and described.



398,465. ICE-VELOCIPEDE. CHARLES STRAKE, Detroit, Mich. Filed Nov. 15, 1888. Serial No. 290,904. (No model.)

398,465.

Claim.—In a velocipede-sleigh, the combination of a standard, a drive-wheel journaled therein, a sleeve loosely embracing said standard above the wheel, suitable frame-work connecting said sleeve with the runners, a guard extending rearwardly from the standard, braces connecting the lower end of said guard with the lower ends of the two shanks *a'* of the standard, and a spring on the standard below the loose sleeve to keep the drive-wheel to its work and permit it to rise and ride over inequalities in the surface traversed, substantially as described.

398,466. GRAIN-BINDER. BENJAMIN F. STEWART, New Philadelphia, Ohio. Filed Aug. 6, 1887. Serial No. 246,236. (No model.)

Claim.—1. A binder-frame, A, consisting, essentially, of a lower horizontal portion and an upright portion projected therefrom, the lower horizontal portion being provided with shaft-supports projecting laterally therefrom in opposite directions, and with a hanger depending from said horizontal portion, and the upright portion being provided at a point above the horizontal portion with a journal projecting laterally therefrom, substantially as set forth.

2. The frame A, having the shaft-supports $a\ a\ a'\ a'$ extending laterally from its lower horizontal portion, the hangers $a^3\ a^3$, depending from said horizontal portion, and the journal a^5, projecting laterally from its upright portion, substantially as set forth.

3. In a grain-binder, the combination, with the yielding packer-shaft support and gear-wheels I and J, the former loosely mounted on the packer-shaft and the latter mounted on the shaft E, of the packer-shaft journaled in the yielding support and having a movement transverse to its axis to throw the said gear-wheels into and out of engagement, substantially as set forth.

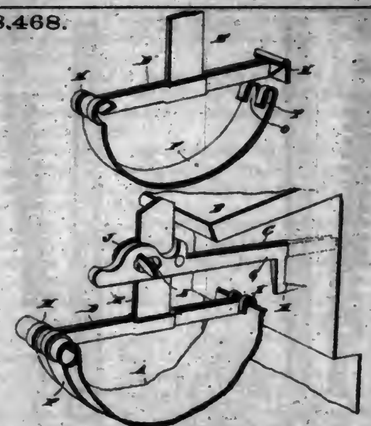
4. The combination, with the binder-frame, of the yielding frame C, shaft D, driving-wheel I, loosely mounted on the shaft, spring-pawls $a^4\ b^4$, mounted in wheel I, and ratchet a^5, gear-wheel J, having groove a^7, provided with notch, and the stop b^5, substantially as set forth.

5. The combination of the wheel J, carrying a roller, d', shaft G, provided with a cam, d^3, and arm d^4, said roller d' being in position to engage the cam d^3 as the wheel J rotates, the bundle-supporting finger d^5, spring d^6, and bolt d^7, to hold the bundle-supporting finger in position to receive grain, the whole being constructed and arranged substantially as set forth.

6. The combination, with the binder-actuating shaft and the needle-shaft, of the knotter-head shaft, cranks secured to the binder-actuating shaft and knotter-head shaft, a differential link connected at one end with the crank on the knotter-head shaft, a link connecting the other end of the differential link with the crank on the binder-actuating shaft, a fulcrum for the link, on which the link bears at different distances from its ends during each revolution of the binder-actuating shaft, and a link connecting the needle and the binder-actuating shaft, substantially as set forth.

398,467. HARVESTER. CHARLES S. STICKLE, Pekin, Ill. Filed June 26, 1888. Serial No. 278,274. (No model.)

Claim.—1. The combination of the axle, a tongue extending rearward therefrom, an adjustable lever pivoted thereon, a bar disposed under the axle, a rectangular frame located in front of and below the bar, and connecting-bars secured to said frame and curved upwardly from the rear edge thereof in front of the axle and rigidly secured to the bar under the axle, the connecting-bars being extended in rear of the axle and connected with the adjusting-lever, substantially as set forth.



2. The combination, with an axle, a transverse vertically-adjustable bar disposed thereunder, a rearwardly-projecting tongue secured to the axle and carrying a lever, a rectangular frame located in front of and below the transverse bar, bars connecting the same with the bar under the axle, said connecting-bars being curved upwardly in front of the axle at the rear edge of said frame and being extended in rear of the axle, and a link provided with a series of perforations for adjustably connecting the latter with the lever, substantially as set forth.

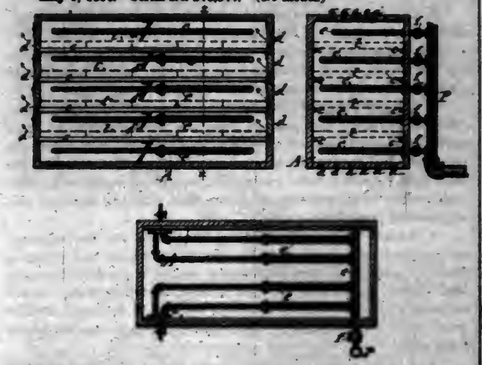
3. The herein-described header, comprising the axle, a transverse bar, F, underlying the axle and having guides therefor at its ends, a rectangular frame, H, located in front of and below the transverse bar, the rearwardly-converging bars I I', the bar J, extending from the front beam of the rectangular frame to near the rear end of the bar I, the parallel bars J' and J³, respectively secured to the bars I and I' at one end and to the guides at the ends of the transverse bar, and a bar, K, secured at one end to the bar I and at the other to the outer end of a bar, L, projecting rearwardly from the rear end of the rectangular frame, said connecting-bars being curved upwardly from the rear edge of the rectangular frame in front of the axle, all arranged substantially as and for the purpose set forth.

4. The herein-described header, comprising the axle, a transverse bar underlying the axle and having guides therefor at its ends, a rectangular frame, and bars connecting the latter with the transverse bar, said connecting-bars being curved upwardly at the rear edge of the rectangular frame in front of the axle, substantially as and for the purpose set forth.

398,468. EAVES-TROUGH HANGER. WILLIAM STINE, Elmore, Ohio, assignor of one-half to Godfrey Jaeger, Jr., same place. Filed May 12, 1888. Serial No. 273,715. (No model.)

398,468.

Claim.—1. The eaves-trough hanger comprising a spike, a standard adjustably secured to the spike and depending therefrom, and a cross-bar secured to the standard and supporting the trough, as set forth.

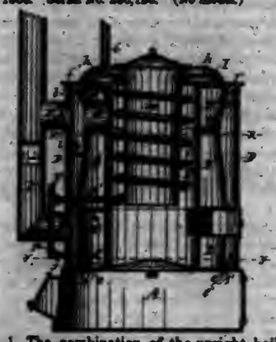


2. An eaves-trough hanger comprising a spike, a clamping-plate permanently secured to the side of the spike, a standard inserted vertically upward between said plate and the spike and adjustably secured between the same, and a suspending loop carried by the standard, as set forth.

3. An eaves-trough hanger comprising a spike having a vertical shoulder on its side and an opening beyond said shoulder, a clamping-plate secured to the spike and having an opening aligning with the opening in the spike, the standard inserted between the spike and the clamping-plate, a cross-bar secured to the standard and supporting the trough, and a wedge-shaped fastening device inserted through the aligned openings in the clamping-plate and the spike, as set forth.

4. An eaves-trough hanger comprising a spike, a standard adjustably secured thereto, a cross-bar at the lower end of the standard, having an open loop at one end to engage the bead of the trough, and a hook at the other end to engage the smooth edge of the trough, and a suspending loop depending from the open loop and adapted to engage the hook, as set forth.

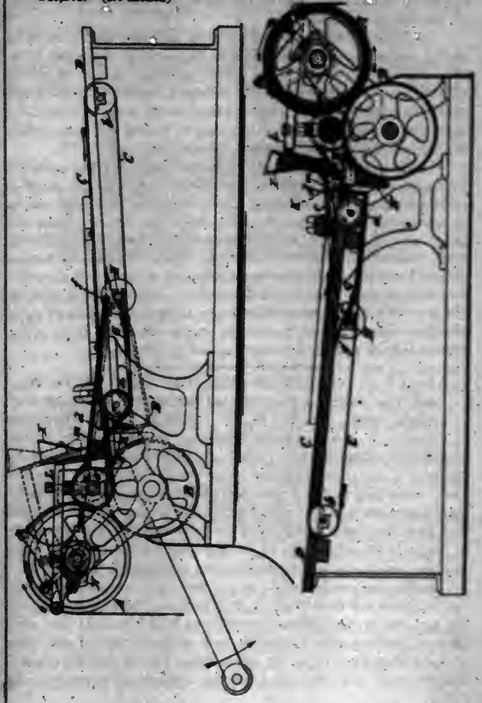
5. An eaves-trough hanger comprising a spike, a standard adjustably secured to the spike, a cross-bar at the lower end of the standard, having a hook at its inner end, and a suspending loop secured to the outer end of the cross-bar and provided at its free end with tongues adapted to be bent over the hook and pass down on opposite sides of the cross-bar, as set forth.



398,469. FRUIT-DRIER. GEORGE STRIEBER, Auburn, N.Y. Filed May 9, 1888. Serial No. 273,977. (No model.)

Claim.—1. The combination of the evaporating-chamber provided with tray-supports at various elevations, doors between the planes of the tray-supports and at opposite ends of the chamber, and steam-pipes between the tray-supports and distributed to present greater heat-radiating surfaces at the induction end of the case than at the eduction end thereof, substantially as described and shown.

2. The combination of the evaporating-chamber provided with a perforated bottom and perforated top, tray-supports at various elevations in the said chamber, inward-swinging doors between the tray-supports at one end of the case, outward-swinging doors diametrically opposite the inward-swinging doors, doors suspended across the central portion of the chamber, and steam-pipes between the planes of the tray-supports and distributed to present greater heat-radiating surfaces in the lower portion and the induction end of the chamber than at the upper portion and the eduction end of the chamber, substantially as described and shown.



398,470. STEAM-BOILER. GEORGE STRIEBER, Auburn, N.Y. Filed July 16, 1888. Serial No. 280,126. (No model.)

Claim.—1. The combination of the upright boiler formed with the central combustion-chamber, C, and provided at its upper portion with the smoke-exit *a*, the smoke-jacket D, inclosing said boiler, the horizontal partition *b*, having the port *c*, the pipe P, having branches P' P", communicating with the smoke-jacket above and below the aforesaid partition and diametrically opposite the port *c*, and the dampers *d* in the direct branch P', substantially as described and shown.

2. The boiler proper, composed of the fire-pot section B, formed flaring externally from its base to its top, the central section, B', seated upon the section B and tapered externally from its base to its top, and the top section, B", seated upon the section B' and flared externally to its top and formed with the exit *a*, in combination with ash-pit A, formed with the projection A', the smoke-jacket D, seated upon said projection and provided with the exit P" at its base, and the horizontal partition *b* in the smoke-jacket between the exits *a* and P", and provided with the port *c*, substantially as described and shown.

398,471. APPARATUS FOR DUPLICATING MANUSCRIPT, &c. CHARLES A. THOMPSON, New York, N.Y. Filed Aug. 6, 1887. Serial No. 246,275. (No model.)

Claim.—1. The combination of the roller for containing the matter to be copied, the pressure-roller B, the feeding-table, and a vertically-movable water-retaining wetting device for moistening the paper arranged above the plane of the table and having a movement below such plane, substantially as described.

2. The combination of the roller A, for carrying the matter to be copied, the pressure-roller B, the secondary feeding and guiding roller E, table D, and a wetting device for moistening the paper, all substantially as and for the purpose herein set forth.

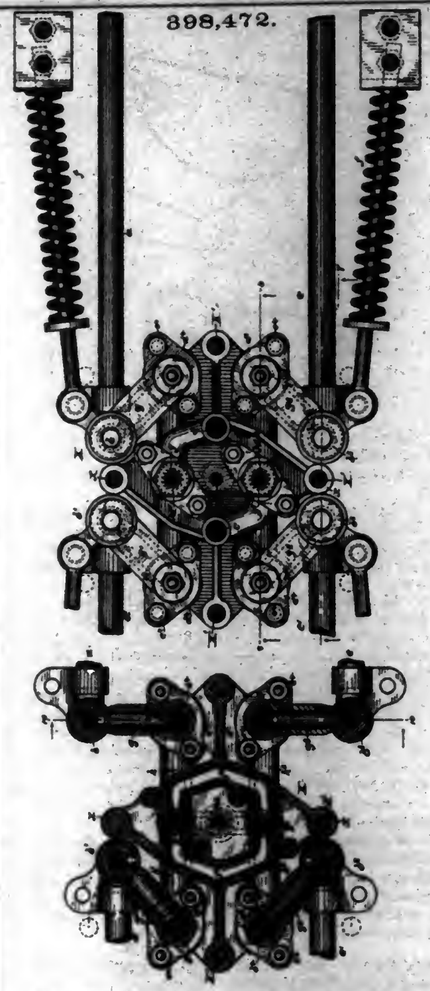
3. The combination of the roller A, for carrying the matter to be be copied, the pressure-roller B, a table, D, a wetting device, and movable stops *d*, for intermitting the movement of the paper from the table to the wetting device and the rollers A B, all substantially as and for the purpose herein set forth.

4. The combination of the roller A, for carrying the matter to be copied, the pressure roller B, the secondary feeding and guiding roller E, a table, D, a wetting device, and movable stops *d*, for intermitting the movement of the paper from the table to the wetting device and the rollers A B, all substantially as and for the purpose herein set forth.

5. The combination of the roller A, for carrying the matter to be copied, the pressure-roller B, table D, a movable wetting-trough and pad, and mechanical devices for giving an intermittent vertical movement thereto, all substantially as and for the purpose herein set forth.

6. The combination of the roller A, for carrying the matter to be copied, the pressure-roller B, table D, a movable wetting device, and bars L and cam N, for giving an intermittent vertical movement thereto, all substantially as and for the purpose herein set forth.

7. The combination of the roller A, for carrying the matter to be copied, the pressure-roller B, the trough B', for containing the moistening-liquid, and a movable device constructed and arranged to force downward the paper as it passes to the rolls A B into the said trough, all substantially as and for the purpose herein set forth.



8. The combination of the roller for carrying the matter to be copied, the pressure-roller B, the trough B', for containing the moistening-liquid, and the movable upper moistening-trough, I, having a dampening-pad, K, and means for intermittently forcing said upper trough and its pad downward, carrying with it the paper to receive the copy into the said trough B', substantially as and for the purpose specified.

9. The combination of the roller for containing the matter to be copied, the pressure-roller, and a feeding-table for the paper to receive the copy, with a trough for containing water having a fixed relation to and arranged beneath the end of said table, a vertically-intermittently-movable trough, I, containing a moistening-pad arranged above the plane of said table, and vertically-intermittently-movable stops *d*, operating beneath the plane of said table, substantially as described, for the purpose specified.

10. The combination of the roller for carrying the matter to be copied, the pressure-roller B, and a feeding-table for the paper to receive the copy, with a wetting device consisting of a fixed and an intermittently-movable trough part arranged, respectively, below and above the plane of the table and the track of the paper to receive the copy, the movable part being operated to depress said paper below the plane of the table, substantially as described.

11. The combination of the roller for containing the matter to be copied, the pressure-roller B, and a feeding-table for the paper to receive the copy, with a wetting device consisting of a fixed and an intermittently-movable trough part arranged, respectively, below and above the plane of the table and the track of the paper to receive the copy, vertically-movable stops arranged below the table, mechanical devices for giving an intermittent downward movement to the movable wetting part upon the said paper, and mechanical devices for giving an intermittent upward movement to the stops upon said paper to raise it when the movable wetting part is raised free of the latter, substantially as described, for the purpose specified.

398,472. CAR-HEATING APPARATUS. HENRY R. TOWER, Stamford, Conn., assignor to The Safety Car Heating and Lighting Company, of New Jersey. Filed May 18, 1887. Serial No. 238,070. (No model.)

Claim.—1. In a car-heating apparatus, the combination of four longitudinally-movable pipes extending two from each end toward the center of a car, an intermediate center-fitting, four hollow arms pivotally connecting said four pipes and center-fitting, and local heating-pipes connected with the center-fitting and through it with the said four pipes, the center-fitting being provided with passages through it, so that a heating-fluid may be admitted into the local heating-pipes and also pass on for heating another car, substantially as set forth.

2. The combination, with a car, of four pipes connected with local heating-pipes and extending two from each end toward the center of the car, and an intermediate center-fitting with which the four pipes have a movable jointed connection, and springs acting on said pipes to move them lengthwise, the center-fitting having passages communicating with said pipes for a heating medium, substantially as set forth.

3. In a car-heating apparatus, a center-fitting containing two parallel longitudinal ports, $h\ h'$ and $h^2\ h^3$, and two transverse ports, $f^4\ f^5$, connected together, these ports being provided with valves for opening and closing them, in combination with the pivoted hollow arms $g\ g'\ g^2\ g^3$, substantially as set forth.

4. A center-fitting or distributing-chamber with two parallel longitudinal ports and two parallel transverse ports, each of the latter having a separate outlet or connection leading to the car, each transverse port being connected with one or the other of the longitudinal ports by a reversing-valve, whereby either of said outlets or connections leading to the car may be connected at will with either of said longitudinal ports.

5. A center-fitting or distributing-chamber having two longitudinal and two transverse ports and provided also with four vibrating arms, the passages or ports contained in each of said arms connecting, as described, with the longitudinal ports in the center-fitting, so that any fluid contained in any of said arms will tend to discharge itself by gravity into said longitudinal ports and thence to a common drip or drain cock.

6. A center-fitting or distributing-chamber having four vibrating arms, each of which is provided at one end with a plug or cock for opening and closing the passages into the center-fitting by the vibration of the arms, substantially as set forth.

7. A center-fitting or distributing-chamber with four vibrating hollow arms, each having at the highest point of its internal port or passage an automatic cut-off, substantially as set forth.

8. A center-fitting or distributing-chamber having one or more vibrating arms, and at each end of each of said arms a rotating plug, substantially as set forth.

9. A center-fitting or distributing-chamber having one or more vibrating arms, one end of each arm being pivoted to the center-fitting and the other connected pivotally to a longitudinal pipe, substantially as set forth.

10. A center-fitting or distributing-chamber fixed to the body of a car and having four vibrating arms and one or more reversing-valves for controlling the direction of flow through said center-fitting, substantially as described.

11. A center-fitting or distributing-chamber fixed to the body of a car, and having four vibrating arms, two longitudinal and two transverse ports, and provided also with a drip or drain cock located centrally, substantially as set forth.

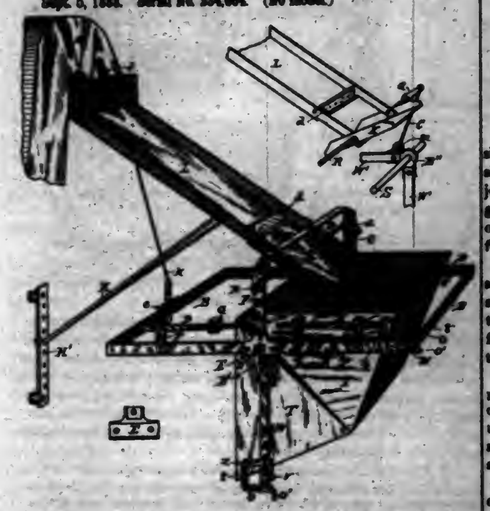
12. A center-fitting or distributing-chamber fixed to the body of a car, and having four vibrating arms, two longitudinal and two transverse ports, one or more reversing-valves, and a drip-valve, substantially as set forth.

13. In a car-heating apparatus, the combination, with a center-fitting or distributing-chamber, of a hollow vibrating arm and a pipe connecting therewith and a spring acting on said pipe to vibrate said arm, substantially as set forth.

14. In a car-heating apparatus, the combination of a center-fitting, a pipe leading thereto, and a vibrating hollow arm pivotally connecting the center-fitting with the pipe, the pipe being supported so as to slide longitudinally with the vibrations of the arm, substantially as set forth.

15. In a car-heating apparatus, the combination of two parallel pipes, a center-fitting connected to the pipes by vibrating arms, and a coupling device for the pipes by which they are moved endwise, substantially as set forth.

16. In a car-heating apparatus, a series of longitudinal pipes extending throughout the train and rigidly connected together endwise, in combination with vibrating arms and center-fitting, substantially as set forth.



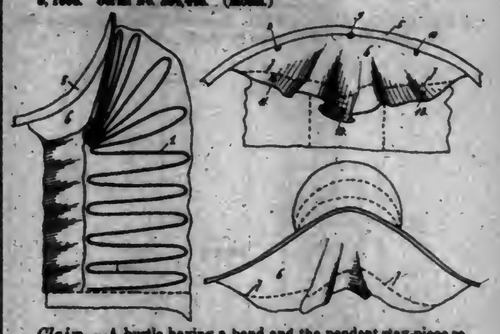
17. The combination, with a car, of a local heater, B, a local system of circulating-pipes, B', pipes *c* and *d*, connecting the local heater and the center-fitting, the center-fitting X, and the longitudinal pipes *a e*, the center-fitting having valve mechanism and passages for providing communication between said pipes, so that steam may be admitted to the local heater for local circulation, substantially as set forth.

18. A center-fitting, X, provided with the hollow pivoted arms g, g', g^2, and g^3, the valves $b\ b'\ b^2\ b^3$, passages $h\ h'\ h^2\ h^3$, valves *y* and *y'*, passages *i i'*, and cock *x*, substantially as set forth.

19. The combination, with the center-fitting X, provided with the valves and passages, as described, of the pipes *c* and *d*, draining to the center-fitting, and pipes *a*, *e*, *d'*, and *c'*, draining from the center-fitting to the opposite ends of a car, substantially as set forth.

20. The combination, with the pipes *a* and *c*, of the springs *f*, spring *o*, the rod *n*, and yoke *m*, with the hand-lever *t*, and the connecting bell-crank levers and rods between it and the rod *n*, substantially as set forth.

398,473. GRAIN-WEIGHING APPARATUS. LE ROY C. TRYON, Marseilles, assignor of one-half to Clarence R. Tryon, Ottawa, Ill. Filed Sept. 5, 1888. Serial No. 284,064. (No model.)



Claim.—1. The combination of the frame B, having the scale-beams D D, the oscillating buckets T T, having, respectively, the latches Z Z, and the oscillating chute K, connected with said buckets in such manner as to be oscillated thereby simultaneously in a reverse direction, substantially as and for the purpose set forth.

2. In a grain-measuring device, the combination of the oscillating chute, the similar and equal oscillating measuring-buckets, the scale-beams and the mechanism for detachably connecting said buckets therewith, and the mechanism, substantially as described, whereby the chute and buckets are oscillated simultaneously and in reverse directions from each other, substantially as and for the purpose set forth.

3. The combination of the frame B, having the bail F, the scale-beams D D, spring-latches Z Z, shaft S, having the crank-lug *n*, cranked shaft R, having the crank *a*, link *c*, connecting said crank and crank-ing, oscillating chute K, spout L, having its floor at its lower end shorter than its sides, brace H, and the mechanism, substantially as described, for adjustably connecting said spout with a separator, substantially as and for the purpose set forth.

398,474. BUSTLE. CHARLES B. TOWN, Utica, N. Y. Filed Sept. 3, 1888. Serial No. 284,462. (Model.)

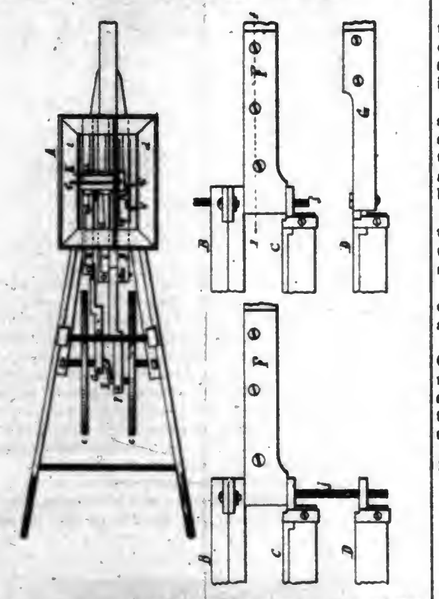
Claim.—A bustle having a band and the pendent stay-piece secured thereto, in combination with three coiled springs, each spring incased in a separate pocket, the pockets being joined by web, the central pocket and spring being of larger diameter than the remaining springs and pockets, the upper and outer end of the central pocket and spring secured to the stay-piece at the band, the remaining springs and pockets secured at their upper and outer ends to the stay-piece on a lower horizontal plane than the central pocket and spring, and the lower portion of the pockets and two or more convolutions of the springs secured to the stay-piece at or near the bottom thereof, whereby the desired curvature may be secured in the bustle.

398,475. ORE-CONCENTRATOR. MILTON T. VAN DERVEER, Amsterdam, N. Y. Filed June 26, 1887. Serial No. 242,430. (No model.)

Claim.—1. The vanning-pan provided with a series of depressions extending across the pan, each depression having an inclined side, *v*, and a shelving bottom, *u*, which laps over the side of an adjoining depression, said depressions being deepest at the center and gradually decreasing in size therefrom and curving upward to ends of the depressions, substantially as described, for the purpose set forth.

2. The combination, in an ore-concentrator, of a pan having a series of pockets or depressions, with inclined bottoms and counter-sunk openings in said bottoms, valves of metal of less specific gravity than mercury fitted loosely in said openings, and suitable mechanism for imparting longitudinal and lateral vibration to said pan, substantially as described, for the purpose set forth.

3. In combination with a vanning-pan provided with vibrating mechanism and loosely supported at one end by hangers, a reciprocating rod, N, a cross-bar, *c*, with arms *h h'*, secured thereto at their upper ends, the lower ends of arms *h* being rigidly secured to the pan and arms *h'* being pivotally connected with the frame, substantially as described, for the purposes set forth.



4. In an ore-concentrator, a vibrating vanning-pan having a series of depressions, each of which has an inclined side wall, and an inclined or shelving bottom provided with grooves or corrugations and a series of perforations, substantially as described.

5. The combination, with a vanning-pan having a series of depressions with inclined bottoms and sides, and mechanism for imparting a longitudinal and lateral vibration to said pan, of a horizontal rod and a series of stirrers conforming to said depressions secured to said rod, so as to follow the longitudinal movement of the pan, substantially as described.

6. In an ore-concentrator, a vanning-pan having a series of depressions, each of which has an inclined side wall and an inclined or shelving bottom which extends over and beyond the wall of the adjoining depression, and said depressions having each a varying depth, in combination with the mechanism for vibrating the pan longitudinally, laterally, and with a rising-and-falling movement, substantially as described.

7. A vanning-pan having a series of depressions, each depression having an inclined side and a shelving bottom that overlaps the side of the adjoining depression, said depressions being deepest at the center and decreasing in size therefrom toward their ends, in combination with a series of stirrers conforming in shape and arrangement to said depressions, substantially as described.

398,476. SEED-PLANTER. ELBRIDGE G. VAN PELT, Centre Hall, Pa. Filed May 1, 1888. Serial No. 98,563. (No model.)

Claim.—1. In a seed-slide, two similar parts, *m n*, arranged oppositely to each other and constructed as shown; so that two measuring-apertures, *i i*, are formed therein, each of said similar parts being formed with a laterally-extending projection, *r*, at one end, and with a longitudinally-extending slot, *o*, at the other end, the slot on one part being over the projection on the other, in combination with adjusting-screws and nuts *p q*, said adjusting-screws being adapted to pass through the projections *r r* and work in the slots *o o*, substantially as set forth.

2. In a seed-slide, the two similar parts *m n*, arranged oppositely to each other and constructed as shown, so that two measuring-apertures are formed therein, each part being formed with a projection, *r*, and a slot, *o*, located as shown and described, in combination with adjusting screws and nuts, and the guides *s s*, adapted to hold the parts *m n* in correct relative position, substantially as set forth.

3. In a fertilizer-slide, the combination of a fixed part extending the whole length of the slide, provided with upwardly-extending projections on each end and with a laterally-extending central projection, two adjustable parts formed with upwardly-extending slotted projections, said parts being located on the same side as the central projection, and means of adjustment whereby apertures of varying size may be formed between said adjustable parts and the laterally-extending central projection on the fixed part, substantially as set forth.

4. In a fertilizer-slide, the combination of the fixed part *w*, formed with upwardly-extending projections *y y* and projecting ways *d' d'*, the adjustable parts *x x*, formed with upwardly-extending projections *z z* and grooves *d' d'*, and means of adjustment, substantially as set forth.

5. The combination of a fertilizer-slide and a stirrer formed with two upwardly and outwardly projecting arms and one horizontally and inwardly extending arm mounted on said slide and traveling with it, substantially as set forth.

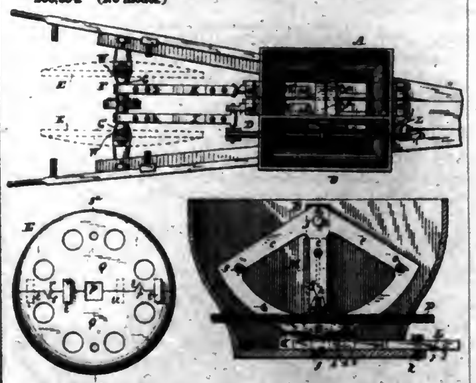
6. The combination of the fertilizer-slide B and the stirrer H, formed with two upwardly and outwardly projecting arms, *h' h'*, and one horizontally and inwardly projecting arm, *i'*, said stirrer being located on and traveling with said slide, substantially as set forth.

7. The combination of the crank E, the connecting-rod F, the fertilizer-slide B, provided with two adjustable measuring-apertures, *g g*, located at a distance apart less than the sweep of the crank E, the discharging-opening *k*, and the vertically-adjustable shoe-I, situated above said discharging-opening and constructed with a part, *j'*, overhanging the slide, of a length equal to or greater than the sum of the short distances which the apertures *g g* travel on opposite sides of the opening *k*, substantially as set forth.

8. In a seed-planter, a double-crank shaft the cranks of which are set at an angle of ninety degrees to each other, and the ends of which are eccentrically attached to the two driving-wheels of the planter at equal distances from the respective centers thereof, substantially as set forth.

9. The combination of a double-crank shaft, the cranks set at an angle of ninety degrees, fertilizer and seed slides, and connecting-rods, substantially as set forth.

10. The combination, with one fertilizer-slide, two seed-slides, and two connecting-rods, of a double-crank shaft, the cranks set at an angle of ninety degrees, one of said connecting-rods operating the fertilizer-slide and one of the seed-slides, and the other connecting-rod operating the remaining seed-slide, substantially as set forth.



11. A double-crank operating-shaft, two seed-slides, a fertilizer-slide, a rod connecting one of the cranks of said shaft with one of said seed-slides, and a rod connecting the other crank with the fertilizer-slide and the remaining seed-slide, in combination with adjustable connections between said rods and slides, whereby the slides may be operated either from one or both cranks, substantially as set forth.

12. The combination of the two seed-slides, each constructed with two measuring-apertures, the fertilizer-slide constructed with two measuring-apertures, a double-crank shaft, the cranks set at an angle of ninety degrees, and the connecting-rods, substantially as set forth.

13. The combination of the connecting-rod F and the adjustable coupling-rod *j* with the clamp J and means of adjustment, substantially as set forth.

14. The double crank E, the connecting-rods F G, the seed-slides C D, each constructed with two measuring-apertures, *i i*, and connected, respectively, with the rods F and G, in combination with the fertilizer-slide B, provided with two measuring-apertures, *g g*, located at a distance apart less than the sweep of the crank E, said slide B being connected to the rod F, substantially as set forth.

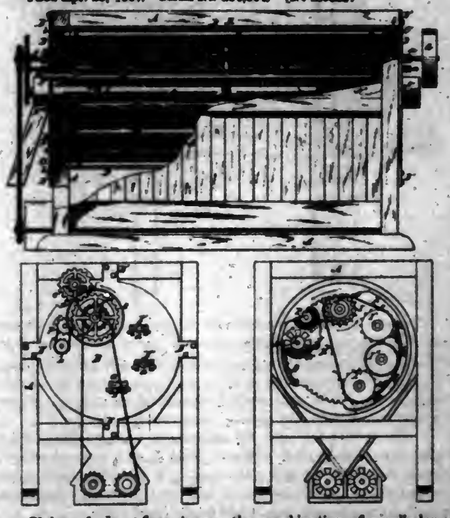
898,477. SEED-PLANTER AND FERTILIZER-DISTRIBUTER. ELBRIDGE G. VAN PELT, Centre Hall, Pa. Filed May 1, 1888. Serial No. 200,854. (No model.)

Claim.—1. The fertilizer-compartment having a discharge-aperture in the bottom thereof, and a swinging fertilizer-distributer in said compartment swinging in a vertical plane, and having its lower edge curved in an arc coinciding with that in which it swings, and horizontally-projecting arms on said distributer, which swing over said discharge-aperture, in combination with a cut-off located in the compartment above the discharge-aperture, beneath which said projecting arms swing, substantially as set forth.

2. The fertilizer-compartment having an aperture in the bottom thereof and the swinging fertilizer distributer having three horizontally-extending arms which swing across said aperture, in combination with a vertically-adjustable cut-off above said aperture and above the path of said horizontal arms, substantially as set forth.

3. The fertilizer-compartment and the swinging fertilizer-distributer within the same, said distributer having a curved side which coincides with the arc in which it swings, in combination with a reciprocating operating-rod connected with said distributer, said rod passing through both ends of the fertilizer-compartment, substantially as set forth.

4. The fertilizer-compartment and the swinging fertilizer-distributer within the same, said distributer having a curved side coinciding with the arc in which it swings, and having two horizontally-extending arms, *h h*, in combination with a reciprocating operating-rod passing through both ends of the fertilizer-chamber, said rod having a pin, *g*, which is located between said arms *h h*, substantially as set forth.



5. The divided axle, each division of which carries a crank, each of said cranks carrying a wheel concentric with the axle, said wheels being adjustable in relation to each other, substantially as set forth.

6. The double-cranked axle, the cranks of which are adjustable in reference to each other, in combination with two reciprocating seed-slides and one reciprocating fertilizer-rod, a connecting-rod connecting one of said seed-slides to one of said cranks, and a second connecting-rod connecting the remaining seed-slide and the fertilizer-rod to the remaining crank, substantially as set forth.

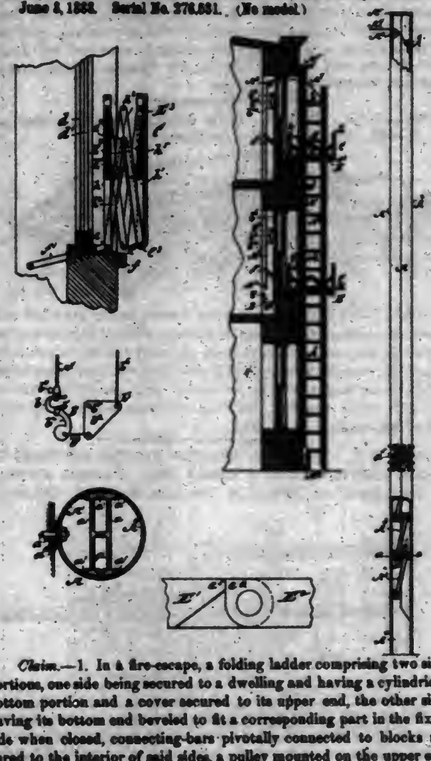
7. The divided wheel composed of two identical halves, each half having interlocking parts which interlock with the corresponding parts on the opposite wheel, substantially as set forth.

8. The axle having cross-bars N N, in combination with the divided wheels, the halves of which are bolted to said bars, substantially as set forth.

898,478. ROTARY BOLT. JOHN H. WALSH, Mason City, Iowa. Filed Apr. 25, 1887. Serial No. 236,004. (No model.)

Claim.—1. In a flour-dresser, the combination of a cylinder or reel, substantially as described, stationary heads upon which the reel revolves, shafts mounted in said heads and provided with sprocket-wheels, chain belts carried by said sprocket-wheels, elevators mounted on said chain belt within said reel, and mechanism, substantially as described, adapted to rotate the reel and carry said elevators in proximity to a portion of its interior, substantially as and for the purpose set forth.

2. In a flour-dresser, the combination of the closed heads B B, the open-ended reel, substantially as described, mounted thereon, sprocket-wheels I I' I', chain belts J J, and elevators K K, substantially as and for the purpose set forth.



3. In combination with an open-ended flour-bolting reel, substantially as described, the sprocket-wheels I I' I', traveler I², guides *c c*, elevators K K, chain belts J J, and mechanism, substantially as specified, whereby simultaneous motion is imparted to the reel and the elevators, as set forth.

4. In combination with the reel of a flour-dresser and with suitable feed and discharge spouts, an internal conveyer adapted to discharge the stock at one side of the reel, and a trough for said conveyer, having its discharge side inclined, whereby the flow of the stock over the edge of the trough is made uniform, substantially as specified.

5. In combination with the reel of a flour-dresser and with suitable feed and outlet spouts, an internal conveyer adapted to discharge the stock at one side of the reel, and a trough for said conveyer, having the discharge side thereof vertically adjustable, whereby the flow of the stock is regulated, substantially as set forth.

6. In a flour-dresser, the combination of the open-ended reel, the feed-spout R, and discharge-spout S, the conveyer L, trough N, and apron O, substantially as described.

398,479. FIRE-ESCAPE. JOHN W. WEAVER, Brooklyn, N.Y. Filed June 4, 1888. Serial No. 276,331. (No model.)

Claim.—1. In a fire-escape, a folding ladder comprising two side portions, one side being secured to a dwelling and having a cylindrical bottom portion and a cover secured to its upper end, the other side having its bottom end beveled to fit a corresponding part in the fixed side when closed, connecting-bars pivotally connected to blocks secured to the interior of said sides, a pulley mounted on the upper end of the fixed side, and an eye-piece secured to the movable side, through which a cable is secured and passed over the said pulley and secured to a suitable retaining device, whereby the release of the cable will cause the ladder to automatically open by gravity, substantially as specified.

2. In a fire-escape, a folding ladder constructed substantially as described, having its side portions provided with projecting spikes on a part of their exterior surfaces, substantially as specified.

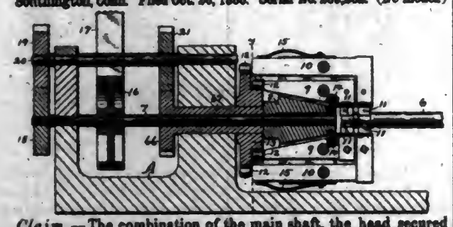
3. In a fire-escape, a ladder constructed substantially as described, having rungs consisting of I-shape bars pivotally connected at their extremities to independent blocks secured to the side portions of said ladder, substantially as described.

4. In a fire-escape, a folding balcony adapted to fold into a position above a window-sill, a support for said platform when open, and an inwardly-extending lever for opening the balcony, rigidly secured to the hinge-rod *c*, and having its free end attached to the cable A^7, whereby the weight of the movable side A^2 of the ladder serves on opening to operate and open the balcony, substantially as described.

5. In a fire-escape, a folding balcony comprising a platform in two or more sections adapted to fold within a window-opening and remain closed, the said platform having hinge-joints provided with the stop portions c^4 and c^5 to retain the same flatwise when open, chains for supporting the balcony when open, a lever rigidly connected to the rod *c* and pivotally connected to the hinge-rod c^3, an inwardly-extending lever for opening the balcony, rigidly secured to the rod *c*, and having its free end secured to a suitable retaining device, substantially as described.

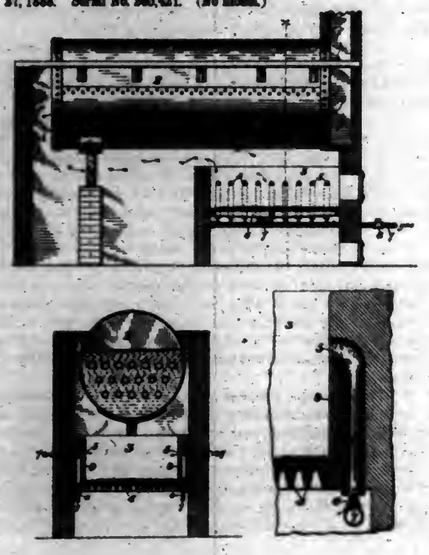
6. In a fire-escape, a folding balcony comprising a platform in two or more sections hinged together and adapted to fold into a vertical position above a window-sill, chains for supporting said platform, a front railing hinged to said platform, the extension device H, comprising the upright slotted posts *h h'* and intermediate bars, h^3 h^4 h^5 h^6, a lever secured to the rod *d* and pivotally connected to the rod d^3, another lever secured to the rod *d*, and having its free end attached to the cable A^7, whereby the weight of the movable side of the lad-

der serves on opening to operate and open the balconies, substantially as specified.



7. In a fire-escape, the combination of the folding ladder A, having a chain secured to the movable side and passing over a pulley mounted in the stationary side, and from thence extending downwardly through a series of floors, the retaining device B, operated by a wire extending vertically through a series of floors and provided with suitable actuating means, the folding balconies C, having their operating-levers attached to the cable A^1, whereby the release of the said cable will cause the ladder to automatically open, and in so doing exert the requisite force for opening the balconies simultaneously therewith, substantially as described.

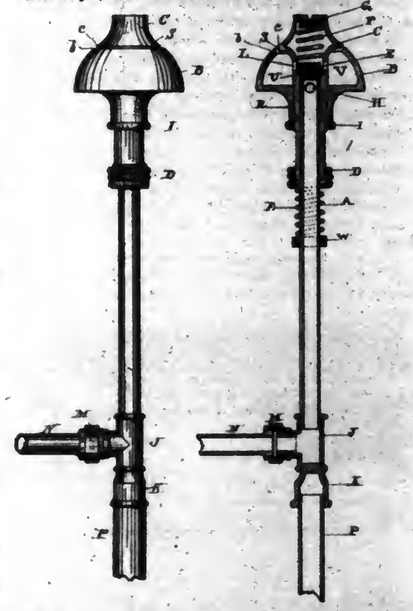
398,480. HARROW. JAMES WHIPPS, Carlisle, Ind. Filed Oct. 17, 1888. Serial No. 288,235. (No model.)



Claim.—The improved reversible harrow herein described and shown, comprising the side bars, B, having a series of angular notches in one side, the runners secured to the opposite sides of the side bars, the angular cross-bars secured to the side bars, with their edges fitting in the angular notches therein, the harrow-teeth secured to the lower front sides of the cross-bars, and the draft-chains secured to the front ends of the side bars, as specified.

398,481. MEANS FOR IMPARTING A RADIAL MOVEMENT TO THE CUTTING-TOOLS OF A ROTARY HEAD. PARDON A. WHITNEY, Southington, Conn. Filed Oct. 26, 1888. Serial No. 289,202. (No model.)

Claim.—The combination of the main shaft, the head secured thereon and carrying radially-moving milling-tools, the cam for moving said tools, mounted to revolve on a common axis with said shaft and head, and the differential gear-wheels for driving said cam at a different rate of speed from that of said shaft, substantially as described, and for the purpose specified.



398,482. GAS-FURNACE FOR STEAM-BOILERS. GEORGE WEYMALL, Toledo, Ohio, and JOHN A. LAMBING, Wilkinsburg, Pa. Filed Feb. 27, 1888. Serial No. 265,421. (No model.)

Claim.—1. A combustion-chamber of a furnace having grate-bars and adapted to the combustion of solid fuel, and having a gas-supply pipe or port entering the combustion-chamber through the wall thereof, and having its opening at said wall above the normal level of the fuel on the grate-bars, substantially as and for the purposes described.

2. In a steam-boiler furnace, the combination, with the boiler and the combustion-chamber below the boiler, of gas-supply ports or pipes opening into the combustion-chamber on opposite sides thereof, and a flue extending from the combustion-chamber beneath the boiler, substantially as and for the purposes described.

398,483. FLUE-CLEANER. JOHN U. WILES, Mansfield, Ohio. Filed May 4, 1888. Serial No. 272,783. (No model.)

Claim.—1. In a steam flue-cleaner, the combination, with the steam-supply pipe, of a spring-controlled sleeve adapted to slide thereon and having an outwardly-projecting edge, and a tapered head B, shaped to co-operate with said projecting edge to produce a narrow steam-jet opening and longitudinally-adjustable upon said sleeve to regulate the size of said opening, substantially as set forth.

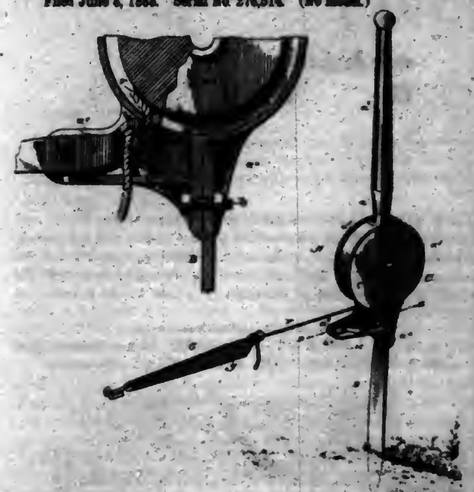
2. The combination, with the steam-supply pipe, of a sleeve fitted to slide thereon and having a tapered head, B, said sleeve having a chamber in its forward end, and a spring, F, situated in said chamber and bearing against the end of said pipe for forcing the sleeve forward relative to said pipe, substantially as set forth.

3. The combination, with a steam-supply pipe, of a sleeve fitted to slide longitudinally thereon and having a tapered head, and a steam-jet opening formed between relatively-adjustable parts, a spring for forcing said sleeve forward, and a valve and valve-seat independent of the jet-opening on said pipe and sleeve, which valve is closed by the action of the spring, and when closed prevents further movement of the sleeve relative to the pipe, substantially as set forth.

4. The combination, with a steam-supply pipe, of a sleeve fitted to slide thereon, a spring for forcing said sleeve forward upon the pipe, an outwardly-projecting flange or edge upon the sleeve, and a tapered head shaped to co-operate with said edge to form a narrow steam-jet opening and adjustably mounted upon a screw-thread upon said sleeve, substantially as set forth.

398,484. HANGER FOR VENETIAN BLINDS. JAMES G. WILSON, New York, N.Y. Filed July 27, 1888. Serial No. 281,236. (No model.)

Claim.—1. A hanger for Venetian blinds, consisting of a parallel series of hinged metallic sections, in combination with cross-pieces pivoted at their extremities to opposite alternate hinges of said series, substantially as set forth.



2. The herein-described hanger for Venetian blinds, comprising two strips each made up of a series of hinged metallic sections, a series of cross-pieces pivotally connected to alternate opposite hinges of said strips, and stop-lips adapted to limit the movement of the sections

398,484.

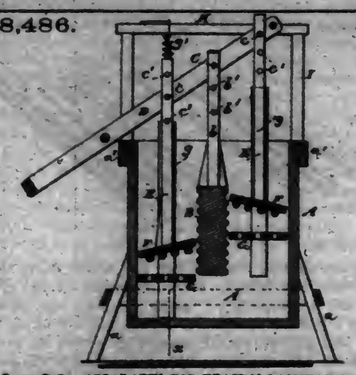
between said cross-pieces, whereby the outward folding of said sections is insured, substantially as and for the purposes set forth.

398,485. CHECK-ROW DEVICE FOR PLANTERS. JOHN W. BARTLETT, Moline, Ill., assignor to the Moline Plow Company, same place. Filed June 2, 1888. Serial No. 276,514. (No model.)

Claim.—1. In an anchor for a check-row wire or cord, the combination of a case or body having a blade to enter the ground, the winding-drum and its actuating-spring, the cord attached to and winding on the drum, and the arm or latch G, attached to said winding-cord and adapted to receive the check-row wire, and also adapted to engage directly and detachably with the body.

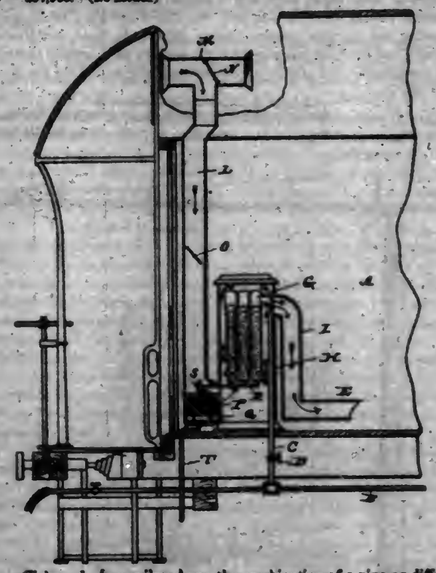
2. In an anchor for a check-row wire, the case or body having the flat or angular blade adapted to resist rotation in the ground, the stud a^2, and spring H, and the laterally-detachable arm G, adapted to engage the stud, said elements constructed and combined, as described, to permit the lateral disengagement of the arm G.

3. In anchor for a check-row wire, the combination of a body having the flattened or angular blade adapted to enter the ground and resist rotation therein and an arm or latch, G, to receive the check-row wire directly interlocked with the body and adapted to disengage therefrom by a lateral movement.



4. The case recessed in its two sides and provided with an anchoring blade and handle, in combination with the central shaft, the spring, the drum or pulley, the cord winding on the drum, and the arm or latch attached to said cord.

5. The case recessed in its two sides, the side plates applied thereto, and the central shaft provided with the plate-holding pins, in combination with the spring, pulley, and cord, as shown.



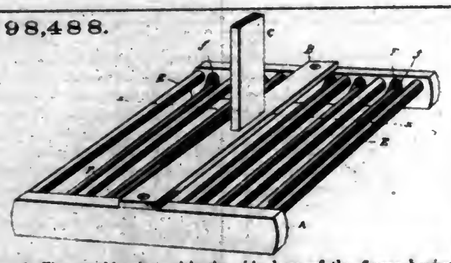
398,486. WASHING-MACHINE. GEORGE E. BEARE, White Stone Va. Filed July 14, 1888. Serial No. 279,910. (Model.)

Claim.—The wash-board B, fixed in the middle of the suds-box A, but not extending to the bottom thereof, and provided with vertical standards *b b*, perforated at *b'*, in combination with two inclined followers, F F, having standards E E, perforated at *e'*, and two clothes-rests, G G, arranged on the lower ends of arms *g*, suspended from springs *g'*, whereby said parts are adapted to be used in connection with an adjustable lever-frame, C D, in the manner described.

398,486.

398,487. APPARATUS FOR HEATING RAILWAY-CARS. GEORGE H. BENJAMIN, New York, N. Y., assignor to The Safety Car Heating and Lighting Company, of New Jersey. Filed Nov. 30, 1887. Serial No. 257,009. (No model.)

Claim.—1. In a railroad-car, the combination of a pipe or diffusing air-flue within the car provided with lateral flues, a steam-radiator, a pipe for connecting said radiator with the source of steam, a casing for said radiator, with which the diffusing air-flue is connected, an air-induction pipe communicating with the external air and said casing, an air-filter for said induction-pipe, a pipe arranged to moisten the filter by the water condensed in the radiator, and a waste-pipe leading from the filter, substantially as set forth.

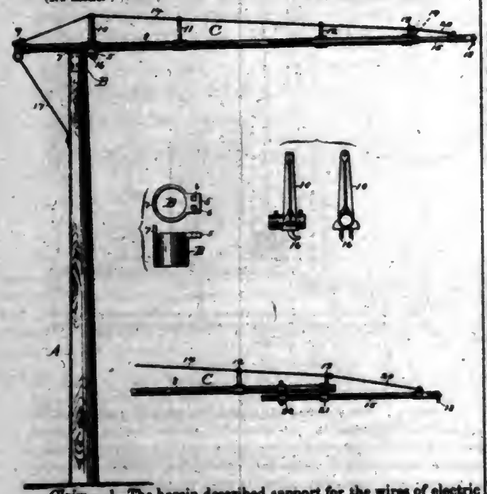


2. In a railroad-car, the combination of a pipe or diffusing air-flue within the car provided with lateral flues, a steam-radiator, a pipe for connecting said radiator with the source of steam, a casing for said radiator, with which the diffusing air-flue is connected, an air-induction pipe communicating with the external air and said casing, an air-filter for said induction-pipe, a pipe arranged to moisten the filter by the water condensed in the radiator, a waste-pipe leading from the filter, and an air-damper, U, in one end of the radiator for admitting air and for placing the filter-basket P, substantially as set forth.

398,488. CHURN-DASHER. CONRAD BERST, Kansas City, Mo. Filed Oct. 23, 1888. Serial No. 288,975. (No model.)

Claim.—1. In a dasher, the combination, with the frame and the fixed beaters arranged at intervals along the frame, of the vertically-movable beaters arranged between the fixed beaters, substantially as hereinbefore described.

2. In a dasher, the combination, with the frame and the fixed beaters arranged at intervals along the frame, of the vertically and laterally movable beaters placed between the fixed beaters to create a counter-current, substantially as and for the purpose described.



398,488.

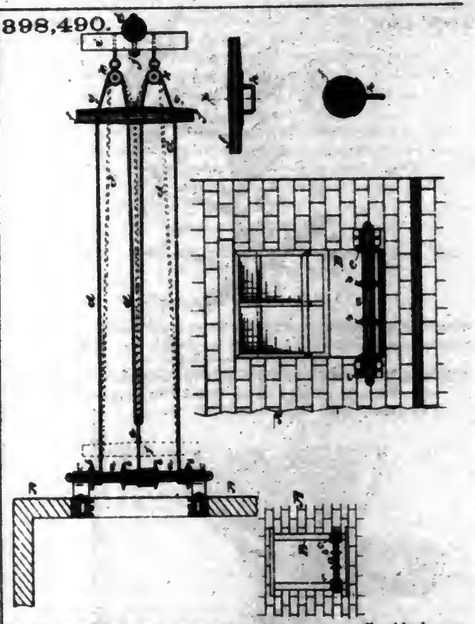
3. The combination, with the side bars of the frame having recesses *f* in their opposing sides, which recesses are widened at their lower ends, and the beater-bars F, having their ends inserted in the said recesses and free to move vertically and laterally, of the fixed beater-bars arranged between the movable beater-bars and connecting the said side bars together, substantially as and for the purpose described.

4. The herein shown and described dasher, composed of the side bars having recesses in their opposing sides, said recesses being contracted at their upper ends and widened at their lower ends, the cross-bar uniting the said side bars, the dasher-rod fitted to the said cross-bar, the movable beaters having their ends fitted in the said recesses, and the fixed beaters arranged between the movable beaters and supported in the said side bars, substantially as and for the purpose specified.

398,489. SUPPORT FOR ELECTRIC-RAILWAY WIRES. THOMAS N. BRADY, New Britain, Conn. Filed Sept. 19, 1888. Serial No. 285,768. (No model.)

Claim.—1. The herein-described support for the wires of electric railways, consisting of the pole A, the bracket-arm C, and the adjustable extension 15 at the outer end of said bracket-arm, substantially as described, and for the purpose specified.

2. The bracket-arm C, consisting of a lower bar, truss-irons, truss-wire, and an extension at the outer end, and the extension-wire 20, for forming a continuation of the truss-wire to near the outer end of said bracket-arm, substantially as described, and for the purpose specified.



3. The combination of the pole A, cap-iron B, having legs 5 and 7, the truss C, fitted to said cap-iron, and the brace 17, substantially as described, and for the purpose specified.

398,490. HANGING DEVICE FOR CLOTHES-LINES. HENRY R. REED, Newark, N. J. Filed May 2, 1888. Serial No. 272,554. (No model.)

Claim.—1. In a clothes-line holder, the combination, with a reel adapted to be secured to a house and a clothes-line secured to said reel, of a separator secured at or near its ends to the clothes-line, pulley-blocks through which the clothes-line passes, eyebolts adapted to be secured in a post or wall of a house, and a drawing-rope secured at one end to the middle of the reel and at the other end at or near the middle of the clothes-line, substantially as and for the purposes set forth.

2. In a clothes-line holder, the combination, with a reel adapted to be secured to a house, of a cross-bar adapted to be secured to a

398,490.

post or wall of a house, eyebolts in said cross-bar, pulley-blocks connected to said eyebolts, a clothes-line secured to said reel and passing over and through the pulley-blocks, and a drawing-rope secured at one end to the middle of said reel and at the other end at or near the middle of said clothes-line, substantially as and for the purposes set forth.

398,491. STEAM-ACTUATED VALVE. JOHN C. BROMLEY, Rock Island, Ill. Filed May 4, 1888. Serial No. 272,804. (No model.)

Claim.—1. The combination of the cylinder and valve-chest, the ports D E, and channels F G, communicating with the opposite ends of said cylinder and centrally with the chest, and the ingress port C, communicating with the center of the valve-chest, and exhaust-ports O *o*, communicating with the ends of said chest, with the piston and the steam-actuated valve in said chest adapted to simultaneously establish communication between the port C and one port, E or D, and to establish communication between the remaining one of said ports and one exhaust-port, O or *o*, all constructed and arranged to operate substantially in the manner and for the purpose described.

2. The combination of the cylinder and valve-chest and the steam ingress and egress ports and channels therein, constructed and arranged substantially as described, with the piston-head H, having annular non-communicating grooves I and perforations *i i* in its opposite faces communicating with said grooves and the valve in said chest, all constructed and arranged to operate substantially as and for the purpose described.

3. The combination of cylinder A, its ports D and E, channels F and G, and piston-head H, grooved and perforated substantially as described, and the valve-chest B, its ingress and egress ports C and O *o*, with the valve J, having collars K *k*, heads L *l*, and intermediate reduced portions, *j*, P, and *p*, and the annular grooves and perforations in heads L *l*, and the rods Q, lever R, and arm S, all constructed and arranged substantially in the manner and for the purpose described.

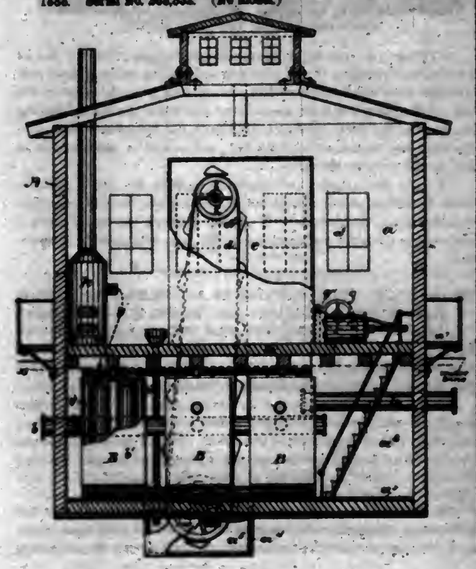
398,492. CARPET-FASTENER. JOSEPH B. CALDWELL, Goodland, Kans. Filed Nov. 21, 1888. Serial No. 291,454. (No model.)

Claim.—The herein-described carpet-fastener, comprising the

398,492.

strip or bar A, adapted to be secured to the floor close to the wall and provided at intervals with tapped apertures C C, and the revoluble hooks having threaded lower ends engaging the said apertures and provided with shoulders E to bind on the upper side of the strip or bar when the free ends of the hooks extend toward the wall, substantially as specified.

398,493. MEAT-BROILER. ANNIS CALLEN, Albany, N. Y., assignor to herself and Alice J. Putnam, same place. Filed Aug. 6, 1888. Serial No. 282,088. (No model.)



Claim.—1. A broiler comprising an open frame having parallel cross rods or wires and a reversible meat-holding frame having a sliding hinge-connection at one end with said cross-rods, substantially as set forth.

2. The combination, with the body or base of the broiler, provided with guide rods or wires, of the meat-holding frame and rings or eyes sliding on said guide rods or wires, and connected to one end of the meat-holding frame, substantially as set forth.

3. The combination, with the body or base of the broiler, provided with guide rods or wires, of the skeleton meat-holding frame, formed of two hinged members and hinged to the said guide-rods by rings, substantially as described.

4. A broiler consisting in an open frame having cross wires or rods, a meat-holding frame hinged to and sliding upon said cross-rods, a handle secured to the open frame and having an eye on one side, and a separate and independent suspending and operating rod having an eye at its outer end and a hook at its inner end, whereby the meat-holding frame may be slid by said rod, and said rod passed through the handle-eye to engage its hook with the swinging end of the meat-holding frame to hold it against the open frame when the broiler is to be suspended, substantially as set forth.

398,494. WATER-RENOVATOR. LEWIS S. CHAMBERLIN, Newark, N. J., assignor to Carrol Phillips Bassett, same place. Filed Mar. 24, 1888. Serial No. 268,332. (No model.)

Claim.—1. In a water-renovating device, the combination, with a filter-tank, *b'*, of a series of pure-water chambers formed by filtering materials within the unfiltered-water chamber of said tank, steam-pipes for conducting steam to said pure-water chambers, pipe *b*, for allowing an inflow of reservoir-water, pipes b^4 b^5, for leading the filtered water from said filter, and having cock b^{21}, for closing off exit therethrough, a waste-pipe, *u*, connecting with said pipe b^4, and having a cock, b^{20}, and a pipe, a^3, leading from the unfiltered-water chamber to said waste-pipe, and having a cock, a^3, therein, substantially as and for the purposes set forth.

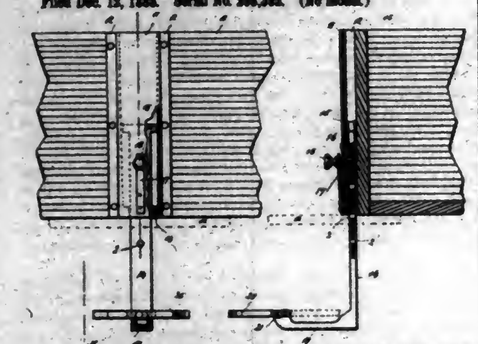
2. The improved floating renovator herein described, combining therein a vessel or structure impervious to water at the bottom and partitioned to form a chamber, a^2, and an aerating-chamber, a^4, therein, filters disposed in chamber a^2 and divided or partitioned by filtering media into filtered-water chambers and unfiltered-water chambers, inlet-pipes connecting the unfiltered-water chamber of the filters with the exterior of the said vessel or structure, said pipes being open at said exterior to allow an inflow of reservoir-water by gravity, pipes connecting the filtered-water chamber with the aerating-chamber, and exit-pipes connecting the aerating-chamber with the outside of the said structure, whereby the filtered and aerated water may be conducted to the main supply-pipes, and an air-pump for forcing air into said aerating-chamber and bringing the air in said chamber under an abnormal pressure, substantially as and for the purposes set forth.

3. The improved water-renovator herein described, combining therein a vessel or structure partitioned to form chambers a' a^2, and partitioned to form an aerating-chamber, a series of filtering-tanks arranged in said chamber a^2, and having therein filtering media, and unfiltered-water chambers and filtered-water chambers, inlet-pipes open to receive reservoir-water and connecting with said tanks, pipes or ducts connecting the tanks and aerating-chamber, and exit-pipes connecting the aerating-chamber with the exterior of the vessel, and adapted to conduct the filtered and air-impregnated water to the main supply-pipe, substantially as and for the purposes set forth.

4. In combination, a vessel or structure having a chamber, a^2, therein and impervious to water at the bottom, and thus adapted to float or be partly immersed in a reservoir without leakage or an uncontrolled inflow thereto, a series of tanks arranged in the chamber a^2 and open to the outside of the said vessel or structure, and having a series of filtering-diaphragms therein, an aerating-chamber, and means, as described, for breaking the water into spray therein, and an air-pump for introducing an abnormal quantity of air into said aerating-chamber, ducts for conveying the water from the filtering-tanks to the aerating-chamber, and ducts or pipes for allowing the outflow of the filtered and air-impregnated water, substantially as and for the purposes set forth.

5. In combination, in a water-renovator, a vessel or structure having a chamber, a^2, for the reception of tanks and an aerating-chamber, pipes for leading reservoir-water through the chamber a^2 to said tanks, an elevator for raising the filtered water to the aerating-chamber, a pump connected with said aerating-chamber and adapted to force air therein and produce an abnormal air-pressure therein, and a pipe for conveying the filtered and air-impregnated water from the said vessel or structure, substantially as and for the purposes set forth.

398,495. BOTTLE-STOPPER. JOHN H. COREY, Pittsfield, Mass. Filed Nov. 16, 1888. Serial No. 290,960. (No model.)



Claim.—1. In a bottle-stopper, the combination of the disk provided with a depending barrel, the washer encircling the barrel and provided near its upper end with a lateral flange bearing on the top of the bottle, and a vertical flange projecting above the lateral flange, and means to draw the disk downward, substantially as specified.

2. The combination, with a stopper provided with a central bore having diametrically-opposite tapering grooves in its sides, of the valve fitting the lower end of the bore and the handle or loop passing through the bore and tapered toward its lower end to fit in the said grooves to allow the valve to drop, substantially as specified.

3. In a bottle-stopper, the combination of the disk provided with a depending barrel and having a central vertical bore, the lateral flange *f* on the lower end of the barrel, the washer fitting around the barrel and provided with an internal groove, *g'*, fitting over the flange *f*, and an inward-extending lip, g^2, fitting over the lower end of the barrel and provided with a depression or valve-seat, and the valve fitting in the said depression or valve-seat and provided with a handle or loop extending upward through the bore, substantially as specified.

4. The combination of the disk D, bearing on top of the bottle and having a depending barrel extending into the neck of the bottle, and provided with grooves I I and notches *i i* in diametrically-opposite sides of its bore, the valve fitting against the lower end of the barrel, and the handle or loop K, connected to the valve and extending through the bore of the barrel and adapted to have its sides engaged in either the grooves I or the notches *i*, substantially as specified.

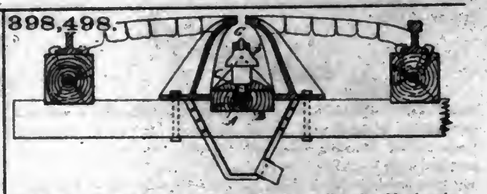
398,496. FOLDING STEP. HARMON T. CORE, Marshall, Ill. Filed Dec. 12, 1888. Serial No. 293,392. (No model.)

Claim.—1. The combination, with a case arranged for connection with a vehicle-body and provided with a spring-pressed plug or pin, of an apertured standard mounted within the case, and a step hinged to the standard, substantially as shown and described.

2. The combination, with a case arranged for connection with a vehicle-body and provided with a spring-supported plug or pin, of an apertured standard mounted within the case, an arm extending outward from the standard, and a step hinged to the arm, substantially as described.

3. The combination, with a case, 11, formed with shoulders 13, of a plug or pin, 16, a spring, 17, by which the plug is carried, a standard, 14, formed with apertures 2 and with shoulders 15, an arm, 19, connected to the standard and formed with a shoulder, 21, and a step, 20, hinged to the arm, substantially as described.

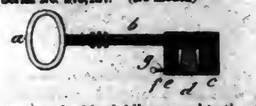
398,497. DEVICE FOR HOLDING CARD-CLOTHING ON GRINDING-MACHINES. GEORGE O. CURRIER, Leicester, Mass., assignor of one-half to J. & J. Murdock, same place. Filed Oct. 15, 1888. Serial No. 288,119. (No model.)



Claim.—1. A device for holding sheets of card-clothing on a grinding-cylinder, consisting of two bars extending parallel to the axis of the cylinder and provided with teeth or sharp points on their under surface, in combination with a stud secured on the cylinder, an adjustable collar on said stud, hinged arms extending from said collar to said bars, and means for drawing down said collar to spread the arms and bars for the purpose stated, substantially as shown and described.

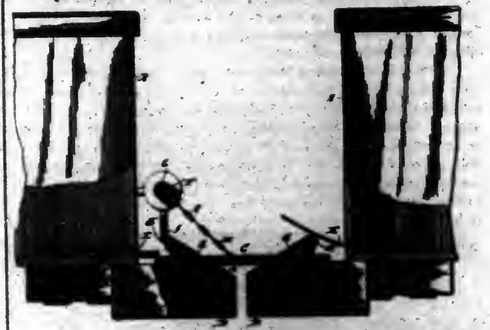
2. In a device for holding sheets of card-clothing on a grinding-cylinder, the combination, with two parallel bars, 4, having teeth on their lower surface, and arms 12, having downwardly-projecting shoulders 12', for the purpose stated, and hinged at their outer ends to the ends of said bars 4, with their inner ends hinged to the adjustable collar 8, and said collar 8 supported on stud 5, and means for adjusting said collar, of said stud 5, extending up from the cylinder-face, a cam-lever, 6, secured upon the lower end of said stud for drawing down said stud and collar 8 to spread the bars 4 against the action of a spiral spring, 9, and said spring, all combined and operated substantially as shown and described.

398,498. CONDUCTOR FOR ELECTRIC RAILWAYS. OLOF DAHL, Brooklyn, N. Y. Filed Nov. 23, 1888. Serial No. 291,843. (No model.)



Claim.—1. In an electric-railway system, a main continuous insulated conductor provided at intervals with posts electrically and rigidly connected thereto, the heads of the posts being inclosed by air and water tight chambers having flexible walls, all in combination with a sectional conductor, the sections of which are movable and

rigidly and electrically connected with the walls of said chamber, whereby a weight upon the sectional conductor will establish electrical connection between the main and sectional conductor, as described.



2. In an electric railway, a continuous electrical conductor, in combination with a sectional conductor whose sections are movable with respect to each other, the ends of the sections lapping each other and lying side by side, one of each adjacent pair of ends being beveled gradually toward its extremity, so that its contact side at the extreme end will normally be below the contact side of the adjacent lapping end, whereby when the current-collector passes from one section to another it will not be impeded and the flow of current to the collector will not be stopped.

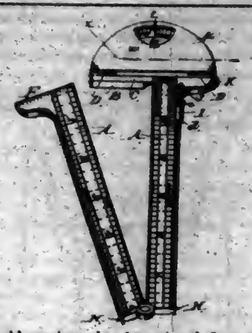
398,499. KEY. JOSEPH P. DANDURAND, Virginia City, Nev. Filed May 26, 1888. Serial No. 275,127. (No model.)

Claim.—A key having the bit rigidly secured to the stem thereof, tumblers mounted on either side of the bit, and a pin passing through one of said tumblers and engaging the side of the bit, substantially as shown and described.

398,500. CAR-COUPLING. IRA C. DOYAL, Chumley, Ala. Filed Sept. 27, 1888. Serial No. 286,479. (No model.)

Claim.—1. In a car-coupler, the combination, with the link of the blocks secured to the draw-heads and having inclined faces and provided with shoulders standing inward and over the ends of the link, of the transverse shaft journaled on one end of the car and having crank-arms, the drum secured to said shaft, and the chains secured to the drum and to the sides of the link, and operating substantially as and for the purpose described.

2. In a car-coupler, the combination, with the link C and the block D, secured to the draw-head and having the inwardly-standing shoulder *d'*, of the detent-bar I, passing through the guide-staple *i'* and resting upon the adjacent end of the link, substantially as specified.



398,501. COMBINED PLOTTER AND PROTRACTOR. JOHN R. DUFFIN, Chester, Ill. Filed Oct. 3, 1887. Serial No. 251,905. (No model.)

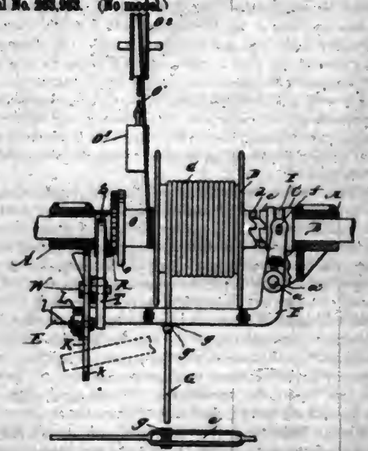
Claim.—1. In a drafting-instrument, the combination of the rule A, having at one end the disk C, the protractor-flange secured to said disk, and the flanged and movable hood or cap E, fitted over said disk and protractor-flange, substantially as herein described.

2. In a drafting-instrument, the combination of the rule A, having at one end the disk C, the graduated protractor-flange seated on said disk, a hood or cap fitted over said disk and protractor-flange, and the block B, said hood or cap having a flanged portion inclosing the outer edges of the disk, the protractor-flange, and the block, substantially as described.

3. In a drafting-instrument, the rule A, having the disk at one end and the flange D, seated on said disk, and having the open center *n*, in combination with the flanged cap or hood having the projecting

398,501.

portion *m* fitting said opening, whereby a pivot is formed around which the disk moves, substantially as described.



4. In a drafting-instrument, the combination of the rule A, having a disk at one end, the flanged hood or cap having a projection fitted in the open center of the disk, whereby said disk may be turned, and the stop-catch L, seated in a recess formed in the disk, said catch having its outer end adapted to project through an opening in the flange of the hood and its inner or free end bearing against one of the walls of the recess, substantially as described.

5. In a drafting-instrument, the combination of the rule A, the pivoted blade C, let into said rule, and the disk C, said disk having a groove within which the blade fits when swung outward to form the middle blade of a center-square, substantially as described.

6. In a drafting-instrument, the combination of the rule A, having the binding H, the sliding clasp I, having the barrel *c*, the pin K, fitted in said barrel, and the nut or socket J, for containing the marking-point, substantially as described.

7. In a drafting-instrument, the rule A, in combination with a clasp fitted to slide thereon, said clasp having a spring-actuated tongue provided with a barrel or socket, a pin adapted to fit said barrel or socket, and the nut or socket J, carried by the rule and adapted to receive a marking-point, substantially as and for the purpose specified.

398,502. CLUTCH MECHANISM FOR WINDING-DRUMS. JULIUS A. DYRLIE and BYVIND L. HEIDENREICH, Chicago, Ill. Filed Feb. 14, 1888. Serial No. 263,963. (No model.)

Claim.—1. The combination, with the winding-drum having teeth on its hub, a clutch-box for engagement with said hub, and a load-rope provided with a suitable stop, of a pivoted elbow-lever, E, one arm of which is connected directly with and is adapted to move in the same direction as the clutch-box, and the opposite arm of which extends across the winding-drum and is provided with an open space, *e*, adapted to engage with the stop on the load-rope, substantially as described.

2. The combination, with a winding-drum having teeth upon its hub, a clutch-box for said drum, and a winding-rope provided with a suitable stop, of an operating-lever adapted to engage said stop of the winding-rope, a suitable arm or bracket for engaging said operating-lever, a cam connected with and controlled by the movement of said winding-drum, and a throw-off lever having one arm extending into the path of said cam and having its opposite arm arranged to move the operating-lever for throwing the clutch-box into engagement with the winding-drum, substantially as described.

3. The combination, with a winding-drum having teeth on its hub and its clutch-box, of an operating-lever connected with said clutch-box, a suitable dependent arm or bracket for sustaining said operating-lever in elevated position, a throw-off lever for releasing said operating-lever, a cam for moving said throw-off lever, a ratchet-wheel for controlling the movement of said cam, and an engagement-rope and its winding-drum having a pawl for effecting the movement of said ratchet-wheel, substantially as described.

4. The combination, with a winding-drum having teeth on its hub and its clutch-box and a load-rope, of an operating-lever, E, a dependent arm or bracket, K, provided with a shoulder, k^2, a counterweighted throw-off lever, T, a cam, S, and ratchet-wheel R upon the main shaft, a pawl, P, engaging with said ratchet-wheel R, a drum, O, and engagement-rope O', and a counter-weight, O^2, substantially as described.

5. The combination, with a winding-drum having teeth on its hub and its clutch-box and a load-rope, of an operating-lever, E, for controlling said clutch-box, a dependent arm or bracket, K, having a shoulder, k^2, a dog, L, to temporarily prevent the entrance of said operating-lever into the space above said shoulder, and suitable mechanism for throwing said operating-lever out of engagement with the shoulder k^2, substantially as described.

398,503. LAMP-BURNER. STEPHEN ELLIS, Jacksonville, Ill. Filed Sept. 14, 1888. Serial No. 285,267. (No model.)

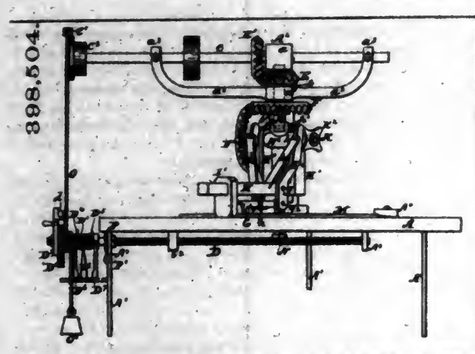
Claim.—1. A lamp-burner constructed with a perforated horizontal plate, with a wick-tube projecting through the same, an air-tube and gas-tube, a guard-casing resting on the perforated horizontal plate of burner and inclosing the wick-tube and open upper ends of air-tube and gas-tube, with a closed top surrounding the wick-tube, openings in its sides for the passage of air, and an air-space between its walls and the wick-tube and above the open upper ends of air-tube and gas-tube and the perforated horizontal plate of lamp-burner, substantially as shown and described.

2. A lamp-burner constructed with a perforated horizontal plate, with a wick-tube projecting through the same, an air-tube and a gas-tube, inlet air-passages in the burner beneath the horizontal perforated plate, a guard-casing resting on the perforated plate and inclosing the wick-tube and upper ends of air-tube and gas-tube, with a closed top surrounding the wick-tube, openings in its sides for the escape of air and gas, and an air-space between its walls and the wick-tube and above the open upper ends of air-tube and gas-tube and the perforated plate, substantially as shown and described.

3. A lamp-burner constructed with a perforated horizontal plate, with a wick-tube projecting through the same, an air-tube, and a guard-casing extending over the open upper end of air-tube inclosing the wick-tube and forming an intervening air-space, with a closed top surrounding the wick-tube, and openings in its sides for the passage of air, substantially as shown and described.

4. In a lamp-burner, the guard-casing 6, formed with the vertical portion 9, wick-tube slot 10 in its top, air-openings 11 in its sides, and a base portion, 7, extending laterally therefrom, with a depending flange, 8, substantially as described.

5. The combination, with a lamp-burner, 1, constructed with air-inlet openings 13, an air-tube, 2, and a gas-tube, 5, located adjacent to the wick-tube 3, with their upper open ends in the perforated plate 4, of a detachable guard-casing, 6, having a base portion, 7, with depending flange 8, resting on plate 4 and inclosing open ends of air-tube 2 and gas-tube 5, and the vertical portion 9, with a slot, 10, in its top, inclosing wick-tube 3, and openings 11 in its sides for passage of air from the space between the wick-tube 3 and casing 6, substantially as shown and described.



398,504. DIVIDING-ENGINE. JAMES A. FARQUHAR, Little Rock, Ark. Filed Jan. 28, 1888. Serial No. 262,231. (No model.)

Claim.—1. In a dividing-engine, the combination of the table or work-holder and a radially-moving tool-carrying arm, with a tangent-plate connected with said arm for marking tangent-graduations upon an arc or plate, substantially as described.

2. In a dividing-engine, the combination of the table or work-holder and a radially-moving arm for carrying a reciprocating marking-tool, a tangent-plate connected with said arm, and an operating-screw for moving the tangent-plate and carrying the outer end of the radially-moving arm, substantially as described.

3. In a dividing-engine, the combination of a table or work-holder

398,504.

and a radially-moving arm having its outer end carried by an adjustable tangent-plate, and a reciprocating tool-holder supported upon said arm, substantially as described.

4. In a dividing-engine, the combination of a table or work-holder and the radially-moving arm carried by an adjustable tangent-plate, a reciprocating tool-holder supported upon said arm, and cam for connecting and intermittently reciprocating said tool-holder, and gearing for moving said tangent-arm, substantially as described.

5. In a dividing-engine, the combination of a table or work-holder and the radially-moving arm pivoted above the center of the work-plate, the reciprocating tool-holder, a driving-shaft, K, above said center, and arms K^2 for reciprocating said tool-holder, substantially as described.

6. In a dividing-engine, the combination of a table or work-holder and the radially-moving carrier-arm pivoted above the center of the work-plate, the reciprocating tool-holder, a driving-shaft, K, and an arm, K', for lifting said tool-holder, substantially as described.

7. In a dividing-engine, the combination of a table or work-holder and the radially-moving carrier-arm having its pivot above the center of the work-plate, the reciprocating tool-holder, a driving-shaft, K, and levers $L' L^3$, operated by cams upon the said shaft to respectively reciprocate and raise or lower the said tool-holder, substantially as described.

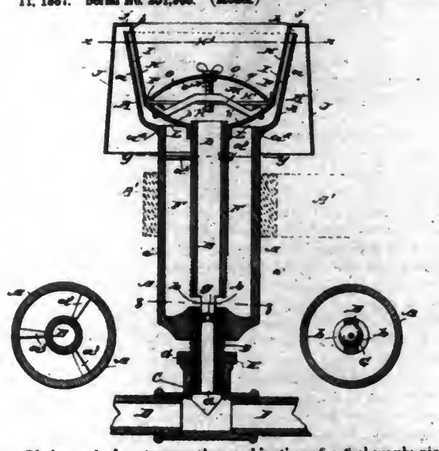
8. In a dividing-engine, the combination of a table or work-holder and an overhanging bracket, a vertical shaft supported thereon, and a tool-carrying arm and tool-holder suspended from said shaft and to be rotated upon said shaft, and gearing for reciprocating the said tool-holder independently of the movement of the said arm, substantially as described.

9. In a dividing-engine, the combination of a table or work-holder and an overhanging bracket, a vertical shaft suspended therefrom for operating the tool-holder, a tool-holder arm and carrier suspended from said shaft, and a centering-bolt passing through the table and passing into a recess in the lower end of the said carrier, substantially as described.

10. In a dividing-engine, the combination of a table or work-holder and a driving-shaft supported above the table, a radially-moving tool-carrying arm and tangent-plate connected therewith, and a screw-shaft fitted under the tangent-plate and operated by the driving-shaft, substantially as described.

11. In a dividing-engine, the combination of a table, the driving-shaft connected with and reciprocating the tool-holder, the radial arm and tangentially-located screw-shaft, a sleeve fitted upon said shaft, and means, as described, for connecting the sleeve and shaft D to operate the same, substantially as described.

12. In a dividing-engine, the combination of a table, a driving-shaft connected with and operating the tool-holder, a radial tool-carrying arm and tangent-screw, a sleeve, a crank-arm upon the driving-shaft, a cord connecting said arm and sleeve, substantially as described, and a weight for returning the sleeve to its normal position upon the shaft, substantially as described.



13. In a dividing-engine, the combination of a table, the driving-shaft, a radial tool-carrying arm and tangent-screw, a sleeve, a cord for rotating said sleeve, and an arm adjustably supported upon the shaft to operate the sleeve, substantially as described.

14. In a dividing-engine, the combination of a table, a radial tool-carrying arm, a tangent-screw, a sleeve upon said screw, an arm or arms secured to and projecting from said sleeve, and stops supported upon the frame for arresting the movement of said arms, substantially as described.

15. In a dividing-engine, the combination of a table, a radial tool-carrying arm, a tangent-screw, a sleeve supported upon said screw, stops supported upon the frame, and an arm or arms adjustably secured upon the sleeve to regulate and limit the movement of the sleeve, substantially as described.

16. In a dividing-engine, the combination of a table, a radial tool-carrying arm, a tangent-screw, a screw-threaded sleeve supported upon the screw-shaft, and a fixed blade engaging with the thread of the sleeve to guide it and cause it to move endwise upon the shaft, substantially as described.

398,505. BURNER. JAMES GIBSON, Jersey City, N. J. Filed Oct. 11, 1887. Serial No. 251,963. (Model.)

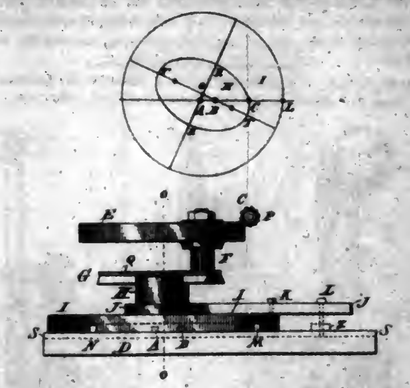
Claim.—1. In a burner, the combination of a fuel-supply pipe, forming also a gas and air mixing tube and apertured at its inner part for inlet of air, and a body or casing surrounding the pipe and forming a chamber supplying or conducting superheated air to the interior of the pipe and in advance of the point of ignition of the burner, the aperture of said fuel-supply pipe and mixing-tube forming the outlet from said superheating-chamber toward the point of ignition for the air superheated in said chamber, and said body or casing and the fuel-supply pipe and mixing-tube made relatively adjustable to control the supply of superheated air to said pipe and to the point of ignition of the burner, substantially as herein set forth.

2. In a burner, the combination of a fuel-supply pipe, forming also a gas and air mixing tube and apertured at its inner part for inlet of air, a flame-cup held at the outer part of said pipe, and a body or casing surrounding the pipe, and also the side walls of the flame-cup, and forming outside the pipe a main chamber supplying or conducting superheated air to the interior of the pipe, and forming at or next the flame-cup walls a passage for superheating air prior to its inlet to the air-superheating chamber around the pipe, said inner aperture of the fuel-supply pipe forming the outlet from said chamber toward the point of ignition for the air superheated in said chamber, substantially as herein set forth.

3. In a burner, the combination of a fuel-supply pipe, forming also a gas and air mixing tube and apertured at its inner part for inlet of air, a flame-cup held at the outer part of said pipe, and a body or casing surrounding the pipe and forming a chamber supplying or conducting superheated air to the interior of the pipe and through its inner aperture in advance of the point of ignition at the flame-cup, said body or casing and fuel-supply pipe made relatively adjustable to regulate the supply of air to the pipe at a passage next the flame-cup wall, and said inner aperture of the pipe forming the outlet from the air-superheating chamber toward the point of ignition for the air superheated in said chamber, substantially as herein set forth.

4. In a burner, the combination of a fuel-supply pipe, forming also a gas and air mixing tube and apertured at its inner part for inlet of air, a flame-cup held at the outer part of said pipe, a plate fitted in the flame-cup to deflect the flame to its side walls, and a body or casing surrounding the pipe, and also the side walls of the flame-cup, and forming outside the pipe a main chamber supplying or conducting superheated air to the interior of the pipe, and forming next the flame-cup walls a passage for superheating air prior to its inlet to the air-superheating chamber around the pipe, said inner aperture of the fuel-supply pipe forming the outlet from said chamber toward the point of ignition for the air superheated in the passage next the flame-cup walls and in the chamber outside the pipe, substantially as herein set forth.

5. The combination, in a burner, of a gas and air mixing tube, B B, apertured at *b* at its inner part, and a casing, A, having an open outer end admitting air and fitted at its closed inner end to the mixing-tube beyond or outside of its apertures *b*, substantially as shown and described, whereby an air superheating and conducting chamber, F, is formed between the mixing-tube and casing, and the superheated air from said chamber will find passage into the mixing-tube through its apertures *b*, as and for the purposes set forth.



6. The combination, in a burner, of a gas and air mixing tube, B B, apertured at *b* at its inner part, and a surrounding casing, A, having an open outer end, admitting air and fitted adjustably at its closed inner end by a screw-joint to the mixing-tube beyond or outside of its apertures *b*, substantially as described, for the purpose set forth.

7. The combination, in a burner, of a gas and air mixing tube, B B, apertured at *b* at its inner part, a flame-cup, H, held to the outer end or part of the mixing-tube, a casing, A, fitted at its inner closed end to the mixing-tube beyond or outside of its apertures *b*, and extending outward around the tube to form an air superheating and conducting chamber, F, and extending, also, around the flame-cup to form an air-superheating passage, I, all arranged for operation substantially as herein set forth.

8. In a burner, the combination, with the tube B B, apertured at *b* and communicating with a fuel-feed pipe, of a body or casing, A, fitted to the tube back of its aperture, and having a part, *a'*, surrounding the tube, and an upper part, *a*, of a flame-cup, H, held to the tube and providing a passage, I, between the part *a* of the body and the side walls of the cup, and a pendent wall, J, forming an air-inlet and heating-chamber, K, outside the part *a* of the body which surrounds the flame-cup, substantially as herein set forth.

9. The combination, in a burner, and with a fuel-supply pipe, forming also a gas and air mixing tube having an air-inlet at its inner part, and a body or casing fitted to the pipe behind its air-inlet and surrounding the pipe to form an air-superheating chamber, of a fuel-feed-pipe coupling, to which the burner-pipe is threaded, and a lock-nut on the burner-supply pipe at the coupling, substantially as herein set forth

398,506. GEAR-CUTTING MACHINE. GEORGE B. GRANT, Maplewood, Mass. Filed Aug. 2, 1886. Serial No. 209,513. (No model.)

Claim.—1. The combination of the elliptic head H with the blank-holder G, adjustable in a direction parallel to the major axis of the ellipse, substantially as described.

2. The combination of the elliptic head H with the blank-holder G, adjustable in a direction parallel to the major axis of the ellipse, and the stud F, fixed on the center line of the holder, substantially as described.

3. The combination of the elliptic head H with the slide G, adjustable in straight guides on the head, substantially as described.

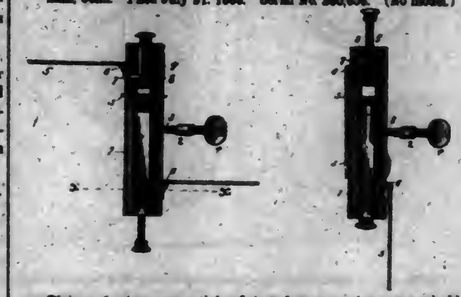
4. The combination of the elliptic head H with the slide G, adjustable in straight guides on the head, and the stud F, in the center line of the holder, substantially as described.

5. The combination of the fixed platen D, the fixed cutter P, with the rotatable elliptic head H, the index I, for spacing the rotary motion of the head, and the index-pin L, confined to move in a straight line with respect to the platen, substantially as described.

6. The combination of the fixed platen D, the fixed cutter P, the rotatable elliptic head H, and the index I on the head, with the two pins A and B on the platen and the two slots M and N on the head, substantially as described.

7. The combination of the fixed platen D, the rotatable elliptic head H, the index I, the pins A and B, and the slots M and N, with the index-pin L and the fixed slot SS in the line of the pins, substantially as described.

8. The combination of the platen D, the rotatable head H, the index I, the arm J, the stop-pin K, the index-pin L, and the slot SS, substantially as described.



9. The combination of the platen D, the rotatable elliptic head H, the pins A and B, the slots M and N, the arm J, the index I, the stop-pin K, the index-pin L, and the slot SS, in the line of the pins A and B, substantially as described.

398,507. MECHANICAL TELEPHONE. ALEXANDER W. HALL, New York, N. Y. Filed May 8, 1883. Serial No. 273,230. (No model.)

Claim.—The combination, with the base A, the diaphragm-supporting ring *c*, and the diaphragm *b*, of the diaphragm-clamping rings *i i'*, and their clamping-screws *g*, and the tension-adjusting screws *e*, applied to said clamping-rings and base, substantially as and for the purpose herein described.

398,508. INSTRUMENT-HOLDER. GEORGE HATCH, South Windham, Conn. Filed July 31, 1883. Serial No. 260,654. (No model.)

Claim.—1. As a new article of manufacture, an instrument-holder consisting of a body, a clamp attached to the body, and the spring grasping-arms projecting from the body, substantially as described.

2. As a new article of manufacture, an instrument-holder consisting of the body, a clamp attached to the body, and the spring grasping-arms pivoted to the body, substantially as described.

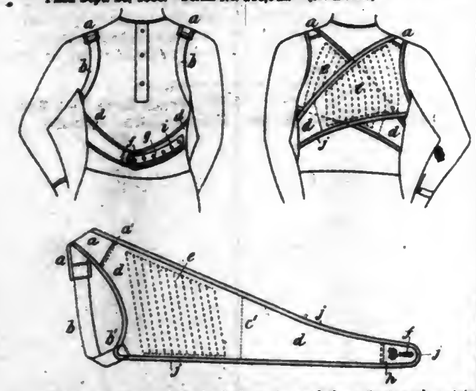
3. As a new article of manufacture, an instrument-holder consisting of a body, a clamp attached to the body, spring-arms pivoted to the body, the inner ends of the said arms projecting into the body, a sliding bolt borne by the body, and locking-lugs attached to the bolt and adapted to strike the inner ends of the spring grasping-arms, substantially as described.

4. In combination, in the within-described instrument-holder, a body, 1, bearing a sliding bolt, 9, having lugs 8, spring-arms 2, pivoted to the body, with their inner end projecting into the path of the lugs 8, and the clamp 2, substantially as described.

398,509. BUTTON-HOLE SCISSORS. JOHANN A. HENKHAS, Solingen, Germany. Filed Sept. 3, 1888. Serial No. 284,967. (No model.)

Claim.—In a pair of button-hole scissors, the combination of the adjusting-pin *a*, the conical slotted nut *b*, having a small neck, the said nut being screwed into one of the arms of the scissors, substantially as described, and for the purpose set forth.

398,510. ELECTRIC SWITCH. WARREN S. HILL, Boston, Mass. Filed May 17, 1888. Serial No. 274,181. (No model.)

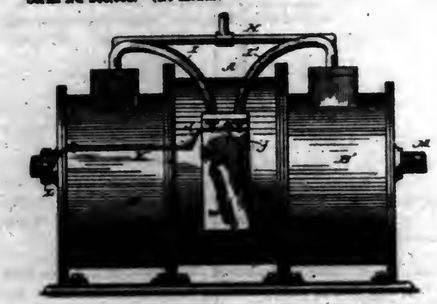


Claim.—1. In an electric switch, the combination, with the terminals having inclined faces, of an arm carrying insulated projections, connectors consisting of a series of thin plates having free ends secured to said projections, and arranged to bear upon the inclined faces of

the terminals, and a handle for operating said arm, substantially as described.

2. In an electric switch, the combination, with the two sets of terminals arranged in a line, each having an inclined face, of a lever carrying two insulating projections, a connector consisting of a series of plates having their centers secured to the insulating projections, a spring for operating the arm in one direction, a handle having an extension-bearing upon a projection of the lever for operating it in the other direction, and a locking-catch for securing it in position, substantially as described.

398,511. BODY-BRACE. ELEANOR R. HOWE, Bridgeport, Conn.

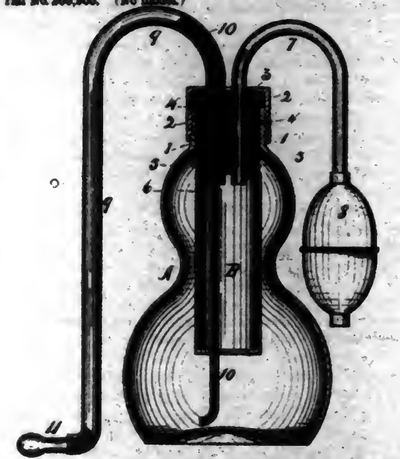


Filed Sept. 26, 1888. Serial No. 286,042. (No model.)

Claim.—1. A band for body-braces, consisting of a tapering strip of flexible fabric, at one end provided with an arm-hole partly encircled by an elastic band and at its other end having a fastening device and re-enforced along its body part by another strip of flexible fabric having its warp-threads at right angles to the warp-threads of the main piece, substantially as set forth.

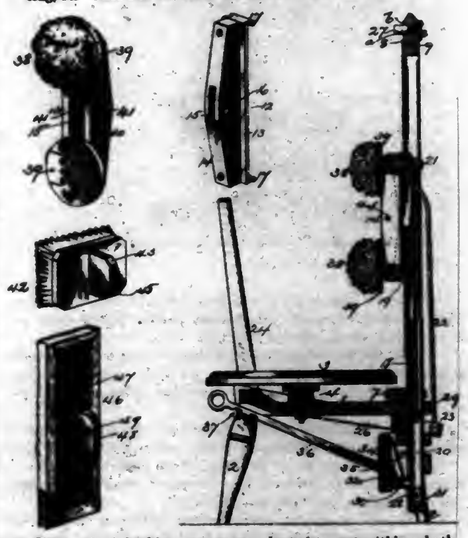
2. A body-brace consisting of two bands, each composed of a shoulder-piece, *a*, a body-piece, *d*, a re-enforcing piece, *c*, and an elastic band, *b*, the direction of the warp-threads in the piece *d* being at right angles to the direction of the warp-threads in the pieces *a* and *c*, and each band provided with a part of a fastening device for securing the ends of the bands together, substantially as shown and described.

398,512. ROTARY ENGINE. LEWIS C. HUSON, Elmira, assignor to Romeyn B. Ayres, Hammondsport, N. Y., and John H. Heale, Scranton, Pa., and the Huson Motor Company, (Limited.) Filed Oct. 24, 1888. Serial No. 288,902. (No model.)



Claim.—1. A compound rotary engine consisting of a central chamber or section having a piston drum or head, the side sections arranged one on each side of the central section and having piston drums or heads, the shaft to which all three of said drums are secured and pipes or channels connecting the exhaust-ports of the side sections with the inlet-ports of the central section, substantially as set forth.

2. In a compound rotary engine, the combination, with a central chamber or section, of two side sections having their exhaust-ports connected with the inlet-port of the central section, each side section being arranged to discharge their exhaust alternately into the said central section, substantially as set forth.



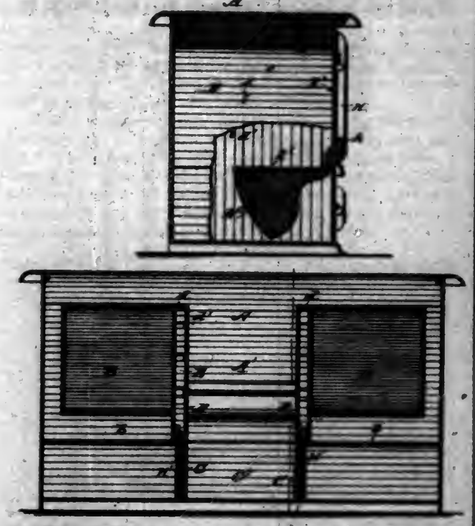
3. In a rotary engine, the combination of the central section, the side sections, the pipes or channels I I', connecting the exhaust-ports of the side sections with the inlet-port of the central section, the valves *i i'*, and connections between valves *i i'* and an eccentric on the shaft, all substantially as and for the purposes specified.

398,513. ATOMIZER. J. GILBERT JUSTIN, Syracuse, N. Y., assignor to Helen De Witt Justin, same place. Filed Apr. 7, 1888. Serial No. 269,908. (No model.)

Claim.—An atomizer consisting of a liquid-holder provided with a cork to close the same, a flexible air-chamber secured to the bottom of the cork, an air-supply tube connected to the air-chamber, a flexible discharge-pipe passing through the air-chamber into the liquid-chamber and inclosed within a discharge-pipe for air, and a spray-nozzle at the end of the discharge-pipe, substantially as described.

398,514. BATHING APPARATUS. EMANUEL W. KITCHEN, Furlong, Pa. Filed Feb. 25, 1888. Serial No. 265,270. (No model.)

Claim.—1. A bathing apparatus adapted to rest within a bath-tub or similar receptacle having water therein and comprising a seat for the bather, a vertical frame connected thereto, a vertical tube communicating at its lower portion with the water-supply, a pipe connected with said tube and extending to the top of the frame and adapted at its upper end to supply water to the bather and the rubbers, valve mechanism under the control of the bather, adapted to govern the supply of water to the bather, a rubber-frame having rubbers thereon and adapted to reciprocate upon the frame of the apparatus, a rubber-operating lever connected with said rubber-frame, and a piston attached to said rubber-frame and adapted to reciprocate within the tube in connection with the water-supply and force water up through the pipe, substantially as set forth.



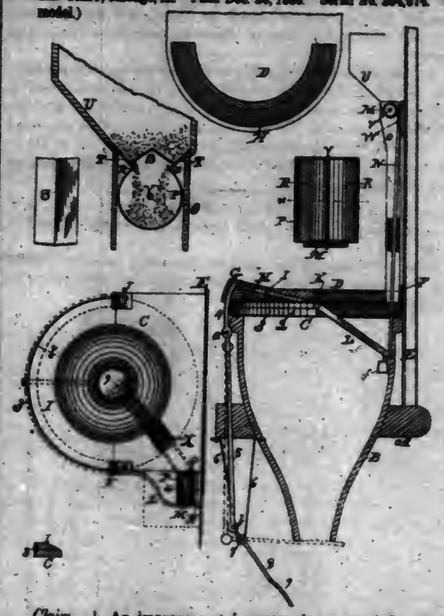
2. A bathing apparatus comprising a seat and seat-support, a framing composed of uprights connected together with an intervening vertical space or passage-way, guide-flanges secured to said uprights, a rubber-frame adapted to engage with and reciprocate along said guide-flanges, a guide-rod depending from said rubber-frame, a tube

secured between the lower portion of said uprights and having water-supply and waste openings and a self-closing valve in its lower end, a water-supply pipe connecting at its lower end with said main supply-tube and extending upwardly therefrom to and projecting inwardly beyond the uprights, an operating-rod connected at one end to the rubber-frame, a hand-lever connected to the lower end of said operating-rod, rubbing devices removably attached to said rubber-frame, a valve hinged to the frame and adapted to close the waste-opening in the main water-supply pipe, and a valve-rod adapted to operate said valve and hold the same either open or closed, substantially as set forth.

3. The combination, in a bathing apparatus, of a framing having a pair of uprights and distance-blocks secured thereto to secure said uprights in position a suitable distance apart, a main water-supply pipe having a waste-opening therein, a water-conveying pipe removably connected at its lower end with said supply-pipe and extending upward therefrom, and having a right-angled upper end, a slotted block attached to the top of the uprights to receive the upper end of said water-conveying pipe, a turn-button pivoted on said block to hold said pipe in position, a rubber-frame adapted to fit and reciprocate between said uprights, removable rubbing devices connected to said rubber-frame, and devices, substantially as described, for attaching said rubber-frame and rubbers and regulating the passage of water through the conveying-pipe, substantially as set forth.

4. In a bathing apparatus, the combination, with a rubber-frame substantially as described, of a sponge rubber comprising a pair of vertical strips adapted to fit over and embrace said rubber-frame, a sponge receptacle or support connected to either end of said strips, and sponges removably secured to said receptacles, substantially as set forth.

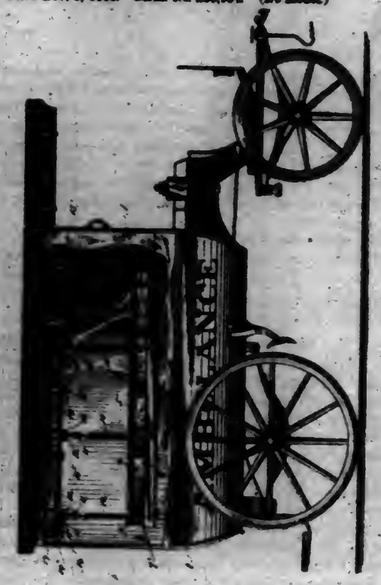
398,515. STOVE OR RANGE. GEORGE G. KNIFFIN, Brooklyn, assignor to Henry R. Jones and Herbert Jones, New York, N. Y. Filed Oct. 10, 1888. Serial No. 287,738. (No model.)



Claim.—1. The combination, with the stove or range having a vertical space at the side of the oven, of the vertically-swinging oven-door having a weight the upper face of which is at right angles to the inner face of the door to rest against the inner side of the front when the door is swung down to a horizontal position, substantially as set forth.

2. The combination, with the range having the two partitions C C, the side ovens, and the detachable partitions D D, resting on the upper edges of partitions C C, parallel with the ovens and having horizontal projections *d* along their upper edges engaging the upper ends of the ovens, of the downwardly-swinging doors hinged at their lower ends to the range-front and having integral weights working in the spaces between the ovens and partitions D, the upper faces of the weights being at right angles to the inner faces of the doors, substantially as set forth.

3. The combination, with the oven of a stove or range, a spaced detachable partition parallel with one side of the oven, and horizontal guide-lugs attached to said oven, arranged upon the arc of a circle, of a drop-door and a counterpoise-weight secured to the door capable of movement between the oven and partition, provided with a cylindrical outer edge and a straight upper surface, substantially as shown and described.

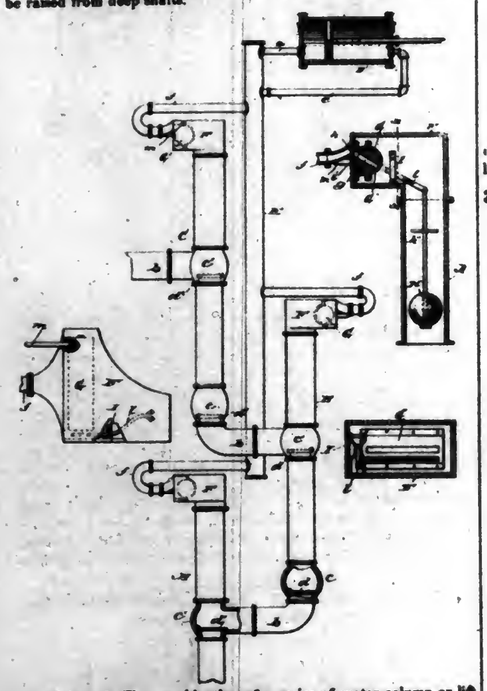


398,516. WATER-CLOSET FOR CARS. LOUIS LATTAN and HERMAN TREPT, Chicago, Ill. Filed Dec. 26, 1888. Serial No. 294,674. (No model.)

Claim.—1. An improvement in water-closets, consisting of the lever I L, which is pivoted to the rabbeted seat C, and the segment part I provided with the rod 4 at its middle portion, in combination with the connecting-rod 5, lever 8, valve 9, bowl B, and a lid, D, provided with a segmental recess, as and for the purpose specified.

2. The seat C, provided with a segmental rabbet in its top front portion, and a lever composed of the segmental part I and the back extending part, L, and the lever pivoted to said seat C, and the segmental part I provided with the rod 4 and lying over said rabbet, in combination with the rod 5, lever 8, and valve 9, the lid D, provided with the segmental recess H, the rod N, jointed to lever L and provided with the rack W, the sand-receptacle U, and the pipes O X, and bowl B, the bucket P, located in the top portion of pipe O, and provided with the shaft V and gear M, and the sand-receptacle U, as specified and shown.

398,517. AMBULANCE. WILLIAM LAWRENCE, Worcester, Mass. Filed Nov. 3, 1888. Serial No. 289,994. (No model.)

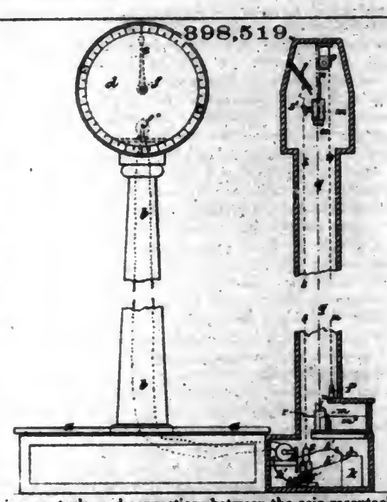


Claim.—1. In an ambulance, the combination, with the stretcher-frame supported by vertical spiral springs and attached to lateral horizontal spiral springs, of means for raising and lowering said frame and holding the same in place, substantially as shown and described.

2. In an ambulance, the combination, with the hanging stretcher-frame, consisting of the base 9, spiral springs 10, and cross-pieces 11, and the horizontal spiral springs 19, attached to said frame, of means for raising and lowering said frame, consisting of a shaft supported and turning in bearings within the ambulance-body, and straps or cords connecting the cross-pieces 11 with said shaft, substantially as shown and described.

398,518. APPARATUS FOR ELEVATING WATER. WILLIAM O. LEETE, Mauch Chunk, Pa. Filed Sept. 20, 1888. Serial No. 286,775. (No model.)

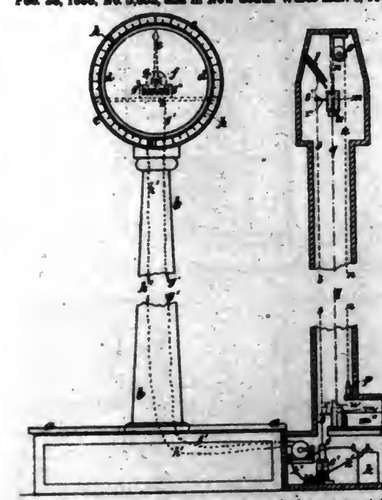
Brief.—By means of an exhaust-cylinder and valve mechanism the air is alternately withdrawn and admitted, thus enabling water to be raised from deep shafts.



Claim.—1. The combination of a series of water columns or lift pipes, A B C, each connected intermediately of its height with the lower end of its adjacent column-pipe, the two check-valves *d d'* within each of said column-pipes, the exhaust air-pump D, arranged to connect with the upper ends of the column-pipes, valves controlling said connection and outside air-inlets at the upper ends of the column-pipes, and combined floats and weights within the upper portions of the column-pipes operating to reverse the actions of said valves, substantially as specified.

2. The combination, with the column-pipes and their upper boxes, F, each of which is provided with an exhaust-air aperture, *h*, and air-inlet *i*, of the valve G within each of said boxes, its cylinder G', its lever *l*, the spring-clamp I, the rod *k*, and the combined float and weight H, essentially as and for the purpose set forth.

398,519. COIN-CONTROLLED INDICATING APPARATUS. FREDERICK G. LYNDE, Manchester, County of Lancaster, England. Filed Jan. 27, 1888. Serial No. 262,162. (No model.) Patented in France Jan. 14, 1888, No. 188,140; in Belgium Jan. 20, 1888, No. 80,235; in Victoria Feb. 28, 1888, No. 5,682, and in New South Wales Mar. 1, 1888, No. 880.



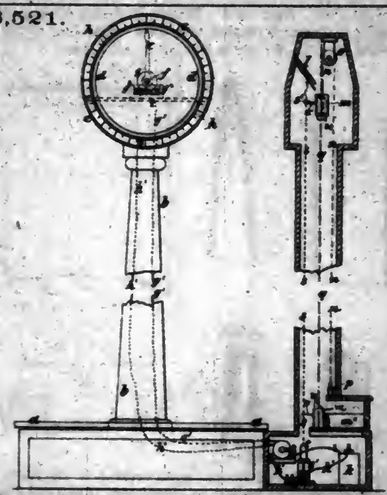
Claim.—1. In a weighing-machine, the combination of a scale and index, one movable and the other fixed, with a semi-opaque shield in front and normally hiding from view the moving part, and a source of light located behind the shield and adapted to illuminate the same when desired.

2. In a weighing-machine, the combination of a scale and index, one movable and other fixed, with a semi-opaque shield in front of and normally hiding from view one of said parts, with a source of artificial light placed behind and adapted to illuminate the shield, a

coin-receptacle, and connections between the coin-receptacle and the light, whereby the exposure of the latter is controlled by the former.

398,520. COIN-CONTROLLED INDICATING APPARATUS. FREDERICK G. LYNDE, Manchester, County of Lancaster, England. Filed Jan. 25, 1888. Serial No. 262,191. (No model.) Patented in France Jan. 14, 1888, No. 188,140; in Belgium Jan. 20, 1888, No. 80,235; in Victoria Feb. 28, 1888, No. 5,682, and in New South Wales Mar. 1, 1888, No. 880.

Claim.—1. The combination, with a coin-box open at the top and movable in a vertical plane, of a bottom for said box movable therein and a stop in its path of movement for engaging with the bottom and forcing the coin up out of the box.



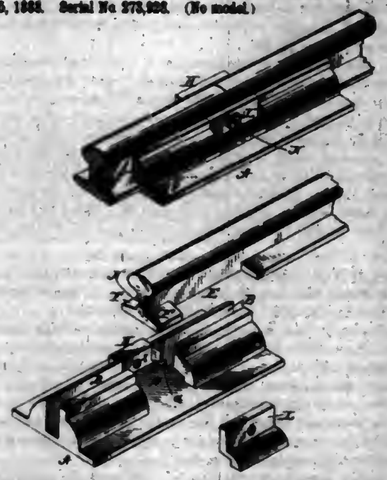
2. The combination of a masked indicator, a light for illuminating the said indicator, a movable controller which causes the light to be displayed or cut off, a movable coin-box attached to and actuating said controller, a movable bottom for said box, causing the removal of said coin when at the end of its path of movement, and means for restoring the box to its normal position.

3. In a weighing-machine, the combination of an indicator and a mask for the same, with an electric lamp located behind the mask and in an electric circuit, a circuit-breaker in the circuit with said lamp, a moving coin-box, and a connection between the latter and the circuit-breaker, whereby the light is controlled by the movement of the coin-box.

398,521. COIN-CONTROLLED INDICATING APPARATUS. FREDERICK G. LYNDE, Manchester, County of Lancaster, England. Filed Jan. 26, 1888. Serial No. 262,192. (No model.) Patented in England Mar. 3, 1887, No. 3,251; in France Jan. 14, 1888, No. 188,140; in Belgium Jan. 20, 1888, No. 80,235; in Victoria Feb. 28, 1888, No. 5,682, and in New South Wales Mar. 1, 1888, No. 880.

Claim.—1. The combination of a metallic visible scale or dial, an

398,521.

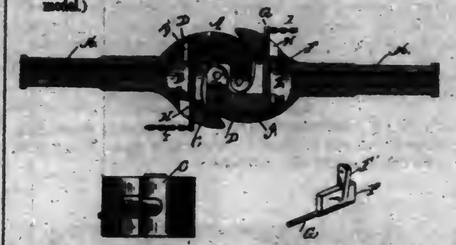


index-finger, and an opaque screen for the latter, with a suitable source of electricity, a circuit therefrom including the index and scale, and a circuit-interrupter, whereby when the circuit is complete a spark or sparks will pass from the index to the scale and indicate their relative positions.

2. In a weighing-machine, the combination of a metallic scale, an index-finger in close proximity thereto, a source of electricity, a circuit therefrom, including the index and scale, and a circuit maker and breaker, with a coin-receptacle, and connections between the receptacle and the circuit maker and breaker, whereby on the insertion of a coin the circuit will be completed and the position of the index denoted by an electric spark or sparks.

3. In a weighing-machine, the combination of the dial and the index or pointer in proximity thereto, one fixed and the other movable, with an opaque screen for the moving part, a suitable source of electricity, a circuit therefrom including both the dial and the index, and a circuit maker and breaker in said circuit, whereby the position of the moving part will be indicated by the passage of a spark from the one member to the other, substantially as described.

398,522. CHAIR AND LOCK-JOINT FOR RAILROAD-RAILS. JAMES H. MARTIN and WILLIAM H. HARRIS, Newberry, S. C. Filed May 15, 1888. Serial No. 273,926. (No model.)



Claim.—1. A chair for railroad-rails having seats with an intermediate locking-space recessed at one end, in which the abutting ends of the rails are secured, substantially as shown and described.

2. The combination, with the chair having seats for the rails and intermediate locking-space and recesses G, of the rails provided with lugs at their ends adapted to fit in the said locking-space, and recesses to hold the rails in the chair, substantially as specified.

3. The combination, with the chair having seats for the rails and an intermediate locking-space, and the perforated web at one side of said space, of the detachable locking-plate, the screw bolt and nut, and the rails having out-away flange portions, whereby the rails are securely fastened, and at the same time the proper expansion and contraction of the rails are provided for, substantially as specified.

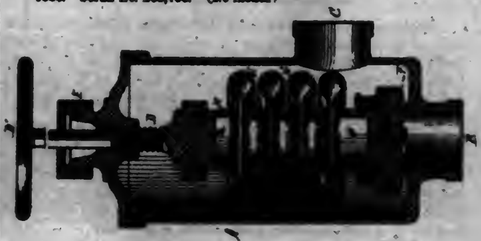
398,523. CAR-COUPLING. JAMES H. MARTIN and WILLIAM H. HARRIS, Newberry, S. C. Filed Dec. 10, 1888. Serial No. 293,079. (No model.)

Claim.—1. An automatic car-coupling having its draw-head provided with a recess, E, a latch, F, having an extension, F', on its upper surface pivoted in said recess, so that the latch will be pendulous in the draw-head, a recess, D', between the latch and inner wall of the draw-head, and the dog D, having a beveled end, *b*, adapted to elevate the latch and engage the said recess D', substantially as specified.

2. The combination, with the draw-head and its pivoted jaw and dog, of the pendulous latch having an arm extending through an opening in one side of the draw-head, and a recess between said latch and draw-head adapted to receive and hold the dog, and said arm adapted to release the dog, substantially as specified.

3. In a car-coupling, the combination, with a draw-head and its pivoted jaw, having a dog, D, with a beveled end, *b*, of the pendulous latch pivoted in the top portion of the draw-head, and having an arm extending through an opening in one side of the draw-head, and a chain connected to said arm, the opposite end of the chain adapted to be connected to a lever on the platform of a car, substantially as specified.

398,524. COVER-FASTENER FOR BUTTER-TUBS. ERWIN W. MAXSON, West Lenox, Pa. Filed Aug. 20, 1888. Serial No. 283,378. (No model.)

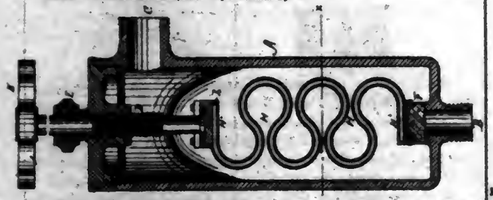


Claim.—1. The cans C, each having a slot, 1, and projection 3, combined with a hoop bent down into such slots, substantially as shown, and for the purposes described.

2. In combination with the slotted cans C and with the cover and its described cleats, the fastening-hooks E F, supported on pivots between the cleats and adapted to engage with said cans and also to be swung on their pivots to fasten or to release the cover.

3. In combination with a cover, the hook F, having a ring at its upper end, and the eccentric lever G, provided with the fulcrum-pin 10 and with the curved rib 11 and pin 12, all substantially as described.

4. In combination with the cleated cover, the hooks E F, eccentric lever G, slotted cans C C, applied to the tub, and the hoop applied to the cans, as set forth.

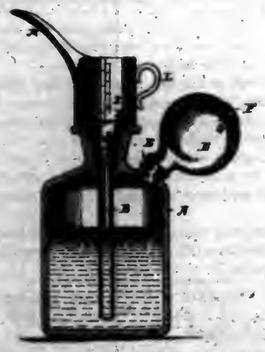


398,525. EXPANSION DEVICE. JOHN MCCLANKEY, Boston, Mass., assignor of one-half to Charles F. Parwell, same place. Filed Aug. 28, 1888. Serial No. 283,700. (No model.)

Claim.—1. The herein-described expansion device, consisting of a tube whose sides are formed externally and internally into one or more annular convolutions of the shape in section of reverse C curves or springs—*i. e.*, arcs comprehending more than semicircles—whereby longitudinal expansion or lengthening of the tube may be obtained, substantially as set forth.

2. The herein-described expansion device, consisting of a tube closed at its ends and whose sides are formed externally and internally into one or more annular convolutions of the shape in section of reverse C curves or springs—*i. e.*, arcs comprehending more than semicircles—said tube containing liquid, whereby by the application of heat longitudinal expansion or lengthening of the tube may be obtained, substantially as and for the purpose hereinbefore described.

398,526. EXPANSION DEVICE. John McCloskey, Boston, Mass., assignor of one-half to Charles F. Farwell, same place. Filed Aug. 25, 1888. Serial No. 283,701. (No model.)

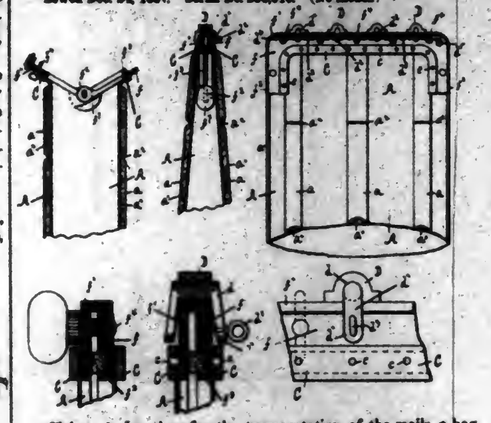


Claim.—1. The herein-described expansion device, consisting of a substantially flattened tube bent or formed into a series of reverse C curves or springs—*i. e.*, arcs comprehending more than semicircles—whereby longitudinal expansion or lengthening of said series forming the tube may be obtained, substantially as set forth.

2. The herein-described expansion device, consisting of a tube closed at its ends and bent or formed into a series of reverse C curves or springs—*i. e.*, arcs comprehending more than semicircles—said tube containing liquid, whereby by the application of heat longitudinal expansion or lengthening of said series forming the tube may be obtained, substantially as described.

398,527. METHOD OF PREPARING INSECTICIDES. James M. A. Miller, San Mateo, assignor to Eben Dean, Jacksonville, Fla. Filed May 22, 1888. Serial No. 274,689. (No specimens.)

Claim.—The within-described process of producing the within-specified insect-destroying compound or solution, especially applicable for the destruction of insects infesting, injuring, and destroying plant or tree and fruit life, and which consists in adding sulphur to lime while the latter is being slaked and afterward dissolving said ingredients in water, as set forth.



398,528. MEASURING APPARATUS FOR LIQUIDS. Charles G. Molin, Brooklyn, N. Y. Filed Oct. 24, 1888. Serial No. 289,087. (No model.)

Claim.—1. The combination, with the bottle A, having a tube, B, secured to the lower portion of its throat and extending into said bottle, and a bulb, D, also communicating with the interior of said bottle, of a detachable liquid-receptacle, I, having at its bottom a tubular projection, H, constructed to fit in said throat, and a valve, J, in said projection, substantially as described.

2. The combination, with the bottle A, having a tube, B, secured to the lower portion of its throat and extending into said bottle, and a bulb, D, having a valve, G, and communicating with the interior of said bottle, of a detachable liquid-receptacle, I, having at its bottom a conical tubular projection, H, constructed to fit in said throat, and a valve, J, in said projection, substantially as described.

398,529. MAIL-BAG. Everett D. Moore, Baltimore, Md., assignor to Thomas C. Chappell, same place. Filed June 3, 1886. Renewed Dec. 24, 1887. Serial No. 258,910. (No model.)

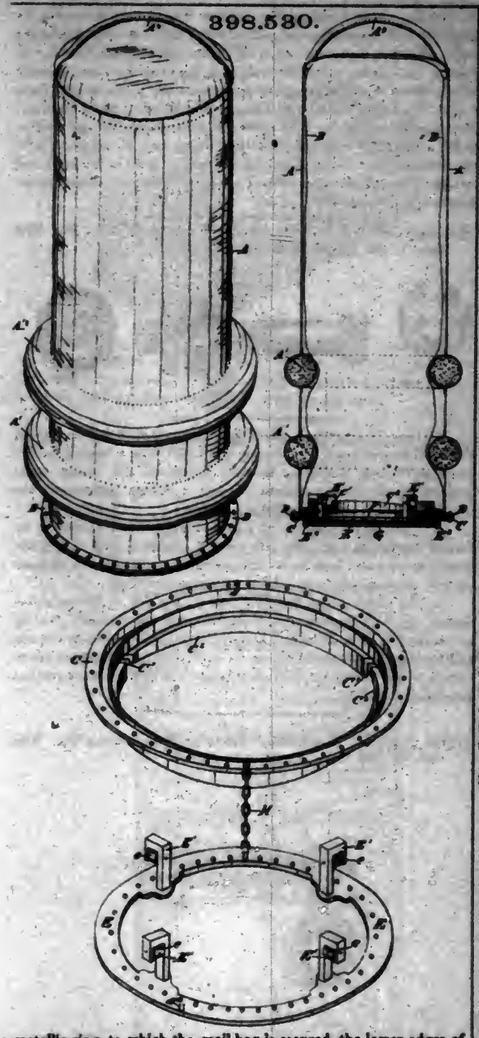
Claim.—1. In a bag for the transportation of the mails, a bag made of water-proof material, combined with independent pockets containing cork or other similar material, which are so located as to permit of the bag being folded, said bag combined with mechanism for hermetically sealing the mouth of the bag, substantially as described.

2. In a bag for transportation of mails, a bag made of water-proof material, combined with independent pockets containing cork or other similar material, which are so located as to permit of the bag being folded.

3. In a bag for the transportation of mails, the combination of a water-proof sack, the mouth of said sack formed by two frames hinged one to the other, the joint forming the hinges of said frames provided with a slot to admit of self-adjustment, a gasket placed between the said frames, wings extended from the said frames at the joints thereof for bearing-surfaces of said gasket, and screws for drawing the said frames together, for the purpose set forth.

4. In a bag for the transportation of mails, the combination of a water-proof sack, the mouth of said sack formed by two frames hinged one to the other, the joint forming the hinges of said frames provided with a slot for self-adjustment, a gasket placed between the said frames, wings extended from the said frames at the joints thereof for bearing-surfaces of said gasket, screws for drawing said frames together, binders pivoted to said frame for securing the said frames in the closed position, and means for locking the said binders in the closed position, for the purpose set forth.

5. In a bag for the transportation of mails, the combination of a water-proof sack provided with pockets around the sides thereof, in which is placed cork or some like buoyant substance, the mouth of said sack formed by two frames hinged one to the other, the joint forming the hinges of said frames provided with a slot for self-adjustment, a gasket placed between the said frames at the joints thereof for bearing-surfaces of said gasket, screws for drawing said frames together, binders pivoted to said frames for securing the said frames in the closed position, and a cord or chain for locking said binders in the closed position, substantially as shown, and for the purpose set forth.



398,530. HERMETIC MOUTH-PIECE FOR MAIL-BAGS. Everett D. Moore, Baltimore, Md., assignor to Thomas C. Chappell, same place. Filed Apr. 10, 1888. Serial No. 270,184. (No model.)

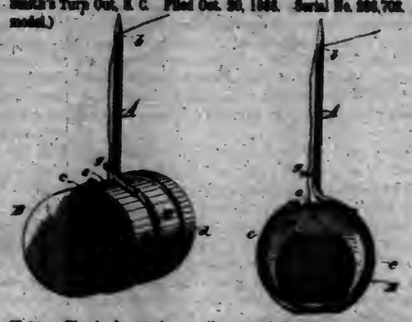
Claim.—1. In a hermetic mouth-piece for mail-bags, the combination of a metallic ring, to which the bag is secured, the lower edge of which is cut into two or more inclined planes, and a cover of about the same size and shape as the ring and arranged to rest upon it, and provided on the side next the ring with two or more hooks set rigidly into the cover and adapted to engage the inclined planes of the ring, whereby the cover and the ring are pressed closely together when the cover is turned, substantially as described.

2. In a hermetic mouth-piece for mail-bags, the combination of a metallic ring, to which the bag is secured, the lower edge of which is cut into two or more inclined planes, and a cover of about the same size and shape as the ring and arranged to rest upon it, and provided on the side next the ring with two or more hooks or carriers set rigidly into the cover and provided with friction-rollers attached to them and engaging the inclined planes of the ring, whereby the cover and the ring are pressed closely together when the ring is turned, substantially as described.

3. In a hermetic mouth-piece for mail-bags, the combination of

398,530.

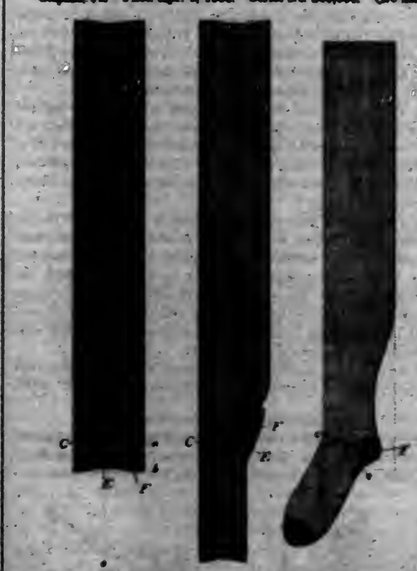
a metallic ring, to which the mail-bag is secured, the lower edges of which are provided with a downwardly-projecting flange cut into two or more inclined planes, a cover of about the same size and shape as the ring, and provided on the side next the ring with two or more hooks set rigidly into the cover and adapted to engage the inclined planes of the flange, and a gasket interposed between the ring and cover, as and for the purpose specified.



4. In a hermetic mouth-piece for mail-bags, the combination of a metallic ring, to which the bag is secured, cut with slots or ways to permit the hooks or carriers to pass through it, the lower edge of said ring being cut into two or more inclined planes, and a cover of about the same size and shape as the ring and arranged to rest upon it, and provided on the side next the ring with two or more hooks set rigidly into the cover and adapted to engage the inclined planes of the ring, whereby the cover and ring are pressed closely together when the cover is turned, substantially as described.

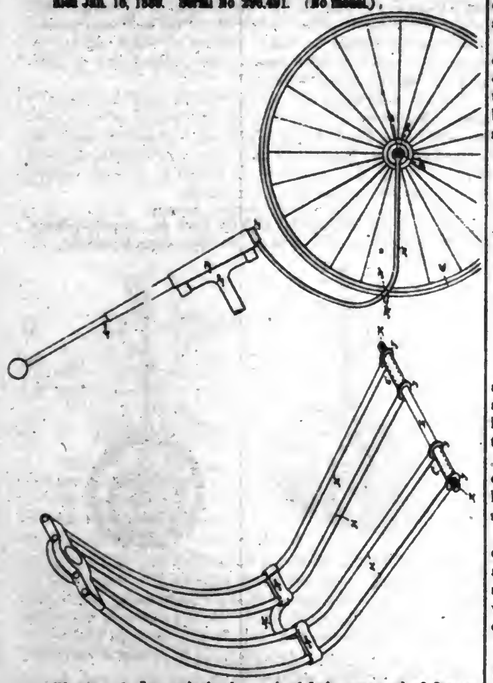
5. In a hermetic mouth-piece for mail-bags, the combination of a metallic ring, to which the bag is secured, the lower edge of which is cut into two or more inclined planes, and a cover of about the same size and shape as the ring and constructed of two rings of metal, between which is riveted a sheet of flexible water-proof material, and arranged to rest upon the bag-ring, and provided on the side next to the bag-ring with two or more hooks set rigidly into the rim of the cover and adapted to engage the inclined planes of the ring, whereby the cover and the ring are pressed closely together when the cover is turned, substantially as described.

6. In a hermetic mouth-piece for mail-bags, the combination of a metallic ring countersunk on the lower edge and provided with a gasket resting in said countersunk space, and having a downwardly-projecting flange the lower edge of which is cut into two or more inclined planes, and a cover of such a size and shape as to fit the countersunk space in the ring and rest upon the gasket, and having hooks provided with rollers secured to the sides of the cover next the ring and adapted to engage the inclined planes of the flange, whereby the cover and the gasket will be pressed closely together when the cover is turned, substantially as described.



7. The combination of a hermetic mouth-piece consisting of a metallic ring provided on its lower side with inclined planes, a cover provided on the side next the ring with means adapted to engage the inclined planes and press the ring and cover together when the cover is turned, and a water-proof mail-bag secured to the ring, whereby the bag may be sealed so as to be water-tight.

398,531. NEEDLE FOR SEWING BAGS, &c. Samuel M. Neely, Smith's Turp Out, S. C. Filed Oct. 20, 1888. Serial No. 288,702. (No model.)



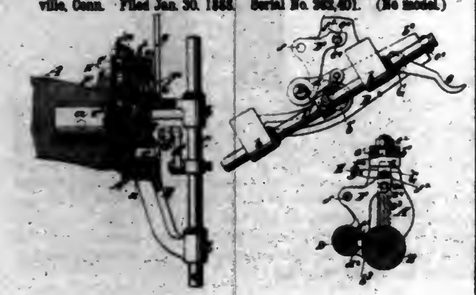
Claim.—The body of the needle provided with an eye near its point and having its rear end portion constructed to form a loop, in combination with a transversely-arranged and opening and closing thread-holding can having the looped rear end portion of the needle coiled around and secured to it, said can being provided with an eye near the base end of the body of the needle for passage of the thread to the needle, essentially as described.

398,532. ART OF MAKING STOCKINGS. Owen Gnogher, Philadelphia, Pa. Filed Apr. 6, 1888. Serial No. 269,809. (No model.)

Claim.—The hereinbefore-described improved art or method of making stockings, which consists of, first, knitting a tube which is to form the leg; second, cutting out a portion of the end of said tube to form an incision the length of whose edges corresponds to the periphery of the foot portion; third, running the loops along said edges onto the needles of a frame of the proper diameter to form the foot portion; fourth, knitting on said foot portion, and, fifth, cutting the tube first formed upon the proper lines to shape the heel, ankle, and lower portion of the leg and uniting the cut edges by sewing, substantially in the manner described.

398,533. VELOCIPEDE. ALBERT H. OVERMAN, Newton, assignor to the Overman Wheel Company, Boston, Mass. Original application filed Dec. 13, 1886, Serial No. 221,268. Divided and this application filed Jan. 16, 1888. Serial No. 296,491. (No model.)

Claim.—1. In a velocipede, a wheel-fork composed of four or more bowed springs placed side by side, with a space between the inner springs for the wheel to run in, substantially as set forth.



2. In a velocipede, the combination, with a wheel-fork composed of independent bowed springs, separated at each end, and each secured at one end to a cross-head common to them all, of a wheel having its axle extended at each end for the attachment of the other ends of the said springs, substantially as set forth.

3. In a velocipede, the combination, with a rearwardly-inclined steering-rod and a steering-wheel, of a bowed spring-fork composed of four or more independent springs connected with the lower end of the rod and with the wheel-axle, and curved, substantially as shown, so as to bring the rod virtually in line with the center of the wheel, substantially as set forth.

4. In a velocipede, the combination, with a steering-rod having a cross-head rigidly secured to its lower end, of a steering-wheel having the ends of its axle extended, and a spring wheel-fork composed of four or more bowed springs placed side by side with a space between the inner rods for the wheel to run in, and having their upper ends rigidly secured to the said cross-head, and their lower ends provided with eyes adapting them to be slipped over the extended ends of the wheel-axle, substantially as set forth.

5. In a velocipede, a wheel-fork composed of bowed spring-rods and a transverse brace tying such rods together, substantially as set forth.

398,534. LOCKING DEVICE FOR SEWING-MACHINE HEADS. WILLIAM H. PALMER, Jr., Norwich, assignor to Palmer Brothers, Montville, Conn. Filed Jan. 30, 1888. Serial No. 262,401. (No model.)

Claim.—1. The combination, with a sewing-machine arm and a head pivoted thereto, one of said parts having a lip overhanging the other, of a locking-bolt in one of said parts and a socket-piece for receiving the locking end of the bolt made separate from and laterally adjustable on the other of said parts, substantially as herein described.

2. The combination, with a sewing-machine arm and a head pivoted thereto and having a lip or portion overhanging the end portion of the arm, of the locking-bolt E, the locking-lever F, connected with the bolt, and the rocking unlocking-trigger journaled in the head, and having its end portion cam-shaped to act upon the said locking-lever, substantially as herein described.

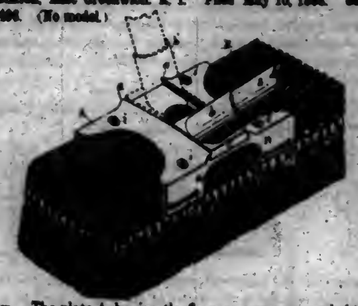
398,535. NUT-LOCK. THOMAS W. PATTEN, Baltimore, Md. Filed Oct. 17, 1888. Serial No. 288,341. (No model.)

Claim.—1. A nut-lock consisting of a screw-threaded nut having an eccentric depression in one side, combined with a washer having an eccentric boss projecting laterally therefrom, and having on its inner periphery transverse teeth adapted to engage transversely the threads of a bolt, substantially as described.

2. A nut-lock consisting of a screw-threaded nut having an eccentric depression in its side with teeth *d*, combined with the washer having an eccentric boss on its side and transverse teeth *a* on its inner surface, substantially as and for the purpose described.

3. The combination, with the bolt, of the nut D, having an eccentric recess or depression, *c*, in its side, and the washer C, having an eccentric boss, *b*, on its side adapted to enter the recess of the nut, and having teeth or serrations on its inner periphery arranged transversely to the threads of the bolt, substantially as and for the purpose described.

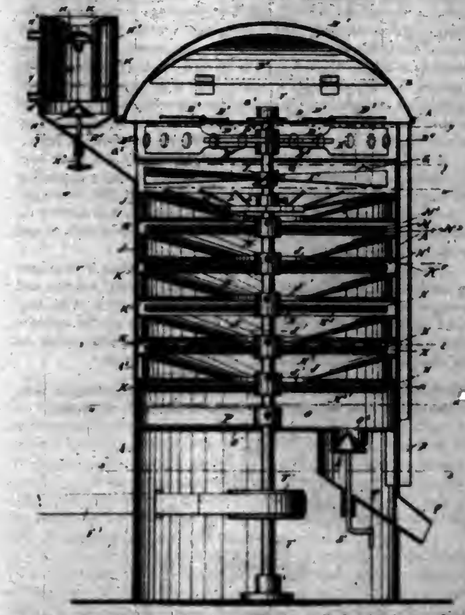
398,536. OIL-BURNER. ANDREW J. PIERCE, Racine, Wis. Filed Feb. 28, 1888. Serial No. 265,618. (Model.)



Claim.—1. In an atomizing oil-burner, the central steam-conducting pipe having the end cavity, *g*, and the central delivery-orifice, *k*, in combination with the inclosing-cap C, having the oil-inlet *n*, and the contracted front end with the central delivery-orifice, *k*, of less diameter than cavity *g*, said cap adjusted with its contracted end in close proximity to the end of the steam-pipe, whereby the oil is directed inward in a thin annular film to the central unexpanded steam-jet.

2. The external cap having an oil-inlet and the contracted end with the discharge-orifice *k* at its extremity, in combination with the internal steam-pipe terminating in close proximity to the end of the cap and provided with the central orifice, *k*, and with an end cavity, *g*.

3. The cock having the cylindrical pipe *a* and external thread, *c*, the cap C, provided with the inlet and outlet orifices and with the internal screw-threads, in combination with the intermediate pipe, B, fitted and threaded closely within the cap C, and also fitted and threaded closely upon the outside of the pipe *a*, whereby said pipe B is adapted to maintain the proper relation of the other parts and also to serve as a valve for regulating the oil-delivery.



4. In an atomizing-burner, the central steam-pipe and the external cap having its delivery-orifice coincident with the bore of the steam-pipe, in combination with the cock comprising the body, with the lateral steam-inlet and the direct opening *b*², and the rotary plug having the angular steam-passage therethrough, and the opening *b'*, forming a continuation of said passage, whereby the steam may be directed through the burner or the steam shut off, and an opening established through the burner from end to end for the passage of a cleaning-instrument therethrough.

398,537. BRUSH-HOLDER. THOMAS A. PIERCE and ISAAC H. WARNER, East Greenwich, R. I. Filed May 10, 1888. Serial No. 273,496. (No model.)

Claim.—The plate A, having the flanges or ears *n n*, and ridges *a a*, forming dovetailed tapering recesses between them, substantially as described, in combination with the handle-socket *c b*, staples *g g*, and brush B, substantially as and for the purpose specified.

398,538. GRAIN-SCOURER. PETER PROVOST, Menominee, Mich. Filed Apr. 13, 1888. Serial No. 270,517. (No model.)

Claim.—1. The combination, with the cylinder having a dust-chamber and suction-fan therefor at its upper end, a grain-inlet leading into the upper end of the cylinder, and a discharge-chute at the lower end of the cylinder, of pipes leading from the upper end of the cylinder into the dust-chamber, a channel leading from said chute upwardly into the dust-chamber, and the shaft provided with cleaning-disks in said cylinder, substantially as set forth.

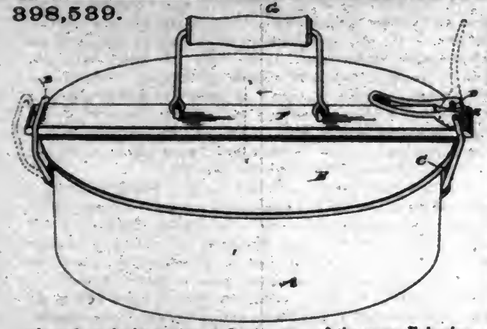
2. In a grain-cleaner, the combination, with a cylinder provided with a wire-screen lining and a suitable inlet, of an imperforate concave disk having a central opening and secured to the said cylinder, a shaft journaled centrally in the said cylinder, an agitator having inclined radial arms and secured to the said rotating shaft, said arms extending on the top surface of the said concave disk, said a flat disk secured to the shaft below the said central opening and of less diameter than the said cylinder, substantially as shown and described.

3. In a grain-cleaner, the combination, with a cylinder provided with wire-screen lining and a suitable inlet, of a concave disk having a central opening and secured to the said cylinder, a shaft mounted centrally in the said cylinder and having a rotary movement, an agitator having inclined radial arms and secured to the said rotating shaft, said arms extending on the top surface of the said concave disk, and a wheel secured to the said shaft directly above the said agitator and provided with inclined blades, so as to press the grain downward onto the said agitator and concave disk, substantially as shown and described.

4. In a grain-cleaner, the combination, with a cylinder provided with a wire-screen lining and a suitable grain-inlet, of a shaft mounted centrally in the said cylinder, a fan secured on the said shaft and located in a chamber formed in the top of the said cylinder, said chamber being provided in its top plate with openings, covers adapted to open and close said openings, a cap fitting over the top of the said cylinder and forming therewith a dust-chamber, and pipes leading from the interior of the cylinder into the said dust-chamber, so as to draw the moisture out of the said cylinder by the action of the said fan-wheel, substantially as shown and described.

5. In a grain-cleaner, a cylinder having a wire-screen lining, a shaft journaled centrally in the said cylinder, a series of concave disks having central openings and secured to the interior of the said cylinder, disks secured to the said shaft between the succeeding concave disks, and an arm secured to the said shaft for discharging the grain from the cylinder into a chamber, in combination with the said chamber, a channel leading from the said chamber upward, a cap held on the upper end of the said cylinder and forming therewith a dust-chamber, into which said channel discharges, a fan-wheel secured to the said shaft and located in a chamber connected with the said dust-chamber, pipes leading from the said dust-chamber to the upper part of the said cylinder, and a chamber formed on the said cap and connected with the interior of the same by a hinged part, substantially as shown and described.

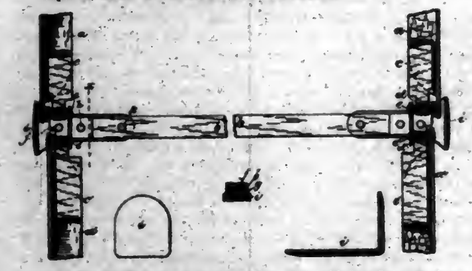
6. In a grain-cleaner, the combination, with a lined cylinder, A and shaft F, journaled in the said cylinder, of the chute G³, discharging the steamed grain into the said cylinder, the concave disks J, having the central openings J', and fastened in the said cylinder, the flat disks N, provided with the arms N', the chamber O, formed in the said cylinder A and having the opening O² in its bottom, the arm P, secured to the said shaft F and forcing the grain into the said opening O², the valve S, adapted to open and close said opening O², the chamber Q, into which opens said valve, and provided with a chute, Q', leading to the outside of the cylinder A, the channel R, opening into the said chamber Q and extending upward, the cap B, held on the top of the said cylinder and forming a dust-chamber, the chamber D, formed in the top of the cylinder A and communicating with the said dust-chamber, the fan E, secured to the shaft F within the said chamber D, the hinged end B' of the said cap B, and the pipes G', leading from the dust-chamber to the interior of the cylinder A, substantially as shown and described.



7. In a grain-cleaner, the combination, with the lined cylinder A, of the shaft F, journaled in the said cylinder, the chute G, leading into the said cylinder, the concave disks J, having central openings J', and fastened in the said cylinder, the flat disks N, provided with the arms N', the chamber O, formed in the said cylinder A and having the opening O² in its bottom, the arm P, secured to the said shaft F and forcing the grain into the said opening O², the valve S, adapted to open and close said opening O², the chamber Q, into which opens said valve S, and provided with a chute, Q', leading to the outside of the cylinder A, the channel R, opening into the said chamber Q and extending upward, the cap B, held on the top of the said cylinder and forming a dust-chamber, the chamber D, formed in the top of the cylinder A and communicating with said dust-chamber, the fan-wheel E, secured to the shaft F and within the said chamber D, the hinged end B² of the said cap B, the pipes G', leading from the dust-chamber to the interior of the cylinder A, and the chamber C, opening into the cap B and provided with the outlet-door C', substantially as shown and described.

8. In a grain-cleaner, the combination, with the lined cylinder A, of the shaft F, journaled in the said cylinder, the chute G, discharging the steamed grain into the said cylinder, the concave disks J, having central openings J', and fastened in the said cylinder, the flat disks N, provided with the arms N', the chamber O, formed in the said cylinder A and having the opening O² in its bottom, the arm P, secured to the said shaft F and forcing the grain into the said opening O², the valve S, adapted to open and close said opening O², the chamber Q, into which opens said valve S, and provided with a chute, Q', leading to the outside of the cylinder A, the channel R, opening into the said chamber Q and extending upward, the cap B, held on the top of the said cylinder and forming a dust-chamber, the chamber D, formed in the top of the cylinder A and having openings D' in its top to communicate with said dust-chamber, the fan E, secured to the shaft F and within the said chamber D, the hinged end B² of said cap B, the pipes G', leading from the dust-chamber to the interior of the cylinder A, the covers D², hinged on the top plate of the chamber D over the openings D', and the rods D³, extending through the cap B and serving to operate said covers D², substantially as shown and described.

398,539. SHIPPING-PACKAGE. ISAAC L. ROCK, Mooers, N. Y. Filed Sept. 14, 1888. Serial No. 285,376. (No model.)

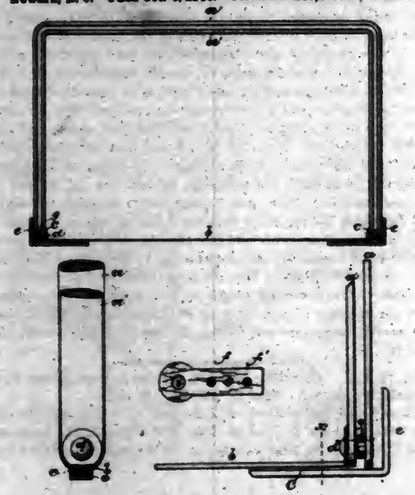


Claim.—The combination, with the pail A, having opposite vertically-swinging loops B C, and the lever D, pivoting on the upper end of loop C, between its sides, and having its pivoted end rounded and

398,539.

enlarged on its lower face to form a cam, of the cover E, having a cleat projecting beyond its sides to enter the loop B at one end and projecting at its opposite end through the loop C and under the lower or cam face of the said lever, substantially as set forth.

398,540. BAG-FRAME. WILLIAM ROEMER, Newark, N. J. Filed Sept. 18, 1888. Serial No. 285,850. (No model.)



Claim.—1. The improved bag-frame, combining jaws or frame-sections *a a'*, a bottom bar or brace, *b*, and hinge-plates having eyes bent up to receive the pivots *c c'*, said plates being secured at the opposite ends to the bottom bar, all substantially as and for the purposes set forth.

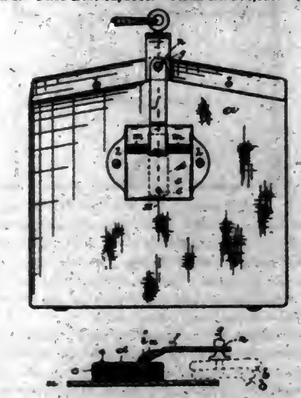
2. The improved bag-frame, combining with jaws *a a'* and a bottom bar or brace, *b*, hinge-plates secured at the opposite ends of said bar or brace and having eyes *m m'* bent up, as described, pivots *c c'* for the jaws, arranged in said eyes, and inlays *e e'*, also arranged on said pivots, substantially as and for the purposes set forth.

3. In combination with the bag-frame, jaws *a a'*, one of which overlaps the other, as described, a bottom bar or brace, *b*, hinge-plates secured at the opposite ends of said bottom bar and having bent-up eyes to receive the pins upon which said jaws are hinged, and said pins made of different sizes, the inner jaw being hinged to the short pins and the outer jaw on the longer pin, substantially as and for the purposes set forth.

398,541. FRAME FOR TRAVELING-BAGS. WILLIAM ROEMER, Newark, N. J. Filed Oct. 6, 1888. Serial No. 287,459. (No model.)

Claim.—The improved frame for traveling-bags herein shown, combining therein jaws or sections *a a*, a brace or bar, *b*, hinge-plates *c c*, secured thereto and having a hinge-eye *c*, bent at or approximately at right angles to said brace or bar, and rivets *d d*, arranged above the line of the brace or bar, substantially as and for the purposes set forth.

398,542. BAG-FASTENER. WILLIAM ROEMER, Newark, N. J. Filed Sept. 7, 1888. Serial No. 284,787. (Model.)



Claim.—1. The improved satchel-catch combining a face-plate adapted to be secured to the frame of the bag or satchel, a box secured on said face-plate and containing a spring, and a slide arranged between the face-plate and box and free to be thrown by the fingers from an uncatching to a catching position, and having a catching-tongue adapted to engage with a co-operating catch on the bag-frame, substantially as and for the purposes set forth.

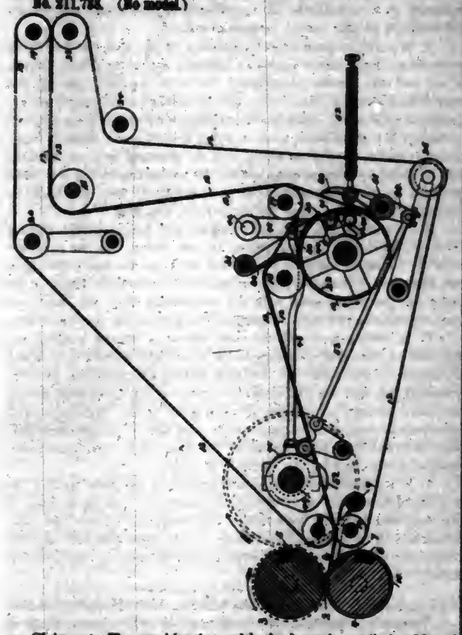
2. In combination, a face-plate having a slot, *c'*, for the catching-tongue to work in and perforations *g* for fastening-lugs, a box, d^3, containing a spring and having said fastening-lugs arranged to pass through said perforations, and having on the under side a notch, d^5, adapted to receive and allow a slide to work therein, and said slide consisting of a cross-bar arranged in the said notch, a catching-tongue extending through the slot *c'* to engage with a co-operating catch, and finger-pieces arranged at the ends of the cross-bar on the outside of the box, the said spring bearing on said cross-bar and against the inner walls of the box, all substantially as and for the purposes set forth.

3. The combination, with the slotted face-plate *c* and a box having a notch, c^4, of a slide held in said notch and having a depending catching-tongue projecting through the slot of the face-plate to engage a co-operating catch, and a spring held in said box and bearing on said slide, said parts being arranged and combined substantially as and for the purposes set forth.

4. In combination, a box forming a spring-chamber, d^3, and having notches to receive a slide, a slide arranged in said notches and having a catching-tongue to engage a co-operating catch of the bag-frame, said slide having finger-pieces or parts lying on the opposite sides of said box, and a spring arranged in said box and bearing on said slide, substantially as and for the purposes set forth.

398,548. CATCH FOR BAG-FRAMES. WILLIAM ROEMER, Newark, N. J. Filed Nov. 12, 1888. Serial No. 290,535. (No model.)

Claim.—1. The combination, with the jaws *b b* of a bag or satchel frame, of a case secured to the body of the bag and containing a spring, a hasp pivoted to said case, and a stud secured to the outer jaw of said frame for receiving the slotted end of said hasp, all arranged and adapted to operate as and for the purposes set forth.

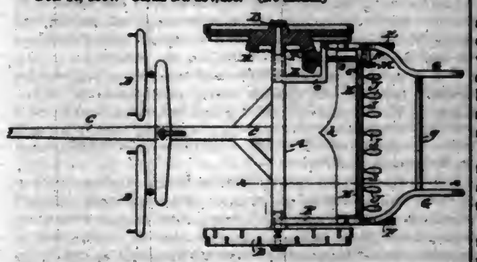


2. The combination, with the frame of a bag or satchel, of a spring-case provided with a spring, *d*, within said case and pivoted thereto, a locking-hasp pivotally connected with said case, and provided at its outer end with an opening, *n*, and a stud secured to said frame, over which one end of the lever passes, securing the parts of the bag-frame together, substantially as and for the purposes set forth.

3. The combination of a spring-case, a spring secured to said case, tubes or sockets *m m* on said case, a locking-hasp having one end resting on said spring, pins *i i* on the side of said hasp, adapted to reciprocate in said tubes, and stud *g*, secured to the bag and

adapted to enter an opening in the outer end of the locking-hasp, substantially as described, and for the purposes set forth.

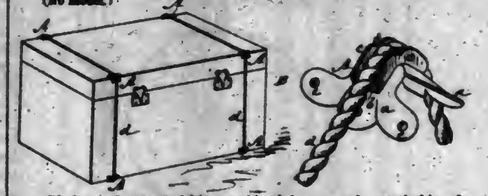
4. In combination, a bag or satchel body, *a*, having jaws *b b*, one of which overlaps the other, studs *g*, secured on the outer of said jaws at the opposite depending ends thereof, and hasps *f*, pivotally secured on said body and adapted to enter into engagement with the pins or studs to hold both of said jaws down to said body, substantially as and for the purposes set forth.



398,544. SHEET-DELIVERY APPARATUS FOR PRINTING-MACHINES. WALTER SCOTT, Plainfield, N. J. Filed Aug. 25, 1888. Serial No. 283,784. (No model.)

Claim.—1. The combination, with the imposing-cylinder 22 and the rollers 16 and 17, and tapes for bringing the sheets to such imposing-cylinder, of the guides 30, with curved faces adjacent to the cylinder 22 and roller 16, and the curved shields 50, cross-shaft 51 for supporting such shields outside the path of the tapes, and mechanism for moving the shields intermittently toward and from the imposing-cylinder, whereby alternate sheets are caused to pass beneath the guides 30, and the pairs of imposed sheets are delivered on the belts 12, substantially as set forth.

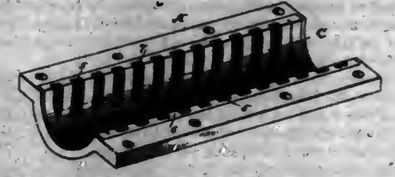
2. The combination, with the imposing-cylinder 22 and the rollers 16 and 17, and tapes for bringing the sheets to such imposing-cylinder, of the guides 30, with curved faces adjacent to the cylinder 22 and roller 16, and the curved shields 50, and cross-shaft 51 for supporting the same outside the path of the tapes 12 and the delivery-fingers 40, and mechanism, substantially as specified, for moving the delivery-fingers and segmental shields alternately for the latter to direct one sheet in beneath the segmental guides 30 and then for the delivery-fingers to cause the two sheets to follow the belts 12 to the rollers 17, substantially as specified.



398,545. POTATO-DIGGER. HIRAM M. SHAW, Penn Yan, N. Y. Filed Dec. 10, 1887. Serial No. 257,489. (No model.)

Claim.—1. In a potato-digger, the combination, with the axle A, wheels B, and gear-wheel R on one of its wheels B, of beams E, pivoted on the axle, a blade, H, secured to and connecting the beams, a shaft, I, journaled in the beams in rear of the blade and provided with tines J and the arm K, the shaft O, journaled in the beams E and provided with the gear-wheel P, meshing with the gear-wheel on the drive-wheel, and with a wrist-pin, M, at its other end, and the pitman L, connected to the arm K and to the wrist-pin M, substantially as herein shown and described.

2. In a potato-digger, the combination, with the axle A, the wheels B, and gear-wheel R on one of the wheels, of the beams E F, pivoted to axle, the handles G, secured to the beams, the narrow blade H, secured to the beams and having the central forwardly-projecting point, *h*, the shaft I, journaled in the beams in rear of the blade and provided with the tines J and the arm K, the shaft O, journaled in the beam E and provided with the gear-wheel P and the crank-pin M, and the pitman L, substantially as herein shown and described.



398,546. ROPING ATTACHEMENT FOR TRUNKS, &c. JOSEPH B. STOCKBAKER, Durango, Colo. Filed Aug. 14, 1888. Serial No. 282,731. (No model.)

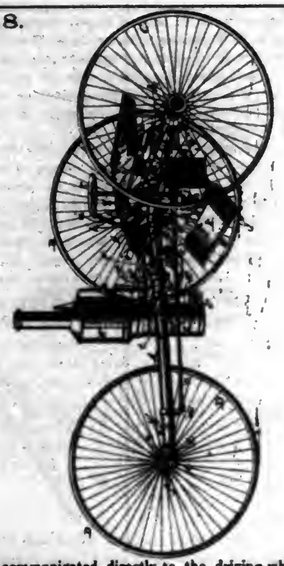
Claim.—1. The within combined brace and rope-holder for trunks and other like articles, constructed of side flanges arranged at right angles with each other on their inner surfaces, and terminating where meeting in a projecting open or covered circular grooved portion, substantially as and for the purposes herein set forth.

2. As a new article of manufacture, a combined trunk-brace and rope-holder composed of perforated sides or flanges *a a*, arranged at right angles with each other on their inner surfaces and terminating at their meeting ends in a circular grooved portion, *b c c*, essentially as shown and described.

398,547. JOURNAL-BEARING. WILLIAM W. SMALLEY, Round Brook, N. J. Filed May 12, 1888. Serial No. 273,720. (No model.)

Claim.—A bearing for journals, consisting of a box, a soft-metal lining having flat-faced ridges substantially parallel with the surface of the journal, and with pockets or channels between the said ridges, and powdered graphite filling the said pockets, whereby it is adapted to fill inequalities in and coat or glaze the flat faces of the ridges, substantially as described.

398,548. STEAM-TRICYCLE. HERRMAN R. SMITH, Smithville, N. J. Filed May 16, 1887. Serial No. 238,249. (No model.)



Claim.—1. In a power-driven tricycle, the axle and its two ground-wheels, the reach extending forward rigidly from the axle, the arm F, pivoted to and extending laterally from the forward end of the reach, the connections extending rearward from said arm to control the position of the wheel, an engine or motor mounted on and sustained wholly by the reach, and intermediate gearing connecting said motor with one of the rear wheels.

2. In a two-track tricycle provided with a steam-motor, the rear axle and its two ground-wheels, one of which is a driver, the reach extending forward rigidly from said axle at a point near the driving-wheel, the steering-wheel pivotally connected with the forward end of said reach in line with the rear driving-wheel, the engine and boiler located outside of the outer side of the reach between the driving and steering wheels and connected to and sustained wholly by said reach and the gearing connecting said engine with the driving-wheel.

3. In a steam-actuated vehicle, the axle, its two wheels, and a forwardly-extending reach, in combination with the boiler, engine, and driving-gear located on the outer side of the reach, and a driver's seat located inside of the reach, substantially as described.

4. In a steam-actuated riding-vehicle having the rear axle, its two wheels, the reach near one end of the axle and the front steering-wheel in line or substantially in line with the rear driving-wheel, the boiler and engine both carried by the reach, and intermediate gear connecting the engine with the rear wheel, as shown, whereby

398,548.

the motion is communicated directly to the driving-wheel and the weight of the boiler and engine applied mainly to the driving and steering wheels.

5. In a steam-tricycle, a frame provided with two independent rear wheels, one of which is the driver, and a front steering-wheel tracking with said driver, in combination with an engine or motor mounted on the reach and geared directly to the driving-wheel.

6. In combination with the non-rotating axle *a*, the driving-wheel revolving loosely thereon, a driving-gear also mounted directly on said axle and revolubly independently thereon, an elastic or yielding connection, substantially as described, between the gear and the driving-wheel, and an engine or motor connected with and driving said gear on the axle, as described, whereby the wheel and its immediate driving-gear are independently supported and allowed to independently turn upon the axle.

7. The axle, its two ground-wheels, the reach extending rigidly forward from the axle, the front steering-wheel located at one side of the reach and connected to the latter by the pivoted arm or axle *f*, in combination with the lever *m*, pivoted to the reach, link *n*, rod *o*, and the rack-and-pinion mechanism for controlling said rod.

8. In combination with the tubular reservoir-frame, the boiler, its burner, the pipe connecting the frame and burner, and the filter, applied as described.

9. In combination with the driving-wheel B, the two gears *o'* and *p'*, of different diameters, coupled thereto, the gears *l'* and *l'*, the shaft *i'*, and its clutch *m'*, and the engine geared to shaft *i'*, substantially as shown.

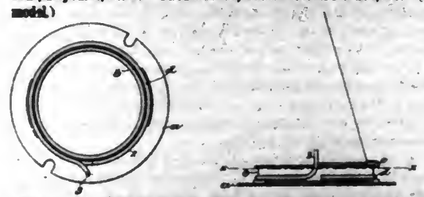
10. In a steam-tricycle or road-wagon, a tubular main frame, a boiler sustained therefrom, an oil-burner for the boiler, an oil-conductor communicating with the interior of the frame and with the burner, and a steam-conductor leading from the boiler to the burner, said elements combined for joint operation, as described.

398,549. SASH-FASTENER. THOMAS S. SMITH, Washington, D. C., assignor to Hobart B. Ives and Company, New Haven, Conn. Filed Feb. 3, 1888. Serial No. 262,830. (Model.)

Claim.—1. In a sash-fastener, in combination with the latch provided with the cam-engaging recess, the cam adapted to engage the outer side of the recess to force the latch outward and provided with an abutting portion to be swung around behind such side of the recess, so as to hold the latch positively outward, substantially as and for the purpose shown.

2. In a sash-fastener, in combination with the latch having the longitudinal slot and the cam-engaging recess, the pivot-pin engaging the slot, and the rotary cam adapted to engage the recess-side, so as to force the latch outward, and having an abutting face on its outer side adapted to be brought by the rotation of the cam around behind the recess-side, so as to lock the latch positively outward, substantially as and for the purpose set forth.

3. In a sash-fastener, in combination with the latch having the cam-engaging recess, the base, and engaging, guiding, and locking devices on the base and latch, respectively, to guide the latch in its swing and lock it from swinging as it is moved longitudinally at the ends of its swing, and the rotary cam having portions to engage the latch-recess sides to swing the latch and move it longitudinally, and with abutting faces on its outer side adapted to be moved around behind the engaged recess-sides when the latch has been moved longitudinally, so as to lock the latch positively against return movement, substantially as and for the purpose described.



4. In a sash-fastener, in combination with the base provided with a curved guiding-surface having an inwardly-extending offset or notch at one end and a radial shoulder at the other, the latch having the longitudinal slot, the cam-recess, and the guide-lug, the pivot-pin engaging the slot in the latch, and the cam having the surfaces adapted to engage the recess-sides, so as to swing the latch and move it longitudinally at each end of its swing, and the abutting faces on its outer side adapted to swing around behind the recess-sides when the latch has been moved longitudinally, so as to positively lock the latch as moved, substantially as and for the purpose specified.

5. In combination with the swinging and longitudinally-moving latch provided with the cam-recess, the cam having the two eccentric sides for engaging opposite sides of the recess as the cam is swung in one direction or the other, and substantially concentric faces on its outer side for engagement with the recess-sides when the latch has been moved longitudinally, substantially as and for the purpose shown.

6. In combination with the base having a curved guiding-surface and an inwardly-extending notch at one end of such surface and a shoulder at the other end, the latch having the guide-lug, the longitudinal slot, and the cam-recess, the pivot-pin, and the cam having eccentric portions to engage opposite sides of the cam-recess and substantially concentric portions on its outer side to engage the recess-sides after the eccentric portions of the cam have acted upon them, substantially as and for the purpose set forth.

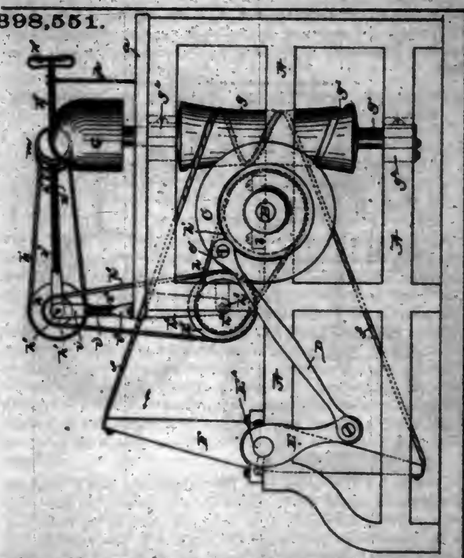
7. In a sash-fastener, in combination with the base having the two concentric slots with oppositely-extending locking-notches at their opposite ends, the latch having the two guide-lugs and the cam-recess, and the triangular cam having the two eccentric sides and the concentric outer end or side, substantially as and for the purpose shown.

398,550. TRAVELER-CLEARER FOR RING-SPINNING FRAMES. THOMAS H. SPEARMAN, Ware, assignor of one-half to George Draper & Sons, Hopedale, Mass. Filed Jan. 15, 1889. Serial No. 296,401. (No model.)

Claim.—1. The herein-described traveler-clearer consisting of wire-like material shaped to form a band to embrace the neck of the ring, and having a projection or finger, 3, substantially as described.

2. The combination, with the ring, of a clearer consisting of a spring-band having a finger, 3, substantially as described.

398,551. HAT-POUNCING MACHINE. CHARLES W. STEVENS, Yonkers, N. Y., assignor of one-half to James P. Ross, Newark, N. J. Filed May 7, 1888. Serial No. 273,093. (No model.)



Claim.—1. A hat-block and its spindle or shaft, combined with a rocker having an alternate rotary movement, and a belt wound at or about its middle one or more times about said spindle or shaft, and having its ends attached to said rocker at opposite sides of its axis of movement, substantially as and for the purpose set forth.

2. A hat-block and its shaft, the latter having an enlarged portion or sleeve, combined with a rocker having an alternate rotary movement, and a belt wound at or about its middle one or more times about said enlarged portion or sleeve, and having its ends attached to said rocker at opposite sides of its axis of movement, substantially as and for the purpose set forth.

3. A hat-block and its shaft, the latter having an enlarged portion or sleeve with a concaved periphery or face, as set forth, combined with an oscillating rocker and a belt wound one or more times about said concaved sleeve, and having its ends attached to said rocker at opposite sides of its axis of movement, substantially as and for the purpose set forth.

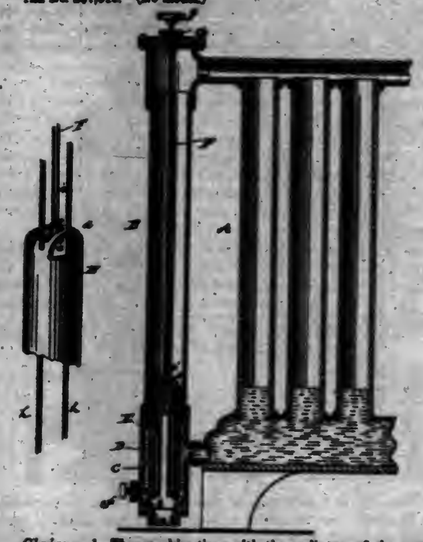
4. A hat-block and its shaft, the latter having an enlarged portion

398,551.

or sleeve with a concaved periphery or face, as set forth, combined with a belt wound one or more times about said concaved face of the sleeve and mechanism for alternately pulling on one and then the other end of said belt to give reverse rotations to the hat-block, as and for the purpose set forth.

5. A hat-block and its shaft, the latter having an enlarged portion or sleeve provided with a concaved face, as set forth, a rocker mounted on a shaft, a belt wound one or more times about the concaved sleeve and having its ends attached to the rocker at opposite sides of the rocker-shaft, a main shaft and means to impart rotary motion thereto, and mechanism, substantially as described, connecting the main and rocker shafts for imparting an oscillatiog movement to the rocker from the rotary movement of said main shaft, in combination, substantially as and for the purpose set forth.

6. The combination, with a rotating hat-block, of a pouncing-tool consisting, essentially, of a disk having its face or flattened surface provided with suitable pouncing paper or cloth and adapted to be brought in contact with the crown and sides of the hat-body to be pounced, the diameter of said disk being considerably less than the diameter of the hat-block and capable of having imparted to it a rotary movement of considerably greater speed than said hat-block, as and for the purpose set forth.



7. The combination, with a hat-block and means for imparting a reciprocatory rotary motion thereto, of a pouncing-tool consisting, essentially, of a disk having its face or flattened surface provided with suitable pouncing material or cloth and adapted to be brought in contact with the crown and sides of the hat-body to be pounced, and of a diameter considerably less than the diameter of the hat-block, and mechanism for rotating said disk at a speed considerably greater than the speed of the hat-block, as and for the purpose set forth.

8. The combination, with a rotating hat-block, of a pouncing-disk the face or flattened surface of which is adapted to be brought in contact with the crown and sides of the hat-body to be pounced and is of considerably less diameter than that of the hat-block, and provided with a pulley and shaft, a hand-rod having the said shaft journaled therein, a yoke-piece mounted on a shaft, as h^3, at one end, and having a swivel-connection with the hand-rod at its other end, the shaft, as h^3, mounted in a yoke-piece swiveled in a supporting-standard, said shaft having a pulley, a belt engaging said pulley and the pulley on the pouncing-disk shaft, and suitable well-known mechanism for imparting rotary motion to said shaft, as h^3, to cause rotation of the pouncing-disk, as and for the purpose described.

9. The combination, with a rotating hat-block, of a pouncing-disk the face or flattened surface of which is to be brought in contact with the crown and sides of the hat-body to be pounced and is of considerably less diameter than that of the hat-block, a swiveled holder for said disk, and mechanism, substantially as described, for imparting a rotary motion to said disk of considerably greater speed than that of the hat-block, as and for the purpose set forth.

10. The combination, with a hat-block having a reciprocatory rotary motion, of a swiveled disk-holder provided with a pair of pouncing-disks arranged with their backs opposite each other, said disks being of considerably less diameter than that of the hat-block, and the faces or flattened surfaces thereof being adapted to be brought in contact with the crown and sides of the hat-body to be pounced, and mechanism for imparting to said disks a speed of rotation in one direction considerably greater than the speed of the hat-block, substantially as and for the purpose set forth.

398,552. WATER-DISCHARGE REGULATOR FOR STEAM-RADIATORS. DANIEL H. SCHNEPER, Norristown, Pa. Filed Oct. 11, 1888. Serial No. 287,812. (No model.)

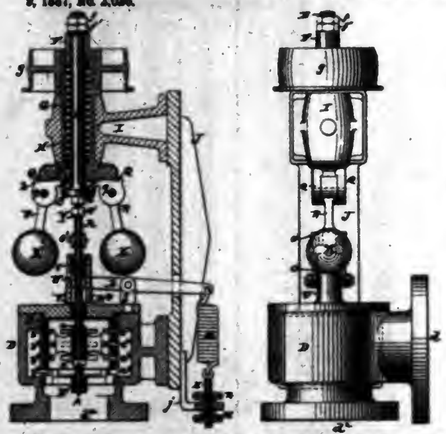
Claim.—1. The combination, with the radiator, of the vertical pipe B, having upper and lower lateral connections with the upper and lower ends of the radiator, and having an outlet, *a*, in its lower extremity, the longitudinally-extensible outlet-pipe within the pipe B, open at both ends and communicating at its lower end with the outlet *a*, and a rod extending down through the pipe B from its upper end to the extensible pipe, substantially as set forth.

2. The combination, with the radiator, of the vertical pipe B, having lateral connections near its upper and lower ends with upper and lower ends of the radiator, and provided with the outlet *a* below the lower connection, *c*, the longitudinally-extensible outlet-pipe open at both ends, with its lower end detachably connected with the outlet *a*, and a rod leading from said extensible pipe upwardly through the top of tube B, whereby said outlet-pipe may be extended and contracted in length and also be bodily moved away from the outlet *a*, substantially as set forth.

3. A water-discharge for steam-radiators, consisting in the tube B, having a cap at its upper end, a lateral opening adjacent thereto, a lateral water-inlet, *c*, near its lower end, and an outlet, *a*, in its bottom, the transverse set-screw *f*, extending into the tube B above the outlet *a*, the longitudinally-extensible and vertically-movable outlet-pipe within the pipe B and detachably held in register with the outlet *a* by said set-screw, the cross-piece *d*, the rod F, extending down through the cap to said cross-piece, and the guide-rods *h h*, extending down from the cap through said cross-piece, substantially as set forth.

398,553. WHIFFLETREE OR NECK-YOKE IRON. BENJAMIN J. SOMERS, Pittsburg, Pa. Filed June 19, 1888. Serial No. 277,534. (No model.)

Claim.—1. A vehicle-iron of the nature described consisting of a radially and longitudinally webbed or flanged steel bar, the flanges of which are reduced in height but not in thickness from at or near the middle of the bar toward its ends, substantially as and for the purpose described.



2. A vehicle-iron of the nature described consisting of a radially and longitudinally webbed or flanged steel bar, the flanges of which are gradually reduced in one only of the cross-sectional dimensions from at or near the middle toward the ends, substantially as and for the purpose described.

3. A vehicle-iron of the nature described consisting of a radially and longitudinally webbed or flanged steel bar, the flanges of which

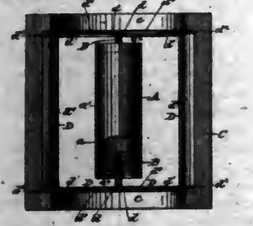
are reduced, the core of the bar being of substantially the same dimension for a considerable portion of its length, substantially as and for the purposes described.

4. A vehicle-iron of the nature described consisting of a radially and longitudinally webbed or flanged steel bar having a clevis-band set thereon at the middle, substantially as and for the purposes described.

398,554. GOVERNOR FOR ENGINES. HENRY TATE, Jr., and JOHN KILLIP, Jr., Liverpool, County of Lancaster, England. Filed Nov. 5, 1887. Serial No. 254,412. (No model.) Patented in England Feb. 9, 1887, No. 2,086.

Claim.—1. In a governor, the combination of the non-rotating valve, its spindle, and the spring M, connected to said spindle to open the valve, the spindle E, bearing upon but disconnected from the valve-spindle, the rotary collar or head G, and its governor-arms R, acting on the spindle E, whereby the arms R are caused to close the valve and the spring M caused to open the same.

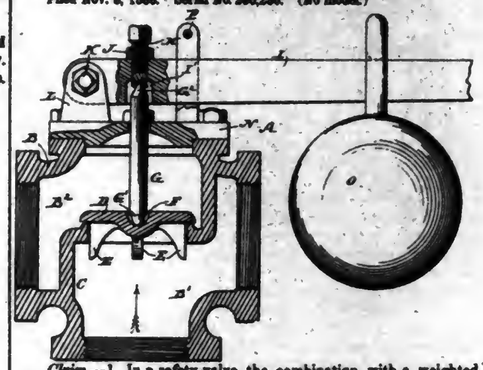
2. In a governor for engines, the upright sustaining-frame J, the rotating sleeve G, mounted therein, the driving-pulley *g*, keyed to the upper end of said sleeve, the flange *g'* on the lower end of the sleeve, and the governor-arms pivoted to said flange, in combination with the spindle E, located within said sleeve and adapted to be engaged by the governor-arms, the collar F on the upper end of the spindle, and the spring encircling said spindle, one end bearing on the collar F and the other end bearing on the flange *g'*.



3. In a governor of the type herein described, the combination of the sleeve G, the governor-arms pivoted thereto, the spindle E, adapted to be engaged by the said arms, and the stops *k* on said arms, adapted to encounter the sleeve and limit the outward motion of the arms.

4. The combination of the sleeve G, governor-arms K, pivoted thereto, ball-crank arm R, projection *k*, and collar S, for the purposes described.

5. In a governor for engines, the valve, the valve-spindle connected thereto, the spindle E, disconnected from said valve-spindle, and the governor-arms adapted to operate the spindle E, in combination with the adjusting device V, having one end connected to one of said spindles and its other end free and adapted to bear against the opposing spindle, substantially as and for the purpose described.



398,555. WITHDRAWN.

398,556. LUBRICATOR FOR JOURNALS OF RAILWAY-WHEEL AXLES. EMERY VAN DUCAR, East Albany, assignor of one-half to AARON FYLER, Bath-on-the-Hudson, N. Y. Filed Nov. 30, 1888. Serial No. 292,263. (No model.)

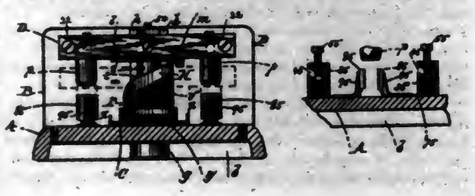
Claim.—The combination, with the lubricating-cylinder A, constructed of perforated metal *a*, and porous outer cushion, covering the former, and mounted on shaft B, and having open end heads, of the bearings *d d*, supported by the elastic holding devices D, constructed, substantially as described, for operation and purposes as set forth.

398,557. SAFETY-VALVE. FRANCIS X. VIEH, Brooklyn, N. Y. Filed Nov. 5, 1888. Serial No. 290,236. (No model.)

Claim.—1. In a safety-valve, the combination, with a weighted lever hung on pointed screws, of a set-screw screwing in the said lever, a pin provided with a point at its upper end engaging the under side of the said set-screw, and a valve-disk mounted to slide vertically and in the center of which rests the lower end of the said pin, substantially as shown and described.

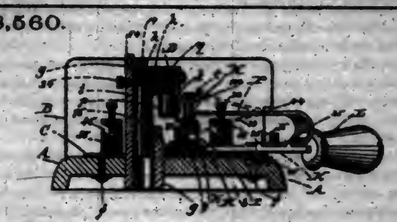
2. In a safety-valve, the combination, with a valve-body provided with a valve-seat and a cover secured on the said valve-body, of a valve provided with downward projections for guiding it in its seat, a pin resting at its lower end in the center of the said valve and passing loosely through said cover, a set-screw engaging the upper pointed end of the said pin, a lever in which screws said set-screw, and screws having pointed ends forming the pivot for the said lever, said screws screwing in lugs on the said cover, substantially as shown and described.

398,558. LAWN-TENNIS BALL. HARRY H. WADDINGTON, Manchester, County of Lancaster, England. Filed Oct. 16, 1888. Serial No. 288,206. (No model.) Patented in England Oct. 21, 1887, No. 14,300.



Claim.—The improvement in the manufacture of lawn-tennis balls, consisting in molding in the surface of the india-rubber ball a groove or grooves corresponding in form with the seam or seams, and after sewing on the cover, as usual, pressing the seam or seams into the said groove or grooves, so as to produce a ball in the form of a perfect sphere and with the stitches below the surface, substantially as hereinbefore described, and illustrated by the drawings annexed.

398,559. DYNAMITE. JOHN WAFFEN, Hancock, Mich., assignor to himself, Daniel Kloeckner, and Philip Schoenermann, both of same place. Filed June 16, 1888. Serial No. 277,267. (No specimens.)



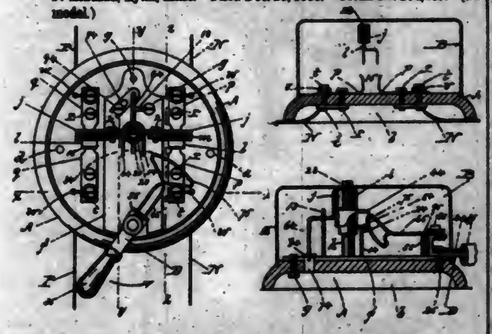
Claim.—The herein-described composition of matter to be used as an explosive, consisting of nitrate of soda, decayed wood, picric acid, sulphur, carbonate of soda, and nitro-glycerine having collodion mixed with it, substantially as and in or about the proportions specified.

398,560. ELECTRIC SWITCH. FRANKLIN A. WHELER and ADOLPH F. RIETZEL, Lynn, Mass. Filed Dec. 12, 1888. Serial No. 293,374. (No model.)

Claim.—1. In a switch of the character described, the combination of a table provided with poles, a rod bearing metallic plungers and fitted to slide in said table, metallic sockets for said plungers in

398,560.

contact with companion poles, a pivoted lever provided with a flat spring, a cam provided with two faces or tracks for distending said spring when the lever is moved, and arms on said rod for engaging the spring when it leaves said tracks, substantially as set forth.



2. In a switch of the character described, the combination of a table provided with poles, a rod fitted to slide in said table and provided with a plate having arms, a bar on said plate provided with metallic plungers, metallic plates in contact with companion poles and forming sockets for said plungers, a pivoted lever provided with a flat spring, and a cam for distending said spring when the lever is moved, whereby it will strike one of said arms when returning to its normal position after leaving said cam, substantially as and for the purpose specified.

3. In a switch of the character described, the combination of a table provided with poles, a bed-plate provided with a tube, a rod fitted to slide therein, a plate on said rod provided with arms, a bar secured to said rod and bearing metallic plungers, metallic plates in contact with companion poles and forming sockets for said plungers, a pivoted lever provided with a flat spring, and a cam on said bed-plate for distending said spring, whereby it may be caused to strike said arms and actuate the plungers, substantially as set forth.

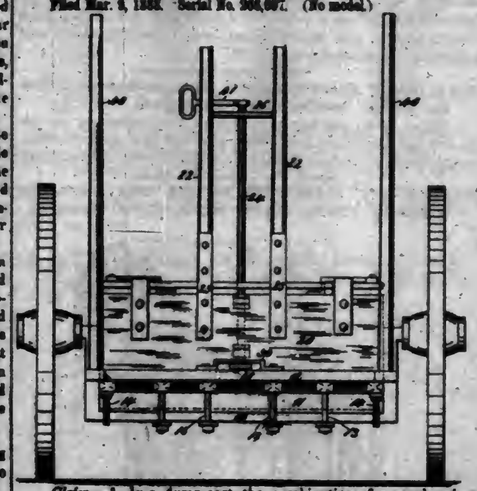
4. In a switch of the character described, the combination of the table A, provided with the poles 35 and 65, the rod *i*, fitted to slide in said table and provided with the plate *k*, having the arms *l m*, the bar D, provided with the plungers *p*, the plates 75 in contact with said poles and forming sockets for said plungers, and mechanism for engaging said arms and actuating said plungers, substantially as and for the purpose set forth.

5. In a switch of the character described, the combination of a table provided with poles, a bed-plate having a vertical tube, a rod fitted to slide in said tube, a plate on said rod having outwardly-projecting arms, a bar provided with metallic plungers and secured to said plate, a soft-copper plate in contact with each pole, companion plates forming sockets for the plungers, a pivoted lever provided with a flat spring, and a cam having two faces for distending said spring when said lever is moved, whereby it is caused to strike an arm of said plunger-plate as it leaves the cam, substantially as and for the purpose set forth.

398,561. ELECTRIC SWITCH. FRANKLIN A. WHELER and ADOLPH F. RIETZEL, Lynn, Mass. Filed Dec. 26, 1888. Serial No. 294,619. (No model.)

Claim.—1. In an electric switch, the lever D, pivoted on the bolt 25 and provided with the retaining-spring 45, in combination with the spring 65, provided with the diagonally-arranged head 75, substantially as and for the purpose set forth.

2. In an electric switch, the combination of a table provided with a standard, a tube fitted to slide on said standard and bearing sheet-metal plungers, connector-plates on said table forming sockets for said plungers, a pivoted lever provided with a spring having a diagonally-arranged head, a post for distending said spring, and arms on said tube for receiving said spring as it leaves said post, whereby said plungers are actuated, substantially as described.



3. In a switch, the tube *i*, fitted to slide on the standard *h* and provided with the clamping-plate *j*, in combination with the guide-rod 64 and plate 84, whereby said clamping-plate may be adjusted horizontally, substantially as described.

4. In an electric switch, the combination of a table, provided with connector-plates bent to form plunger-sockets, a bed-plate provided with a standard, a tube fitted to slide on said standard and provided with sheet-metal plungers adapted to engage said sockets, a lever pivoted to said table, a spring secured to said lever and provided with a cam-shaped head, a post on said bed-plate for engaging said cam-head and distending the spring, and arms on said tube projecting into the path of said spring, whereby the plungers may be forced into contact with or disconnected from their sockets, substantially as described.

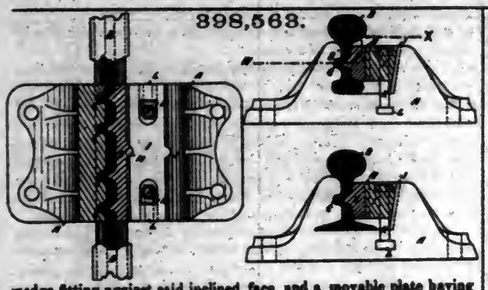
5. In an electric switch, the combination of the table A, provided with the connector-plates *p q*, bent to form sockets 15, the bed-plate *f*, provided with the standard *h* and post 14, the lever D, the spring 65, having the cam-head 75, the tube *i*, provided with the clamping-plate *j*, and arms 44 and 54, projecting into the path of said spring, the plungers *l*, adjustably secured in said clamping-plates, and the guide-rod 64 and plate 84, whereby said plungers may be adjusted horizontally, all being arranged to operate substantially as set forth.

6. In an electric switch, a pivoted lever provided with a spring having a cam-shaped head, in combination with a standard for engaging and distending said spring when the lever is moved, and a tension-spring secured to said lever and bearing upon the pivot thereof, substantially as and for the purpose specified.

398,562. DUMP-CART. HARTWELL A. WILKIN, New York, N. Y. Filed Mar. 3, 1888. Serial No. 266,097. (No model.)

Claim.—1. In a dump-cart, the combination of a crank-axle, a body mounted thereon at one side of the center of its length, angular draft-irons pivotally connected to the crank-axle, thills secured to the forward ends of the draft-irons, and a locking device for securing the body in its normal position, substantially as described.

2. In a dump-cart, the combination, with a crank-axle and a body secured thereto, of the thills provided with a foot-board, angular draft-irons pivoted to the axle and having their forward ends secured to the thills, and a locking-tongue adapted to engage the body to lock it in position, substantially as described.



3. In a dump-cart, the combination, with a crank-axle and a body mounted thereon and provided with a keeper, of the thills 16, provided with the foot-board 17, the angular draft-irons 19, pivoted to the crank-axle and having their forward ends secured to the thills, and the shaft 24, provided with the locking-tongue 28 on its lower end for engaging the keeper of the body, substantially as described.

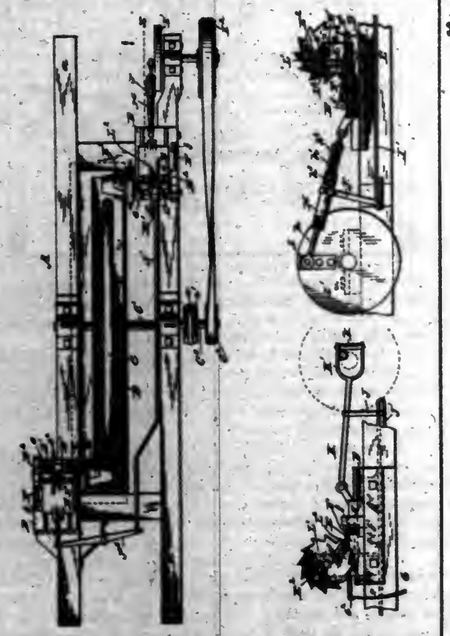
4. In a dump-cart, the combination, with a crank-axle and a body mounted thereon and provided with a keeper, of the thills 16, the foot-board 17, the apertured board 20, the angular draft-irons 19, pivoted to the axle and secured to the board 20 and to the thills, the thill-rungs 22, and the shaft 24, journaled between the thill-rungs and provided with the locking-tongue 28, substantially as herein shown and described.

398,563. RAILWAY-CHAIR AND THE METHOD OF SECURING RAILS THEREIN. GEORGE W. WILLFORD, Sheffield, County of York, England. Filed June 26, 1888. Serial No. 278,082. (No model.) Patented in England Mar. 16, 1885, No. 3,577.

Claim.—1. A rail having ribs on one side and corresponding recesses in the other, in combination with a chair which has recesses to receive said ribs and an inclined face on the other side of said rail, a

398,563.

wedge fitting against said inclined face, and a movable plate having ribs which fit the recesses of the rail, said plate being held in position against said rail by said wedge, substantially as set forth.



2. A rail having recesses in one side of it, in combination with a movable plate having ribs which fit into such recesses, and also a vertical rib or projection on its outer side, a wedge recessed to receive said rib, and a chair having an inclined face in contact with said wedge, substantially as set forth.

3. A rail having recesses on one side, in combination with a movable plate having ribs which fit into said recesses, and also a vertical rib or projection, H, on its outer face, a wedge recessed to receive said vertical rib or projection, and also provided on its outer face with a similar rib or projection, J, and a chair having an inclined face for contact with said wedge, and also recessed to receive said projection J, substantially as set forth.

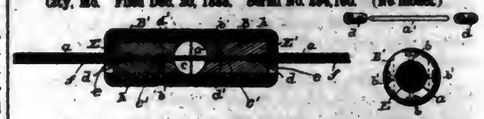
398,564. MORDANT. WILLIAM J. WILLIAMS, Camden, N. J. Filed Aug. 13, 1888. Serial No. 282,612. (No specimens.)

Claim.—The mode herein described of fixing colors and preventing rust and crocking in textile fibers or fabrics, said mode consisting in subjecting the fabrics or fibers to the action of trisodium phosphate.

398,565. GLASS-CUTTING MACHINE. HARRY C. WOOD, New Brighton, Pa. Filed Apr. 20, 1888. Serial No. 272,243. (No model.)

Claim.—1. In a machine for cutting, grinding, or polishing glassware, the combination, with a grinding or polishing wheel, of a sliding carriage for supporting the glass and a yielding connection between the carriage and motive power, substantially as described.

2. In a glass-cutting machine, the combination, with the stone, of a reciprocating carriage for supporting the glass, a crank, and a yielding pitman connecting the crank with the carriage, substantially as described.

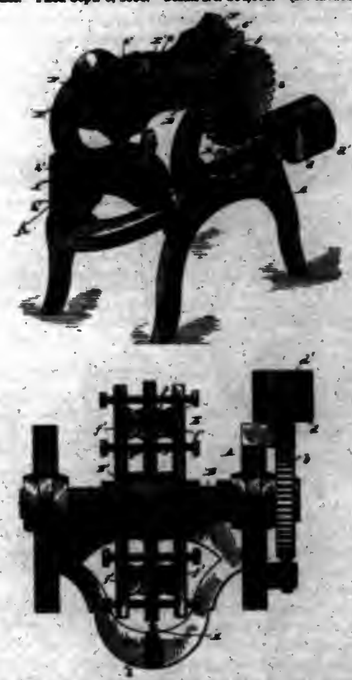


3. In a glass-cutting machine, the combination, with the stone and reciprocating work-support, of the sleeve-shaft, crank, rods connecting the sleeve-shaft with the crank and work-support, and a spring interposed between the end of the sleeve-shaft and an adjustable stop on one of the rods, substantially as described.

4. In a glass-cutting machine, the combination, with the stone, of a sliding work-support, a spring for moving the support toward the stone, a yielding connection between the support and the motive power, and an automatic stop for arresting motion of the support substantially as described.

5. In a glass-cutting machine, the combination, with the stone, of two sliding work-supports arranged on opposite sides of the stone, a lever and rod for connecting the two supports, and a yielding connection between one support and the motive power, substantially as described.

6. In a glass-cutting machine, a sliding carriage having a shaft provided with a chuck and a ratchet, said shaft being also provided with a hole in its circumference, a track having a hole and supporting a pawl, a spring-bolt adapted to engage both of said holes, and a lever connected to said bolt and adapted to hold it out of engagement with said holes, all combined substantially as and for the purpose set forth.



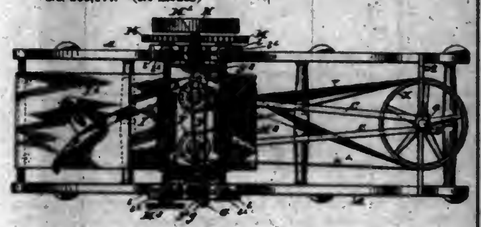
398,566. ELECTRIC CUT-OUT. WILLIAM H. S. WRIGHT, Kansas City, Mo. Filed Dec. 20, 1888. Serial No. 294,160. (No model.)

Claim.—1. An electric cut-out comprising two wires joined by a fusible connecting-rod and an inclosing insulated transversely-divided case, whereby when the fusible rod melts the wires are prevented from forming a ground-connection, substantially as set forth.

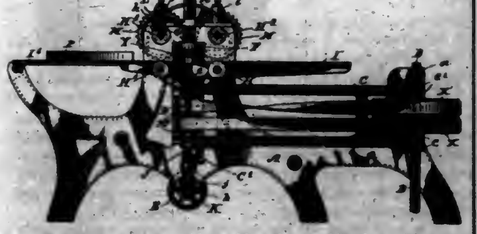
2. In an electrical insulated cut-out, the combination, with the adjacent terminals of an electrical conductor-wire and ferrules placed on these ends, of a fusible rod composed of metallic alloy, two cylinders having electrical conductivity, two enveloping-shells of insulating substance, two sleeves or ferrules placed on the ends of the fusible rod, and set-screws which engage these ferrules and have their heads embedded in the insulating-shells, substantially as set forth.

398,567. CRIMPING-MACHINE. ALPHEUS A. ABBOTT, Auburn, Me., assignor to Stephen Moore, Newton, and Frank T. Fuller, Boston, Mass. Filed Sept. 6, 1888. Serial No. 284,691. (No model.)

Claim.—1. In a machine for crimping boots and shoes, the combination, with the frame provided with an upright, and a spring-held form pivoted thereto, of a rotatable head carrying jaws adapted to pass over said form, substantially as and for the purpose set forth.



2. In a machine for crimping boots and shoes, the combination, with the frame provided with an upright, of a form pivotally secured to the latter, springs secured to the upright and bearing against the form to retain it in place, and a rotatable head carrying jaws adapted to pass over said form, substantially as set forth.



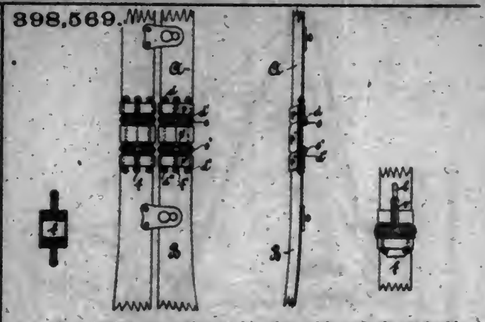
3. In a crimping-machine, the herein-described head, comprising a rotatable shaft, parallel arms mounted thereon and projecting in a straight diametrical plane at each side thereof, oppositely-disposed jaws pivoted at the ends of the arms upon their inner faces, and set-screws provided through the arms at each side the pivot, for adjusting the jaws, substantially as set forth.

4. In a crimping-machine, the herein-described head, comprising a standard, a form hinged vertically thereto, and springs secured to the standard at each side and having their free ends bearing against the form, substantially as set forth.

5. The herein-described crimping-machine, comprising a frame, a standard projecting therefrom carrying a spring-held form, a shaft journaled in the frame and carrying parallel arms projecting at each side thereof, jaws pivoted at both ends of the arms upon their inner faces, and set-screws for adjusting the same, and gearing connected with one end of the shaft for imparting motion thereto, all arranged and adapted to operate substantially as and for the purpose set forth.

398,568. MOLDING-MACHINE. JOSEPH BAKER, Andover, N. H., assignor to Baker, Carr & Co., same place. Filed Sept. 12, 1888. Serial No. 285,177. (No model.)

Claim.—1. In a two-side molder, the combination, with a vertical driving-shaft and pulleys thereon, of horizontal radial arms mounted upon said shaft, rotary cutter-heads and their driving-pulleys mounted upon an arbor running in the free ends of said horizontal arms, and means for maintaining an equal pressure of said arms automatically each toward the other and at varying distances apart.



2. In a two-side molding-machine, the combination, with a suitable frame having horizontal feed and pressure rolls, of an adjustable table over which the work to be dressed is passed, a vertical driving-shaft and pulleys thereon, the horizontally-movable radial arms mounted upon said shaft, rotary cutter-heads and their driving-pulleys mounted upon an arbor running in the free ends of said radial arms, and means for maintaining an equal pressure of said arms automatically each toward the other and at varying distances apart, substantially for the purposes specified.

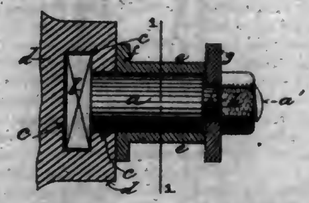
3. The combination of horizontally-movable radial arms provided at their free ends with an arbor and rotary cutter-heads and their drive-pulleys mounted thereon, and one or more trucks mounted on their under side and adapted to move upon a fixed support for partially sustaining their weight, as set forth.

398,569. CORSET-BUSK. OTTO RAHDER, Hamburg, Germany, assignor to Adolph Hartshorn & Co., same place. Filed June 11, 1888. Serial No. 166,908. (No model.) Patented in Belgium May 15, 1888, No. 86,895; in France May 23, 1888, No. 189,110; in Austria-Hungary Oct. 9, 1888, No. 39,109 and No. 51,512, and in England June 4, 1888, No. 6,907, and June 13, 1888, No. 8,128.

Claim.—1. A corset busk or stay composed of two halves united by hinge-joints and a helical spring placed transversely to the busk or stay, one end of the said spring being attached to one half and the other end to the other half of the busk or stay, substantially as described.

398,569.

2. In a busk or stay, the combination, with a single or double hinge, *d*, fitted with a single or double spring, *f*, across the staff coiled round pins *e*, of cover-plates *p*.

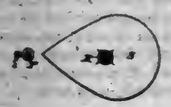


398,570. LOOM-PICKER. JOHN W. BARLOW, Lawrence, Mass. Filed Nov. 7, 1888. Serial No. 290,190. (No model.)

Claim.—1. A loom-picker having a foot or tenon composed of two parts, each folded upon itself and interlocked with the other.

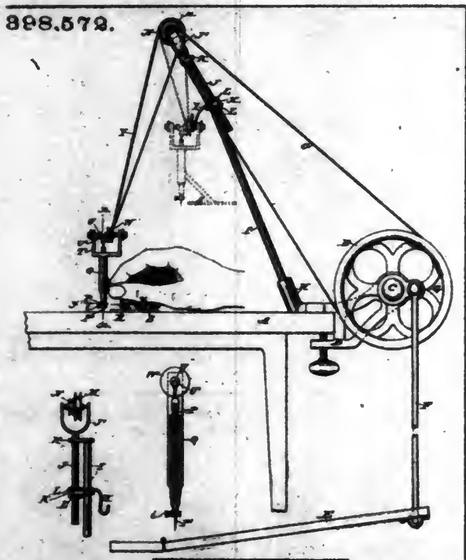
2. A loom-picker having a foot or tenon composed of two parts, each folded upon itself and interlocked with the other, and having its greatest width in the direction of the movement of said picker when in operation.

398,571. TRUNNION FOR CYLINDERS. GODFAY A. BARTH, St. Louis, Mo., assignor to Pierre Chouteau, same place. Filed Oct. 22, 1888. Serial No. 288,836. (No model.)



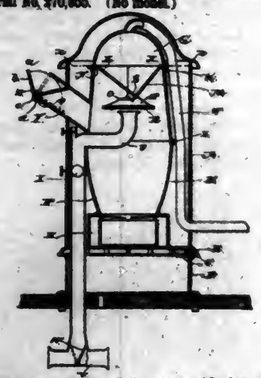
Claim.—1. The combination, with a cylinder having slotted projections, of detachable sleeve-trunnions, and T-headed bolts and nuts for securing the sleeve-trunnions to said cylinder, substantially as and for the purposes described.

2. The combination, with a cylinder having slotted projections, of detachable sleeve-trunnions provided with collars, and T-headed bolts and nuts for securing the sleeve-trunnions to said cylinder, substantially as and for the purposes described.



3. The combination, with a cylinder having slotted projections, of detachable sleeve-trunnions provided with collars and washers, and T-headed bolts and nuts for securing the sleeve-trunnions to said cylinder, substantially as and for the purposes described.

398,572. MACHINE FOR PERFORATING PAPER PATTERNS. MAX RENNER, New York, N. Y. Filed Mar. 5, 1888. Serial No. 266,307. (No model.)



Claim.—The combination, with a reciprocating stencil-perforating needle and the case inclosing the same, of the flat extended base-plate and the interposed bracket-bar connecting the plate and case, whereby the needle is upheld in a vertical position by the base-plate independently of other support, substantially in the manner and for the purpose herein set forth.

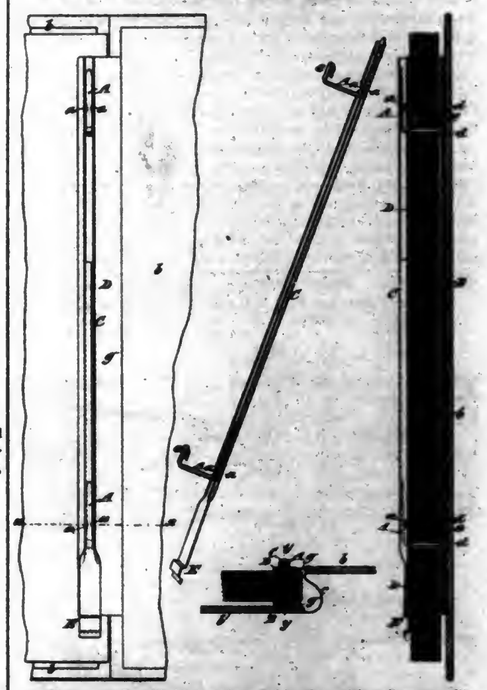
398,572.

398,573. DOMESTIC OR RAILWAY-CAR HEATER. WILLIAM P. BRINER, Columbus, Ohio, assignor of nine-sixteenths to Van S. Baltzer, A. R. Robinson, and Wm. H. Slade, all of same place. Filed Apr. 14, 1888. Serial No. 270,655. (No model.)

Claim.—1. The inner shell and the removable dome G, the latter having the depending flange K, to fit around the upper end of the shell, in combination with the deflecting-plates L M, inclined in opposite directions and having the flanges N at their upper edges, said flanges bearing on the upper side of the shell, substantially as described.

2. The combination, with the shell or stove, of the deflecting-plates L M, suspended in the upper end thereof and inclined in opposite directions, and the horizontal deflecting-plate R, having the vertical ribs P on its upper side fast to the lower edge of the plate M, substantially as described.

3. The heater comprising the outer shell, the inner shell or stove, the eduction-pipe leading from the upper end of the latter and extending out through the outer shell, the oppositely-inclined deflecting-plates L M in the upper end of the inner shell, the horizontal deflecting-plate below plates L M, and the air-induction pipe having its upper end arranged under the horizontal deflecting-plate, substantially as described.



4. In a heater, the fire-pot, combined with the deflecting-plates L M, arranged in the upper end of the fire-pot, the lower edge of the plate M being extended below the plate L and having the ledge O, and the horizontal deflecting-disk R, suspended below the deflecting-plates at or about the ledge O, as set forth.

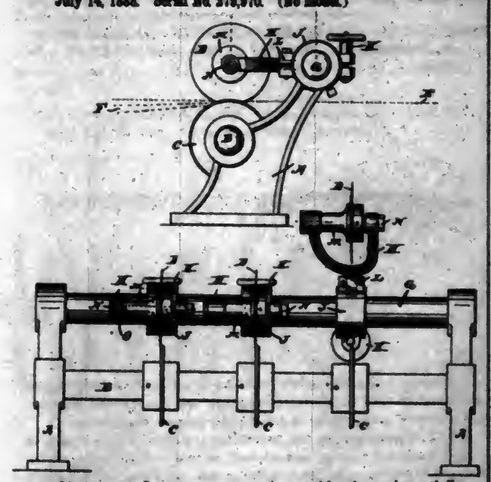
5. The heater provided with the oppositely-inclined plates L M, having their meeting inner ends separated by a space, and the horizontal deflecting-disk R, suspended below the meeting inner ends of the plates and secured to one of said plates, as set forth.

6. The inner shell and the removable dome G, combined with the removable deflectors L M, the latter being held in place within the shell by means of the dome, as set forth.

7. The heater having the inclined deflector-plates L M above the fire-box, the deflector-disk R, suspended below the plates, the eduction-pipe T, leading from the dome of the heater above the deflectors, and the induction-pipe U, having its upper end arranged below the deflectors, as set forth.

398,574. FILE-BINDER. MARCELLUS F. BERRY, Brooklyn, N. Y. Filed June 18, 1888. Serial No. 277,402. (Model.)

Claim.—1. In a file-binder, the combination, with a pliant metallic needle to pass through the file of papers and bend over thereon and bind the same, of a head-clamp bar, to which the needle is firmly attached, and a point-clamp bar grooved to receive the point and having a portion of the said groove closed or contracted to pass under and retain the needle, substantially as described and set forth.



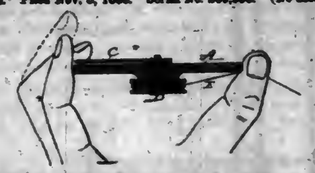
2. In a file-binder, the combination, with a pliant metallic needle to pass through the file of papers and bend over thereon and bind the same, of a head-clamp bar, to which the needle is firmly attached, a point-clamp bar grooved to receive the point and having a portion of the said groove closed or contracted to pass under and retain the needle, and an intermediate clamp-plate beneath the bent-over parts of the needle to stiffen the binding or attach to a cover, all substantially as described and set forth.

3. In a file-binder, the combination, with a pliant metallic needle to pass through the file of papers and bend over thereon and bind the same, and a head-clamp bar, to which the head of the needle is firmly attached by a loop or bend therein inclosing a portion of the bar, of a point-clamp bar grooved to receive the point of the needle and having a portion of the said groove closed or contracted to pass under and retain the needle, substantially as described and set forth.

4. In a file-binder, the combination, with a pliant metallic needle to pass through the file of papers, bend over thereon and bind the same, and a head-clamp bar, to which the head of the needle is firmly attached, of a point-clamp bar grooved to receive the point and having a portion of said groove closed or contracted to pass under and retain the needle, and an elastic catch or holder to retain the point-clamp bar on the needles, substantially as described and set forth.

5. In a file-binder, the combination, with a pliant metallic needle to pass through the file of papers, bend over thereon and bind the same, a head-clamp bar, to which the needle is firmly attached, a point-clamp bar grooved to receive the point and having a portion of said groove closed or contracted to pass under and retain the needle, an intermediate clamp-plate beneath the bent-over parts of the needle, of two covers and a flexible back, one of said covers being flexibly attached to the head-clamp bar and the other cover being flexibly attached to the intermediate clamp-plate, all substantially as herein described and set forth.

398,575. PAPER-CUTTER. ALBERT BEIS, Hamilton, Ohio. Filed July 14, 1888. Serial No. 279,970. (No model.)

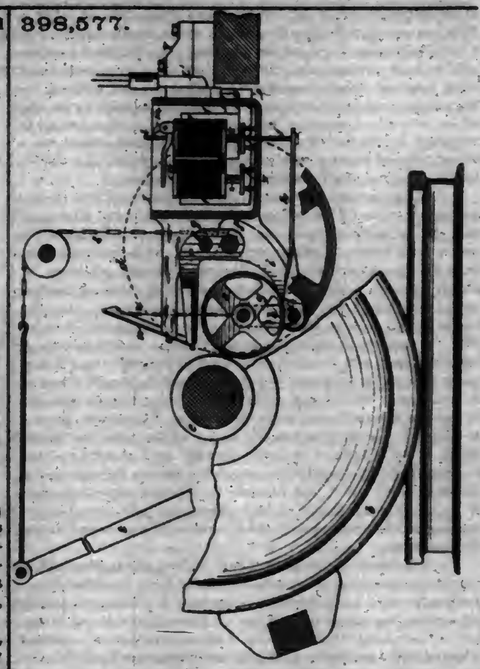


Claim.—1. In a paper-cutter, the combination, substantially as set forth, of a shaft carrying one or more slitter-disks, and a non-rotary shaft parallel therewith, a slitter-housing clamped to said non-rotary shaft and adapted for longitudinal and rotary adjustment thereon, a slitter carried in said housing and movable axially therein, and a spring engaging said slitter and housing.

2. In a paper-cutter, the combination, substantially as set forth, of a rotary shaft provided with one or more slitters, a non-rotary shaft disposed parallel thereto, a forked slitter-housing clamped to said non-rotary shaft and adjustable longitudinally and rotarily thereon, bolt N, slitter D, provided with hub M, engaging said bolt, and spring O.

3. In a paper-cutter, the combination, substantially as set forth, of shaft B, provided with one or more slitters, C, non-rotary shaft G, two-part collar J, provided with clamp-socket L, clamp-screw K, housing H, engaging said clamp-socket by a longitudinal shank, and slitter D, carried by said housing.

4. In a paper-cutter, the combination, substantially as set forth, of shaft B, one or more slitters, C, thereon, non-rotary shaft G, two-part collar J, clamp-screw K, clamp-socket L, housing H, slitter D, hub M, bolt N, and spring O.



398,576. TOY FORTUNE-WHEEL. WILBERT C. BLAKEMAN, Shelton, Conn. Filed Nov. 5, 1888. Serial No. 289,963. (No model.)

Claim.—The herein-described toy fortune-wheel, consisting of a disk, A, having upon its face a concentric series of objects, a rotative shaft, B, centrally through the disk, combined with a pointer fixed to the said shaft on the face side of the disk, with a grooved pulley, D, fixed upon the shaft on the reverse side of the disk, and an elastic cord, one end of which is made fast to the pulley, and so that the said elastic cord may be wound upon said pulley under tension, and the free end of said cord held stationary upon said toy while the pointer is also held stationary, and whereby upon the release of the pointer the reactive force of the said elastic cord will impart rotation to the pointer around the dial, substantially as described.

398,577. ELECTRIC BRAKE FOR RAILWAY-TRAINS. ALEXANDER E. BOWMAN, Pemberton, Pa., and WARNER P. WINCHFIELD, Uxbridge, Ontario, Canada, assignors to said Winchfield, Anson Todd Button, Uxbridge, and Samuel Street Fuller, Stratford, Canada. Filed Oct. 20, 1888. Serial No. 288,469. (No model.)

Claim.—1. In a system of electric brakes for railway-trains, the combination of an electro-magnet, a second electro-magnet, two independent electric circuits respectively including said electro-magnets, a third electric circuit, T, including an electric-magnetic closing-switch normally closed as to the magnet of the circuit-closer, the circuit-closer itself being adapted to close the first electro-magnet's circuit, a suitable circuit-closer for the second electro-magnet's circuit, electric generators of equal electro-motive force, the one located on the locomotive of the train and the other on the last car of the train and connected in opposition with the said two independent electric circuits, and a third electric generator in circuit with the magnet of the said electro-magnetic circuit-closer.

2. In a system of electric brakes for railway-trains, the combination of two friction-pulleys, the one connected to the brake-lever and the other to the armature of an electro-magnet, and both being connected to each other and geared to a collar upon the car-axle, the said collar consisting of alternate rings of metal and fiber secured upon the car-axle.

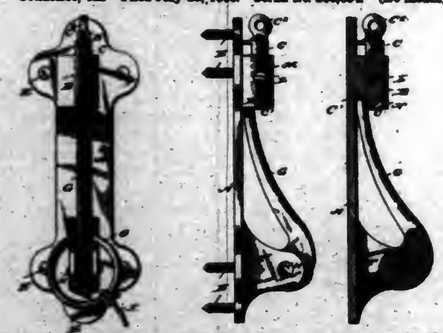
3. In a system of electric brakes for railway-trains, the combination, with the friction-pulleys of the brake, of a collar upon which the said pulleys press, the said collar consisting of alternate rings of fibrous substance, as wood and metal.

4. In a system of electric brakes for railway-trains, the combination of a car-axle provided with a collar, a friction-pulley supported upon a lever, a friction-pulley of smaller diameter than the first-named pulley and whose shaft is connected to said lever, both pulleys being adjustable relatively to the said collar, a lever applied at one end to the smaller pulley and at the other end or arm to the core of a solenoid, the said arm being elastic, as and for the purpose described, a retaining device for the said core, consisting of a rack and pawl, and a second solenoid whose armature or core is in the path of the said pawl and so arranged as to be adapted to release the pawl from said rack, the said solenoids being located in suitable electric circuits.

5. In an electric-brake system for railway-trains, the combination of a normally-closed electric circuit, brakes on all the cars of the train normally out of action, a normally-open circuit, means for closing the latter to bring the brakes into action, electro-magnets in the said first circuit, and magnetic circuit-closers within attractive distance of said electro-magnets and included in circuit with the said normally-open circuit, electric generators located on both the locomotive of the train and on the rear car and included in circuit with said electric circuits.

6. In a system of electric brakes, the combination of a friction-pulley adapted to be brought in engagement with the axle of the car-wheels, a lever for applying the pulley to the axle, an elastic arm for the said lever, a solenoid, and a rod connecting the said elastic arm to the core of said solenoid.

7. In a system of electric brakes for railway-trains, the combination of a pulley in frictional contact with one of the axles of the wheels of the train, a shaft carrying said pulley and supported at one end to a suitable bearing and at the other end by one arm of a pivoted bent lever, a second pivoted lever hinged at one end to the remaining arm

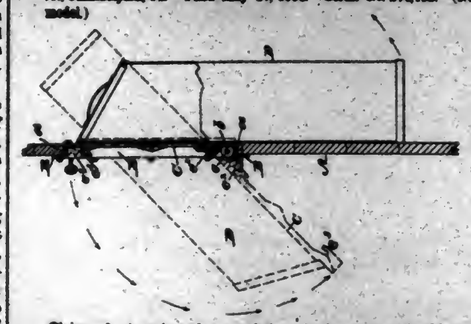


of the first lever and at the other end to a chain, a second pulley in frictional contact with the said axle and whose shaft is supported by a suitable bearing at one end and upon one arm of a third bent pivoted lever at another point, the said shaft being connected to said chain, a second chain connecting the shaft of the first pulley to the brake-lever, a solenoid whose core is connected elastically to the arm of the lever which supports the second pulley, a ratchet or toothed projection for the said core and a pawl engaging said ratchet, and a second solenoid whose core is adapted to trip said pawl, the said solenoids being included in independent electric circuits.

8. In an electric-brake system, the combination of two electric generators, the one A being located on the locomotive of the train of cars, and the other, A', being located upon the last car of said train, one or more electric couplings connecting the conductors which pass from the generators, of which there is one more generator, M, similarly located, a conductor, B, connecting similar poles of the first-named generators, two other conductors connecting the remaining similar or like poles of the same generators, a magnet, F, in circuit with the last-named conductors B and C, and a second magnet, *p*, being in circuit with the conductors B and D, a circuit-closer, E, normally open and in conductor D, a circuit-closer, P, normally open and in conductor C, both of said circuit-closers being located upon the locomotive and on the rear car, a circuit-closer, P', normally open and in conductor C, and located on the last car of the train, the circuit-closers P and P' being of magnetic material—such as soft iron—and magnets Q and Q', located within attracting distance beneath the said circuit-closers P and P', and normally in closed circuit with battery M by a conductor, T, and thereby maintaining said circuit-closers open against tension-springs R and R', respectively connected to said circuit-closers.

9. In a system of electric brakes for railway-trains, the combination of two generators of equal electro-motive force connected in opposition in such a manner that one conductor, B, connects two similar poles of the two generators, and two other conductors, C and D, connect the remaining two similar poles of the same generators, a solenoid in circuit with a conductor connecting the conductors B and C, a second solenoid in circuit with a conductor connecting the conductors B and D, the conductors D and C being normally open, a normally-closed circuit containing a magnet whose core is connected with a normally-open circuit-closer in conductor C, and a suitable generator for said normally-closed circuit.

10. In a system of electric brakes for railway-trains, the combination of two solenoids, movable cores for both solenoids, stops located under the cores at such a distance below the solenoids that the cores cannot fall away from the attractive influence of the solenoids, a rack or toothed rod secured to one of the said cores and gearing into a ratchet which is pivoted and whose one arm is located in the path of the core of the other solenoid, and a spool for the windings of the solenoids, the said spools having openings for the cores.

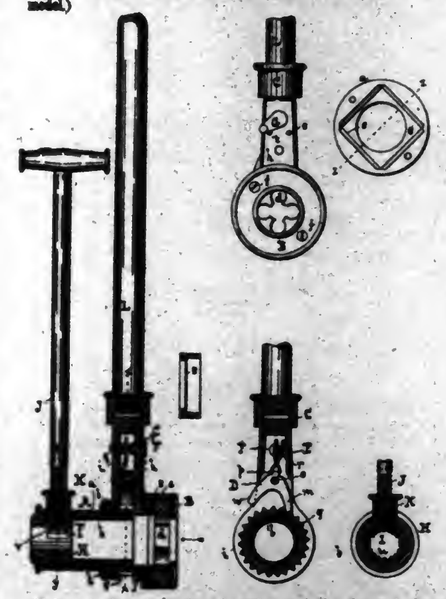


398,578. ANIMAL-RELEASING DEVICE. ALONZO R. BRANN, San Francisco, Cal. Filed July 23, 1888. Serial No. 280,854. (No model.)

Claim.—1. In a horse-releasing device, the combination, with the attaching-plate having a guide-catch box formed thereon and recessed at its lower end, of a catch-bolt arranged vertically in the said box and having its lower end beveled, and a tongue pivoted to the attaching-plate and having its free end beveled, so that it may engage the beveled end of the catch-bolt and lift the same, so as to be locked thereby, substantially as specified.

2. The combination, with the attaching-plate having the guide-catch box formed thereon near its upper end, and a hinge-bracket formed near its lower end, of the tongue to receive a halter-ring pivoted to the said bracket, and having its opposite end beveled, as shown, the said box having its lower end recessed for the entrance of the beveled end of the tongue, and also having a vertical slot in one of its side walls, and the catch-bolt having its lower end beveled, and also having a thumb-piece passing through the slot of the box, substantially as specified.

398,579. GARBAGE BOX OR RECEIVER. WILLIAM H. BUCKLEY, Jr., Philadelphia, Pa. Filed May 17, 1888. Serial No. 274,132. (No model.)



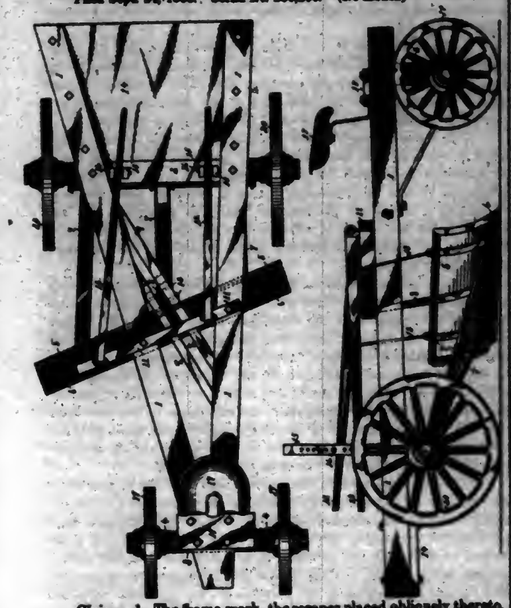
Claim.—1. A garbage-box consisting of a frame, a casting hinged or pivoted thereto, and a vessel secured to the casting, said parts being combined substantially as and for the purpose described.

2. In a garbage-box, the combination, with a metallic frame, of a casting pivoted thereto, and a vessel secured to said casting above the axis of the box, adapted to abut against the bottom of the frame when the vessel is overturned, substantially as described.

3. In a garbage-box, the combination, with a frame, of a casting pivoted thereto, carrying a vessel and provided with stops, a handle or pull, and a lock, substantially as described.

4. In a garbage-box, the metal frame B, the casting C, secured to the box and having lugs *e*, with rod B' passing through said lugs, and the stops *d'*, adapted to abut against the frame B, said parts being combined substantially as described.

398,580. MACHINE FOR THREADING PIPE. GEORGE W. BURGARNER, Baltimore, Md. Filed Nov. 19, 1888. Serial No. 291,354. (No model.)



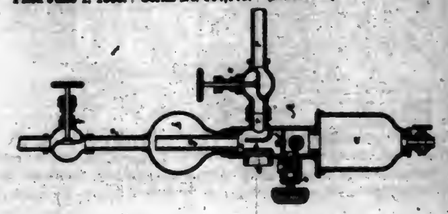
Claim.—1. In a screw-thread-cutting tool, the sleeve A, formed of the outer and inner threaded sections, *a* and *b*, the former having a polygonal chamber, *c*, at its end adapted to hold a die and ratchet-teeth on its circumference, and the latter provided with the centering-ring H, having inner teeth, and the movable toothed jaw I, with a threaded bar to adjust it within the said ring, combined with a handle, C, formed of the plates *h* and *i*, double pawl D, forked spring E, and shaft F, having the crank-pin *r* situated between the tines of the said forked spring, substantially as and for the purpose specified.

2. In combination with the sleeve-section *a*, having the circumferential teeth *g*, the handle C, having the double pawl D, forked spring E, shaft F, with the crank-pin *r* situated between the tines of the said forked spring, and handle C, whereby the said crank-pin is moved and the position of the pawl changed, substantially as and for the purpose specified.

3. As means for holding a pipe within the section *b* of the sleeve A, the interiorly-toothed ring H, movable toothed jaw I, and the threaded bar J, all combined substantially as and for the purpose specified.

398,581. ROAD-SCRAPER. ELIAS BURHANS, South Kent, Conn. Filed Sept. 24, 1888. Serial No. 286,260. (No model.)

Claim.—1. The frame-work, the scraper placed obliquely thereto, a front axle and wheels, and a rear axle and wheels, one rear wheel being in line with the corresponding front wheel and the other rear wheel in line with the forward end of the scraper, in combination with diagonal braces 9, an arm, 8, projecting from the scraper, whereby the angle may be adjusted, and levers 12 and rods 13, connecting said levers with the opposite ends of the scraper, whereby either end may be raised or lowered.



2. The scraper having an arm, 8, the rear axle, and braces pivoted to the axle and to the scraper, whereby the latter is supported, in combination with frame-work, diagonal braces 9, between which the arm lies, and pins passing through said braces, whereby the arm may be locked in position to hold the scraper at any desired angle.

398,582. DEVICE FOR SECURING HOSE TO COUPLINGS. ROBERT COWEN, Boston, Mass., assignor to the Boston Woven Hose Company, same place. Filed Jan. 23, 1888. Serial No. 261,628. (No model.)

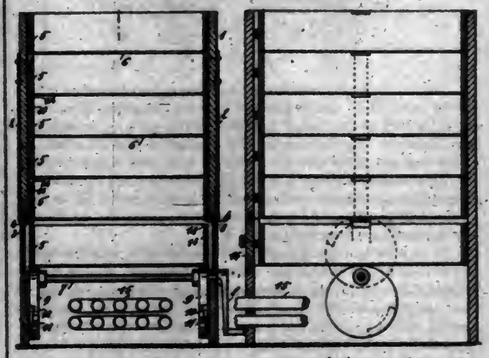
Claim.—The combination, with a tail-piece and a compressible hose or pipe placed thereon, of a metal ring placed upon that portion of the hose which receives the tail-piece, and corrugated or indented at intervals on the hose to form a series of inwardly projecting or inverted hose-clamping arches and intermediate outwardly-projecting arches, as set forth.

398,583. LUBRICATOR. WARREN H. CRAM, Lawrence, Mass. Filed June 1, 1885. Serial No. 167,173. (No model.)

Claim.—1. The combination of a lubricator provided with a sight-feed or observation chamber in which oil rises through water in its passage to the discharging-conduit for leading such oil to the part or parts of the engine to be lubricated, with a conduit to lead steam from the boiler into the condenser of such lubricator, and with another conduit within and to lead steam from such condenser into the said oil-discharging conduit, as set forth.

2. A lubricator combining these elements: a condenser, a reservoir for oil, an observation-chamber in which oil rises through water, an oil-discharging conduit leading from the top of the observation-chamber, a conduit for conveying steam from the boiler into the condenser, and another conduit wholly within the lines of the lubricator and for conveying live steam from the induct-conduit of the condenser to the top of the observation-chamber, as set forth.

3. In a sight-feed lubricator through water in which the oil rises, the combination of the oil-reservoir, the sight-feed chamber, the oil-discharging conduit, the condenser having a pipe communicating with the boiler, and an internal tube leading from within the condenser and communicating with the sight-feed chamber and oil-discharging conduit, said latter conduit having in it a stop-cock, through which conduit the oil and steam may be discharged from said lubricator to the parts of the engine to be lubricated, as set forth.



4. In a sight-feed lubricator through water in which oil rises, the combination of the oil-reservoir, a steam-chamber at the top thereof, the oil-discharge conduit and the condenser having a pipe to lead steam thereto, and also a pipe to lead steam into the said steam-chamber and oil-discharging conduit.

5. In a sight-feed lubricator of the character described, a steam-chamber located near the top of the oil-reservoir and communicating with the sight-feed chamber through which oil rises through water, and also having a pipe to lead steam into such chamber and also communicate with the steam-condenser of such lubricator, and another pipe to lead steam to the condenser and communicate with the steam-chamber or pipe leading thereto, whereby an equalizing pressure is obtained, as set forth.

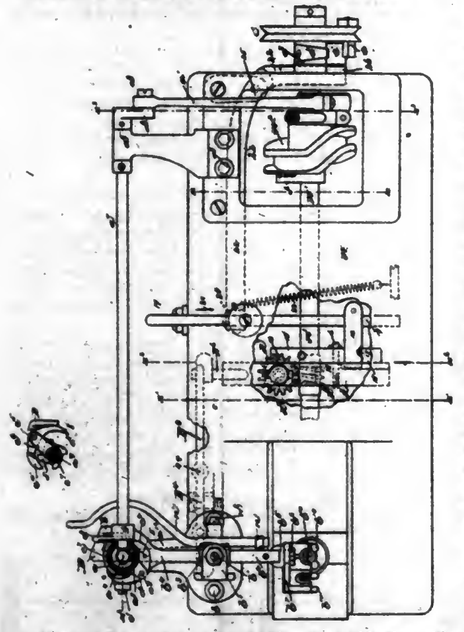
6. A steam-chamber located at the top of the oil-reservoir and having a pipe to lead steam into such chamber and also to communicate with the condenser, and a pipe to lead steam to such condenser, such steam-chamber also communicating with a sight-feed chamber through which oil rises through water, and also having an oil-discharge passage to communicate with a pipe to convey the oil or oil and steam to the part or parts of the engine to be lubricated, all being substantially as set forth.

7. In a sight-feed lubricator in which oil rises through water and having a steam-chamber at the top part of the oil-reservoir of such a lubricator, the combination of the following: the steam-chamber referred to, a condenser, a pipe to lead steam thereto and another pipe to lead steam into the said steam-chamber, a conduit communicating with the sight-feed and steam chambers, a choked oil-discharge conduit communicating with the two last-named chambers, the oil-reservoir, and feed-regulating valve, all being combined to operate substantially as set forth.

398,584. FRUIT-DRIER. HENRY A. CRANDALL, Harrison, Ark. Filed Apr. 13, 1888. Serial No. 270,893. (No model.)

Claim.—1. In a fruit-drying apparatus, a drying-chamber, movable supports on which the trays rest projecting into the chamber, and a rotary shaft with eccentric-disks which engage and move back the supports and release and lower therefrom one tray at a time, substantially as described.

2. In a fruit-drying apparatus, a drying-chamber, a series of trays located therein, spring-actuated movable supports extending into the chamber and supporting the trays, and a rotary shaft having eccentric-disks which engage the spring-actuated supports, release



them from the trays, and lower a tray out of engagement with the supports, substantially as described.

3. A fruit-drying apparatus consisting of the drying-chamber 1, having spring-strips 2, with bent ends 3, having tapered edge 12 and projecting through openings 4 into chamber 1, the trays 5, with inclines 13 and slots 14 in line with bent ends 3, resting upon one another and supported by bent ends 3, and the eccentric-disks 9, mounted on shaft 7, with crank-handle 8, and having the recess 10, with tapered side 11, all constructed and arranged substantially as described.

4. In a fruit-drying apparatus, a drying-chamber, 1, having openings 4, spring-strips 2, with bent ends 3, having bevel-edge 12, and projecting through openings 4, and the shaft 7, with crank-handle 8, and eccentric-disks 9, with recess 10, having tapered sides 11, substantially as described.

5. In a fruit-drying apparatus, the combination, with the drying-chamber 1, having a feed-opening at its top and a tray-exit in its side, and tray-supports projecting into said chamber, of revoluble eccentrics mounted in the casing below the exit-opening and supports and having the inclined recesses 10, the side walls of which engage the said supports and force them outward, substantially as set forth.

398,585. BUTTON-SEWING MACHINE. HENRY H. CUMMINGS, Malden, assignor to the Union Button Sewing-Machine Company, Boston, Mass. Filed Dec. 21, 1886. Serial No. 222,165. (No model.)

Claim.—1. In a button-sewing machine, the combination, with a carrier bar or lever and its attached button-holding foot, of a pivoted guide for said carrier bar or lever between its ends, an eccentric or cam, a strap or collar surrounding said eccentric or cam and connected to the rear end of the said carrier bar or lever, and means for intermittingly rotating said cam or eccentric, whereby positive vibratory and longitudinal movements are imparted to the said carrier bar or lever to place different eyes of a button alternately under the needle of a sewing-machine, substantially as set forth.

2. In a button-sewing machine, the combination, with the carrier bar or lever b^4 and its attached button-holding foot, of a vertically-pivoted guide, b^5, having an opening through which the said bar or lever can slide and which is of sufficient size vertically to permit of a vertical movement of the said bar or lever therein, means for depressing and lifting the button-holding end of said bar or lever, and means for imparting positive vibratory and longitudinal movements to the latter to bring different eyes of the button alternately under the needle of the sewing-machine, substantially as set forth.

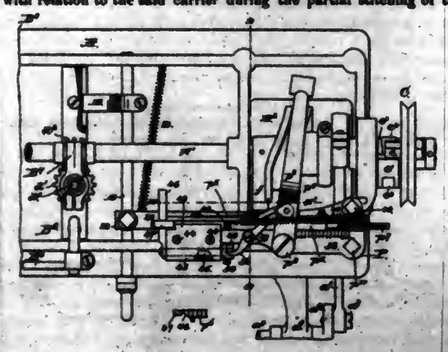
3. The carrier bar or lever and the foot or button-holder connected thereto loosely and provided with means for holding buttons of different sizes, combined with a latch or locking device to retain the said foot or holder in adjusted position, substantially as described.

4. The carrier-bar b^4, the collar upon which the said carrier-bar is pivoted, the eccentric within said collar, means for intermittingly rotating said eccentric, and a button foot or holder attached to said carrier-bar, combined with a pivoted block, b^5, through which said carrier-bar is free to slide, the said block being located between the ends of the carrier-bar, and operating substantially as described.

5. The carrier-bar, a button-holder attached to the carrier-bar at one end, a collar upon which the said carrier-bar is pivoted at its other end, an eccentric within the collar, an attached ratchet-pawl, a pawl-carrier, and means to rotate it intermittingly for a half-turn, combined with a pawl-releasing device to act upon the pawl to effect a quarter rather than a semi rotation of the said eccentric, substantially as described.

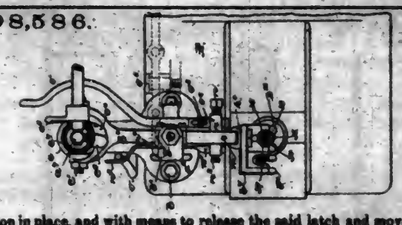
6. The carrier-bar b^4, its attached button-holding foot, the collar upon which the said carrier-bar is pivoted, the eccentric located within the said collar, the ratchet and pawl and pawl-carrier, and the beveled gear c^7, combined with the rock-shaft c^4, the toothed sector c^5, and means to operate the said rock-shaft, substantially as described.

7. In a sewing-machine for stitching buttons, the main rotating shaft A', worm thereon, the worm-gear d'', actuated thereby, the finger B^7, moved in unison with the said worm-gear, the lever B^8, having the projection B^9, and pawl-releasing device B, combined with the pawl C^3, having a tail, 8, the pawl-carrier, means to operate it, and the ratchet-wheel and eccentric, whereby change of position of the pawl-releasing device alters the effectual length of stroke of the said pawl, substantially as described.



8. In a sewing-machine, the shaft A', the belt-pulley loosely mounted thereon and provided with a pin or projection, e, the worm attached to the said shaft, the worm-gear driven thereby, the projection or finger 13, moved in unison with the said worm-gear, the notched lever 15, actuated by said finger, the slide-rod 19, its projection engaged by the said lever, and a spring, as 23, and the shipper-lever, combined with the dog e', attached to the hub e^3, fast on the shaft A', and engaging the pin e of the band-pulley, the movement of the said lever effecting such a movement of the shipper-lever as to cause its outer end to disengage the dog e' from the pin or projection of the belt-pulley, permitting the latter to run loose on the shaft A'.

9. In a sewing-machine, the combination, with the shipper-lever 22, the shaft A', the belt-pulley loose thereon, and means for detachably connecting the said shaft and pulley and for operating said shipper-lever, of the locking device consisting of the notched arm f, attached to said shaft and provided at its outer end with the spring-pressed latch f', said locking device being arranged to engage the said shipper-lever and stop the rotation of the said shaft when the said pulley is disconnected therefrom, substantially as set forth.

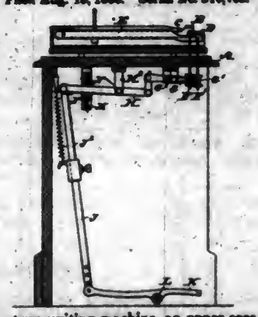


10. In a machine for stitching buttons upon fabric or other material, a carrier-bar having at one end a button-holding foot and pivoted at its other end to a collar, a guide for the said carrier-bar between its ends, an eccentric within the said collar and adapted by its rotation to vibrate the carrier-bar, a ratchet connected with the said eccentric, a pawl-carrier, and a pawl, combined with means, substantially as described, whereby the eccentric may be rotated, as desired, for a greater or less distance, whereby the carrier-bar may be moved far enough at each operation of the eccentric to enable the needle to descend first through one hole in the button and then through a hole diametrically across the center of the button, or whereby the carrier may be moved to cause the needle to descend through first one and then the next hole to it in the direction of the surface of the button and not across the center of the button, substantially as described.

398,586. BUTTON-SEWING MACHINE. HENRY H. CUMMINGS, Malden, assignor to the Union Button Sewing Machine Company, Boston, Mass. Filed Dec. 21, 1886. Serial No. 222,169. (No model.)

Claim.—1. The carrier-bar, means to vibrate it, the rod A, and the button-holder or foot connected therewith, combined with a latch and a projection to retain the button-holder or foot in locked position with relation to the said carrier during the partial stitching of the

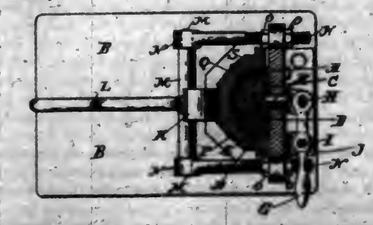
398,586.



button in place, and with means to release the said latch and move the rod with its attached foot longitudinally with relation to the carrier-bar, substantially as described.

2. The carrier-bar, means to vibrate it intermittingly, the button-holder or foot, its attached rod free to be moved longitudinally with relation to the carrier-bar, and the head to act as a guide, combined with means to hold the rod in locked position with relation to the said carrier-bar to retain the button-holder or foot in proper position while part of the button is being stitched, and with means to release the said rod from its locked position and move it with its attached foot longitudinally with relation to the carrier-bar, substantially as described.

3. In a button-sewing machine, the combination, with the shaft A', the cam A^3 thereon, the pawl-carrier p^3, actuated by the said cam, the pawl p^4, pivoted to said carrier, the toothed slide-bar p^5, having the beveled end 42, a detent for said slide-bar, the rock-shaft 45, having the finger 49, said shaft having also an arm, 46, provided with the finger 47, the disengaging-lever 52, the shipper-lever 22, its actuating-spring, the loose pulley C, and detachable connections between said pulley and the shaft A', substantially as set forth.



4. In a sewing-machine, the shaft A', the loose pulley C, detachable connections between said pulley and shaft, the shipper-lever 22, the notched and inclined arm 46, to hold the said shipper-lever, the rock-shaft 45, its attached finger 49, the pawl-disengaging lever 52, the pawl-carrier p^3, its attached pawl and the detent, and means to move the pawl-carrier, combined with the toothed slide p^5, moved intermittingly by the pawl of the pawl-carrier and adapted to operate the inclined and notched arm to release the shipper-lever, and means to move the shipper-lever to enable it to continue the movement of the said inclined arm, to operate substantially as described.

398,587. TYPE-WRITING MACHINE. JOHN S. DOVE, Jr., Philadelphia, Pa. Filed Aug. 13, 1886. Serial No. 210,782. (No model.)

Claim.—In a type-writing machine, an upper-case lever, in combination with a foot-treadle and intermediate depending rod, levers, and connecting-rod, one of said intermediate levers having a guide with buffers, all substantially as and for the purpose set forth.

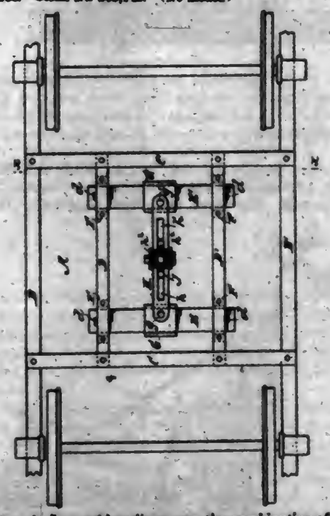
398,588. MACHINE FOR LINING JOURNAL-BOXES. BENJAMIN J. DOWNS, Somerville, Mass. Filed Sept. 25, 1886. Serial No. 214,363. (No model.)

Claim.—1. The mandrel A, having in its working-face a deep vertical recess, C, and a laterally-movable tongue or block, D, of less depth than and located permanently in said recess, in combination with the lever G and stem E or equivalent means for giving lateral movement to said block, substantially as and for the purpose set forth.

2. The vertically-recessed mandrel A C, the tongue or block D, of less depth than the recess in the mandrel and permanently located therein, and means, substantially as described, for giving the block lateral movement in such recess, in combination with suitable clamping mechanism for holding the shell firmly, for the purpose set forth.

3. The mandrel A, fixed to the base B and standard F, and having the recess C in its front face and the smaller laterally-moving block, D, therein, in combination with the pivoted lever G, connected to the stem E for lateral adjustment of said block, and the cam K, pivotally connected to said standard, substantially as set forth.

398,589. HARNESS. FREDERICK DRIFFILL, Sterling, assignor to the Eureka Company, Rock Falls, Ill. Filed Oct. 13, 1888. Serial No. 288,512. (No model.)

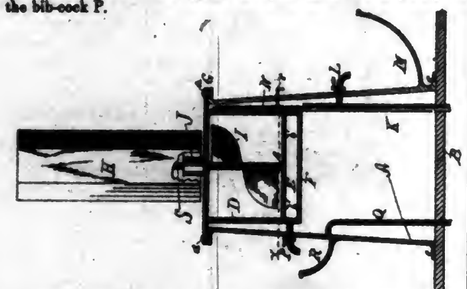


Claim.—1. In a harness, the combination of the pad C, provided with the forwardly-projected tongue 2, the bow A, provided with rearwardly-extending jaws 1 1, and the vertical bolt 4, substantially as shown, and for the purpose described.

2. In combination with the thills G, provided with box F, having opening H therein, the bow A, provided with pin J, and the pad C, centrally pivoted to said bow, substantially as shown, and for the purpose described.

3. The combination of the pad C, provided with tongue 3 and the recess 7, the bow A, supported at its front and rear ends, substantially as shown, and provided with jaws 1 1, bolt 4, and means, substantially as shown, for attaching the rear ends of said bow to the vehicle, for the purpose specified.

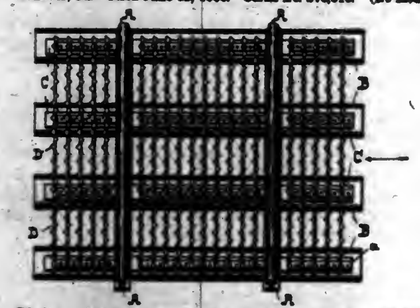
398,590. MEANS FOR MOUNTING THE GRIP ON CABLE-RAILWAY CARS. CARL E. REDDOCK, Long Island City, N. Y. Filed Sept. 11, 1888. Serial No. 285,142. (No model.)



Claim.—1. In a cable-railway car, the combination of stationary bars extending crosswise of the truck-frame and detachably secured to the same, with sleeves loosely mounted to slide on said stationary bars, each sleeve consisting of a block having an opening extending

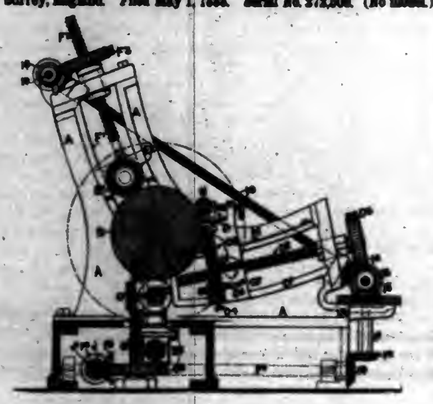
centrally through it adapted to receive one of the said stationary bars, and also having an end portion of the grip-carrying head-block pivotally connected thereto, substantially as described.

2. In a cable-railway car, the combination, with the car-truck, of stationary bars extending crosswise of the car and passing loosely through keepers secured to the truck-frame, and held in place by pins passing through their extremities, and sleeves loosely mounted to slide on said stationary bars and having pivotally connected thereto the head-block carrying the grip-gear, substantially as described.



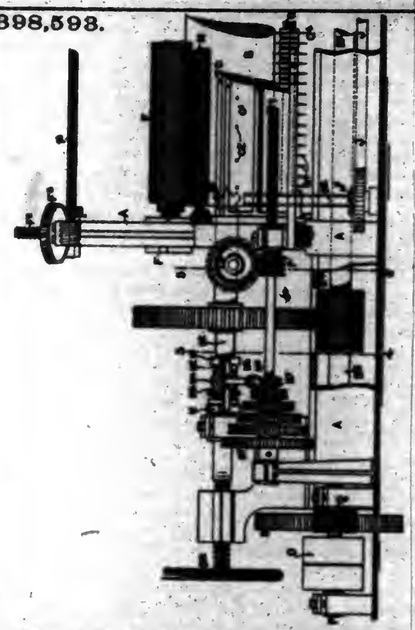
398,591. DRINKING-FOUNTAIN AND SHOW-STAND. CHARLES BERNHARDT, Chicago, Ill. Filed July 24, 1888. Serial No. 280,908. (No model.)

Brief.—The show-stand H is caused to revolve with the shaft S by the force of the water against the spiral blade I in its passage to the bib-cock P.



Claim.—The hollow post A, the cylinder D G F, partition E, the post S, extending into and above the cylinder, the screw I within the cylinder and on the post S, and the show-stand H on the post above the cylinder, in combination with the water-supply pipes K N and faucet P, substantially as specified.

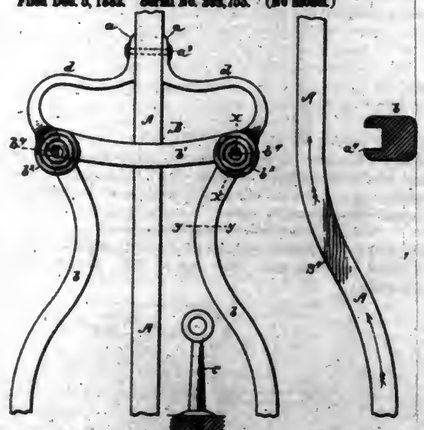
398,592. RAILWAY CATTLE-GUARD. ABNER W. EICHELBERGER, Hanover, Pa. Filed June 12, 1888. Serial No. 276,816. (No model.)



Claim.—In a cattle-guard, the guard-bars having a toothed or serrated upper edge, the said teeth being set or arranged with each alternate tooth bent to one side, and the intervening teeth bent to the other side, substantially as and for the purpose specified.

398,593. MACHINERY FOR CUTTING WOOD FOR MATCHES, SPLINTS, AND MATCH-BOXES. WILLIAM ELLIS, Peckham, County of Surrey, England. Filed May 1, 1888. Serial No. 272,508. (No model.)

398,593.

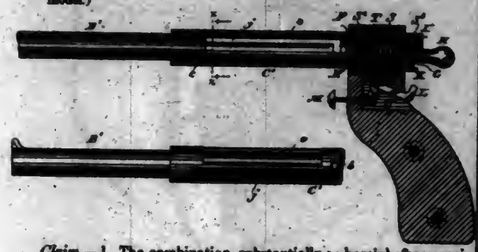


Claim.—1. In machinery for the purposes stated, the combination, with a long knife, a longitudinal incisor, and a circumferential incisor, of the curved guides D', screws D², slides D³, pivoted blocks D⁴, curved guides F', and screws F², hinged to slides F³, as and for the purposes set forth.

2. In machinery for the purposes stated, the combination, with longitudinal and circumferential incisors, of the long knife C, knife-carrier C', blocks D, curved guides D', straight screws D², suitably turned, slides D³, and pivoted blocks D⁴, as and for the purposes described.

3. In machinery for the purposes stated, the combination, with the shaft B², of the bracket H³, held by rings H and H', shaft H², bevel-wheels H⁴ H⁵, worm H⁶, change worm-wheels H⁷, sleeve H⁸, screw H⁹, sectoral bearing H¹⁰, frame H¹¹, screw H¹², and shaft I, all substantially as and for the purposes described.

398,594. STREET-CAR. WILLIAM G. ELLIS, Amesbury, Mass. Filed Dec. 5, 1882. Serial No. 260,763. (No model.)

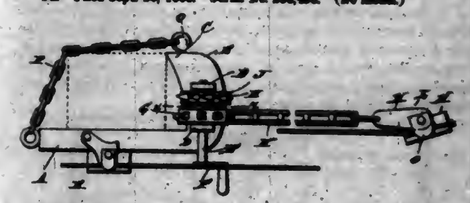


Claim.—1. As an improvement in street-cars, the within-described post A A, the uprights *b b*, and cross-piece *b'* of the panel-frame B, constructed and adapted as herein described, for the purposes set forth.

2. In the panel-frame B of a street-car, the metal guard *b²*, having the goose-neck *d*, with the flange *a*, rim-socket *d'*, hole *e*, and flange *a²*, constructed substantially as herein described, for the purposes set forth.

3. In a seat for street-cars, the panel-frame B, with the metal guard *b²*, having the goose-neck *d*, with the flange *a*, the hole *a*, rim-socket *d'*, and flange *a²*, in combination with the post A A, seat-bars *a³*, draw-bolts *b⁴* and *c'*, and foot-rail stanchion *c*, constructed and arranged as herein described, for the purposes set forth.

398,595. GUN AND PROJECTILE FOR THE SAME. STEPHEN H. EMMENS, London, England. Filed May 1, 1888. Serial No. 272,469. (No model.)

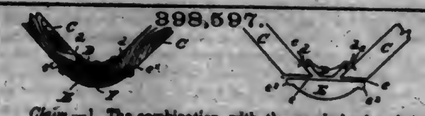


Claim.—1. The combination, substantially as hereinbefore specified, of a projectile composed of a head and a rearwardly-projecting open-ended tube, which latter contains the charge and is formed with an expanded rear end, and a fire-arm having the rear end of its barrel open and internally chamfered to receive said expanded end of the projectile and having an abutment behind the bore of the barrel, for the purposes set forth.

2. The within-described projectile, composed of a head and a rearwardly-projecting open-ended tube having a chambered and expanded rear end, which tube and its chamber contain the charge and a disk of fulminate, in combination with a fire-arm having the rear end of its barrel open and internally chamfered to receive said expanded end of the projectile, and having an abutment behind the bore, and a firing-pin projected through a hole in said abutment to explode the fulminate, substantially as hereinbefore specified.

3. The combination, substantially as hereinbefore specified, of a projectile composed of a head and a rearwardly-projecting tube, the latter having its rear end chambered and expanded, a sliding smooth-bore barrel having its rear end internally chamfered and provided externally with bayonet-joint studs, an outer tube having bayonet-joint slots and a projectile-admitting opening, and provided with an internal abutment behind the bore of the barrel, a piston behind said abutment provided on its respective sides with a firing-pin and a stem, and a pair of spiral springs on the respective sides of said piston, for the purposes set forth.

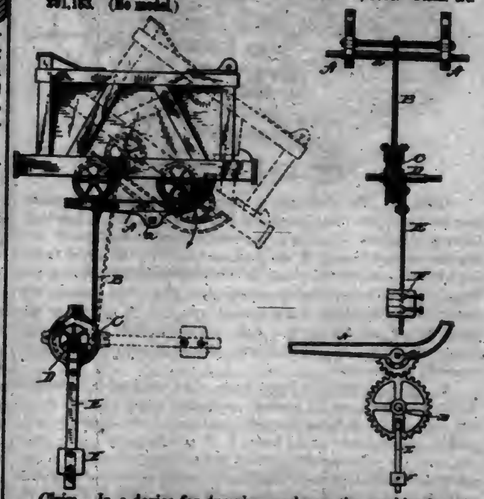
4. In combination with the spring-projected piston carrying the firing-pin and having on its back a flat stem which is slotted and provided with a terminal cocking-knob, a spring-projected stop-piston at right angles thereto, having a stem which passes through said slotted stem, and a disk which coacts directly with said knob, and a disengaging-lever acting on said stop-piston to fire the piece, substantially as hereinbefore specified.



398,596. WIRE-STRETCHER. JOHN L. ESTRABE, Shirleysburg, Pa. Filed Sept. 26, 1888. Serial No. 286,453. (No model.)

Claim.—1. The combination of the casting A, the driving-shaft mounted thereon having a ratchet-wheel, the eye secured to the under side of the casting, and a pawl secured in said eye and extending around the casting and engaging the teeth of the ratchet-wheel, as set forth.

2. The improved wire-stretcher comprising the L-shaped casting A, having the lugs D D on the upper side of its shorter arm and the hook Q at the end of said arm, the chain permanently attached to the end of the longer arm of the casting and adapted to engage the end of the hook Q, the driving-shaft journaled in the ends of the lugs D D, the sprocket and ratchet wheels mounted on the said shaft between said lugs, the chain passing beneath and engaging the sprocket-wheel, the clamp at the end of the chain, and the pawl secured to the under side of the casting and engaging the teeth of the ratchet-wheel, substantially as specified.



398,597. CARRIAGE SEAT AND BODY. HORACE S. FAIRBANKS, Racine, Wis. Filed Nov. 10, 1888. Serial No. 291,206. (No model.)

Claim.—1. The combination, with the panels having their ends beveled and sides grooved, substantially as shown, of the metallic plates D E, and means for securing said panels between said plates, in connection with bolts or rivets for clamping said plates firmly together.

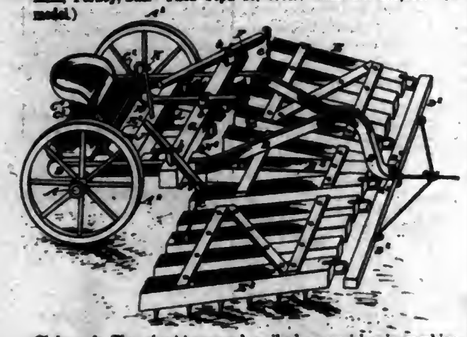
2. The combination of the panels having their ends beveled and provided on their inner sides with vertical grooves, as shown, an angle-plate having vertical tongues fitting the vertical grooves in said panels, an outside vertical plate bearing against the beveled ends of said panels and the said angle-plate, and bolts or rivets clamping said plates and the panels securely together.

398,598. AUTOMATIC DEVICE FOR DUMPING COAL-CARS. CHARLES J. FARNER, Dunmore, Pa. Filed Nov. 19, 1888. Serial No. 291,183. (No model.)

Claim.—In a device for dumping coal-cars, the combination of the tip A, the rope B, having the upper end secured to the rear part of said tip and its lower end extending downward and around the sheave C, to which it is attached, the sheave C, the axle D, having suitable bearings, the lever E, secured to said sheave, and the weight bolted to said lever, substantially as described and shown.

398,599. SNAP-HOOK. WILLIAM H. FERGUSON, Castor, N. Y. Filed July 2, 1888. Serial No. 278,777. (No model.)

Claim.—1. The combination, with the hook and shank, of a sliding gate having a vertical back edge and adapted to move lengthwise through the shank up to and away from the entrance to the hook, and a lever pivoted to the shank and adapted by its movement to lock the the sliding gate and to automatically move the same down, substantially as set forth.



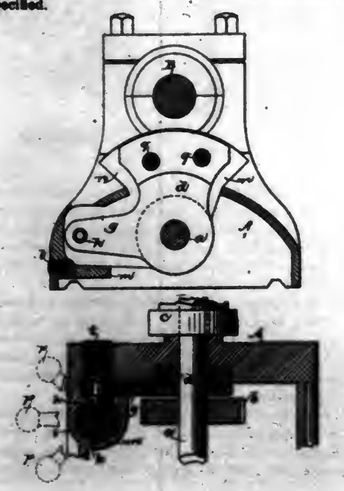
2. The combination, with the moving gate and a pivoted operating-lever, of the hook *a* and shank *b*, stamped up to shape of one piece of metal, and connected together as a double thickness, there being a bent edge to the shank at *b'*, said bent edge connecting the parts forming the shank and hook, and acting as a guide to the moving gate, substantially as set forth.

3. The combination, with the hook *a* and shank *b*, having a bent edge, *b'*, of a sliding gate, *c*, having a recess at 2, and curved portion 3, the lever *d*, pivoted at *d'* in the shank, and having an edge, 4, which is the arc of a circle from the pivot *d'*, and a stud, *e*, the loop end *f*,

and swivel *g*, the said gate moving automatically with the turning of the lever on its pivot, substantially as and for the purpose set forth.

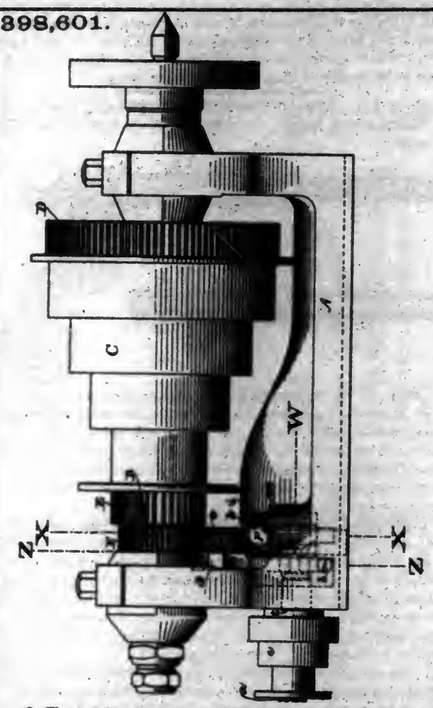
4. The combination, in a snap-hook, with a moving gate and a swivel for attaching the chain or strap, of a hook and shank stamped up for a single piece of metal and bent to shape, a lever pivoted to the shank for operating the gate, said lever also being stamped up from a single piece of metal and bent to shape, and a loop end formed by the connecting portion of the metal of the lever, substantially as set forth.

398,600. WHEEL-HARROW. JAMES FISHMAN and WILLIAM MISS, Forney, Dak. Filed Sept. 19, 1888. Serial No. 285,808. (No model.)



Claim.—1. The wheel-harrow described, comprising in combination the wheels, the frame composed of a bifurcated rod, as described, the seat supported upon the spring-arms C^3, and vertical rod C^2, surrounded by spiral spring C^4, the draft-bar pivoted at its center to the downwardly extended front end of the bifurcated rod, forming the frame, the foot-levers pivotally attached at their front ends to the under face of the timber G, the pivoted arms F F^2 F^3, pivoted to the upper face of said timber G, and the connecting-links between said foot-levers, pivoted arms and harrows, all arranged and operating substantially as described.

2. The combination, with the frame, the arched rod D, connected thereto, the draft-bar D^2, pivotally connected to the forward end of said rod, and the harrows pivotally connected to said draft-bar independent of each other, of the levers F, F^2, and F^3, pivoted near their centers to the cross-bar of the frame and pivotally connected at one end to said harrows, and the foot-levers pivoted at their forward ends to said cross-bar and pivotally connected to the levers F, F^2, and F^3, to the rear of their fulcrums, substantially as and for the purpose described.

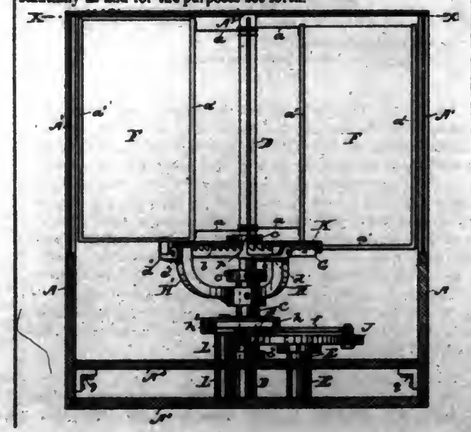


398,601. ENGINE-LATHE. JOSEPH FLATHER, Nashua, N. H. Filed June 21, 1888. Serial No. 277,757. (No model.)

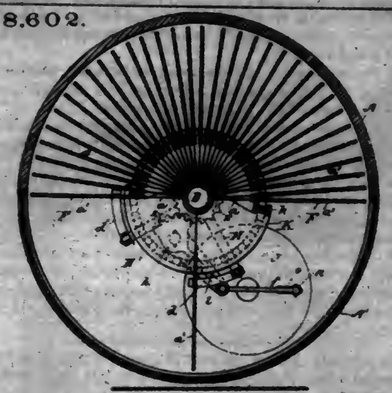
Claim.—1. In an engine-lathe, the combination, with gear-carrier *d*, having arm *g*, provided with the side stud, *h*, of cam *i*, mounted on vertical axis *k* and formed with spiral groove *d*, interlocked with said stud and provided with lever *p*, all substantially as specified.

2. The combination of gear-carrier *d*, cam *i*, and the adjustable arm-supporting screw *t*, arranged at the side of said arm, substantially as specified.

398,601.



3. The combination of spindle B, feed-gear F, secured thereon, feed-spindle *a*, with its fixed gear *b*, gear-carrier *d*, having arm *g*, with its stud *h*, gears *e f*, mounted on said carrier, and cam *i*, mounted on its axis *k* and formed with groove *j*, interlocked with said stud *h* and arranged to actuate said carrier, all substantially as specified.



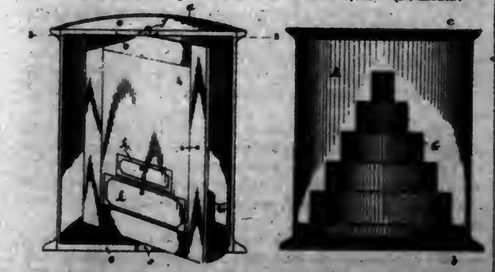
398,602. EXHIBITING OR ADVERTISING DEVICE. ELMER FLETCHER, Needham, assignor of one-half to Isaac M. Hall, Boston, Mass. Filed Apr. 4, 1888. Serial No. 269,550. (No model.)

Claim.—1. In an advertising or exhibiting device, the combination of the box A, vertical shaft D, connecting-rod *a*, frames *a'*, arms H H', fingers *d d'*, suitably supported by the springs *e* and *e'*, the collar G, provided with the notches *b*, the said collar being placed under the said frames, and the shield K, placed over the said collar to support the frame during a portion of each revolution, and the sleeve C, arranged to actuate the said arms, all adapted to be operated substantially as and for the purposes set forth.

2. In an advertising or exhibiting device, the sleeve C, provided with the gearing *x'*, the actuating-gear *x*, working in gear *x'*, and the lever *h*, connected with the gear *x*, the crank *f*, attached to the said lever, and the wheel J, arranged to form a pitman, all combined and adapted to impart an oscillating motion to the arms H and H', substantially as and for the purposes set forth.

398,602.

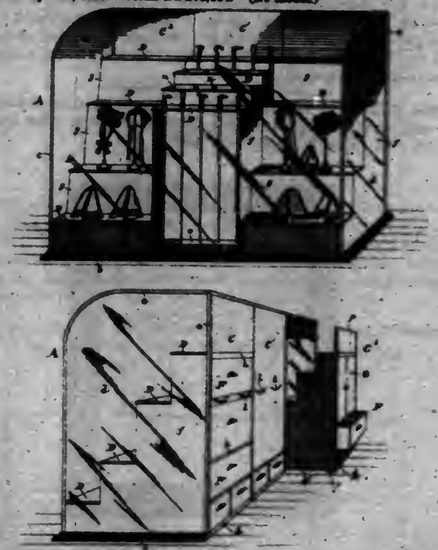
398,603. MACHINE FOR MITERING THE METAL OF SHOW-CASE MOLDINGS. FRANCIS X. GASTER, Baltimore, Md. Filed Jan. 26, 1888. Serial No. 262,214. (Model.)



Claim.—1. A machine for mitering sheet-metal moldings, comprising the combination of a support, B, for the piece of molding, and a cutter or knife moving in a plane that is inclined one way with respect to said support and oblique in a crosswise direction with respect to said support.

2. A machine for mitering sheet-metal moldings, comprising the combination of a support, B, for the piece of molding, standards A', having grooves, and a cutter or knife having tongues which fit in said grooves and move in a plane that is inclined one way with respect to said support and oblique in a crosswise direction with respect to said support.

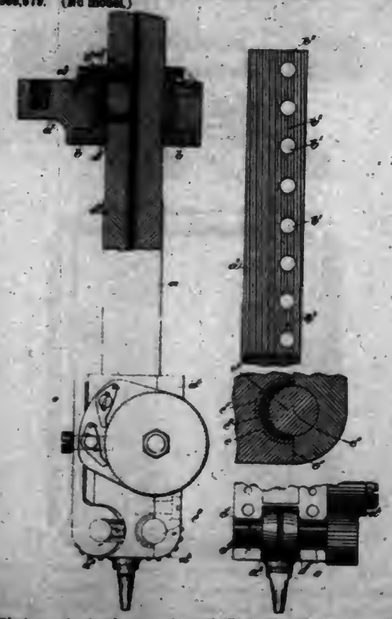
3. A machine for mitering sheet-metal moldings, comprising the combination of a support, B, for the piece of molding, two inclined standards at the front end of the support, one at each side of the machine and one having position in advance of the other, and each standard provided with a groove, and a cutter or knife having tongues which fit in said grooves.



4. A machine for mitering sheet-metal moldings, comprising the combination of a support, B, for the piece of molding, two inclined standards at the front end of the support, one at each side of the machine and one having position in advance of the other, and each standard provided with a groove, a cutter or knife having tongues which fit in said grooves, a lever, L, and means, substantially as described connecting the lever and movable cutter.

398,604. REVOLVING SHOW-CASE. FRANCIS X. GASTER, Baltimore, Md. Filed Apr. 14, 1888. Serial No. 270,663. (No model.)

Claim.—The combination, in a show-case, of an inclosing-casing having a semi-cylindrical transparent front, and a display-stand provided with a series of semi-cylindrical step-like shelves in front, and a flat door or back, and recesses having drawers at the rear, the display-stand being pivoted within the casing, as described, whereby it may be turned to insert the articles to be displayed, substantially as shown and described.

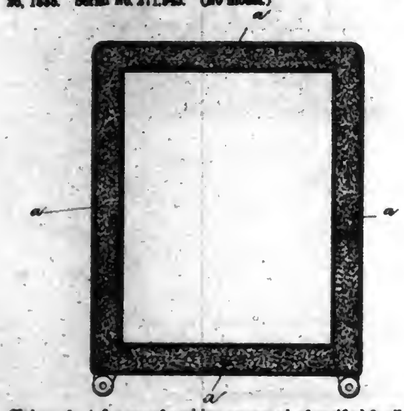


398,605. SHOW-CASE. FRANCIS X. GASTER, Baltimore, Md. Filed Apr. 14, 1888. Serial No. 270,664. (No model.)

Claim.—1. The combination, in a show-case, of an external case, A, having glass panels c, the removable sections C C^2 C^3, having step-like shelves in front for the display of goods, and the drawers F, located in said sections and adapted to be withdrawn from the same at the rear, substantially as shown and described.

2. The combination, with the casing A, of the removable sections having step-like shelves in front, internal recesses provided with drawers F, and doors G at the rear for closing said recesses, substantially as shown and described.

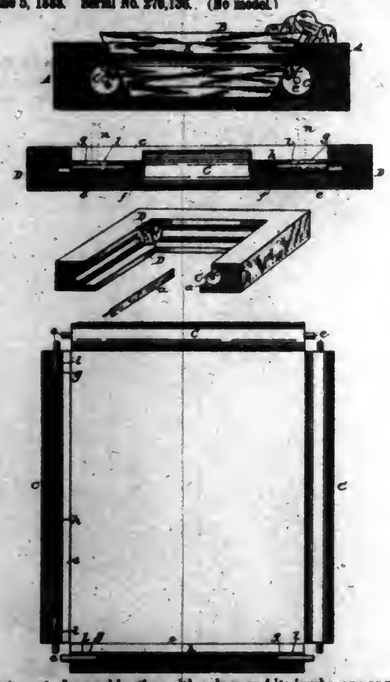
398,606. WIRE-NAILING MACHINE. LOUIS GOSON, Winchester, assignor to James W. Brooks, trustee, Cambridge, and Frank F. Stanley, associate trustee, Boston, Mass. Filed Apr. 5, 1888. Serial No. 269,679. (No model.)



Claim.—1. A wire-carrying spindle having feed-rolls, a sliding segment, a^3, to operate them, and provided with screw-threads a^5, and a threaded sleeve to engage the screw-threads a^5, combined with a

threaded nut, as a^4, having a series of adjusting-holes, b', arranged in line with or so as to follow the pitch of a thread of the said nut, and with means to secure said nut in adjusted position, substantially as described.

2. The combination, with the sleeve a^4, provided with a bolt-receiving hole, of a nut, as a^4, having a series of adjusting-holes, b', arranged in line with or so as to follow the pitch of a thread of the said nut, and with a bolt or screw to secure the said nut and sleeve, substantially as described.



398,607. PACKING FOR SAFES, &c. ANTON GRAF, Georgetown, assignor of two-thirds to George H. Meader, Boston, Mass. Filed Apr. 26, 1888. Serial No. 271,943. (No model.)

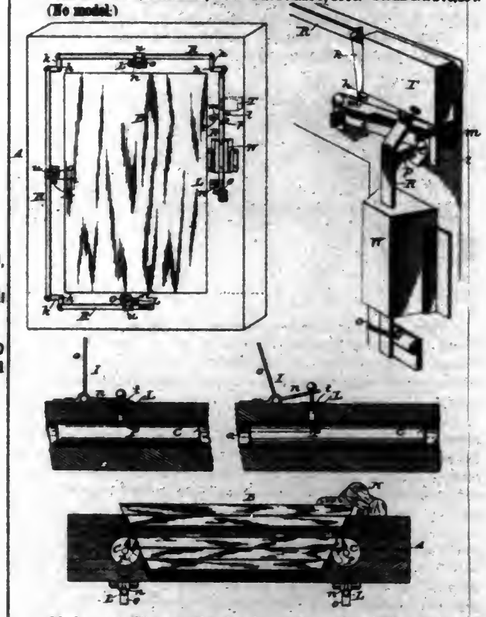
Claim.—1. A fire-proof packing composed of purified fossil meal, as set forth.

2. A safe or receptacle having its walls packed with purified fossil meal, as set forth.

398,608. INTERLOCKING JOINT FOR THE DOORS AND FRAMES OF SAFES, &c. JOSEPH L. HALL, Cincinnati, Ohio. Filed June 5, 1888. Serial No. 276,136. (No model.)

Claim.—1. In combination with a door and its jambs, one or more movable bars or bolts, C, located in one of said parts, and a flange, *b*, on the other of said parts, arranged to engage therewith, substantially as and for the purpose set forth.

2. In a door and its frame, the combination of the movable bar or bolt C, located in one of said parts, the packing *m*, and the flange *b*, said parts being arranged for joint operation, substantially as and for the purpose set forth.



3. The combination of the movable bar or bolt C, provided with the slots *g*, the pintle or journals *e*, provided with the lugs *l*, and the springs *f*, all substantially as shown and described.

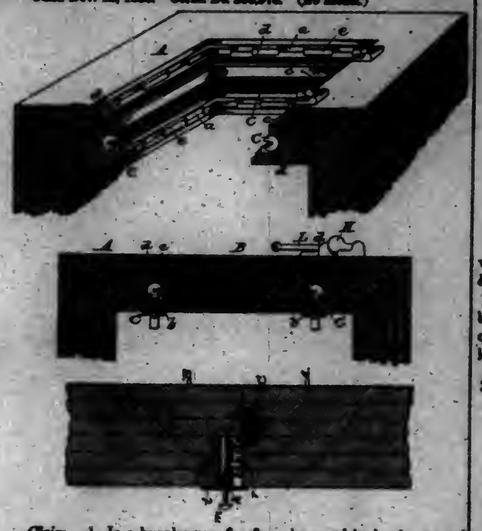
4. In combination with the movable bar or bolt C, set in the face of a door-jamb or in the edge of a door, as herein described, the removable strip *a*, substantially as and for the purpose set forth.

5. A door provided on one or more of its edges with a flange, *b*, projecting therefrom in the plane of the door and arranged thereon so as to engage with a movable bar or bolt set in the jamb of the door-frame, substantially as herein shown and described.

6. A movable bar or bolt set in the jamb of a door-frame or in the edge of a door, and provided with a longitudinal groove adapted to receive and interlock with a laterally-projecting flange on the opposing edge of the door or face of the jamb, substantially as herein set forth.

398,609. MEANS FOR FASTENING THE DOORS OF SAFES, &c. JOSEPH L. HALL, Cincinnati, Ohio. Filed June 5, 1888. Serial No. 276,137. (No model.)

Claim.—1. The combination, in a safe, vault, or other inclosure having a door and jambs, of the movable bars or bolts C, located in one of said parts, and a projection, *b*, on the other of said parts, a series of locking-bolts, L, and mechanism, substantially such as described, for connecting and operating said locking-bolts, whereby they can be simultaneously withdrawn to unlock the movable bars or bolts.



2. The combination, with a door and its jambs, of the movable bars or bolts C set therein, a series of locking-bolts, L, connected by mechanism for simultaneously withdrawing the locking-bolts, and a weight, W, arranged to operate the same when released, substantially as described.

3. In combination with the movable bars or bolts C, set in the jambs or door, a series of locking-bolts, L, with their connecting and operating mechanism, and a time-lock, T, adapted to be connected to the locking-bolt mechanism and to be disconnected therefrom by the action of the time-movement, substantially as and for the purpose set forth.

4. In combination with one or more movable bars or bolts, C, arranged and operating as described, a corresponding number of locking-bolts, L, connected to a sliding bar, R, having a weight, W, attached thereto, a time-lock, T, and the intermediate pivoted levers *m* and *i*, all arranged for joint operation substantially as shown and described.

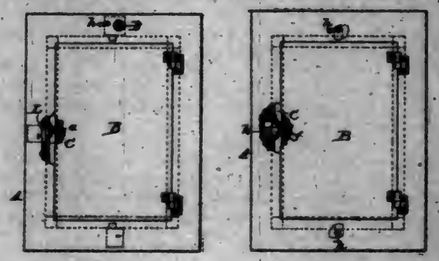
5. In combination with the movable bars or bolts C, the bolts L, provided with springs to cause them to automatically engage with the movable bars or bolts C, a weight arranged to withdraw said locking-bolts when released, and a time-lock arranged to hold said weight and automatically release the same at the time set, substantially as and for the purpose set forth.

398,610. SAFE OR VAULT. JOSEPH L. HALL, Cincinnati, Ohio. Filed Nov. 12, 1888. Serial No. 290,573. (No model.)

Claim.—1. In a burglar-proof safe, a door and its jambs, one of said parts having the movable bolt C set therein, with a laterally-projecting flange, *b*, on the other part, and both the door and its jambs being provided with an interlocking tenon and groove, *c d*, all constructed and arranged to operate substantially as and for the purpose set forth.

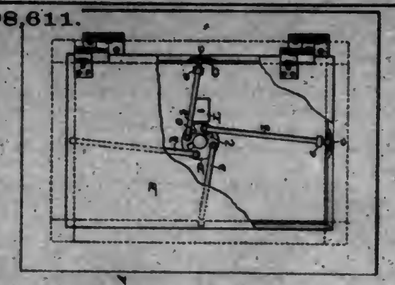
2. In a burglar-proof safe, a door and its jambs, each provided with a series of interlocking dovetails, *c a*, with one or more movable bars or bolts, C, set in one of said parts, and a laterally-projecting flange, *b*, on the other of said parts, all constructed and arranged for joint action substantially as and for the purpose set forth.

3. In a burglar-proof safe, a door and its jambs, each provided with an interlocking tenon and groove, *c d*, and a series of interlocking dovetails, *c a*, with one or more movable bars or bolts, C, set in one of said parts, and a laterally-projecting flange, *b*, on the other of said parts, all constructed and arranged to operate substantially as described, for the purpose of fastening the door more securely in place when closed.



4. In combination with a movable bar or bolt, C, a spring-bolt, *m*, arranged to bear against the bolt C and hold it by friction from being accidentally moved while the door is open.

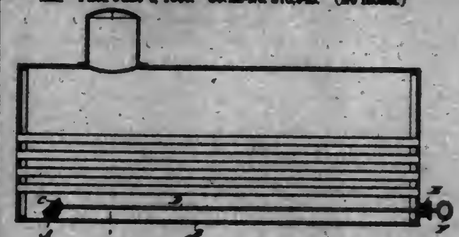
5. In combination with the movable bar or bolt C, the spring-bolt *m*, provided with a stud, *r*, arranged to engage with the former and lock it positively in position, said bolt *m* having its end arranged to project beyond the inner lip of bolt C, so as to be forced back by the flange *b* and disengage its stud *r* from the bolt C in the act of closing the door.



398,611. MEANS FOR FASTENING MOVABLE BARS OR BOLTS IN DOORS, &c. JOSEPH L. HALL, Cincinnati, Ohio. Filed Nov. 12, 1888. Serial No. 290,572. (No model.)

Claim.—1. In combination with a door and its frame, one or more movable bars or bolts, C, seated in one of said parts, with an interlocking projection or flange on the other of said parts, and a fastening device arranged to engage with said movable bar or bolt, substantially as and for the purpose set forth.

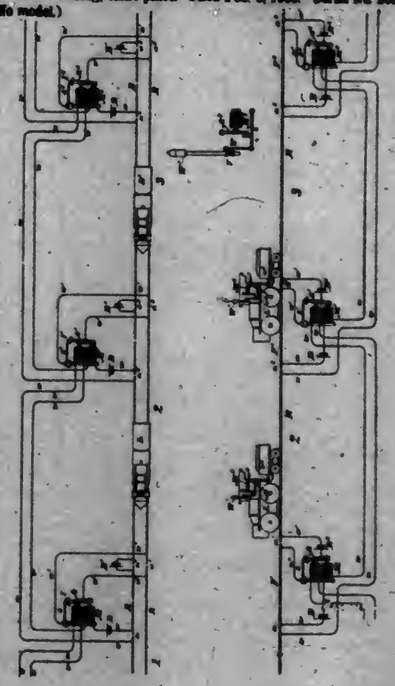
2. In combination with a door and its frame, having a movable bar or bolt, C, seated in one of said parts, with a projecting flange on the other of said parts, a series of bolts, *b*, arranged to engage



398,611.

with said movable bar or bolt, and a lock arranged to hold the bolts *b*, substantially as shown and described.

3. In combination with a door and its frame, having a movable bar or bolt, C, seated in one of said parts, with a projection or flange on the other of said parts, a lock, L, arranged to engage with and lock said movable bar or bolt, substantially as described.



398,612. BOILER-CLEANER. WILLIAM T. HANEY, Chittenden, Ala. Filed June 4, 1888. Serial No. 275,945. (No model.)

Claim.—1. In a boiler-cleaner, a brush having on its upper side a beveled or inclined surface arranged to be acted on by the water as the brush is reciprocated, whereby to force said brush against the surface of the boiler, substantially as set forth.

2. A boiler-cleaner consisting of the brush having a block or body formed on its upper side with a beveled or inclined surface, and a handle connected with said brush, substantially as set forth.

398,613. ELECTRICAL RAILWAY-SIGNAL. HORACE HAYDEN, Jr., and WILLIAM F. X. DEBANY, New York, N. Y., assignors of one-third to Albert R. Gooding, same place. Filed Feb. 6, 1883. Serial No. 263,342. (No model.)

Claim.—1. In a system of block-signals for railways, the combination of a main battery located at one end of a block-section in a circuit including one coil of a switching-magnet at the home station and one coil of an additional switching-magnet at a distant station, with a local battery, also located at the home station, having circuit-connections, as described, with the armature-lever of the switching-magnet, and a local circuit extending into the cab of the engine, including a magnet the armature of which controls an alarm, substantially as described.

2. In a system of block-signals for railways, the combination of a series of batteries, one for each block-section, each of which includes in its circuit one coil of a switching-magnet at the home station and an additional coil of a switching-magnet at the next station in the rear, with a local battery at each station, and circuit-connections, as described, for closing a circuit through an alarm apparatus in the cab of the engine, substantially as described.

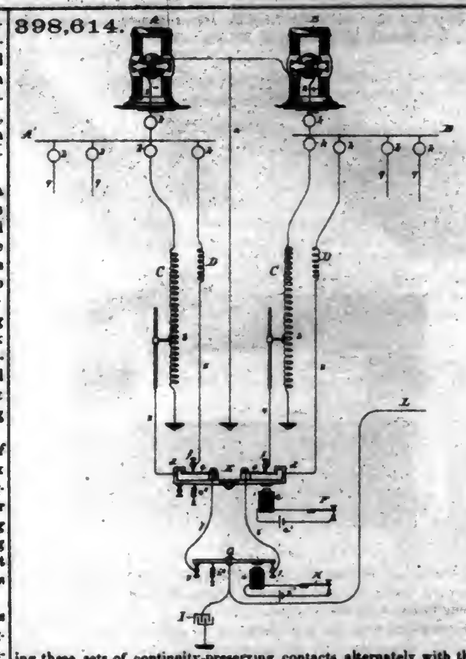
3. In a system of block-signals, the combination of the following elements: a main or switching battery and a magnet at each block having two independent coils, switching-circuits running to the adjoining advance and rear blocks and including the separate coils of said magnets, and a local battery at each block including in its circuit the armature of the switching-magnet, the insulated ends of two adjoining rails, and an alarm-circuit on the cab.

4. In a system of block-signals for railways, the combination of the following elements: one main or switching battery for each block included in a circuit running to one coil of each of two switching-magnets, one of said magnets being near the battery and the other at the next block to the rear, a local battery at each block including in its circuit the armature of the switching-magnet, a circuit running to the insulated ends of two adjoining rails, and a signaling-magnet located on the engine and included in a local circuit, substantially as described.

5. In a system of block-signals, the combination of two batteries located at each block, one of which includes circuits and switching-magnets located at the home and rear ends of the block for manipulating the circuit relations of an alarm located on the engine, while the second includes in its circuit the armature of the switching-magnet, the adjoining ends of two insulated rails of the track, and an alarm-magnet located on the engine and included in a local circuit, substantially as described.

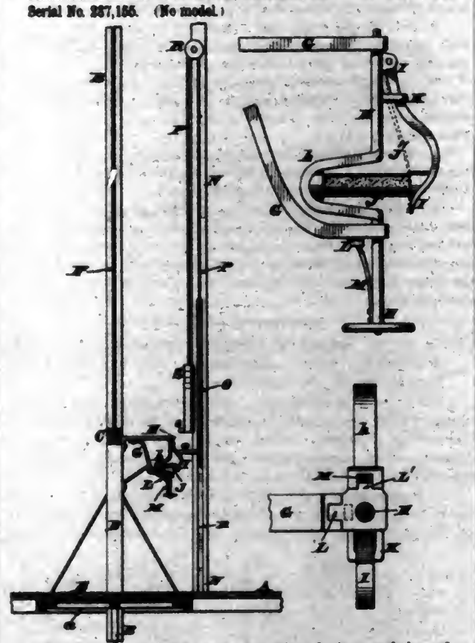
6. In a system of block-signals for railways, the combination of two circuits for each block connected to a single line of insulated rails, one of said circuits including a battery and one portion of the coils of two switching-magnets located at each end of the block, while the other includes a second battery, the armature-lever of the first-named magnet, the adjoining ends of two insulated rails, and an alarm-magnet located on the engine and included in a local circuit, substantially as described.

7. In a system of block-signals for railways, the combination of the following elements: a single line of rails separated into block sections by insulation, a single battery for each section including in its circuit the insulated ends of the rails and one coil of a magnet at the battery end of the block and one coil of an additional magnet at the distant end of the block, a tilting armature-lever for each magnet adapted to tilt to the right or left, according to which half of the magnet is energized, a local circuit including each tilting armature-lever and a separate battery with circuit-connections, as described, running to the insulated ends of two adjoining rails, and a circuit on the engine including an alarm-magnet, whereby the engineer is warned in the event of danger in advance, substantially as described.



398,614. QUADRUPLEX TELEGRAPHY. CLARENCE L. HEALY, Brooklyn, N. Y. Filed Jan. 16, 1888. Serial No. 260,988. (No model.)

Claim.—1. In telegraphs, the combination, with a line, of a dynamo or other source of electrical energy grounded at one pole, a ground through resistance from the other pole of the dynamo, a direct-line connection from the latter pole of the dynamo through the balancing-resistance, a shunt-line connection from an intermediate point on the grounded resistance, and a key placing the direct and shunt connections alternately to line, substantially as set forth.

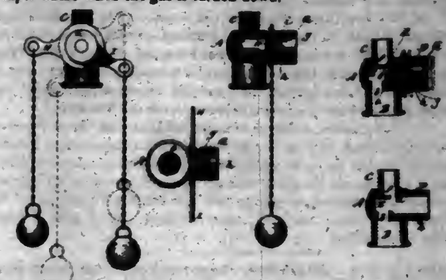


2. In telegraphs, the combination, with a line, of two dynamos or other sources of electrical energy grounded directly at opposite poles, a ground through resistance from the other pole of each dynamo, a direct-line connection from the latter pole of each dynamo through a balancing-resistance, a shunt-line connection from an intermediate point on each grounding-resistance, a key placing the shunt or direct connections alternately to line, and a key closing the line to the dynamos alternately, substantially as set forth.

3. In telegraphs, the combination, with a line, of two dynamos or other sources of electrical energy grounded at opposite poles, two line-connections from the other pole of each dynamo, giving different electro-motive forces, a lever having two sets of continuity-preserving contacts insulated from each other and connected with the line-connections of the two dynamos, respectively, a second lever connecting these sets of continuity-preserving contacts alternately with the line, and a grounded condenser connected with the line before it reaches said second lever, substantially as set forth.

398,614.

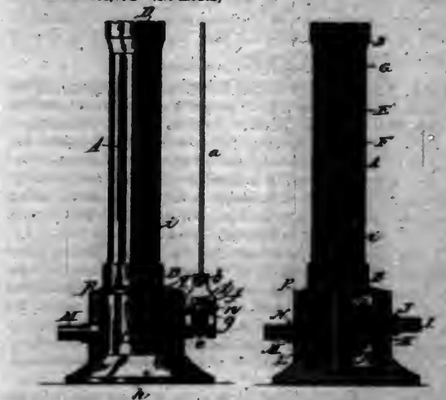
398,615. DEVICE FOR OPERATING HATCHWAY-GATES. FREDERICK HEISE and EDWARD BINGEL, Cincinnati, Ohio. Filed Oct. 4, 1888. Serial No. 287,185. (No model.)



Claim.—1. An elevator-gate-operating device consisting of a frame attached to the platform or cab, a rock-shaft mounted in bearings of said frame, a lever pivoted to the rock-shaft to engage the gate, and a spring-lock adapted to hold said rock-shaft and lever in an operative or in an inoperative position, substantially as described.

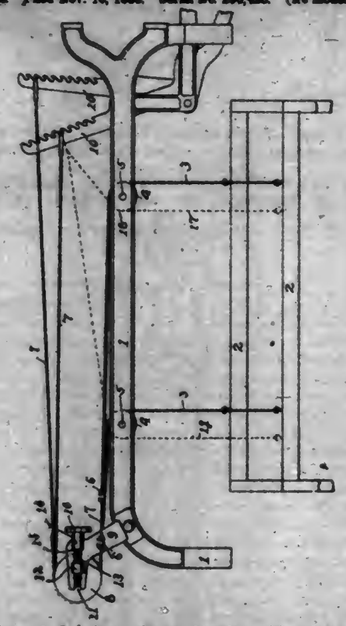
2. The combination of rock-shaft H, pivoted lever I, spring J, locking-spring M, and a supporting-frame provided with bearings for the rock-shaft and sockets L L′ for said locking-spring, all substantially as described.

398,616. GAS-COCK. WILLIAM C. HOMAN, Hoosick, Conn., assignor to Edward Miller & Company, same place. Filed Nov. 5, 1888. Serial No. 289,959. (No model.)



Brief.—The gas is never completely cut off, so that there will be a taper flame when the gas is turned down.

Claim.—1. The herein-described cock, consisting of a shell constructed with an inlet at one end and an outlet at the opposite end, with an intermediate chamber, E, between said outlet and inlet, the outlet opening into the said chamber E, the said shell constructed with a right-angular cylindrical projection, D, the interior of which is in line with and opens into the said chamber E, but the transverse area of the interior of the projection greater than the transverse area of the chamber E, and so as to form a seat, *a*, between the said chamber and interior of the projection, the interior of the said projection also opening into the outlet-passage of the cock, the said seat constructed with a slight escape, *e*, into the outlet-passage, combined with a cylindrical plug, F, adapted to rotate in said projection and to come to a bearing against the said seat *a*, and the said plug provided with a spiral or cam-shaped slot, and the said projection with a corresponding stud adapted to work in said cam-shaped slot, substantially as described, and whereby under rotation of the said plug the said cam-shaped slot operating in connection with said stud will impart to the said plug a longitudinal movement from or to its seat, according to the direction in which the plug is rotated.



2. The herein-described gas-cock, consisting of a shell having an inlet at one end and outlet at the opposite end, with an intermediate chamber, E, into which the outlet opens, the shell constructed with a cylindrical tubular projection, D, the interior of said projection being in line with but of greater transverse area than the transverse area of the chamber E, and so as to form a seat, *a*, between the said chamber E and the interior of the projection D, the interior of the said projection opening into the outlet-passage from the cock, combined with a rotative plug, F, in said chamber, constructed with or formed as a part of a sleeve, G, concentric with and surrounding said cylindrical projection D, the sleeve constructed with a cam-shaped slot, *g*, and the projection provided with a corresponding stud, A, the seat between the chamber E and the interior of the projection D constructed with a slight escape, *e*, into the outlet-passage of the cock, substantially as and for the purpose described.

398,617. JACK-SCREW. CHARLES H. HOPKINS, Lyndonville, assignor to Sumner S. Thompson, Lyndon, Vt. Filed Aug. 1, 1888. Serial No. 281,704. (No model.)

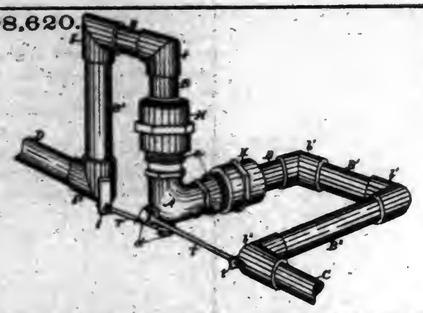
Claim.—In a jack-screw, the combination, with the standard, cap, and base-rest A B C, of a cylindrical nut, E, working on a screw, F, therein, the bevel-gear K, rigidly attached thereto, the bevel-gears H and L on the stub-shafts I and M at right angles to said gear K and engaging therewith, a ratchet-wheel, *c*, that may be rigidly attached to said stub-shafts I and M, an operating-handle, *b*, that may be loosely mounted on said stub-shafts, and a double pawl, *g*, pivoted between the lugs of said handle and forced into engagement with the ratchet-wheel *c* by the action of the beveled edge on the lower end of the bar *a* in forcing the spring *f* to one side or the other, as and for the purpose set forth.

398,618. SHEDDING MECHANISM FOR LOOMS. GEORGE F. HOPKINS, Worcester, Mass., assignor to the Knowles Loom Works, same place. Filed Nov. 10, 1888. Serial No. 290,430. (No model.)

Claim.—1. In a loom, the combination, with a harness-lever, harness-frame, and two sheaves, as 4, located in the loom-frame, of a third supplemental sheave, as 8, located in a place above the sheaves 4 and at the opposite end of the frame from the harness-lever, and straps or cords connecting the harness-lever with the harness-frame, which passes over the sheave 8 to the sheaves 4, substantially as set forth.

2. In a loom, the combination, with a harness-lever, two sheaves located in the loom-frame, a harness-frame, and individual straps or cords passing from said frame over said sheaves, of a third supplemental sheave supported above the loom-frame, means for adjusting said sheave laterally, and a strap or cord passing over said sheave to connect the individual harness-frame straps or cords with the harness-lever, substantially as shown and described.

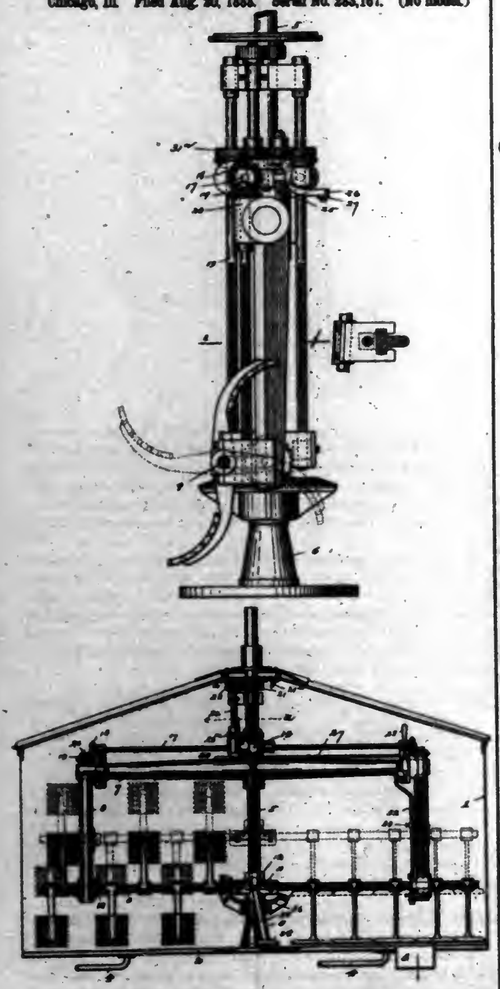
398,619. PRESERVING AND HARDENING WOOD. WARREN INGRAM, Warren, Ohio. Filed Dec. 20, 1888. Serial No. 294,211. (No specimens.)



Claim.—The process or treatment of wood, as herein described, by which it is preserved, rendered hard and weather-proof, &c., consisting in subjecting it to a bath in a boiling solution composed of concentrated lye or potash, burnt lime, alum and salt, and pulverized iron ore mixed with water, and then subsequently immersing it with a hot solution composed of linseed-oil, petroleum-oil, rosin, red lead, or any suitable coloring-matter whereby the tint is given the wood, substantially as and for the purpose set forth.

398,620. STEAM-FITTING FOR RAILWAY-CARS. LEMUEL D. JONES, Erie, Pa. Filed Dec. 14, 1888. Serial No. 293,616. (No model.)

Claim.—1. The elbows A, having sockets with stuffing-boxes at the ends of its arms and pivot-lugs *a′* at its angle in axial line with said sockets, in combination with two goose-necks swiveled and packed in said sockets and the tie-rods T, journaled on said pivot-lugs *a′* and adjustably connected with lugs on the swinging ends of said goose-necks.

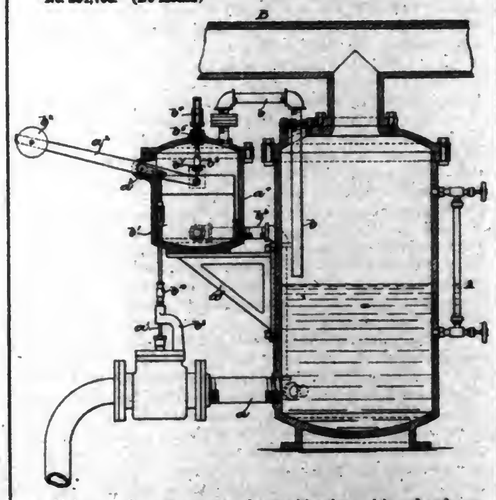


2. The elbow A, having externally-screw-threaded and internally-grooved sockets *a* at its ends and pivot-lugs *a′* on opposite sides of its angle in axial line with said sockets, goose-necks pivoted in each of said sockets, splined glands on said goose-necks fitting in said grooved sockets, nuts on said sockets acting on said glands, and tie-rods piv-

398,620.

oted on said pivot-lugs and adjustably connected with the swinging end of the goose-neck, which is pivoted concentrically therewith.

398,621. BREWER'S MASHING-MACHINE. CHARLES KARSTNER, Chicago, Ill. Filed Aug. 20, 1883. Serial No. 283,167. (No model.)



Claim.—1. In a mashing-machine, in combination with a non-adjustable central driving-shaft, a rigid arm extended longitudinally therefrom, vertical guides, one toward each end of said arm, a shaft carrying mash-working devices and having bearings movable along said vertical guides, operating-shafts having a threaded connection at one end with the movable bearings, and suitable gearing whereby to rotate the operating-shafts, substantially as described.

2. In a mashing-machine, the combination, with a longitudinal shaft carrying mash-working devices, of movable bearings for said shaft having threaded nuts, vertical operating-shafts, one for each bearing, said shafts adapted to turn in said nuts, whereby to move the bearings, and suitable gearing to rotate the operating-shafts, substantially as described.

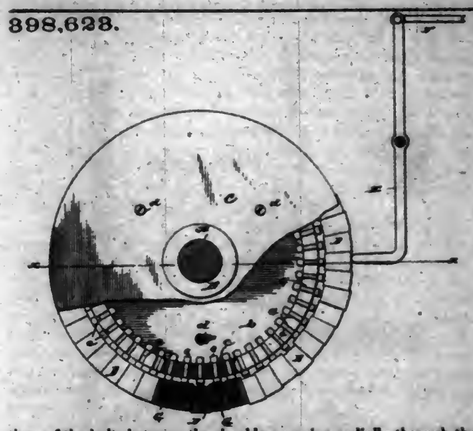
3. In a mashing-machine, the combination, with the mixer-shaft and shovel-shaft having movable bearings provided with threaded nuts, of vertical operating-shafts threaded at one of their ends to adapt them to the threads of the bearings and suitable gearing whereby to rotate said operating-shafts and thereby simultaneously adjust the mixer-shaft and the shovel-shaft, substantially as described.

4. In a mashing-machine, the combination, with the mixer-shaft and shovel-shaft having movable bearings provided with threaded nuts, of vertical operating-shafts threaded toward one of their ends to adapt them to the threaded nuts of the bearings and a shifting rod having stops adapted to engage the movable bearing of one of the shafts, whereby to throw the operating-shafts out of gear, substantially as described.

398,622. STEAM-TRAP. CHRISTOPHER KANNEBERG, Boston, Mass., assignor to Joseph P. Stillman, same place. Filed Nov. 23, 1886. Serial No. 201,706. (No model.)

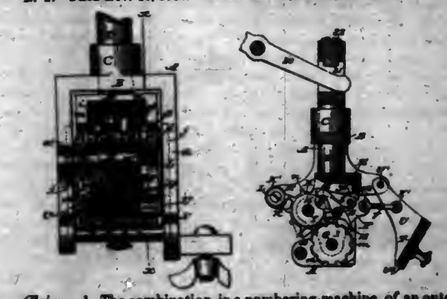
Claim.—1. In a steam-trap, the combination, with a chamber or vessel, A, provided with a steam-inlet and water-outlet and a valve to control said water-outlet, of an auxiliary chamber connected with the chamber or vessel A, a float in said auxiliary chamber operatively connected to the said valve, and a counter-balance for said float, substantially as described.

2. In a steam-trap, the combination, with a chamber or vessel, A, provided with a steam-inlet and water-outlet and a valve to control said water-outlet, of an auxiliary chamber connected with the chamber or vessel A, a float in said auxiliary chamber operatively connected to the said valve, an air-outlet in the auxiliary chamber, a valve for said outlet carried by the float, and a counter-balance for said float, substantially as described.



398,623. PATTERN-WHEEL FOR WARP-KNITTING MACHINES. JAMES KENYON, Brooklyn, N. Y., assignor of one-half to Job Welling, same place. Filed Mar. 22, 1888. Serial No. 268,125. (No model.)

Claim.—1. The combination, with the hub, the web, and the rim, of a series of radially-adjustable blocks forming the working-face of the wheel and having central longitudinal threaded apertures, and screw-bolts swiveled at their inner ends in the said rim and extending through the said apertures to the outer or working faces of the blocks to receive a screw-driver, substantially as set forth.

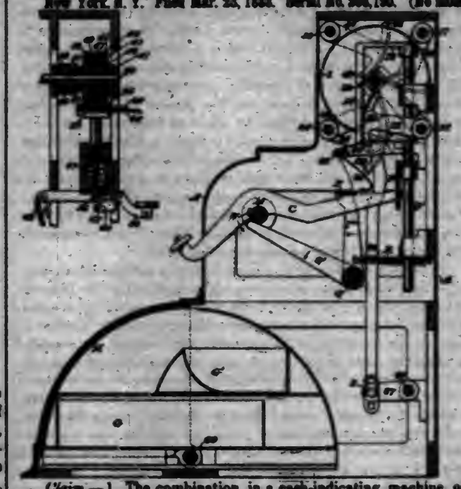


2. The combination, with the hub, web, and rim having slots *s* opening through the outer edge of the rim and the removable face-plate covering said slots, of the radially-extending screw-bolts swiveled at their inner ends in said slots and removable laterally out of the same, and the radially-adjustable segmental blocks having longitudinal threaded apertures, through which the said bolts pass to the working-faces thereof and there adapted to receive a screw-driver, substantially as set forth.

3. The combination, with the hub, the web, and the rim at opposite sides of the web near its periphery and having slots *c*, open at its edges, of the screw-bolts having nicks at their outer ends and two shoulders, *s s*, at their inner ends at opposite sides of the rim, the portions of the bolts between the shoulders passing radially through the slots, the radially-adjustable segmental blocks D at opposite sides of the web beyond the rim and having longitudinal threaded apertures, through which the threaded portions of the bolts pass to the working-faces of the blocks, the removable face-plate C at opposite sides of the web closing the slots in the rim and extending alongside of the blocks, and the screws *d*, securing said plates in position, substantially as set forth.

398,628.

398,624. NUMBERING-MACHINE. WILLIAM KOCH, New York, N. Y. Filed Nov. 10, 1887. Serial No. 254,773. (No model.)



Claim.—1. The combination, in a numbering-machine, of an outer stationary frame, an inner movable frame reciprocating therein, parallel shafts mounted in said inner movable frame, a series of one or more peripherally-cogged numbering-wheels revolving upon one of said shafts and each bearing type upon their cogs, corresponding spur-wheels revolving upon the other shaft and gearing severally with said cogged numbering-wheels, a yielding finger projecting from the stationary frame in position to be engaged by a tooth of the first spur-wheel at each reciprocating movement of the inner frame, a stop preventing said finger from yielding under the pressure of the tooth as the frame moves inward, and a spring actuating said finger to carry it to its normal position, all substantially in the manner and for the purpose herein set forth.

2. The combination, in a numbering-machine, of an outer stationary frame, an inner movable frame reciprocating therein, parallel shafts mounted in said inner movable frame, a series of cog-wheels having type upon the cogs and revolving upon one of said shafts, a corresponding series of spur-wheels revolving upon the other shaft and gearing severally with said type wheels, a single tooth projecting laterally from each spur-wheel to engage the next adjacent type-wheel at each complete revolution, a disk upon the outer side of the first of said spur-wheels, said disk having a single notch in its periphery, a wide dog pivoted to the movable frame upon an axis parallel with the axial shafts of the spur and type wheels, and which engages simultaneously all the type-wheels excepting the first, and an arm projecting from the dog into contact with the periphery of the disk, all substantially in the manner and for the purpose herein set forth.

3. The combination, with the swinging ink-pad bracket U, pivoted to the fixed frame A, the reciprocating frame traversing in said fixed frame, and the numbering-wheels mounted in said reciprocating frame, of the link V, pivoted to the swinging bracket-frame and to the frame carrying the numbering-wheels, whereby the movements of the head operate to swing the bracket and its pad in and out of contact with the numbering-wheels, all substantially in the manner and for the purpose herein set forth.

398,625. CASH INDICATOR AND RECORDER. WILLIAM KOCH, New York, N. Y. Filed Mar. 23, 1888. Serial No. 268,195. (No model.)

Claim.—1. The combination, in a cash-indicating machine, of a group of keys all having the same length of stroke, a single reciprocating rod moved differentially by the engagement therewith of each separate key at a different interval in the length of its stroke, and a series of signal characters or numbers designating severally the several keys, all actuated by the movements of the one rod and each brought to view by a different length of movement of said rod, substantially in the manner and for the purpose herein set forth.

2. The combination, in a cash-indicating machine, of a group of oscillating keys pivoted intermediate their ends upon a common shaft, a vertically-reciprocating rod mounted at the rear of said keys to be actuated thereby, a plate fixed to the vertical rod, with its lower edge extending transversely over the ends of said keys and having differential notches or offsets formed in said edge, each adapted to be engaged by one of said keys, (whereby each key in making its stroke will produce a different extent of movement of the rod,) and one or more wheels geared to said rod, to be revolved thereby, and which bear characters or numbers designating the several keys in the group, substantially in the manner and for the purpose herein set forth.

3. The combination, in a cash-indicating machine, of two or more groups of keys, a series of two or more indicating-wheels, each bearing numbers or characters corresponding with the keys in one of said groups, and which are mounted to be read in their normal order from left to right at the front of the machine, and a second series of duplicate wheels mounted to be read in similar order from left to right at the rear of the machine, the corresponding wheels in the two series being geared to move in unison and be actuated simultaneously by the movement of the one key appropriate thereto, substantially in the manner and for the purpose herein set forth.

4. The combination, in a cash-indicating machine, of a series of indicating-wheels, each revolving about a common axis, a corresponding series of concentric tubular shafts revolving upon the same axis, a type-wheel upon each shaft, a series of rock-shafts mounted parallel with the axis of the indicating-wheels, and suitable gear coupling each rock-shaft with an indicating-wheel at one end and with one of said tubular shafts at the other, substantially in the manner and for the purpose herein set forth.

5. The combination, in a cash-indicating machine, of one or more type-wheels, keys C, to operate said wheels, two superimposed, slotted, or perforated guide-plates mounted adjacent thereto and below the same, a platen moving through the opening in the plates into contact with the type-wheels, a spring operating to carry the platen toward the type, a stop to limit the action of the spring before the movement of the platen is completed, a pivotal lever adapted to withdraw the platen and contract the spring, and a yielding contact-point adapted to engage the lever as it moves in the direction to withdraw the platen and allow its independent return, substantially in the manner and for the purpose herein set forth.

6. The combination, in a cash-machine, of a movable lid, a pivoted segmental frame, to which said lid is secured, an actuating-wheel revolving upon an axis parallel with the pivotal axis of the lid, a wrist-pin upon the wheel, and a connecting-rod coupling the wrist-pin with the pivoted frame, whereby the revolution of the wheel is made to alternately open and close the lid, substantially in the manner and for the purpose herein set forth.

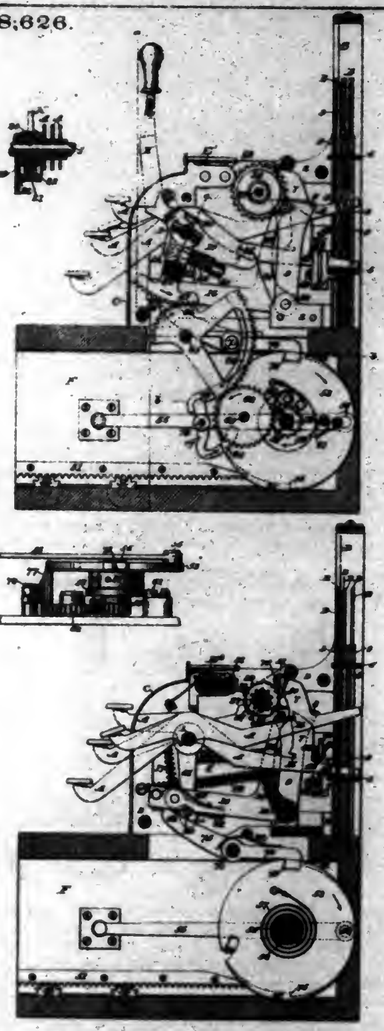
7. The combination, in a cash-machine, of a movable lid, an acte-

ating-wheel revolving on an axis at a right angle to the line of movement of said lid, a wrist-pin upon the wheel, a connecting-rod coupling the wrist-pin and lid, a coiled spring actuating the wheel to produce an automatic revolution thereof, a controlling-disk secured to the axle of the wheel, to revolve with it, a movable stop-pin adapted to engage a notch or offset on said controlling-disk to arrest the movement of the wheel at each complete revolution thereof, a group of pivoted actuating-keys, a transverse bar pivoted above the ends of the keys, to be struck and lifted by either of them when the key is played, a rock-shaft mounted parallel with the axis of the actuating-wheel beneath the key-bar, a connecting-rod coupling said bar with a radial arm on the rock-shaft, and a radial arm projecting from the rock-shaft, to carry the stop-pin, whereby the play of a key will operate to disengage the stop-pin and allow the wheel to make its revolution, and thereby automatically open and close the lid, substantially in the manner and for the purpose herein set forth.

8. The combination, in a cash-machine, of a movable lid, an actuating-wheel revolving on an axis at a right angle to the line of movement of said lid, a wrist-pin upon the wheel, a coupling-rod connecting the wrist-pin and lid, a spring actuating the wheel to produce an automatic revolution thereof, a controlling-disk secured to the axle of the wheel, to revolve with it, a movable stop-pin adapted to engage a notch or offset on said controlling-disk, to arrest the movement of the wheel at each complete revolution thereof, a second movable stop-pin adapted to engage a second notch or offset formed at a diametrically-opposite point on the disk, to arrest the movement of the wheel at each half-revolution thereof after it is disengaged from the first stop-pin, a pivotal arm carrying said second stop-pin, a spring enforcing the engagement of the pin with the notch or offset, and an oscillating hand-lever adapted to move the arm and disengage the pin, substantially in the manner and for the purpose herein set forth.

9. The combination, substantially as set forth, of the actuating-wheel coupled, as herein described, to the reciprocating lid of a cash-machine, a controlling-disk secured to the axle of said wheel, to revolve with it, a movable stop-pin adapted to engage a stop or offset on said disk, to arrest its movement at a complete revolution thereof, a second movable stop-pin adapted to engage a second notch or offset on said disk, to arrest its movement at a half-revolution thereof after it has been disengaged from the first stop-pin, a pivoted arm carrying said second stop-pin, a spring enforcing the engagement of the pin with the notch or offset, a second winding-disk mounted parallel with the controlling-disk, to revolve independently about the same axis, a helical spring coiled between the two disks and secured at either end thereto, a pawl pivoted outside the winding-disk, to engage a notch in its periphery and prevent a reverse movement of the disk after the spring is wound, a toothed wheel revolving loosely upon the hub or axle of the winding-disk, a pawl pivoted to said disk, to engage the toothed wheel and prevent its independent rotation as the spring is wound, an oscillating hand-lever, a segmental rack carried by said lever and which gears with said toothed wheel, a spring-actuated yielding stop fitted upon the arm which carries the second stop-pin, to engage the controlling-disk, and a tooth upon the segmental rack adapted to slip by the yielding stop as the rack moves forward, to wind up the spring and to engage the stop and move the lever so as to release the controlling disk at the end of the return-stroke of the rack, substantially in the manner and for the purpose herein set forth.

398,626. CASH INDICATOR AND REGISTER. WILLIAM KOCH, New York, N. Y., and CHARLES R. HARLEY, Washington, D. C.; said Harley assignor to said Koch. Filed Mar. 30, 1888. Serial No. 269,452. (No model.)



Claim.—1. In a cash-indicating machine, the combination of a tablet, a vertically-moving rod carrying said tablet, and a key-lever jointed immediately to said rod to prevent any independent movement of the two, whereby the position of the one shall indicate positively the position of the other, substantially in the manner and for the purpose herein set forth.

2. The combination of the series of parallel key-levers having a uniform length of stroke and a controlling-plate actuated differentially by the stroke of each key-lever, whereby the movement of a second key in the series is prevented until the first key has resumed its normal position, substantially as herein set forth.

3. The combination, with a series of parallel key-levers and a transverse controlling-plate mounted to reciprocate above said key-levers, of a series of differentially curved or inclined fingers severally carried by the key-levers to project therefrom into contact and engagement with said plate to move it, whereby the upward movement of any one key-lever will produce a transverse movement of the controlling-plate differing in its extent from that produced by the movement of any other key-lever in the same series, substantially in the manner and for the purpose herein set forth.

4. The combination of the series of parallel key-levers having a uniform length of stroke, a controlling-plate actuated differentially by the stroke of each key-lever, and an adding mechanism, substantially

398,626.

as described, actuated by the differential movements of the controlling-plate, substantially in the manner and for the purpose herein set forth.

5. The combination, in a cash indicating and adding machine, with a train of adding-wheels, a ratchet-wheel actuating the same, a segmental disk revolving at the side of the ratchet-wheel on the same axis and extending to the outer end of the ratchet-teeth, an oscillating pawl overlapping both the ratchet and proximate controlling-disk, and a toothed wheel or segment attached to said controlling-disk, of a group of oscillating key-levers, an actuating-finger projecting from the upper edge of each lever, a transverse reciprocating controlling-plate mounted immediately above the key-plates to be actuated by an upward movement thereof and moved differentially by each toward the controlling-disk, and a rack carried with the controlling-plate and adapted to gear with the toothed wheel or segment of the controlling-disk, whereby an upward movement of any one key operating to move the controlling-plate and its attached rack to a greater or less extent will thereby move the controlling-disk, so as to determine the point at which, in its movement, the swinging pawl shall engage the teeth of the ratchet-wheel of the adding-train, all substantially in the manner and for the purpose herein set forth.

6. The combination of a group of parallel key-levers, A A, actuating-fingers 7, projecting upwardly therefrom, a transverse strip, 12, mounted to oscillate over the key-levers into engagement with a notch, 15, in the proximate edge of each finger when elevated, upright arms 13, pivoted at their lower ends and carrying said locking-strip on their upper ends, a lever, 16, projecting from the lower pivoted end of one of said arms at about a right angle therewith, a spring, 17,

adapted to elevate the lever, a spring-actuated latch, 42, pivoted to the side of the lever near its outer free end, a stop, 43, to limit the down play of the latch, a rock-shaft, 1, mounted transversely to said lever above its outer end, a hand-lever, H, actuating said shaft, an arm, 41, depending from the rock-shaft in proximity to the latch, and a pin, 40, on said arm, adapted to ride under the latch to lift it from its stop in moving forward and over the latch to depress the latch and lever in moving back again, whereby the return movement of the hand-lever after being depressed will operate to depress the lever 16 and release the elevated key from the locking-strip, all substantially in the manner and for the purpose herein set forth.

7. The combination, with the rock-shaft 1, the hand-lever H, actuating the same, the arm 41, depending from the rock-shaft, the pivoted lever 16, whose outer free end extends at a right angle with the shaft 1 in proximity to the arm 41, the spring-actuated latch 42, pivoted upon the side of said lever, and a double-edged pin, 40, upon the proximate side of the arm 41, of a series of ratchet-teeth formed upon the upper and lower edges of said latch 42 and inclined in opposite directions to engage the pin in the movement of said arm and thereby prevent a reverse of the movement of the rock-shaft and hand-lever in either direction, substantially in the manner and for the purpose herein set forth.

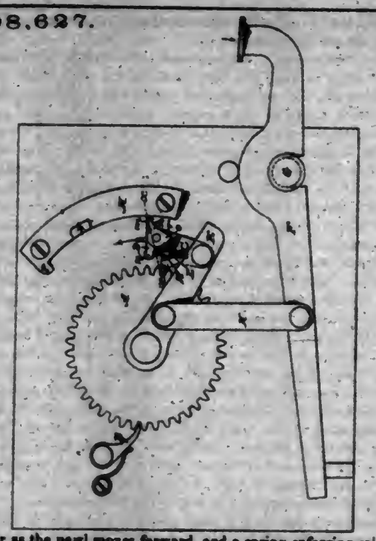
8. The combination, substantially as above described, of the rock-shaft 1, the hand-lever H, actuating it, the arm 41, depending therefrom, the group of parallel keys A A, pivoted upon said shaft, a transverse longitudinal plate, 45, upon which the outer ends of the keys rest, pins projecting upward from said movable plate between the keys, lateral catches formed upon the ends of said pins and adapted when moved sidewise to overlap and lock the keys, and a rod, 50, pivoted to the arm 41 and terminating in a wedge-shaped end made to engage the end of the plate 45 at a right angle therewith.

9. The combination, substantially as above described, of the hand-lever H, the spring 24, the rod 21, encircled by said spring and pivoted to the hand-lever, the arm 19, having an offset, 23, through which said rod plays, and the rock-shaft 1, to which said arm is made fast.

10. The combination, in a cash-machine, of a cash-drawer, a crank-wheel, a pitman coupling the wrist of the crank-wheel to the drawer, a spring actuating said crank-wheel, and a hand-lever by whose movement the spring is compressed or energized, substantially in the manner and for the purpose herein set forth.

11. The combination, in a cash-machine, of a cash-drawer, a crank-wheel, a pitman coupling the wrist of the crank-wheel to the drawer, an idle-disk revolving loosely upon the axle of the crank-wheel adjacent thereto, a coiled spring interposed between the crank-wheel and disk and whose ends are secured to the one and the other, a toothed wheel revolving loosely upon the axle adjacent to the idle-disk, a rock-shaft geared to said wheel, a hand-lever by which the shaft is oscillated, and a pawl pivoted to the idle-disk to engage the toothed wheel, whereby the oscillation of the rock-shaft will operate to turn the idle-disk in the direction required to wind the attached spring, substantially in the manner and for the purpose herein set forth.

12. The combination, in a cash-machine, of a spring-actuated crank-wheel, a drawer coupled thereto to be reciprocated thereby at each revolution thereof, a detaining-pawl adapted to engage the crank-wheel at each semi-revolution thereof, and a hand-lever adapted by its movement to lift the pawl, substantially in the manner and for the purpose herein set forth.

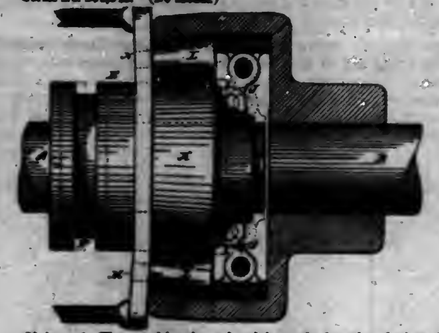


13. The combination, in a cash-machine, of a spring-actuated crank-wheel, a drawer coupled thereto to be reciprocated thereby at each revolution thereof, a detaining-pawl adapted to engage the crank-wheel at each semi-revolution thereof, a group of keys, a vibrating locking-strip adapted to be engaged automatically by each key when the key has been played, a lever oscillated by the movement of the locking-strip, and a second lever actuating the detaining-pawl and itself actuated by the movement of said locking-strip lever, whereby the crank-wheel will be released and the drawer be thereby automatically closed whenever any one key is played, all substantially in the manner and for the purpose herein set forth.

14. The combination, substantially as hereinbefore described, of a drawer, a casing inclosing it, a reciprocating arm coupled to one end of the drawer to actuate it, a rack upon the side of the drawer, and pinions mounted to rotate idly in the casing under the rack and to gear therewith to steady the movements of the drawer.

398,627. STOP DEVICE FOR ADDING AND REGISTERING WHEELS. WILLIAM KOCH, New York, N. Y. Filed Sept. 25, 1886. Serial No. 214,252. (No model.)

Claim.—1. The combination of the toothed wheel, the fixed friction-bar having a curved surface concentric with the wheel, the pawl-arm swinging upon the axis of the wheel as its pivotal center, the pawl pivoted to said arm to engage the wheel, the dog pivoted to said pawl to swing into frictional contact with the curved surface of

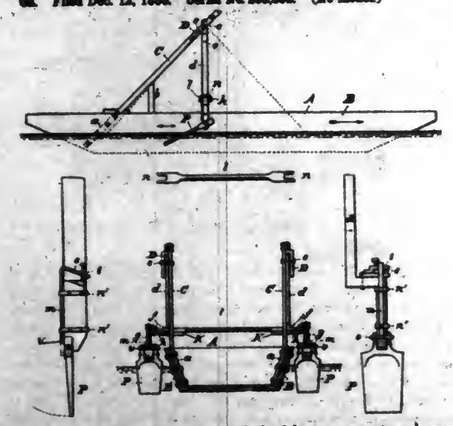


398,627.

the bar as the pawl moves forward, and a spring enforcing said contact, substantially in the manner and for the purpose herein set forth.

2. The combination of the toothed wheel, the fixed friction-bar having a curved surface concentric with the wheel, the pawl-arm swinging upon the axis of the wheel as its pivotal center, the pawl pivoted to said arm to engage the wheel, the dog pivoted to said pawl to swing into frictional contact with the curved surface of the bar as the pawl moves forward, a spring enforcing said contact, and fixed stops engaging the dog and the pawl-arm when the stroke of the latter is completed, substantially in the manner and for the purpose herein set forth.

398,628. FRICTION-CLUTCH. FREDERICK H. LAFOUNE, Waterbury, Conn., and HUGH J. BARKER, Philadelphia, Pa. Filed Nov. 19, 1888. Serial No. 291,948. (No model.)



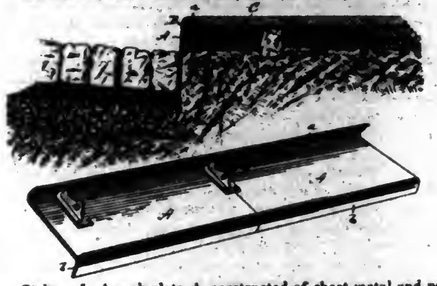
Claim.—1. The combination of a driven shaft and a shaft to be driven, the two shafts being in axial line with each other, a head made fast to one of said shafts, the said head constructed with a concentric chamber, into which the other shaft extends, a longitudinal slide on said other shaft secured to said other shaft and so as to revolve therewith, but free for longitudinal movement thereon, the said slide provided with a surface within said chamber corresponding to and adapted to frictionally engage or disengage said slide and head, according to the direction of movement of said slide, the said slide also constructed with a conical concentric surface within said chamber diminishing in diameter in the direction in which the slide moves to disengage its frictional surface from said head, said conical surface being of smaller diameter than the internal diameter of said chamber, that portion of the surface of said chamber which surrounds said conical portion of the slide being concentric with the said conical surface, with rollers arranged upon stationary axles between the conical surface of said slide and the corresponding surface of the said chamber, substantially as described, and whereby the movement of the said slide in one direction engages the said head, so as to impart rotation to the shaft with which the head is connected in the same direction as that of the other shaft, and when the slide is moved in the opposite direction the slide disengages the said connection with the said head, and the conical surface of the slide engages the said rollers, and thereby

imparts a rotation to the said head and its shaft in the direction opposite to that of the said other shaft.

2. The combination of a driven shaft and a shaft to be driven, the two shafts being in axial line with each other, a head made fast to one of said shafts, the said head constructed with a concentric chamber, into which the other shaft extends, a longitudinal slide on the said other shaft secured to said other shaft so as to revolve therewith, but free for longitudinal movement thereon, one or more shoes within said chamber and presenting a surface or surfaces corresponding to the surface of the wall of said chamber, the said shoes being in connection with the said slide, so that the longitudinal movement of the slide will impart corresponding radial movement to said shoes, the said slide constructed with a conical concentric surface diminishing in diameter in the direction in which the slide moves to retract the said shoes, said conical surface of smaller diameter than the internal diameter of said chamber, that portion of the surface of the said chamber which surrounds the said conical portion of the slide being concentric with the said conical surface, with rollers arranged upon stationary axles between the conical surface of said slide and the corresponding surface of the said chamber, substantially as described, and whereby the movement of the said slide in one direction applies the shoes to the said head to impart rotation to the shaft with which the head is connected in the same direction as that of the other shaft, and when the slide is moved in the opposite direction disconnects said shoes from the head, and the conical surface of the slide engages the said rollers, and thereby imparts a rotation to the said head and its shaft in the direction opposite to that of the said other shaft.

3. The herein-described friction-clutch, consisting of a head arranged upon a shaft and forming a concentric chamber around said shaft, combined with a longitudinal slide concentric with said chamber and arranged upon a shaft for longitudinal movement, but engaged with said shaft circumferentially, the said slide provided with a surface within said chamber corresponding to and adapted to frictionally engage or disengage said slide and head, according to the direction of movement of said slide, the said slide also constructed with a conical concentric surface within said chamber diminishing in diameter in the direction in which the slide moves to disengage its frictional surface from said head, said conical surface of smaller diameter than the internal diameter of the said chamber, that portion of the surface of said chamber which surrounds said conical portion of the slide being concentric with the said conical surface, with rollers arranged upon stationary axles between the conical surface of said slide and the corresponding surface of the said chamber, substantially as and for the purpose described.

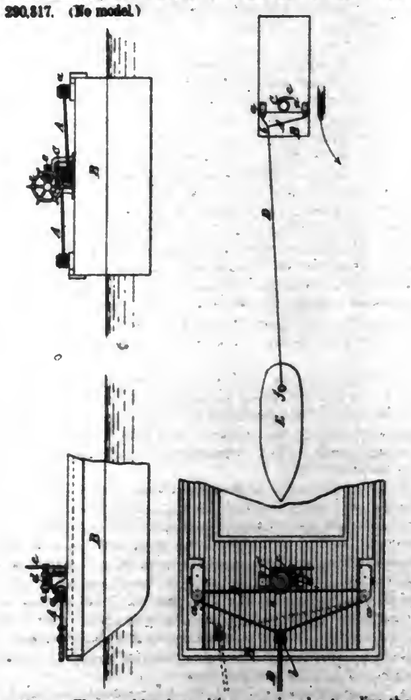
398,629. VIBRATING PROPELLER. JAMES S. LAMAR, Valdosta, Ga. Filed Dec. 12, 1888. Serial No. 293,362. (No model.)



Claim.—1. The combination, with the fulcrum-supports and angular pendent paddle-shanks, of the paddles and the stop-joints, each consisting of a slide having at its lower end a cross-head engaging with the respective paddle, and which slide moves in bearings upon the paddle-shank, and has at its upper end an inclined arm engaging with an adjustable bearing connected to the horizontal portion of the paddle-shank, substantially as specified.

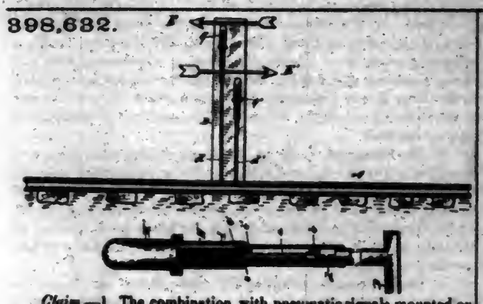
2. The combination, with the fulcrum-supports and angular pendent paddle-shanks, of the paddles, the stop-joints, each consisting of a slide having at its lower end a cross-head engaging with the respective paddle, and which slide moves in bearings upon the paddle-shank and has at its upper end an inclined arm engaging with an adjustable bearing connected to the horizontal portion of the paddle-shank, and the removable transverse bar, substantially as specified.

3. The combination, with fulcrum-bars attached to the boat, and pendent paddle-shanks, of the bifurcated transverse handle-bar, substantially as specified.



398,630. PAVEMENT-CURB. ISRAEL L. LANDIS, Lancaster, Pa. Filed Dec. 13, 1888. Serial No. 293,426. (No model.)

Claim.—1. A curb-plate, A, constructed of sheet metal and provided with a flange, *a*, at its upper edge and a stiffening-bracket secured in the angle formed by the said flange *a*, substantially as described.

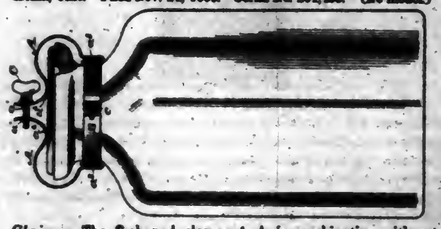


2. The combination of the curb-plates provided at their upper edges with inwardly-turned flanges, and cast brackets riveted in the angle formed by the said flanges, and securing-rods attached to the said brackets, substantially as described.

398,631. STEERING-GEAR FOR VESSELS AND FLOATING BODIES. VALDEMAR F. LEMOS, Brooklyn, assignor of one-half to Cornelius H. De Lamater, New York, N. Y. Filed Nov. 14, 1888. Serial No. 290,817. (No model.)

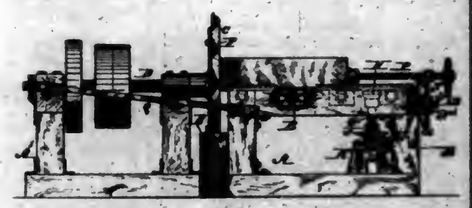
Claim.—The combination, with a vessel and a tow-line therefor, of a running steering-bridle, consisting of a rope or chain having its ends connected together and arranged athwart the vessel, supports for said bridle arranged on opposite sides of the center of the vessel, and a rotary barrel or capstan for moving said bridle athwart the vessel, the tow-line being connected with the bridle by a connection which is movable athwart the vessel by the movement of the bridle, substantially as and for the purpose herein set forth.

398,632. PNEUMATIC SIGNAL FOR RAILWAYS. JOHN K. LEIDY, Tom's Brook, assignor of two-thirds to Noah W. Solenberger and German Smith, Winchester, Va. Filed Dec. 3, 1887. Serial No. 257,237. (No model.)



Claim.—1. The combination, with pneumatic signals mounted on posts and communicating with signals in remote stations, of signal-arrows fixed to said posts and pointing in opposite directions, substantially in the manner and for the purposes described.

2. A pneumatic signal composed of an opaque cylinder, a superimposed transparent cylinder, a guiding cylinder or barrel, and a colored vertically-movable signal provided with a valve-stem, and a valve adapted to close against a seat when the colored signal is raised and exposed to view, substantially as described.



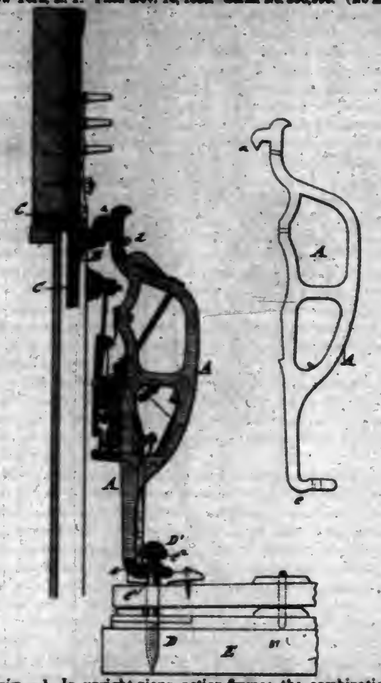
3. The combination of an opaque cylinder, a transparent cylinder, an inclosed vertically-movable visible signal, a pneumatic tube, and a valve, substantially in the manner and for the purposes described.

398,633. SEALING DEVICE FOR FRUIT-JARS. JOHN LOGAN, Xenia, Ohio. Filed Nov. 21, 1888. Serial No. 291,433. (No model.)

Claim.—The S-shaped clamps A A, in combination with set-screw C and adjustable band B, substantially as described, and for the purpose named.

398,634. MACHINE FOR RUBBING OR DRESSING STONE. DAVID MACKIE, Philadelphia, Pa. Filed Feb. 27, 1888. Serial No. 265,263. (No model.)

Claim.—1. The stone rubbing or dressing disk having cups or buckets connected with the periphery of the same and adapted to empty or discharge their contents over the rubbing side thereof, substantially as described.

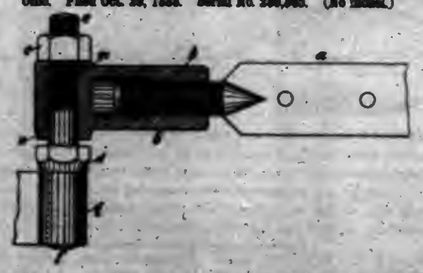


2. A stone rubbing or dressing disk having cups or buckets connected with the periphery thereof, in combination with a feeding-box into which said buckets dip and are filled as the disk rotates, substantially as described.

3. In a stone rubbing or dressing machine, a frame, a screw for holding the stone against a rubbing or dressing disk, and an arm supporting said screw adjustably connected with the frame, substantially as described.

4. A stone rubbing or dressing machine having a disk, a frame with rollers thereon, a box swiveled to said frame, an arm secured in said box, and a screw working in said arm, said parts being combined substantially as described.

5. A stone rubbing or dressing machine having a rubbing-disk, a frame with rollers journaled therein, an arm secured to said frame, a screw working in said arm, and a lifting-screw with mechanism, substantially as described, for operating the same, said parts being combined substantially as described.

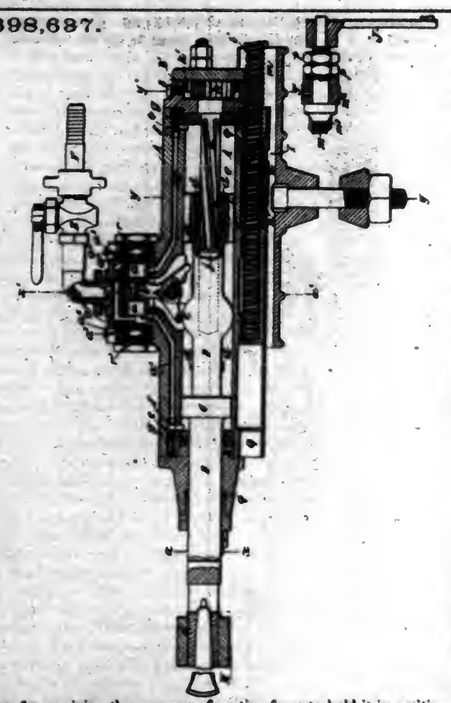


398,635. UPRIGHT-PIANO ACTION-FRAME. HENRY MALLMER, New York, N. Y. Filed Nov. 12, 1888. Serial No. 290,999. (No model.)

Claim.—1. In upright-piano action-frames, the combination of a string-frame having projecting brackets and recesses or sockets in said brackets, upright standards provided with beveled noses resting in said sockets, and screw-bolts connecting the lower ends of the standards with the key-bottom, substantially as set forth.

2. In upright-piano action-frames, the combination, with a string-frame having projecting brackets provided with recesses or sockets, upright standards for the actions, said standards having beveled noses at the upper ends resting in said sockets, set-screws passing through the upper ends of the standards and engaging the brackets, and screw-bolts connecting the lower ends of the standards with the key-bottom, said bolts having shoulders and threaded shanks for the fastening screw-nuts, substantially as set forth.

398,636. ADJUSTABLE HINGE. ELWYN A. MALLORY, Cincinnati, Ohio. Filed Oct. 20, 1888. Serial No. 288,265. (No model.)



Claim.—In a hinge, the combination of the leaf *a*, having a cylindrical screw-threaded end, *b*, a cylindrical body, *b*, provided with a screw-threaded longitudinal bore to receive the screw-threaded end of the leaf, and provided also on its inner end with a head comprising the lugs *m n*, said head having a screw-threaded bore transversely thereof, a pivot-bolt, *f*, having a screw-threaded stem, *e*, designed to be screwed into the head of body *b*, a collar, *d*, integral with the pintle, a lock-nut, *c*, and a hinge-loop, *g*, all substantially as described.

398,637. ROCK-DRILL. JAMES MCCULLOCH, Manchester, England. Filed June 20, 1888. Serial No. 278,008. (No model.) Patented in England Aug. 16, 1887, No. 11,192.

Claim.—1. In a rock-drill or other machine, the combination, with a piston and a tappet operated by said piston, of the valve engaged with said tappet and having pockets in its ends forming cham-

398,637.

bers for receiving the pressure of motive force to hold it in position, substantially as shown and described.

2. In a rock-drill or other machine, the combination, with the cylinder and the double-ended piston, of the exhaust-ports *d*, placed at a distance from the ends of said cylinder, and check-valves in the supply-passages for preventing the escape of the air in the ends of the cylinder, substantially as described.

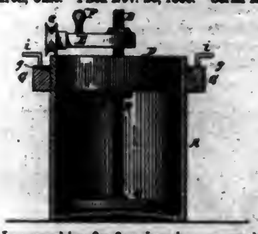
3. In a rock-drill or other machine, the combination, with the cylinder A, bracket I, and screw-threaded spindle *m*, mounted in said bracket, of screw-threaded nuts *n*, mounted on the cylinder and engaging with the spindle, and an auxiliary nut, *o*, placed around and screwed upon nuts *n*, for compensating for the wear upon said nuts, substantially as described.

398,638. BALL FOR TUBE-WELDING MANDRELS. WILLIAM S. MCMAHON, Chester, Pa. Filed Dec. 10, 1888. Serial No. 293,151. (No model.)

Claim.—1. A ball for the purpose set forth, formed of an integral hollow body having the continuity of its peripheral wall broken by a longitudinally-extending slot or slots, substantially as described.

2. A ball for the purpose set forth, consisting of an integral hollow body with an interior neck and slot or slots breaking the peripheral continuity of said integral body, substantially as described.

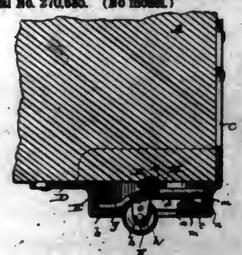
398,639. BARBER'S CHAIR. EDWARD MELCHIOR, Chicago, Ill. Filed Feb. 24, 1888. Serial No. 265,194. (No model.)



Claim.—1. The lifting-arm A, having the recess B, and a foot-piece, C, pivoted to said arm A at one end, said foot-piece having a projecting piece, D, for releasing purposes, in combination with the spring E, secured at one end to the arm A, a locking-block, F, pivoted in the recess B, and a locking-bar, G, which passes through the slot in the releasing end of the foot-lever C, substantially as and for the purpose specified.

2. The lifting-arm A, having the recess B, foot-piece C, pivoted to said arm A at one end, said foot-piece having a projecting piece, D, for releasing purposes, a locking-block, F, pivoted in the recess B, and the locking-bar G, which passes through the slot in the releasing end of the foot-lever C, in combination with the lifting-bar K, pivoted to the inner end of the arm A, and rock-shaft I, substantially as and for the purpose specified.

3. The lifting-arm A, having the recess B, and slot H, for the passage of the locking-bar G, and a foot-piece, C, provided with a releasing-piece, D, having a slot, I, near its acting end, in combination with the locking-block F, pivoted in the recess B, and locking-bar G, which passes through the slot in the releasing end of the foot-lever C, and engages with said locking-block F for adjusting the chair, substantially as specified.

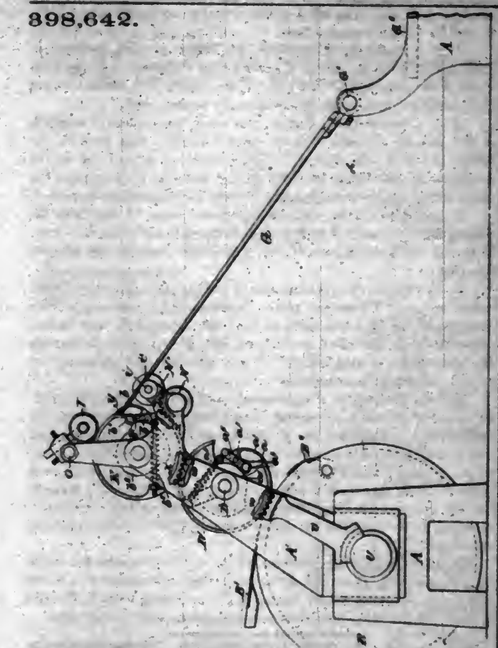


398,640. MACHINE FOR MAKING CROCK-RIMS. HENRY R. MERRILL, Akron, Ohio. Filed Nov. 20, 1888. Serial No. 291,362. (No model.)

Claim.—1. In a machine for forming rims on earthenware vessels while they are in a plastic state, the combination, with a shaft arranged to stand and be supported in the axis of the vessel and a radial arm carrying a rim-forming wheel arranged to revolve about said shaft, of an opening ring arranged to be clamped about said vessel and having a mold to form the lower part of the rim, substantially as shown and described.

2. The combination, with the cut ring G, having a mold for the lower part of the crock-rim, of the bent rods *i i*, arranged to be turned therein and support said ring, substantially as shown and described.

398,641. CASTER. SIGMUND M. MICHELSON, Milwaukee, Wis., assignor of one-half to George Sylvester, same place. Filed Apr. 14, 1888. Serial No. 270,685. (No model.)



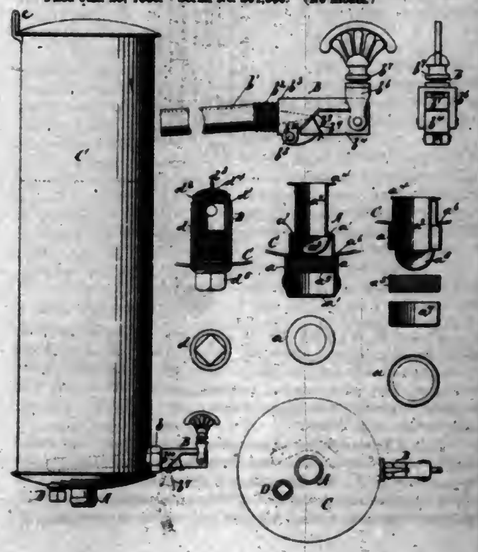
Claim.—In a caster, the combination, with a housing having an opening in its bottom plate, of a roller-carrying frame having an arm carrying an anti-friction roller at the end, and another arm or arms projecting above and beyond the edge of said opening, the said roller-frame having a pivotal bearing with the upper part of the housing, but free from attachment therewith, and the said housing having a suitable track or bearing-surface for engagement with the said anti-friction roller, substantially as set forth.

398,642. SHEET-DELIVERY APPARATUS FOR PRINTING-MACHINES. ROBERT MIEHLE, Chicago, Ill. Filed Mar. 21, 1887. Serial No. 231,786. (No model.)

Claim.—1. The combination, with the impression-cylinder, of a series of revolving sheet lifters or grippers, and a receiver-cylinder journaled at the front or top of the cylinder to seize the edge of the sheet and deliver it to a delivery-cylinder, said delivery-cylinder discharging the last (or freshly) printed side away from the receiving devices, substantially as described.

2. The combination, with the impression-cylinder, of a series of revolving sheet lifters or grippers, a revolving delivering-cylinder

398,642.



and receiving-fingers journaled at the front or top of the cylinder to seize the edge of the sheet and deliver it to a revolving delivery-cylinder, which in turn delivers it to a series of fingers with the last or freshly printed side away from the fingers, substantially as described.

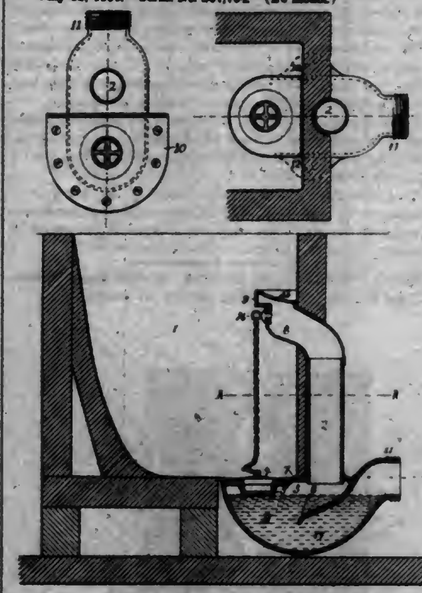
3. The combination, with the impression-cylinder, of two sets or series of revolving sheet lifters or grippers journaled at the front or top of the cylinder, and a reel or reels revolving with said grippers to support the sheet as it is delivered to the second set of delivery-reels, the same delivering the sheet to the receiving devices with the last or freshly printed side away from the same, substantially as described.

4. The combination of the impression-cylinder, sheet-lifters *a'*, delivery-cylinder E, fly-fingers G, and pulleys *i*, substantially as and for the purpose set forth.

5. The combination of the impression-cylinder, revolving sheet-lifters *a'*, delivery-cylinder or reels E, stripping-fingers G, and pulleys *i*, said pulleys receiving motion by gearing from the cylinder E, substantially as described.

398,643. FIRE-EXTINGUISHER. JOSEPH M. MILLER, Chicago, Ill. Filed Jan. 23, 1888. Serial No. 261,639. (No model.)

Claim.—1. The combination, with a portable fire-extinguisher consisting, essentially, of an air-tight receptacle or can containing a fire-extinguishing liquid and air or gas maintained under pressure and provided with a discharge-valve adapted to be operated by hand, and a supplemental discharge-valve applied at or near the base of the can and adapted to be released by an increase in temperature, whereby said receptacle is adapted for use as a portable extinguisher or as a stationary extinguisher by suspending it over or near the place to be protected, the hand-operated valve serving a double purpose to discharge the contents and test the pressure, substantially as described.



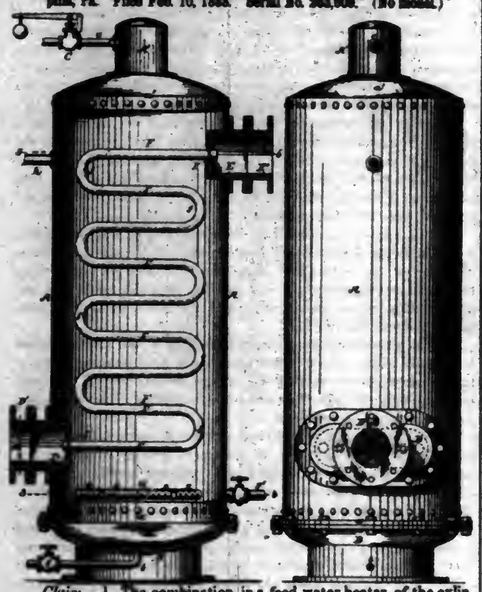
2. In a fire-extinguisher such as described, the combination of the tube *b'*, containing the discharge-orifice, the block b^4, carrying the packing or valves, and the link to which the fastening for engaging the cube is attached, said block b^4 being pivotally attached to the tube and swinging down to clear the discharge-orifice when the link is disengaged from the tube, substantially as described.

3. In a fire-extinguisher, the combination of the shouldered tube *a* with a sliding internal tube, a^3, provided with a spraying device at its outer end, and with a soft elastic block or disk, a^5, which closes the tube *a* and against which said spraying device normally rests, and the retaining cap or plug a^7, secured in the tube *a* by fusible solder, substantially as described.

4. In a fire-extinguisher, the combination of the discharge-tube *b'* with the rubber valve b^3, the pivoted block b^4, for forcing the valve to its seat, the freely-swinging link b^6, and the set-screw b^7, for tightening the pressure upon the valve while permitting of its rapid opening, substantially as described.

5. The combination, to form a portable fire-extinguisher such as described, of an air-tight can or receptacle provided with inlet and two outlet orifices, the one closed by a hand-operated valve and the other by an automatic valve released by an increase in temperature, all of said orifices being located at or near the base of the can or receptacle, which latter is charged with a fire-extinguishing liquid and a volume of air or gas under pressure, whereby all the orifices being below the liquid the escape of air or gas is prevented, and should the orifices be imperfectly closed the liquid in escaping will indicate the fact that the apparatus is not in perfect order and requires attention.

398,644. BATH-TUB. CHARLES H. MOORE, Yonkers, N. Y. Filed July 12, 1886. Serial No. 207,784. (No model.)

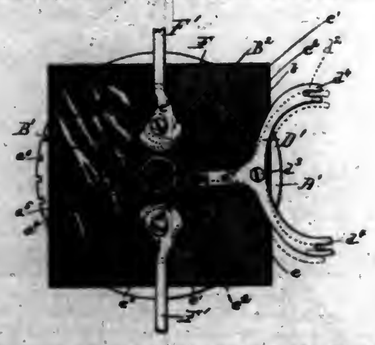


Claim.—1. The combination of a trap having a flat top with a bath-tub bottom having a U-shaped opening and a metal lining having a similar opening, the said trap being soldered to the said lining and so supported thereby that its flat top fills said U-shaped opening flush with the bottom of the tub and forms a section or portion of said bottom, as set forth.

2. The combination of a trap having a flat top provided with a threaded opening and a threaded plug-socket, with a bath-tub bottom having a U-shaped opening, and a metal lining having a similar opening, the said trap being soldered to and supported by said lining, so that its flat top fills said opening and forms a section or portion of the said tub bottom, and the said plug-socket being removable from the

inside of the tub (for the purpose of cleaning the interior of the trap) without interfering with or disconnecting the trap, as set forth.

398,645. FEED-WATER HEATER. EDWARD J. MOORE, Philadelphia, Pa. Filed Feb. 10, 1888. Serial No. 263,609. (No model.)



Claim.—1. The combination, in a feed-water heater, of the cylindrical casing, with oblong inlet and exhaust saddles inserted in the sides of said cylindrical casing and presenting internally plane faces parallel with each other, and a row of serpentine tubes in said casing, the lower ends of the tubes being secured to the saddle and the upper ends of the tubes to the other saddle, all substantially as described.

2. The combination, in a feed-water heater, of the cylindrical casing, with oblong saddles inserted therein, rows of tubes connecting said saddles, and caps for the saddles, each consisting of a plate having a central projecting flanged tube, substantially as described.

3. The combination, in a feed-water heater, of the casing with a spray-feed device cruciform in shape and having two or more of the tubes extending to the outside of the casing, substantially as and for the purpose described.

4. The combination, in a feed-water heater, of the casing with a spray-feeding device having four tubular arms, each arm extending to and supported by the casing and each arm adapted to be secured to the inlet-pipe, substantially as and for the purpose set forth.

398,646. TYPE-WRITING MACHINE. H. GRIER MOORE, Chicago, Ill. Filed Sept. 14, 1887. Serial No. 249,730. (No model.)

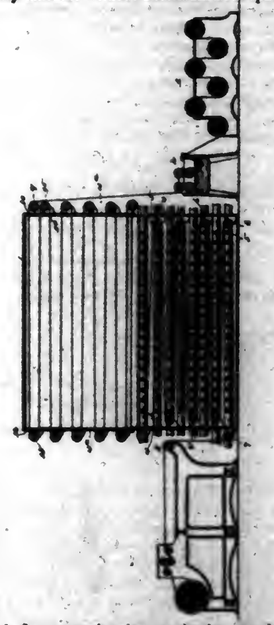
Claim.—1. In a type-writing machine, the combination of the type-disk A, movably secured to the non-rotating shaft B' by the hub a^2, the shaft B', the vertically-sliding collar B^3 thereon, with levers B^4 and B^5 and stops b^3 and b^4, substantially as described, to present the different tiers of type on the type disk or segment to the printing-point.

2. In a type-writing machine, the combination of the spacing-lever J, pawl J', the shaft *i*, the pinions I and I', mounted thereon, and the spring j^2 with a traveling paper-carrying carriage, substantially as and for the purpose specified.

3. In a type-writing machine, the paper-carrying carriage, in combination with the pinions I I' and spring j^2, mounted on the shaft *i*, the shaft *i*, the pawl J', the lever J^3, the bridges j^3 j^3, and the frames C C, arranged and operated substantially as described.

4. In a type-writing machine, the rotating type disk or segment A, the disk A', movably secured thereto by the collar a^2, with the levers J^3 and K, said disk A' having slots a^3, to engage one end of said lever K, and being provided also with a stop, a^7, to engage the other end of said lever, substantially as and for the purpose described.

5. In a type-writing machine, the combination of the pinion B^3, the segments or racks F F, the plate E, the yoke D', with the levers D D, and the key-frames C C, substantially as and for the purpose specified.

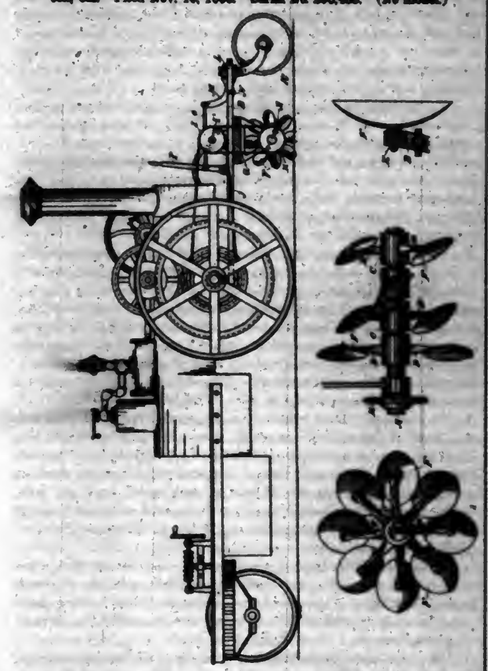


6. In a type-writer, the combination of the plate E, a pair of horizontal levers, F' F', secured thereto, each having a long and a short arm, the pinion B^3, connected to a type disk or segment, with means, substantially as described, for shifting said plate E so as to engage the short arms of said levers F' F' with the pinion B^3 alternately or at will, substantially as specified.

7. In a type-writer, the combination of the key-levers C C, vertical levers C^3 C^3, each connected, substantially as described, with its respective key-lever, and the pivoted levers F' F', each having a long and a short arm, said levers C^3 being so disposed along the long arms of the pivoted levers F' F' that the equal horizontal motion of each lever C^3 by its key-lever C will move the short arm of said lever F (to wit, the segment F) a distance greater or less as said key-lever C is nearer or farther from the fulcrum of said lever F', substantially as specified.

8. In a type-writing machine where the impressions are made by an oscillating paper roll or hammer, the combination of a series of key-levers, C C, with the frames C' C', the tilting lever G, the rod g^3, and a paper-carrying roll or hammer, substantially as specified.

398,647. WARP-DRESSING MACHINE. SIGMUND OBERDORFER, New Orleans, La. Filed Oct. 16, 1888. Serial No. 288,269. (No model.)



Brief.—The object of the invention is to increase the capacity of the ordinary machine without additional floor-space.

Claim.—1. In a warp-dressing mechanism or slasher, a hot-air or drying compartment consisting of the ordinary drying-chamber having steam-pipes and yarn-guiding rolls, and provided with a vertical extension having exterior guiding-rolls upon its ends and apertures for admitting the passage of the yarns to and from said rolls, substantially as described.

2. In a hot-air slasher or warp-dressing mechanism, the combination, with the sizing-rolls, of a hot-air chamber or drying-compartment consisting of a lower part having steam-pipes and interior guiding-rolls and an upper portion or extension communicating therewith, and provided with exterior rolls and with apertures permitting the passage of the yarns through the interior and to and from said rolls of the lower portion, substantially as described.

398,648. PLOW. JAMES PATTERSON and WILLIAM PATTERSON, Stockton, Cal. Filed Nov. 10, 1888. Serial No. 290,482. (No model.)

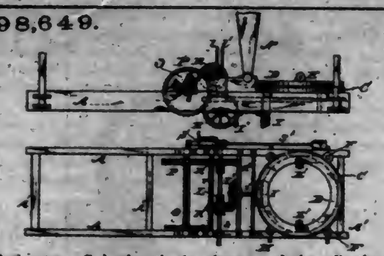
Claim.—1. A plowing device consisting of independent disks F, loosely journaled in the ends of arms which radiate from a central driving-shaft and are caused to revolve about said shaft by power applied thereto, substantially as herein described.

2. A series of disks loosely journaled in the ends of radial arms which are fixed to a central driving-shaft and are caused to rotate around it by power applied to said shaft, whereby the rotary disks are caused to travel through the ground with a motion independent of that which rotates the shaft, substantially as herein described.

3. A series of disks loosely journaled by means of central studs in the ends of arms which are fixed to a central shaft and extend spirally around said shaft, a mechanism whereby power may be applied to rotate said shaft, and mechanism whereby the apparatus to which the shaft is journaled is caused to travel along the surface of the ground at a rate of speed independent of that given to the rotary shaft, substantially as herein described.

4. The rotary driving-shaft having the radial arms spirally arranged around it, and a series of disks loosely journaled in the outer ends of said arms, so as to enter the soil successively and intermittently during its rotation, in combination with a mechanism whereby the shaft and disk may be raised or depressed to regulate the depth of cut, substantially as herein described.

5. A vertically-adjustable frame, B, having the disk-carrying driving-shaft A journaled to it, and means for raising and depressing the same, as shown, in combination with the extension-frames B', hinged at each side of the main frame and carrying similar shafts and plowing-disks, said extension-frames having caster-wheels supporting their outer ends, and a bell-crank lever and mechanism whereby they may be raised and depressed, substantially as herein described.



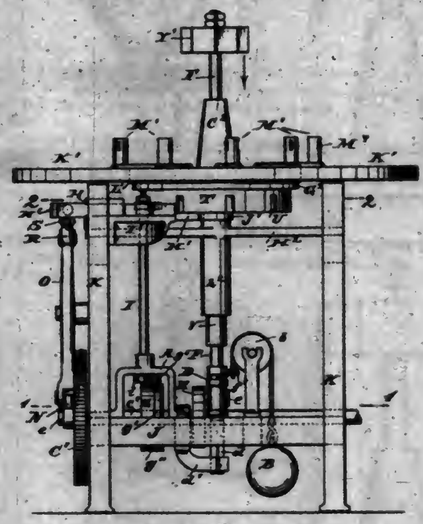
6. The center and jointed extension-frames, B B', having independent disk-carrying shafts journaled to them, each having a chain driving-pulley, H H', in combination with a driving-shaft carrying the pulleys I I', the driving-chains G G', and the main driving-chain J, by which power is transmitted to drive all the shafts and cutters, substantially as herein described.

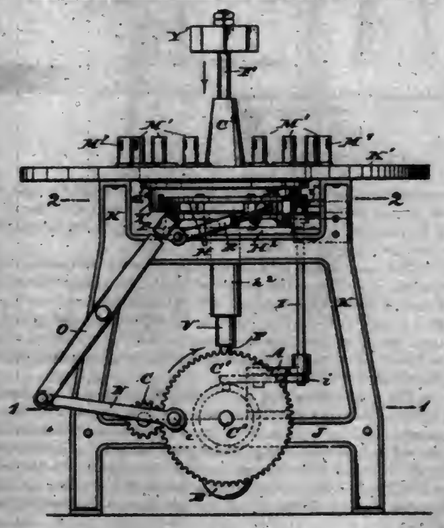
398,649. WELL-BORING MACHINE. GUSTAVUS PROE, Storm Lake, Iowa. Filed May 24, 1888. Serial No. 274,899. (No model.)

Claim.—1. The combination, with the frame A A', of the circular curb C, the movable rim D, resting upon the curb, and the adjustable friction-rollers F, substantially as described.

2. The combination, with the frame A A', of the circular curb C, the movable rim D, having a flange, *d*, resting upon the curb, the roll-

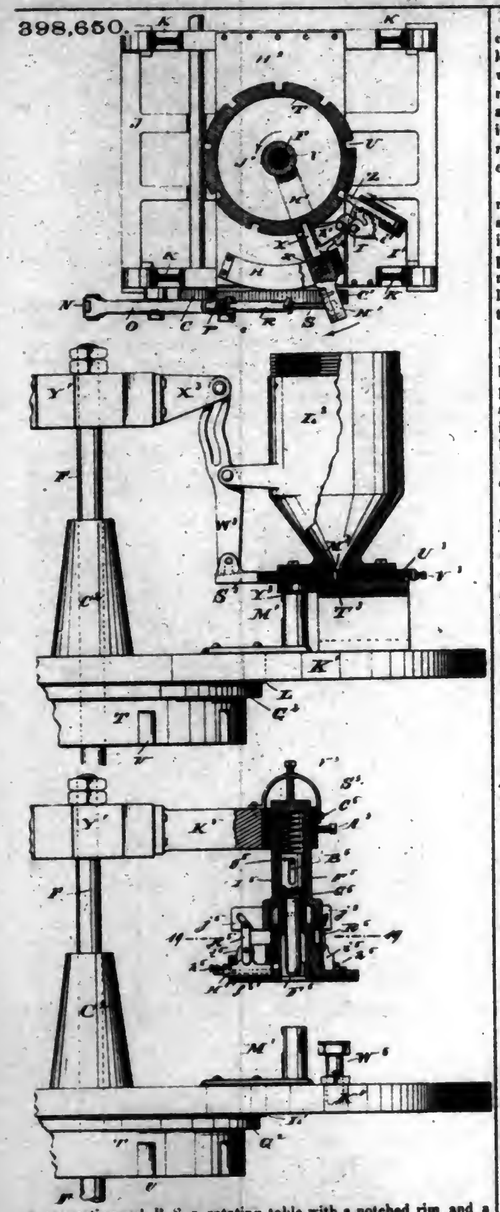
398,649.





ers F, the straps G, having the bearings *g*, and the adjusting-screws H, pressing against the bearings, substantially as described.

398,650. CARTRIDGE-LOADING MACHINE. GIBSON M. PETERS, Cincinnati, Ohio. Filed Aug. 26, 1888. Serial No. 283,096. (No model.)



Claim.—1. In a cartridge-loading machine, the combination, with the primary actuating mechanism, of a cam-wheel having opposite cams, a vertical oscillating shaft, I, connected with the table locking and releasing mechanism, and a pivoted lever one end of which is in engagement with the said cam-wheel and the other in gear with the shaft I, substantially as described.

2. The combination, with the primary actuating mechanism, of a crank-wheel, C c, a pivoted lever one end of which is linked to the crank of said wheel and the other connected to an adjustable pitman

398,650.

or connecting-rod, R S, a rotating table with a notched rim, and a lever, H', movable in the plane of the table, connected with the pitman R S, and carrying a spring-pressed bolt to engage the notches of the table, substantially as described.

3. The combination, with the primary actuating mechanism, of a cam-wheel, G, a pivoted lever one end of which is in engagement with said cam and the other provided with a segmental gear, a vertical shaft, I, in gear with said lever and with a reciprocating locking-bolt, Z, and a revolving shell-carrying table provided with a notched rim, with which said locking-bolt engages to lock the table, substantially as described.

4. The combination, with the rotating crank-wheel G', of a cam-wheel, G, on the same shaft therewith, a vertical shaft, I, carrying a segmental gear, *z'*, a rotating shell-carrying table having a notched rim, a toothed locking-bolt in engagement with the gear *z'* to lock the table, and a pivoted lever one end of which is in engagement with the cam-wheel and the other with a gear on the shaft I, whereby the latter is intermittently oscillated and the table locked, substantially as described.

5. The combination, with the rotating cam-wheel G and with crank-wheel E of a vertical shaft, I, carrying a gear, *z'*, an interposed lever one end of which engages the cam-wheel G and the other gears with the gear *z*, a rotating shell-carrying table provided with a notched rim, a locking-bolt, Z, in gear with the shaft I and adapted to engage and lock the table, and a reciprocating vertical shaft, F, carrying at its lower end a yoke with which the crank-wheel E engages to reciprocate the same, and having its upper end connected with the shell-charging mechanism, substantially as described.

6. The combination, with the oscillating shaft I and the vertical reciprocating shaft F, connected with the shell-charging device, and suitable mechanism for actuating the same, of a rotating shell-carrying table having a notched rim, a vibrating lever, H', moving in the plane of the table and carrying a spring-pressed bolt to engage the notches of the table, and a toothed locking-bolt in gear with an oscillating shaft, E, to engage and lock the table after each movement of the latter, substantially as described.

7. The combination, with the cam-wheel G and the crank-wheel E, of a rotating shell-carrying table provided with a notched rim, a lever, H', movable in the plane of the table and carrying a spring-pressed bolt or pin, X, to engage said notched rim and rotate the table, a vertical shaft, I, in engagement with the cam-wheel G through an intermediate lever, *g*, and with a toothed locking-bolt to engage and lock the table, and a reciprocating vertical shaft the upper end of which carries the various shell-charging mechanism and the lower end connected with the crank-wheel E, substantially as described.

8. The combination, with the rotating table having a notched rim, of a lever, H', movable in the plane of the table and carrying a bolt, X, to engage and rotate the table, and a locking-bolt, Z, to lock the table, the said bolts X and Z being connected with the primary driving mechanism, such mechanism imparting reciprocations to said bolts, so that they will be alternately advanced into and retracted from the notched rim of the table to rotate, to lock, and to release the same, substantially as described.

9. In a cartridge-loading machine, the combination, with a stationary table supporting the shell-filling devices, of a rotating table having an integral upper and lower extension, which forms an elongated bearing for the shaft which operates the shell-filling devices, substantially as shown and described.

10. In a cartridge-loading machine, the combination, with the rotating table and filling devices, of a central shaft, a head-block adjustably secured thereto, said block having openings for the passage of wad-strips, and arms secured to said head and block, and the filling devices, whereby the filling devices are actuated directly by the central shaft, as set forth.

11. In a cartridge-loading machine, the combination, with the rotating table carrying the shell-cases and provided with a notched rim, of the arm H', movable in the plane of the table and carrying a bolt, X, a bolt, Z, geared with and actuated by an oscillating shaft, I, the shaft F, operating the various shell-charging mechanism, a cam-wheel, G, connected with the shaft I by an intermediate lever, *g*, and a crank-wheel, E, connected with the shaft F to reciprocate the latter, the parts being arranged and adjusted, as shown and described, to start the table when the shaft F is at the limit of its upward movement and to stop the same when said shaft begins its downward movement substantially as shown and described.

12. In a cartridge-loading machine, the combination, with the rotating table and the filling devices, of a central shaft actuating said filling devices and provided with a counterbalancing-weight which exerts a constant resistance to the downward throw of said shaft, substantially as shown and described.

13. In a cartridge-loading machine, the combination, with the stationary table having openings for the descent and insertion of shells, of a shell-carrier and actuating mechanism therefor, said carrier sliding horizontally beneath the table and having its inner end open and semicircular, as and for the purpose set forth.

14. The combination, with the rotating table carrying the shell-cases, the filling devices, and actuating mechanism therefor, of a shell-carrier having an open inner end, and a shell-placer consisting of a piston moving vertically through the inner end of the carrier-frame to the shell-cases, said carrier and piston being linked and pivotally connected with each other and the central shaft, whereby the piston and carrier are given a regular and continuous movement, the shell being carried forward with the downstroke of the piston, and the carrier moved back with the upstroke of the piston, as set forth.

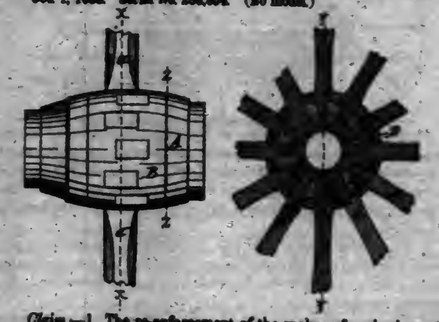
15. In a cartridge-loading machine, the combination, with the powder and shot hopper, and with a vertical reciprocating shaft, of a charge-slide having a charge-opening, a graduating-slide lying on said charge-slide with its inner end bent down and projecting into the charge-opening, and a cam-lever between the said shaft and charge-slide, whereby the latter is reciprocated by the reciprocation of the shaft, substantially as shown and described.

16. In a cartridge-loading machine, the combination, with the rotating table having a notched rim and suitably actuated, and a wad cutter and rammer operated by the central shaft, as described, of a wad-strip feed operated by a slide, T', having a roller engaging the notched rim of the table, said slide being pivotally connected with the ratchet-feed for the wad-strip, whereby the rotating table and ratchet-feed are operated in unison, the ratchet being moved with each intermittent movement of said table, as set forth.

17. In a cartridge-loading machine, the combination of a reciprocating shaft having an arm, K', which carries a jam, *j'*, a reciprocating indenter, and a lever-connection between said indenter and cam, substantially as shown and described.

18. In a cartridge-loading machine, the combination, with the arm K', open at its outer end and actuated directly by the central shaft, F, of an indenting device consisting of a head-piece bored centrally and adjustably secured to said arm, and provided with extensions *j'*, having diagonal slots, a secondary head-piece, F', a rammer secured therein and having depressions at its lower end, and sliding indenters having links secured thereto and moving in the slots of the extension, as and for the purpose set forth.

19. The combination, with the stationary table having a stop, W', on the hollow head I', reciprocating toward and from said stop, a secondary head spring-seated within the first, a rammer connected with the secondary head and having depressions at its lower end, and indenting-points connected with and operated by cams on the primary heads, whereby as the indenting device descends and strikes the stop the secondary head will give back against the spring and cause the indenter-points to be thrust forward, as and for the purpose set forth.

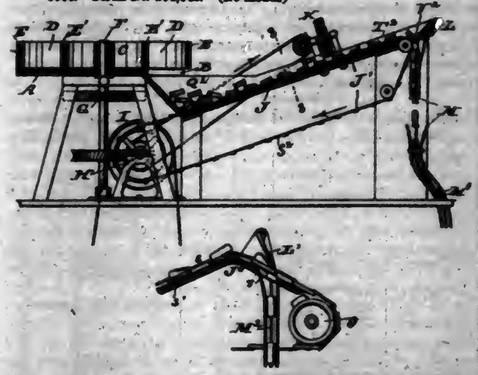


20. The combination, with the rammer G', having suitable depressions at its ends, of a shell-indenter movable toward and from said rammer and having indenting ends, consisting of a knife-edge extension, Y', to cut the shell, and a shouldered surface, X', to give form to the indentation after the cut is made, substantially as set forth.

21. In a cartridge-loading machine, the combination, with the rotating table and central shaft suitably actuated, of an extractor and inking device for the wad-marker, consisting of the extractor-rod secured to an arm of the central shaft, a triangular lever pivoted at its upper end to a collar on the extractor-rod, its outer end having a link pivoted thereto and to a lug on the stationary table, the inner lower end having an inking-roller, the vertical movement of the extractor giving a swinging movement to the triangular lever, and thus intermittently inking the die on the bottom of the extractor, as set forth.

upper end, and a carrying-belt running along said trough, of a cage divided into two separate parts, the delivery end of the upper part being vertically above the receiving end of the lower part, substantially as and for the purpose set forth.

5. The combination of an inclined trough having a downwardly-inclined upper end, J', a belt or chain having at regular intervals openings greater than the width and less than the length of a bullet, and having an obstacle in the path of the bullet for arresting and tilting same, as and for the purpose set forth.

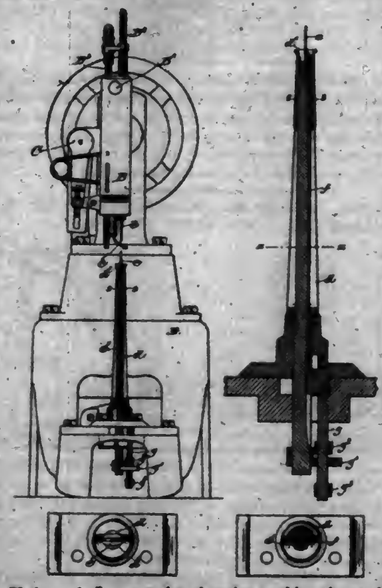


398,652. KUR. GEORGE J. RAPPEL, Middleville, N. Y. Filed Oct. 1, 1888. Serial No. 286,864. (No model.)

Claim.—1. The re-enforcement of the spokes of a wheel, consisting in forming an annular peripheral groove in the hub of greater width than the spoke-mortises, then driving the spokes into the hub, and then casting metal into the groove and over the shoulders of the spokes.

2. The gripping of the shoulders of the spokes of a wheel and the spokes themselves adjacent but exterior to the shoulders by casting a metallic band into an annular peripheral groove in the hub and around the spokes and their shoulders after the spokes have been driven into the hub.

398,651. FEEDING MECHANISM FOR CARTRIDGE-LOADING MACHINES. GUSTAVUS M. PETERS, Cincinnati, Ohio. Filed Nov. 26, 1888. Serial No. 291,842. (No model.)



Claim.—1. In a device of the nature described, the combination, with a hopper, of an inclined trough, a belt passing along the bottom of same, and its actuating mechanism, and a revolving brush placed above the trough and moving across the path of the belt, substantially as and for the purpose set forth.

2. The combination, with the hopper, of an inclined trough tapering to about the width of a shell, a belt suitably actuated and moving along the bottom of said trough, a brush in the path of the belt and revolving at right angles thereto, and a side trough set at an angle to the hopper to receive shells or bullets thrown off by said brush, as set forth.

3. The combination, with a hopper and a belt to draw forward the cartridges, of a gradually-narrowing trough having an outlet-opening in its bottom, and a piece, I, at its upper end inclined at an angle to the bed of the trough to receive the open ends of the shells and lift the same as they are brought to the opening in the trough, substantially as set forth.

4. The combination, with the trough having an opening near its

398,653. WAX-THREAD SEWING-MACHINE. ARTHUR S. RAMSDELL, Reading, Mass. Filed Aug. 13, 1888. Serial No. 282,604. (No model.)

Claim.—1. In a wax-thread sewing-machine, the combination, with a work-support, of a needle-bar having an undercut groove and a cast-off bar fitting in said groove and retained therein by the inwardly extending or converging walls or flanges at the sides thereof, substantially as described.

2. The narrow post having its inner face grooved to guide the needle-bar at one side, and having the support or throat, combined with the needle-bar having an undercut groove, and the cast-off bar fitting in said groove and retained therein by the walls or flanges at the sides thereof, substantially as described.

3. The post having the narrow throat or support for the sole adjacent to the needle and the fenders 2 3, combined with the needle-bar having the undercut groove and the cast-off bar fitting in said groove and retained therein by the walls or flanges at the sides thereof, substantially as described.

398,654. CULTIVATOR. WILLIAM H. ROGERS, Indianapolis, Ind. Filed Apr. 23, 1888. Serial No. 272,154. (No model.)

Claim.—1. The combination of the axle, the supporting-wheels thereon, the clevises secured to the axle, the laterally-adjustable beams having their front ends pivotally connected to the clevises, and the harrow-beams having their front ends flexibly connected together, the said beams being also connected to the cultivator-beams, substantially as described.

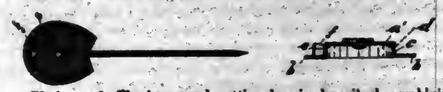
2. The combination of the axle, the cultivator-beams pivotally connected thereto and arranged on each side, and the harrow-beams arranged within the cultivator-beams and connected thereto and also connected together.

3. In combination with the axle, the cultivator-beams having a hinged or pivotal connection therewith, the harrow-beams I', arranged between the cultivator-beams, said harrow-beams being hinged together at K, and having the links L', connecting the harrow-beams with the cultivator-beams, as set forth.

398,655. MACHINE FOR LOCKING SHEET-METAL JOINTS. LOUDLEY L. SAGENDORPH, Cincinnati, Ohio, assignor of one-half to Harlan P. Lloyd, same place. Filed Sept. 20, 1888. Serial No. 285,883. (No model.)

Claim.—In a machine for locking the joints of sheet metal, the lower stationary bar, B, having the ribs *b* and flat groove *b'* between them, and a semicircular groove, b^2, near the center of said groove *b'*, in combination with the movable bar A, having the flat groove *a'* in its under face and a rib projection, a^2, near the center of said groove *a'*, and suitable mechanism for operating said movable bar.

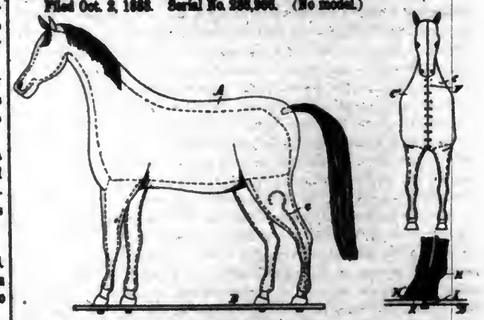
398,656. FOLDING BED. MARIUS SAMUEL, New York, N. Y. Filed June 20, 1888. Serial No. 278,506. (No model.)



Claim.—1. The combination, in a folding bed, of a support, a swinging bed portion composed of an inner section pivoted to the support and an outer section sliding on the inner section, and a link pivoted at one end to the support and at its other end to the sliding section to slide the latter outward when the bed portion is swung to a horizontal position, substantially as described.

2. The combination, in a folding bed, of a support, a swinging bed portion comprising an inner section pivoted to the support and an outer section sliding on the inner section, a link pivoted at one end to the support and at the other end to the sliding section, a folding frame on the inner section, a mattress connected with the inner end of the inner section and with the folding frame, and a catch for holding the mattress and folding frame extended, substantially as described.

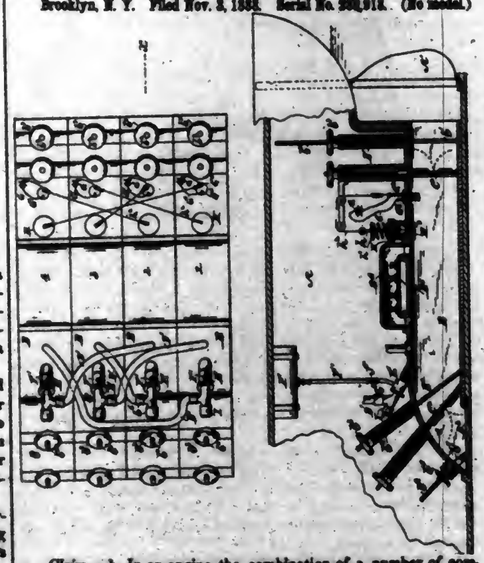
3. The combination, in a folding bed, of a support, A, a bed portion pivoted to the support and carrying at its outer end the sliding spring-impelled catches S, having finger-pieces T, and the sliding legs O, having upper and lower recesses Q, substantially as described.



398,657. JEWELRY. EMIL SCHILL and ANDREAS BECKER, Newark, N. J. Filed Sept. 20, 1888. Serial No. 285,842. (No model.)

Claim.—1. The improved setting herein described, combining therein a raised blank or body portion of sheet metal, the outer rim of which is bent at right angles to said body portion to form a bearing, *c*, provided with a recess or groove, *d*, a flange, *b*, and a gallery secured to said flange provided with grasping-fingers and co-operating with said groove-bearing to hold the jewels firmly in place, as set forth.

2. The improved jewel-setting herein described, combining therein a body portion bent to form a recessed or grooved shoulder or bearing for the jewels and a flange or seat for a gallery, said bearing and flange being formed of one piece of metal, and said gallery fastened on said seat and adapted to hold the jewels against said grooved bearing, as set forth.



398,658. DISPLAY-MODEL. HENRY SCHWERDLE, Toledo, Ohio. Filed Oct. 2, 1888. Serial No. 286,966. (No model.)

Claim.—1. A display-model formed of two hollow side sections conforming to the contour of an animal, the legs being formed integral therewith, and an interior holding-strip also formed to correspond to the interior contour of the body of the model, said sections being united by nails driven through the adjoining edges into the holding-strips, substantially as described.

2. A display-model comprising two hollow side sections formed of plastic material, and having legs formed with a central core, the sections being united at their adjoining edges to a central holding-strip, said model being secured to a platform by rods and turn-buckles embedded within the central core of the leg-sections, and a bolt passed through the platform, substantially as described.

398,659. ENGINE FOR MARINE PROPULSION. JOHN A. SNOOK, Brooklyn, N. Y. Filed Nov. 3, 1888. Serial No. 289,918. (No model.)

Claim.—1. In an engine, the combination of a number of combustion-chambers, pipes or conduits conveying the product of combustion from one chamber to another, an apparatus for igniting the contents of the chambers, and motors for operating said igniting apparatus, substantially as specified.

2. In an engine, the combination of two or more combustion-chambers, said chambers having communication by means of conduits, feed-injectors for said chambers communicating with said pipes, a receptacle for hydrocarbon connecting with the chambers, and an apparatus for igniting the contents of the chambers in succession, substantially as specified.

3. In an engine, the combination, with a combustion-chamber and an igniting apparatus, of the piston-valve operating in a cylinder on the chamber and having connection with an igniting device, substantially as specified.

4. In an engine, the combination of a number of combustion-chambers, fuel-feeders therefor, and igniting apparatus, the fuel-feeder belonging to one combustion-chamber being in communication with a different combustion-chamber, substantially as specified.

398,660. PERMUTATION-PADLOCK. GEORGE F. SEIBER, CALVIN B. JOHNSON, and MORGAN B. PERRY, Port Royal, Ky. Filed June 12, 1888. Serial No. 276,907. (Model.)

Claim.—1. In a permutation-padlock, the case having a suitable longitudinal depression or groove, O, the arbor mounted in the case, the staple having suitable legs to enter the case, and the notched tumblers mounted on the arbor and adapted to engage notches in the legs of the staples, in combination with the springs having loops fitting in and held from movement by the depression or groove O, and the spring-arms embracing the tumblers, substantially as and for the purpose specified.

2. In a permutation-padlock, the case, the arbor, and the rigid tumbler on the arbor, in combination with the movable tumblers mounted on the arbor and having the annular flanges *k'*, and the springs having curved arms embracing the flanges and held from movement in the case, substantially as specified.

3. In a permutation-lock, the combination, with the arbor mounted in a suitable case and the shackle having its arms fitted in suitable openings in the case, of the tumblers mounted on the arbor to engage notches in the arms of the shackle and provided in their under sides with annular grooves, the pins *l'* in the said grooves, the pins *l* on the upper sides of the tumblers fitting and operating in the grooves of the superimposed tumblers, and the springs secured in the case and provided with arms embracing the tumblers, all substantially as specified.

4. In a permutation-padlock, the combination, with the arbor mounted in a suitable case, the shackle having its arms inserted in the case, and the rigid tumbler H and revoluble tumblers K, arranged on the said arbor and engaging the shackle, of the revoluble dial G, mounted on the arbor outside the case and bearing on the adjacent end of the latter, the head or knob on the outer end of the arbor provided with a pin engaging a perforation in the outer side of the said dial, and the spring I, coiled on the arbor between the rigid tumbler and the adjacent end of the case to normally hold the head or knob on the arbor pressed against the dial, substantially as specified.

5. In a permutation-padlock, the combination, with the arbor mounted in a suitable case and having tumblers mounted thereon, and the shackle having its arms inserted in the case and engaged by the said tumblers, of the annular bearing-plate F, secured on the opposite end of the case from the shackle, the revoluble dial G, mounted on the arbor without the case, and having a shoulder, *f*, fitting within the said plate and provided in its outer side with sockets *g'*, the head or knob on the outer end of the arbor bearing against the dial G, and provided with a pin, *c'*, engaging the sockets *g'*, and the spring I, arranged on the arbor and bearing at opposite ends against one of the tumblers and the adjacent end of the case to normally hold the head or knob in contact with the dial, substantially as specified.

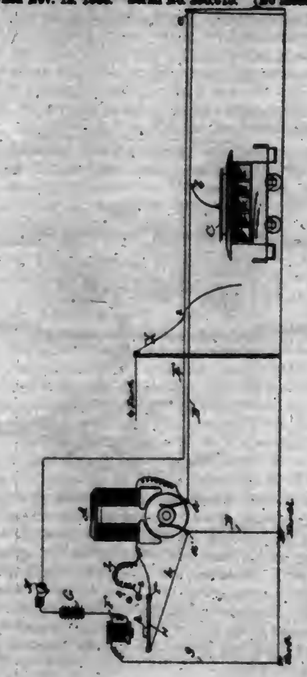
6. In a permutation-padlock, the combination, with the longitudinally-movable arbor D, mounted in a suitable case and provided with a head or knob, E, provided with a pin, *c'*, the revoluble dial G, mounted on the arbor without the case, bearing against one end of the case and provided with sockets *g* to receive the pin *c'*, whereby the arbor and dial are locked together, the tumblers H and K, arranged on the arbor and provided with engaging-pins *l l'*, and the spring I, coiled on the arbor between the tumblers H and the adjacent end of the case, of the shackle having its arms fitting in openings in the case and provided with notches *d'*, in which the tumblers engage and fit snugly, whereby when the shackle is locked in place longitudinal movement of the arbor is prevented and the pin *c'* cannot be withdrawn from the socket *g'*, in which it is engaged, substantially as specified.

398,661. INSULATING-SUPPORT FOR ELECTRIC CONDUCTORS. ROBERT H. SHORT, Columbus, Ohio. Filed Nov. 6, 1888. Serial No. 290,117. (No model.)

Claim.—1. In combination with a supporting-wire, a tubular extension supported thereon through an adjustable insulating-block, and the insulator fixed in the tubular extension having a shank, *d*, provided with a clip supporting the conducting-wire, substantially as described.

2. In combination with the shank and its clip, the conducting-wire formed with an offset fitted to the clip, substantially as described.

3. The conducting-wire formed with an offset, and the clip fitted thereto and provided with a hole in its upper end for connection with the shank, substantially as described.



4. In combination, a supporting-wire, a tubular extension supported thereby, the conducting-wire and means for suspending it from the tubular extension, an arm, F, extending laterally, and a stay-wire, G, substantially as described.

5. In combination, the supporting-wire and the elongated curved clip, combined with the wire having an offset, and means of attachment between the said clip and the supporting-wire, substantially as described.

6. In combination with the conducting-wire, the guard-wire E, supported upon the insulating-block B, substantially as described.

7. The prongs on the sleeve C, combined with the button and wire and with the guard-wire E, all substantially as described.

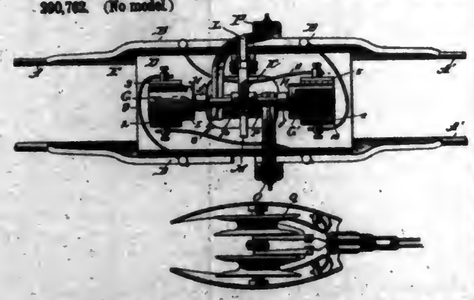
398,662. ELECTRIC RAILWAY. ROBERT H. SHORT, Columbus, Ohio. Filed Nov. 12, 1888. Serial No. 290,615. (No model.)

Claim.—1. In combination with an electrical conductor and a generator, a guard-wire arranged in proximity to the main conductor, forming a normally-open circuit, a source of electrical energy included in the guard-wire circuit, and a controlling resistance-connection between said guard-wire and the generator, whereby in the closing of the guard-wire circuit the pressure on the main conductor is reduced, substantially as described.

2. In combination with an electrical conductor and a generator, a guard-wire arranged in proximity to the main conductor, forming a normally-open circuit, a source of electrical energy included in the guard-wire circuit, and a controlling resistance-connection automatically operated by the closing of the circuit between said guard-wire and the generator for reducing or controlling the pressure in the main conductor, substantially as described.

3. In combination with an electrical conductor and a generator, a guard-wire arranged in proximity to the main conductor, forming a normally-open circuit, a source of electrical energy, a controlling resistance-connection between said guard-wire and the generator for reducing or controlling the pressure in the main conductor, and a signaling device operated by the closing of the guard-wire circuit, substantially as described.

4. In combination with an electrical conductor and a generator, a guard-wire arranged above the main conductor, forming a normally-open circuit and including a source of electrical energy, a switch for controlling the electrical pressure on the main conductor, and an electro-magnet in the guard-wire circuit for automatically operating the switch, substantially as described.



5. In combination with an electrical conductor and a generator, a guard-wire above the conductor, forming a normally-open circuit including a source of electrical energy, a switch for controlling the electrical pressure in the main conductor, an electro-magnet in the guard-wire circuit for automatically operating the switch, and a signaling device in the guard-wire circuit, substantially as described.

6. In combination with an electrical conductor and a generator, a guard-wire forming a normally-open circuit with a source of electrical energy included therein, a switch, an electro-magnet in the guard-wire circuit for automatically operating said switch, a connection from said switch to one brush of the armature, contact-points in the path of the switch, one directly connecting with a terminal of the field-magnet and the other connecting therewith through a resistance, substantially as described.

7. In the described combination, the switch-lever, the electro-magnet in the guard-wire circuit for automatically operating the same, a connection from the lever to one of the armature-brushes, contact-points in the path of the lever, a direct connection from one contact with one terminal of the field-magnets, a resistance-coil interposed between the second contact and the field-magnet, and the third contact having no connection, whereby the full pressure of the current may be maintained, reduced, or interrupted, substantially as described.

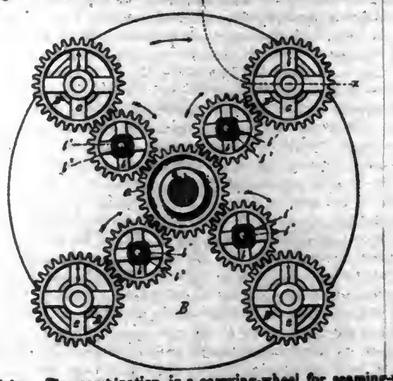
8. In combination with an electrical conductor and a generator, a guard-wire arranged in proximity to the main conductor, forming a normally-open circuit, a source of electrical energy included in the guard-wire circuit, and a signaling device operated by the closing of the guard-wire circuit, substantially as described.

398,668. SWITCH MECHANISM FOR ELECTRIC RAILWAYS. SIDNEY H. SHORT, Columbus, Ohio. Filed Nov. 13, 1888. Serial No. 290,762. (No model.)

Claim.—1. In combination with a sectional double line-conductor of an electric railway, a switch between the sections adapted to open one line and close the other upon the passage of the trolley, and a trolley having connection with both lines and arranged to operate the switch in its passage, and having also contact-surfaces in connection with the terminals of the motor, contact-surfaces in connection with the conductors and in line with the contact-surfaces of the trolley arranged to short-circuit the switch and establish an electrical connection between the conductors while the switch is shifting, substantially as described.

2. In combination with a double sectional line-conductor of an electric railway, a switch located between the sections, electrical connections between the sections of each line through a commutator, and a lever for operating the commutators, a trolley having contact-surfaces in line with the lever, whereby said lever is operated by the passing trolley and one line is closed and the other opened by the passage of the trolley.

3. In combination with a double sectional line-conductor of an electric railway, a supporting-frame, plates attached to the sides thereof, and interposed insulating-pieces, said plates having the ends of the sections attached thereto, two commutators mounted on the frame, each commutator being interposed between the sections of one of the lines, and levers arranged to turn the commutators upon the passage of the trolley, substantially as described.



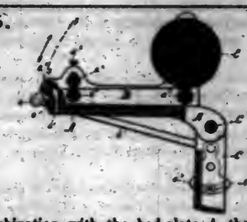
4. In combination with a trolley, a supporting-frame, the insulating-plates B B', to which the ends of the sections are attached, the shaft carrying two commutators supported in standards on the frame, each commutator having two conducting and two non-conducting sections arranged alternately in respect to each other, connections between the sections on each line through one of the commutators, and mechanism in the path of the trolley for turning the commutators one-fourth revolution by the passage of the trolley, substantially as described.

5. In connection with the commutator-shaft arranged upon the frame and in the described relation to the sections of the line, a star-wheel on the shaft, the operating and locking arms for the star-wheel, a lever arranged to operate these arms having its lower end in range with the trolley and adapted to be operated thereby, and means for returning the arms after the trolley has passed, substantially as described.

6. In combination with the star-wheel of the commutator-shaft, the short arm L and the long arm M, pivoted to move together, an insulating-bearing on the long arm for the operating-lever, the said operating-lever being pivoted upon the side plate, having its upper end arranged to bear upon the insulating-bearing of the long arm and its lower end extended into range with the trolley, and the spring for returning the arms L and M, substantially as described.

7. In combination with the arms operating with the commutator to ship the switch, said arms being in electrical connection with the line-sections on one side of the break, a trolley having contact-surfaces for the levers in electrical connection with the terminals of the motor, and arranged to short-circuit the switch and establish an electrical connection between the sections on the passage of the trolley and while the switch is shifting, all substantially as described.

398,664. CARRYING-WHEEL. CHARLES W. SLEEPER, Island Pond, Vt. Filed Apr. 17, 1888. Serial No. 270,996. (Model.)



Claim.—The combination, in a carrying-wheel for seaming-machines, of the stationary gear *a*, the wheel or flange B, the intermediate gears *b b b b*, and the gears *c c c c*, substantially as described, and for the purpose set forth.

398,665. DEVICE FOR FEEDING AND CUTTING SOLDER. CHARLES W. SLEEPER, Island Pond, Vt. Filed Sept. 5, 1888. Serial No. 284,804. (No model.)

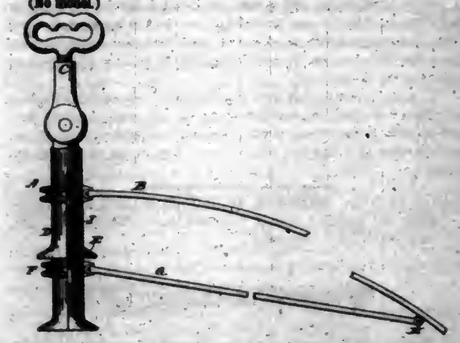
Claim.—1. The combination of the bed-plate A, the sides B B, the knife *a*, the rolls a^2 a^3 a^4, the cutting-roll a^5, and means for operating the movable parts, substantially as described, and for the purpose set forth.

2. The combination, with the bed-plate A, the sides B B, the knife *a*, the rolls a^2 a^3 a^4, the cutting-roll a^5, and means for operating the movable parts, of the ratchet-wheel *b*, the pawls *b'*, the lever b^2, and the adjustable stop b^3, substantially as described, and for the purpose set forth.

398,665.

3. The combination, with the bed-plate A, the sides B B, the knife *a*, the rolls a^2 a^3 a^4, the cutting-roll a^5, and means for operating the movable parts, of the crank *c*, the connecting-rod *d'*, and the quadrant d^2, substantially as described, and for the purpose set forth.

398,666. UMBRELLA. JAMES T. SMITH, New York, N. Y. Filed Aug. 26, 1888. Serial No. 283,776. (No model.)



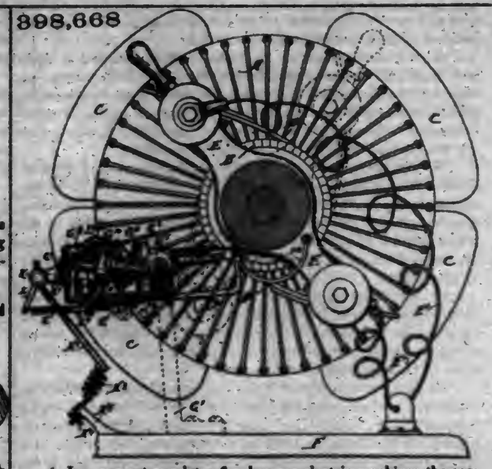
Claim.—1. In combination with a hollow handle of an umbrella, parasol, or cane, a folding stick composed of the parts A A', connected by a joint or bit and adapted to slide into the handle, so as to conceal from view the said joint, and a lock within the handle to connect the handle and stick, which lock is also concealed from view when the stick is in place within the handle, substantially as described.

2. In combination with the stick of an umbrella, parasol, or cane, a handle, a jointed rod connecting the stick and handle, and a tube within and concealed by the handle, into which the jointed rod is adapted to slide, substantially as described.

3. The combination of the stick, jointed rod, provided with a pin, the tube within which said rod is adapted to slide, and provided with a slot to receive said pin, and the hollow handle within which is secured said tube, substantially as described.

398,667. CANOPY FOR CHILDREN'S CARRIAGES. ADOLPHUS G. SELLI, New Haven, Conn. Filed Dec. 14, 1888. Serial No. 293,612. (No model.)

Claim.—In a carriage-canopy substantially such as described, the combination of the notch A, to which the ribs are hinged, and the runner F, to which the stretchers are hinged, the one constructed with a tubular projection, D, as an integral part thereof and terminating in a flaring mouth opening into it, the other constructed with a stud, I, as an integral part thereof, corresponding to the interior of the tubular projection D, substantially as described.



398,668. REGULATOR FOR DYNAMO-ELECTRIC MACHINES. ELMER A. SPERRY, Chicago, Ill., assignor to the Sperry Electric Company, same place. Filed Oct. 26, 1886. Serial No. 283,812. (No model.)

Claim.—1. In a current-regulator for dynamo-electric machines, the combination of a vibrating magnetic mass in proximity to the field-magnet with a movable current-collector and an elastic connection between the two.

2. In a current-regulator for dynamo-electric machines, the combination of a vibrating magnetic mass pivoted in proximity to the field-magnet with a movable current-collector and an elastic connection between the two.

3. In a current-regulator for dynamo-electric machines, the combination of a magnetic mass responsive to the resultant of the magnetism of the field-magnet and the currents of the armature with a movable current-collector and a power-transmitting connection between the collector and the mass.

398,668

4. In a current-regulator for dynamo-electric machines, the combination of a magnetic mass in proximity to the field-magnet with a movable current-collector, connections between the two, a compensating motor, and power-transmitting connections therefrom to the collector.

5. In a current-regulator for dynamo-electric machines, the combination of a magnetic mass in proximity to the field-magnet with a movable current-collector, connections between the two, a compensating motor, and power-transmitting connections therefrom to the mass and thence to the collector.

6. In a current-regulator for dynamo-electric machines, the combination of a magnetic mass in proximity to the field-magnet with a movable current-collector and an elastic connection between the two, and a compensating motor and connections therefrom to the mass.

7. In a current-regulator for dynamo-electric machines, the combination of a magnetic mass in proximity to the field-magnet, a movable current-collector, a shifter therefor connected therewith, and power-transmitting connections between such mass and shifter.

8. In a current-regulator for dynamo-electric machines, the combination of a magnetic mass in proximity to the field-magnet, a movable current-collector, a shifter therefor connected therewith by an elastic connection, and power-transmitting connections between such mass and shifter.

9. In a current-regulator for dynamo-electric machines, the combination of a magnetic mass in proximity to the field-magnet, a movable current-collector, a shifter therefor connected therewith, a compensating motor connected with such mass, and power-transmitting connections between the shifter and mass.

10. In a current-regulator for dynamo-electric machines, the combination of a magnetic mass in proximity to the field-magnet, a movable current-collector, a shifter therefor connected therewith by an elastic connection, a compensating motor connected with such mass, and power-transmitting connections between the shifter and mass.

11. In a current-regulator for dynamo-electric machines, the combination of a magnetic mass responsive to the resultant of the magnetism in the field-magnet and the currents in the armature with a movable current-collector, connections between the two, a compensating motor connected with the mass, and a controller for such motor moving with the collector, so as at a certain point in the motion thereof to apply the said motor.

12. In a current-regulator for dynamo-electric machines, the combination of a movable current-collector with a shifter therefor, a driving-motor for such shifter, a magnetic mass in proximity to the field-magnet, and mechanical connections from the mass to the motor to control the application of the latter to the shifter.

13. In a current-regulator for dynamo-electric machines, the combination of a movable current-collector with a shifter therefor, an elastic connection from such shifter to such collector, a driving-motor for such shifter, a magnetic mass in proximity to the field-magnets, and connections from the mass to the motor to control the application of the latter to the shifter.

14. In a current-regulator for dynamo-electric machines, the combination of a movable current-collector with a shifter therefor, the two connected by an elastic connection, and a driving-motor for such shifter.

15. In a current-regulator for dynamo-electric machines, the combination of a movable current-collector with a shifter therefor, a driving-motor for such shifter, a magnetic mass in proximity to the field-magnet, a compensating motor, and connections for such magnetic

mass and re-enforcing motor to the driving-motor to control the application of the driving-motor to the shifter.

16. In a current-regulator for dynamo-electric machines, the combination of a movable current-collector with a shifter therefor having oppositely-faced ratchets, a driving-motor carrying oppositely-acting dogs to engage such ratchets, a magnetic mass in proximity to the field-magnet, and connections therefrom to the driving-motor to control the application of the driving-motor to the shifter.

17. In a current-regulator for dynamo-electric machines, the combination of a movable current-collector with a shifter therefor having oppositely-faced ratchets, a driving-motor carrying oppositely-acting dogs to engage such ratchets, a magnetic mass in proximity to the field-magnet, a compensating motor, and connections from such mass and re-enforcing motor to the driving-motor to control its application to the shifter.

18. In a current-regulator for dynamo-electric machines, the combination of a movable current-collector with a shifter therefor having oppositely-faced ratchets, and a driving-motor for the shifter having oppositely-acting dogs to engage such ratchets, said dogs movable in a line at an angle to said ratchets.

19. In a current-regulator for dynamo-electric machines, the combination of a movable current-collector with a shifter therefor having oppositely-faced ratchets, a driving-motor for the shifter having oppositely-acting dogs to engage such ratchets, said dogs movable in a line at an angle to said ratchets, a magnetic mass in proximity to the field-magnet, and connections therefrom to the driving-motor to control its application to the shifter.

20. In a current-regulator for dynamo-electric machines, the combination of a movable current-collector with a shifter therefor, a driving-motor for such shifter, a pivoted magnetic mass in proximity to the field-magnet, and an arm therefrom to the driving-motor to control its application to the shifter.

21. In a current-regulator for dynamo-electric machines, the combination of a movable current-collector with a shifter therefor, a driving-motor for such shifter, oppositely-faced ratchets on the shifter and oppositely-acting dogs on the motor, said dogs movable in a line at an angle to the line of the ratchets, a magnetic mass in proximity to the field-magnet, a compensating motor and connections from the mass, and the re-enforcing motor to the driving-motor to control its application to the shifter.

22. In a current-regulator for dynamo-electric machines, the combination of a movable current-collector with a shifter therefor connected therewith by a spring-connection and having oppositely-faced ratchets, with a motor having oppositely-acting dogs to engage such ratchets, said dogs movable in a line at an angle to the line of the ratchets.

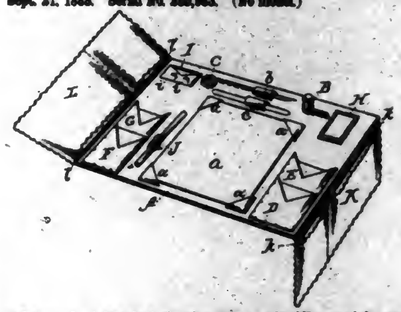
23. In a current-regulator for dynamo-electric machines, the combination of a movable current-collector with a shifter therefor, a constantly-moving motor to intermittently drive the same, severable connections between the motor and shifter, and a magnetic mass in proximity to the field-magnet, and connections therefrom to such severable connections to control the application of the driving-motor to the shifter.

24. In a current-regulator for dynamo-electric machines, the combination of a movable current-collector with a driving-motor for such collector, a magnetic mass in proximity to the field-magnet, and mechanical connection from the mass to the motor to control the application of the latter to the collector.

25. In a current-regulator for dynamo-electric machines, the combination of a movable current-collector, a driving-motor for such collector, a magnetic mass in proximity to the field-magnet, a compensating motor, and connections from such magnetic mass and compensating motor to the driving motor to control the application of the driving-motor to the collector.

26. In a current-regulator for dynamo-electric machines, the combination of a movable current-collector with a driving-motor therefor having oppositely-faced ratchets and carrying oppositely-acting dogs to engage such ratchets, a magnetic mass in proximity to the field-magnet, and connections therefrom to the driving-motor to control the application of the driving-motor to the collector.

27. In a current-regulator for dynamo-electric machines, the combination of a movable current-collector with a driving-motor therefor having oppositely-faced ratchets and carrying oppositely-acting dogs to engage such ratchets, a magnetic mass in proximity to the field-magnet, a compensating motor, and connections from such mass and compensating motor to the driving-motor to control its application to the collector.



28. In a current-regulator for dynamo-electric machines, the combination of a movable current-collector with a driving-motor therefor having oppositely-faced ratchets and oppositely-acting dogs to engage such ratchets, said dogs movable in a line at an angle to said ratchets.

29. In a current-regulator for dynamo-electric machines, the combination of a movable current-collector with a driving-motor therefor, a pivoted magnetic mass in proximity to the field-magnet, and an arm therefrom to the driving-motor to control its application to the collector.

30. In a current-regulator for dynamo-electric machines, the combination of a movable current-collector with a shifter therefor, a constantly-moving motor to intermittently drive the same and adapted to be connected therewith, a magnetic mass in proximity to the field-magnet, and connections therefrom to such motor to control the application thereof to the shifter.

31. In a current-regulator for dynamo-electric machines, the combination of a movable current-collector, a shifter therefor, a driving-motor for said shifter, connecting parts between the shifter and motor and attached to one and adapted to engage the other at varying intervals, a magnetic mass in proximity to the field-magnet, and connections therefrom to the motor to control its application to the shifter.

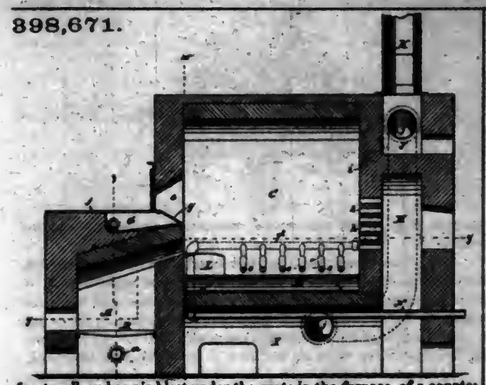
398,669. LAP-DESK. HELEN A. STARKEY, Sioux Falls, Dak. Filed Sept. 21, 1888. Serial No. 285,963. (No model.)

Claim.—1. A lap-desk having a base of stiff material, provided with a central space for writing and pockets at the sides thereof for holding paper and similar articles, in combination with flaps attached to the ends of said base and adapted to be folded over said pockets to protect them, leaving said central space uncovered, substantially as set forth.

2. In combination with a stiff base or lap board having a pocket on its face, and also a part for writing on which remains uncovered a flap, also provided with a pocket and attached to said board, in order that when folded on the face of the latter both of these pockets may be protected, as described.

3. A lap-board having flaps attached to its ends and provided on the inside with pockets, said lap-board having pockets on its face near its ends, and a central writing space or tablet, which is left uncovered when said flaps are folded over to protect the pockets, as set forth.

398,670. METHOD OF ENAMELING BOBBINS, &c. LORENZO STONE and ALONZO O. AUSTIN, Providence, R. I. Filed June 19, 1888. Serial No. 277,608. (No model.)



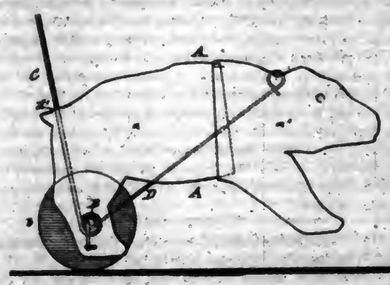
Claim.—The improvement in the method of enameling bobbins, spools, &c., which consists, first, in subjecting the bobbin to a high temperature before enameling; second, reaming the spindle hole or center; third, covering the exterior and interior surfaces of the bobbin with enameling material, as Japan varnish, and baking it thereon, and, fourth, in reaming the enameled surface of the spindle-hole to fit the driving-spindle, substantially as hereinbefore described and set forth.

398,671. REFUSE-BURNER. EDGAR G. TEED, Brooklyn, N. Y. Filed Apr. 19, 1888. Serial No. 271,236. (No model.)

Claim.—1. The combination of the furnace A, the combustion-chamber C, located at one side thereof and having the charging-opening *c* in its front wall, the hearth E in the bottom of the combustion-chamber, a flue, D, leading from the upper part of the furnace into the lower part of the combustion-chamber above the hearth, an air-blast delivering air into the combustion-chamber above the hearth and into the furnace below the grate, and an air-blower having its discharge-mouth extending through the front wall of the combustion-chamber beneath its charging-opening for directing an air-blast into the combustion-chamber to counteract the pressure therein and carry the charge therein, substantially as described.

2. The combination, with a furnace, A, a combustion-chamber, C, communicating therewith and having a charging-opening in its front wall, and an air-blast under the grate in the furnace, of a counter air-blower having its discharge-mouth extending through the front wall of the combustion-chamber directly beneath its charging opening to overcome the pressure in the combustion-chamber produced by the air-blast under the grate and the chimney and to carry the charge into the combustion-chamber, substantially as described.

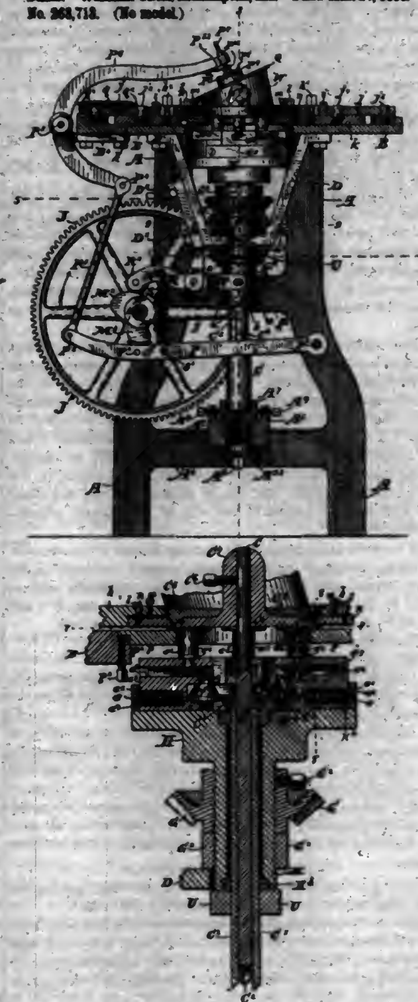
398,671.



3. The combination of the furnace A, the combustion-chamber C at one side thereof, having the charging-opening *c* and bottom hearth, the flue D, leading from the upper part of the furnace-chamber into the combustion-chamber above the hearth, the flues F, located along the sides of the combustion-chamber and connecting at one end with the furnace-chamber above the grate, the blast-nozzles *e*, leading from the side flues into the combustion-chamber above the hearth, headers *d*, connected with the nozzles for supplying them with fresh air, and an air-blast pipe, N, connected with the headers, substantially as described.

4. The combination of the furnace A, the combustion-chamber C, located at one side thereof, having a bottom hearth, E, and provided in its wall with a charging-opening, *c*, a flue, D, leading from the upper part of the furnace into the lower part of the combustion-chamber, a cleaning-opening, L, located in the wall of the combustion-chamber on or about a level with the hearth and between the latter and the charging-opening, and an air-blowing mechanism having a discharge-mouth extending through the wall of the combustion-chamber beneath the cleaning-opening, to prevent the gases and flame escaping through the cleaning-opening when the hearth is being cleaned during the operation of the furnace, substantially as described.

5. The combination of the furnace A, a chimney, K, having a smoke-box, J, a combustion-chamber, C, located between the furnace and chimney, having transverse contracted flues *h* in its rear wall, and provided with a hearth, E, and a front charging-opening, *c*, the flue D, leading from the upper part of the furnace into the lower part of the combustion-chamber, an ash-pit, I, under the hearth of the combustion-chamber, a vertical flue, H, located in rear of the combustion-chamber and connecting the contracted flues with the ash-pit, and an external flue, *j*, leading from the ash-pit to the smoke-box in the chimney, substantially as described.



398,672. MOVABLE TOY. RICHARD TRUSHAM, Brooklyn, N. Y. Filed July 24, 1888. Serial No. 280,881. (No model.)

Claim.—1. The combination, with the body or shell of a toy figure, said body being provided with a guide opening or eye, of a crank-axle pivoted at the ends of said cranks to said body at one end of the same, wheels or rollers attached to said crank-axle, and an actuating handle-rod that is applied loosely by an eye or sleeve to the crank-axle and guided in the opening or eye of the body, substantially as set forth.

2. The combination, with the body or shell of a toy figure composed of a hind part having a guide opening or eye and a hinged front part, of a wheeled crank-axle pivoted to the hind part, an actuating handle-rod applied loosely to the crank-axle and passed through said guide-opening, and a connecting-rod pivoted to the crank-axle and the front part, whereby a falling and rising motion is imparted to the front part alternately with the rising and falling motion of the hind part, substantially as set forth.

398,673. MACHINE FOR FLANGING SHEET-METAL CYLINDERS. WILLIAM THUM, Indianapolis, Ind. Filed Mar. 27, 1888. Serial No. 268,713. (No model.)

Claim.—1. In an automatic machine for forming flanges on sheet-metal cylinders, the combination, with a rotating head carrying radially-sliding carriers in which are journaled the flanging-rollers, of a support for the sheet-metal section, an arm, P^4, carrying a hood, Q, a lever, P, connected to said arm, the rods C', carrying the cone-collar C^3 and collar T, a lever, R, connected to the collar T, and a shaft having cams actuating the levers P and R, substantially as described.

2. The combination, with a rotating head carrying radially-sliding carriers in which are journaled the flanging-rollers c^4, of a support for the pipe-section, a series of slides moving in ways toward and from said support, said slides having jaw-plates A, a ring, B^3, to which the slides are linked, a cam-slide, D^3, working in a slot in said ring, a lever, O, connected to said slide, a cam, N, on counter-shaft K, rods C', carrying the cone-collar C^3 and collar T, a lever connected to the latter collar, and a shaft having a cam, M^3, substantially as described.

3. The combination, with the revolving head H, carrying the sliding carriers c^4, having forming or flanging rolls c^4 and retracting-springs c^5, of the standard C, the rods C', moving in channels in said standard and carrying the cone-collar C^3, a lever, R, fulcrumed on a

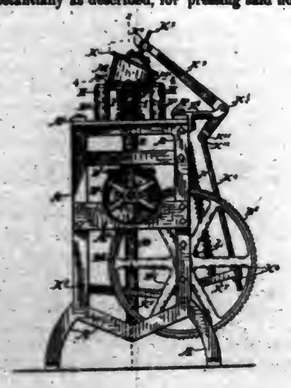
bracket, D', and connected to a collar, T, on the rods C', a cam, M³, on a counter-shaft, a support, C³, for the pipe-section, slides having clamping-jaws k, surrounding said support, and means for moving said slides toward and from the latter, substantially as described.

4. The combination, with the revolving head H, having grooves H³, of the carriers c^3, the studs c^4, adjustable thereon, the flanging-rolls c^5, mounted on said studs, the rods C', carrying the cone-collar C³ and having the collar T, the lever R, cam M³ on counter-shaft K, a support for the pipe-section, and movable jaws for clamping the latter, substantially as described.

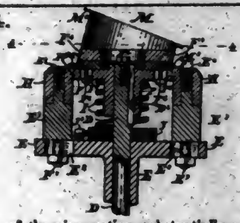
5. The combination, with the rotating head H, having grooves, of the carriers c^3, the adjustable flanging-rolls c^5, the rods C', arranged in channels in the standard C and carrying the cone-collar C³, acting upon friction-rolls f on the carriers, the slides k, linked to the ring B³ and having clamping-jaws k, said slides moving between ways B³, a support, C³, for the pipe, a lever, P³, carrying a hood, Q, a lever, F, connected to said lever, a lever, R, connected to a collar, T, pinned to the rods C', a cam-slide, O³, bearing on a friction-roll, B⁴, on the ring B³, a lever, O, connected to the cam-slide, and cams M', M³, and N on the counter-shaft K, substantially as described.

6. The combination, with the revolving head H, having ways H³, of the carriers c^3, having the adjustable rolls c^5 and friction-rolls f, and provided with openings e to receive springs c^6, of the rods C', moving in channels in the standard C and carrying the cone-collar C³, said rods provided with the collar T, the lever R, connected to said collar, the counter-shaft K, having a cam, M³, a support for the pipe-section, and means for clamping the latter upon said support, substantially as described.

7. The combination, with the revolving head H, having grooves, of carriers c^3, having grooves c^7, the flanging-rolls c^5, mounted on studs c^4, adjustable in said grooves, the support B, having ways B³, the slides k, moving therein and having steel jaws s mounted on the clamping-jaws k, the rods C', carrying the cone-collar C³ and connected to the collar T, a support, C³, for the pipe, a lever, R, connected to the collar T, a cam, M³, on counter-shaft K, a ring, B³, moving on the support B and connected to the slides k by links j, the cam-slide O³, the lever O, connected thereto, the cam N on shaft K, and the head-spring q, connected to support B and ring B³, respectively, substantially as described.



8. In an automatic machine for forming flanges on sheet-metal cylinders, the supports c^3 for the cylinder or pipe, the hood Q, the connected levers P and P³, the latter having an eye which receives the rod P⁷ on the hood and provided with a cushion-spring, P¹¹, and the cam M' on the counter-shaft K, substantially as described.



9. The combination, with the lever P, arm P³, and lever P⁹, having an eye receiving the threaded rod P⁷ on the hood Q, the latter having a socket receiving a ball on said rod, of the cushion-spring P¹¹, the nut P¹⁰, turning on the threaded rod P⁷, and the cam M' on the counter-shaft K, substantially as described.

10. The combination, with the top plate, B, having an orifice, of the gage-plate p, the set-screws p', the carriers c^3, having adjustable flanging-rolls c^5 and moving in ways in the revolving head H, the rods C', carrying the cone-collar C³, bearing upon friction-rolls f, a support for the pipe, movable clamping-jaws, a lever, R, connected to a collar on the rods C', a cam, M³, on a counter-shaft, K, and means, substantially as described, for operating the clamping-jaws, substantially as described.

398,674. FLANGING-MACHINE. WILLIAM TROM, Indianapolis, Ind. Filed Mar. 27, 1888. Serial No. 268,714. (No model.)

Claim.—1. In an automatic lock-seam elbow "hook-flanging" machine, the combination of the driving-shaft B, head E, gears B⁴ and B⁵, cone-rollers H, vertically-moving head F and adjustable hood K, and means, substantially as described, for pressing said hood against

the upper edge of the pipe-section, substantially as set forth and described.

2. In a machine for forming hook-flanges, the combination, with the standard D and the head E, running loosely on said standard, of gearing rotating said head, cone-collars H, mounted in said head and adjustable thereon, the head F, splined on the standard D, the spring I, adjustable collar J, and means, substantially as described, for pressing the pipe-section down on the head F, substantially as described.

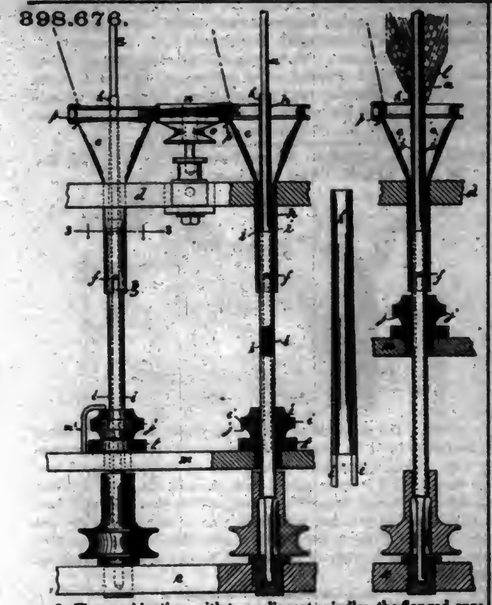
3. In a machine for forming hook-flanges, the combination, with the shaft B and standard D and with the gears B⁴ B⁵, of the counter-shaft C, gears B⁶ and B⁵, the lever K³, connecting-rod K⁴, the lever K², the hook K, adjustably mounted thereon, the head F, splined on the standard D and having a seat for the pipe-section, the cone-rollers H, head E, and cam L, substantially as described.

4. In a machine for forming hook-flanges, the combination, with the standard D, of the head E, having slots E², the cone-rollers H, having their supports adjustable in said slots, gearing for rotating the head E, the head F, splined on the standard D, the spring I, collar J, and means, substantially as described, for clamping the pipe-section upon the head F, substantially as described.

5. In a machine for forming hook-flanges, the combination, with the standard D and with gears B⁴ B⁵, of the head E, the adjustable cone-rollers H, the head F, splined on standard D and having the ring F⁶, and cast ring F⁴, the spring I, collar J, set-screw J', and means, substantially as described, for clamping the pipe-section upon the head F, substantially as described.

398,675. PROCESS OF MAKING DUPLICATE COPIES OF WRITINGS, &c. CHARLES A. THOMPSON, New York, N. Y. Filed June 18, 1887. Renewed Feb. 4, 1889. Serial No. 299,562. (No model.)

Claim.—1. The improved method of preparing a transfer-sheet for manifold printing or copying, consisting in placing the absorbent sheet face down upon a surface impregnated and coated with the copying or printing medium or material, and producing by pressure the desired delineations or characters in obverse upon the back of the transfer-sheet, causing the said sheet to absorb the copying or printing medium at the points of impression and to have the delineations or characters to appear in reverse upon the face of the sheet absorbed into the same, as shown and described.

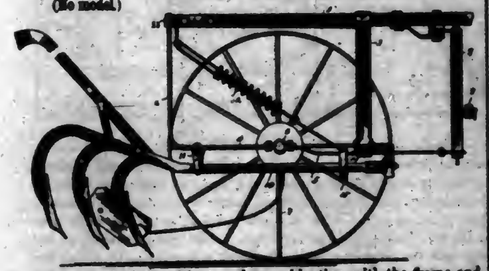


2. The improved method of preparing a transfer-sheet for manifold copying or printing, consisting in placing the absorbent transfer-sheet between two sheets having their facing sides coated or impregnated with the printing or copying medium, and thereupon producing the desired delineations or characters by pressure upon the back of one of the inclosing-sheets, causing the transfer-sheet to absorb the copying or printing medium at the points of pressure and to be thoroughly impregnated therewith from both sides, producing the impressed delineations or characters to appear in obverse upon the back of the transfer-sheet and in reverse upon the face of the same, and to be absorbed through the entire thickness of the sheet from both sides, as shown and described.

398,676. SPINNING-MACHINE, &c. PAUL WALLACE, Milnsbridge, County of York, England. Filed Oct. 15, 1888. Serial No. 288,173. (No model.) Patented in England June 28, 1884, No. 9,515, and July 20, 1887, No. 10,141.

Brief.—The object of the invention is to improve the parts directly concerned in the spinning, whereby bobbins or cops of various sizes may be produced by the same apparatus in either hard or soft yarn.

Claim.—1. The combination, with the spindle i, of the flanged cup thereon, the sleeve k thereon, inside of said cup, and means, substantially as described, for reciprocating said sleeve.



398,676.

2. The combination, with two adjacent spindles, the flanged cups thereon, and the travelers carried by said cups, of the revolving brush-wheel arranged to contact peripherally with both travelers, substantially as and for the purposes set forth.

3. The combination, with the grooved spindle, of two diameters, and the flanged cup, detachably mounted on the larger part of said spindle, of the longitudinally-sliding sleeve k, mounted on the smaller upper part of said spindle, and provided with the forks i, and means, substantially as described, for reciprocating said sleeve.

398,677. WHEEL-CULTIVATOR. WILLIAM WARING, Colora, and JOSEPH C. BERD, Rising Sun, Md. Filed Oct. 15, 1888. Serial No. 288,049. (No model.)

Claim.—1. In a cultivator, the combination, with the frame and drag-bars pivotally connected thereto, of a spring-connection between the drag-bars and the frame, the point of attachment to the frame being laterally adjustable from a vertical plane of the drag-bar, whereby side draft of the cultivator-beams inwardly or outwardly may be counteracted.

2. In a cultivator, the combination, with the frame thereof and drag-bars pivotally supported to said frame, of a spring-connection between each drag-bar and the frame of the machine, the point of connection on the drag-bar being longitudinally adjustable to vary the tension of the spring and counterbalancing effect and the point of connection on the frame being laterally adjustable to limit the side draft of the drag-bars, as and for the purpose set forth.

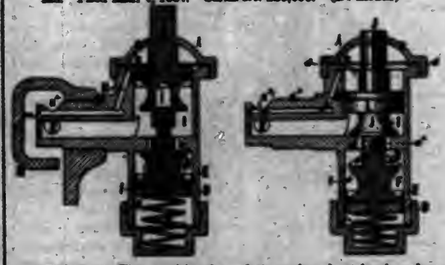
3. In a cultivator, the combination of the frame, a horizontal slotted arm for supporting the clevis, a clevis provided with a tongue extending into the slot in the arm, a clamping-plate, 20, and a U-shaped bar provided with nuts for locking the plate to the horizontal arm at any point in the slot, one limb of the bar 21 passing through the tongue of the clevis, as and for the purpose set forth.

398,678. CULTIVATOR. WILLIAM WARING, Colora, Md. Filed Nov. 13, 1888. Serial No. 290,665. (No model.)

Claim.—1. A plow-support comprising a frame, 1, channeled to embrace a standard, said frame being provided with concave extension, and a shovel-block provided with a convex stem co-operating

398,678.

with the extension, the shovel-block having rotary adjustment upon the frame through a slot and bolt.



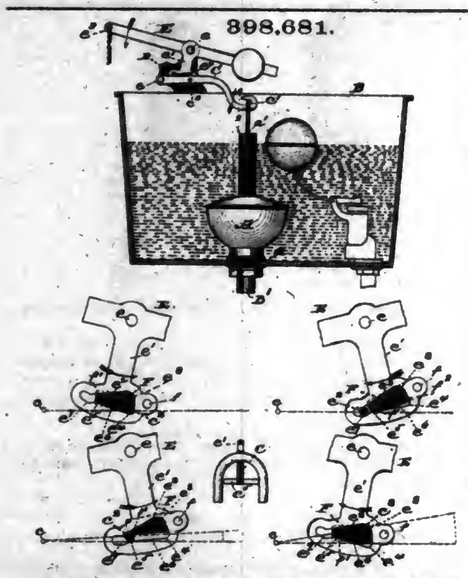
2. In a plow-support, the combination of a part, 1, adapted to be fixed to a plow-standard, a curved extension provided with a transverse slot, 4, a shovel-block provided with a stem, 6, having a curved face co-operating with the extension, and a bolt passing through the slot 4 for locking the parts together.

398,679. VACUUM-HOOK. FRANK WHITE, Philadelphia, Pa., assignor to Philip W. Pratt, Boston, Mass. Filed Oct. 3, 1887. Serial No. 251,570. (No model.)

Claim.—The combination of a metallic shank having a flange or enlargement at its inner end and suspensory device at its outer end, with a concavo-convex elastic holder having a thickened central portion in which the flange or enlargement of the said shank is embedded between the inner and outer surfaces of the holder, and an acute-angled marginal lip on its concave side, said lip having a beveled inner side which forms a flat bearing-surface when the holder is pressed inwardly, the thickness of the lip forming a depression in the outer surface of the holder when the latter is pressed against its seat, as set forth.

398,680. WATER-CLOSET VALVE. PETER WHITE, St. Louis, Mo. Filed Mar. 7, 1887. Serial No. 230,803. (No model.)

Claim.—1. The combination of the valve-chest having the tubular shank a', the passage N, and the cap a, with the cup-leather L and stem J, said cup-leather being turned toward the main valve and said passage N being wholly disconnected from all that portion of the construction through which the main pressure circulates and having an outlet independent of the main outlet K, substantially as described.



2. The combination of the valve-chest having the inlet, outlet, and valve-seat, as described, the grooved chamber, the stems H J, the spring, the cup-leathers E L, and the valve C, said cup-leather L being turned toward the valve-seat c, and said valve-chest having a passage, N, leading from the space beneath the chest-cap a, and being wholly disconnected from all that portion of the construction through which the main pressure circulates, and having an outlet independent of the outlet K, substantially as described.

398,681. TANK-VALVE. PETER WHITE, St. Louis, Mo. Filed Sept. 8, 1888. Serial No. 284,982. (No model.)

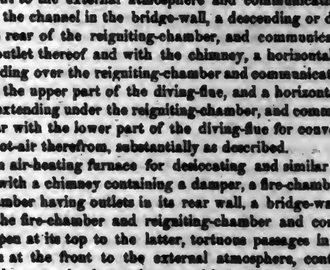
Claim.—1. The combination of the pivoted lever E, having the slotted arm, as described, the pivoted inclined plane, and the pivoted lever C, having the pin c^2, said pin c^2 traveling around said inclined plane and within the slot in said lever-arm, substantially as described.

2. The combination of the pivoted lever E, having the arm e', slotted at e^2, as described, with the pivoted lever C, having the pin c^2, and the hooked end c', and the float-valve and stem, said pin c^2 traveling around said inclined plane and within the slot in said lever-arm, substantially as described.

398,681.

3. The combination of the tank, the float valve and stem, the bracket, the pivoted lever E, having the arm slotted, as described, the pivoted inclined plane, and the pivoted lever C, having the pin c^3 and hooked end c', said pin c^3 traveling around said inclined plane and within the slot in said lever-arm, substantially as described.

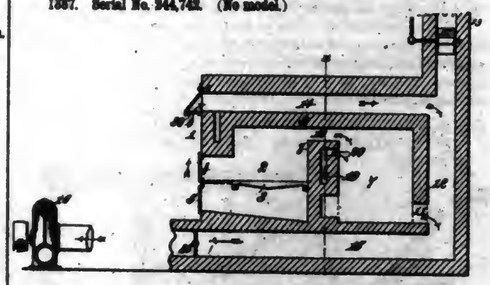
398,682. HAY-LOADER. WILLIAM M. WHITE, Tacoma, Wash. Filed May 29, 1888. Serial No. 276,673. (No model.)



Claim.—1. The combination, with the wagon-body having the central transverse opening and the brackets, of the reel having its shaft supported by said brackets, the series of radial arms secured to said shaft and arranged in pairs, the casing attached to the outer ends of said arms and having slits formed therein, the rake-heads having curved teeth or tines and end plates, E', and the cams secured to said brackets, substantially as set forth.

2. The combination, with the wagon-body and the brackets secured thereto, of the reel, its shaft, the series of radial arms secured to said shaft, the rake-heads having end plates, E', the stationary cam G, secured to said brackets, the movable cams G' G^2, connected together at their upper ends, the pivoted stud K, upon which said cam G' is rigidly secured, and the lever for operating said stud and cams, substantially as set forth.

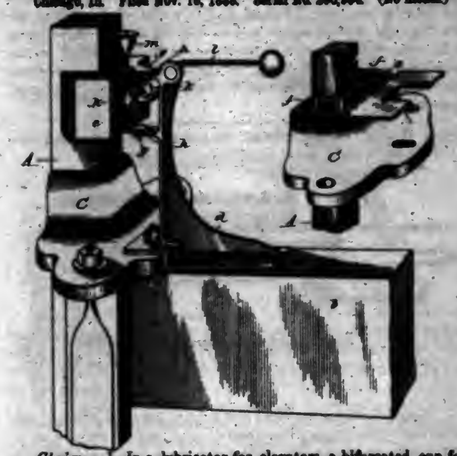
3. As an improvement in hay-loaders, the combination, with the wagon-body, of the rear tilting bottom hinged to the rear axle, and the rock-shaft extended across said wagon-body and provided with curved arms overlapping the forward end of said bottom and having a weighted handle, substantially as set forth.



4. The combination, with the wagon-body, of the rear tilting bottom, the rock-shaft extended across said wagon-body and having curved arms overlapping the front end of said bottom, and the supporting-bar beneath the rear end of said bottom sliding in keepers on the wagon-body, substantially as set forth.

398,688. HOPPLE. WESTON WHITTEN, Unity, Me. Filed May 28, 1888. Serial No. 275,345. (No model.)

Claim.—The combination of the neck-strap 1, ring 2, breast-strap 3, the fetters 10 11 12, fitted to the hock of the mare, and connected by a short strap, 9, to prevent kicking sidewise, the belly-strap 7, having rings 6 and 8 at its respective ends, through the latter of which the fetter-connecting strap 9 runs freely, and the cord or strap 5, having one loose end attached by its other end to one of the rings, and rove through the rings 2 and 6 for instantly tightening the connection with both hind legs simultaneously and to any necessary extent, as explained.

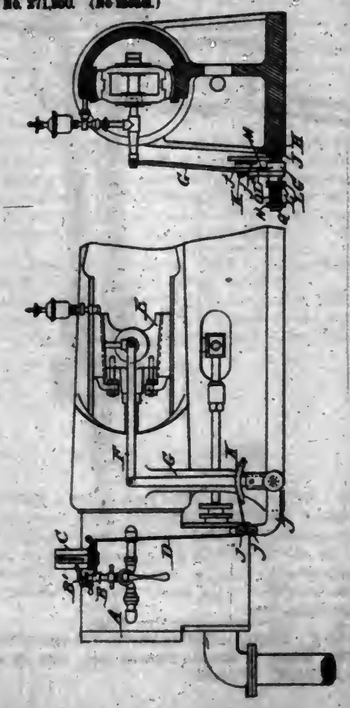


398,684. SMOKE-CONSUMING FURNACE AND AIR-HEATER. FREDERICK W. WIESENBOCK, Long Island City, N. Y. Filed July 19, 1887. Serial No. 244,742. (No model.)

Claim.—1. An air-heating furnace for desiccating and similar purposes, provided with a chimney, a fire-chamber, a reigniting-chamber having outlets in its rear wall, a bridge-wall located between the fire-chamber and the reigniting-chamber and containing a channel open at its top to the latter, tortuous passages in the side walls open at the front to the external atmosphere and communicating at the rear with the channel in the bridge-wall, a descending or diving flue located in rear of the reigniting-chamber, and communicating with the rear outlet thereof and with the chimney, a horizontal fresh-air flue extending over the reigniting-chamber and communicating at the rear with the upper part of the diving-flue, and a horizontal flue at the base extending under the reigniting-chamber, and communicating at the rear with the lower part of the diving-flue for conveying the purified hot-air therefrom, substantially as described.

2. An air-heating furnace for desiccating and similar purposes, provided with a chimney containing a damper, a fire-chamber, a reignition-chamber having outlets in its rear wall, a bridge-wall located between the fire-chamber and reigniting-chamber and containing a channel open at its top to the latter, tortuous passages in the side walls open at the front to the external atmosphere, controlled by valves, and communicating at the rear with the channel in the bridge-wall, an arch over the fire and reigniting chambers arranged to provide a passage above the bridge-wall, a descending or diving flue located at the rear of the reigniting-chamber, and communicating with the rear outlets thereof and with the chimney, a horizontal fresh-air flue extending above the arch, controlled at the front by a valve, and communicating at the rear with the upper part of the diving-flue at a point below the damper in the chimney, and a horizontal flue at the base containing a damper extending under the reigniting and fire chambers, and communicating at the rear with the lower part of the diving-flue for conveying the purified hot air therefrom, substantially as described.

398,685. LUBRICATOR FOR ELEVATORS. JAMES M. ARNOLD, Chicago, Ill. Filed Nov. 16, 1888. Serial No. 290,904. (No model.)



Claim.—1. In a lubricator for elevators, a bifurcated cup for containing a lubricant, in combination with the guides and carriage of an elevator, whereby the guides are automatically lubricated, substantially as shown and described, and for the purpose set forth.

2. In a lubricator for elevators, a bifurcated cup for containing a lubricant fixed on a bracket attached to the cross-beam of elevator-carriage, in combination with a weighted lever, and the elevator-guide, substantially as shown and described, and for the purpose set forth.

3. In a lubricator for elevators, the combination of the cup *c*, having the openings *f*, the guide A, a suitable bracket, *d*, whereon said cup is movably mounted, and a lever, *l*, for forcing the cup normally toward the guide, substantially as described.

4. In a lubricator for elevators, the combination, with the cup *c*, having the openings *f*, the adjustable plate *j*, and extensions *g*, of the guide A, a suitable bracket, *d*, having slotted supports *h*, and a lever, *l*, all constructed and arranged for operation substantially as described.

398,686. DEVICE FOR OPERATING STEAM-ENGINE INDICATORS. ROBERT M. BECK, Chambersburg, Pa. Filed Apr. 26, 1888. Serial No. 271,990. (No model.)

Claim.—1. In a device for operating steam-engine indicators, the combination of the oscillating cylinder, the moving cross-head, a leverage and cord connection between the cross-head and cylinder, and disengaging or clutch mechanism whereby the oscillating cylinder may be stopped when it is desired without stopping the engine, substantially as and for the purpose described.

2. In a recorder-indicator for steam-engines, the combination with the indicating mechanism and a moving part of the engine, of suitable connections between said indicating mechanism and said moving part, and a suitable disengaging or clutch mechanism whereby the indicator mechanism may be stopped without stopping the engine, substantially as and for the purpose described.

3. In a recorder-indicator for steam-engines, the combination of the operating-cord, the oscillating cylinder, the moving part of the engine, an armed sleeve supported on a stud on the engine-frame and carrying a quadrant to which the operating-cord is attached, the leverage-connections whereby the moving part communicates motion to the quadrant and operating-cord, and disengaging mechanism for throwing said leverage-connections out of operative connection with the quadrant and operating-cord, substantially as described.

4. In a device for operating steam-engine indicators, the combination of a vertical rock-lever actuated by a moving part of the engine, an armed sleeve supporting a device to which the operating-cord is attached, and the oscillating cylinder, said armed sleeve and rock-lever being mounted on a stud on the engine-frame, and disengaging mechanism for throwing the armed sleeve and its supporting-quadrant out of connection with the rock-lever, substantially as described.

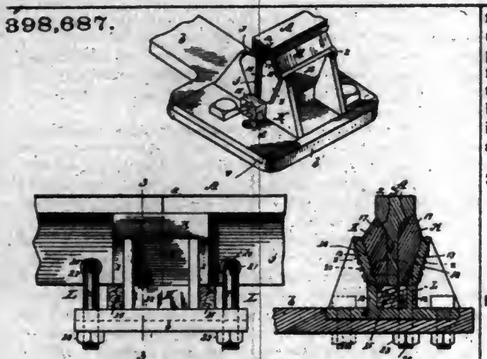
5. In a device for operating steam-engine indicators, the combination of the moving cross-head, the vertical lever fulcrumed on a stud on the engine-frame, the link-connection between said lever and the cross-head, the armed sleeve carrying the device to which the operating-cord for the cylinder is attached, and adapted to be connected with the rock-lever, and the sleeved nut and its surrounding spring, said sleeved nut and armed sleeve being located on the same stud that operates the rock-lever, substantially as described.

6. In a recorder-indicator for steam-engines, the combination of a moving part of the engine, an oscillating vertical rock-lever fulcrumed at its lower end, a link-connection between it and the moving part, an armed sleeve located adjacent to the rock-lever, the oscillating cylinder, and the operating-cord for connecting it with said armed sleeve, and suitable devices whereby the armed sleeve is engaged with or disengaged from the rock-lever, substantially as described.

7. The combination, in a recorder-indicator, of the operating-cord D, rock-lever G, armed sleeve L, the arc K, carried by said sleeve and devices for engaging or disengaging the armed sleeve and rock-lever, substantially as described.

8. In a device for operating steam-engine indicators, the combination of the moving cross-head, the vertical lever G, fulcrumed on a stud, H, on the frame and connecting with said moving cross-head, the armed sleeve L, supported likewise on the stud and having projections M M and carrying the arc K, the cord D, attached thereto, and an oscillating cylinder which is actuated by said cord, substantially as described.

9. The combination of the lever G, the stud H, on which the lever is supported, a moving part of the engine by which said lever is actuated, the armed sleeve L on said stud H, having projections M M, which normally lie alongside lever G, and carrying the arc K, the indicator-cord attached thereto, said armed sleeve being also provided with a pin, *b*, the sleeved nut N, likewise on the stud, and having the slot *a*, and the surrounding spring O, all the parts being arranged for joint operation as specified.

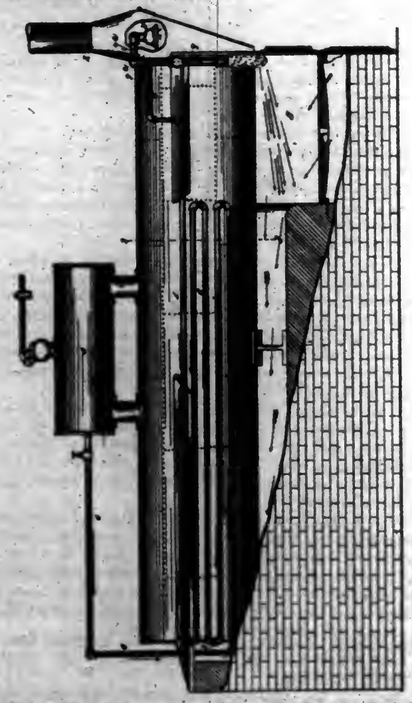


10. The combination of the oscillating lever G, having a sleeved portion, G', the stud H on the engine-frame surrounded by said sleeved portion, the armed sleeve L, having projections M M and carrying the pin *b*, the arc or quadrant K, secured to the armed sleeve, the sleeved nut N, fitted at *a*; the surrounding spring O, and the jam-nut Q, substantially as described.

11. The combination of an oscillating lever, a stud on the engine-frame on which it is fulcrumed, an armed sleeve supported on the stud alongside said lever, said armed sleeve being adapted for connection with the operating-cord and having the pin located as described, the sleeved nut, likewise on the stud and suitably slotted, as shown, and the coiled spring surrounding said nut, substantially as described.

398,687. RAILWAY. SUMNER A. BEMIS, Springfield, Mass., and LOUIS PFINDER, New York, N. Y. Filed June 30, 1888. Serial No. 278,671. (No model.)

Claim.—1. The combination, with the chairs, each comprising the base and the opposing inclined walls 13 13, of the track-rails having the enlarged upper tread and narrower mid-rib *j*, provided with the apertures 21, the wedge-blocks K, the confining-dogs L, each comprising the leg 20, entering one of said rail-apertures, and the screw-threaded shank 22, passing vertically through said base, and the nuts 23, substantially as and for the purpose described.



398,687.

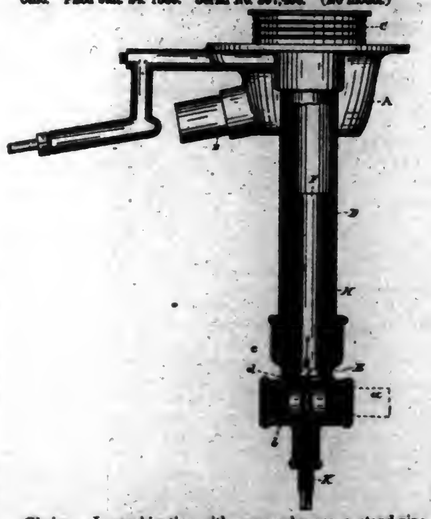
2. The combination, with the chairs, each comprising the base and the opposing inclined walls 13 13, of the track-rails having the enlarged upper tread and narrower mid-rib *j*, provided with the apertures 21, the wedge-blocks K, provided at each end with the outwardly-extended flanges *z*, the confining-dogs L, each comprising the lug 20, entering one of said rail-apertures, and the screw-threaded shank 22, passing vertically through said base, and the nuts 23, all substantially as shown, and for the purpose described.

3. The combination, with the chairs, each comprising the base and the opposing inclined walls 13 13, and the blocks 15, resting on the said base, of the track-rails having the enlarged tread and narrower mid-rib *j*, resting on said blocks 15 and provided with the apertures 21, the wedge-blocks K, the confining-dogs L, each comprising the lug 20, entering one of said rail-apertures, and the screw-threaded shank 22, passing vertically through said base, and the nuts 23, substantially as described.

398,688. SMOKE-CONSUMER. HARRY BLAISDELL, St. Louis, Mo., assignor of one-third to Charles A. Stix, same place. Filed Sept. 17, 1883. Serial No. 225,608. (No model.)

Claim.—In a smoke-consumer, the combination, with the boiler, the setting in which said boiler is mounted having a fire-box and the smoke-stack, of the perforated pipe 7, extending under the boiler in juxtaposition thereto and to the forward end of the fire-box and curved to the contour of said boiler, a fire-proof crating around said pipe, having openings complementary to the perforations therein, an inverted funnel in said stack, a pipe, 7ª, connecting said funnel with pipe 7 at right angles thereto, the pipe 6, an injector-nozzle extending from said pipe 6 axially into pipe 7 beyond pipe 7ª, a cock for regulating the flow from said nozzle, and said pipe 6 extending from the steam-space to the boiler and connected to the lower one of a number of return-bends located between the boiler and the setting, forming a superheating-coil, and the pipe 7 being connected to the upper one of said bends, as set forth.

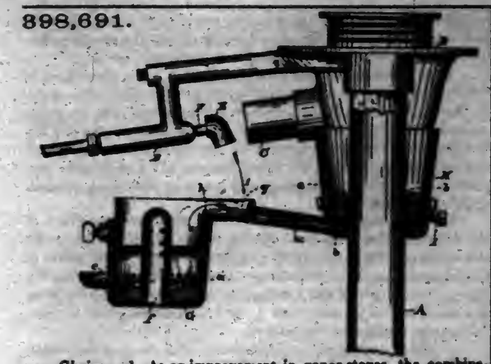
398,689. VAPOR-BURNER. GEORGE W. BILLINGS, Cleveland, Ohio. Filed Apr. 6, 1888. Serial No. 269,845. (No model.)



Claim.—1. In a vapor-stove, a generating-burner, a mixing-chamber, branch pipes leading therefrom to supplemental burners, an induction-tube leading to the mixing-chamber, a single valve for controlling the vapor in line with the induction-tube, and an eduction-tube from the mixing-chamber to the generating burner, whereby the generating and the supplemental burners are controlled by a single valve, substantially as described.

2. In a vapor-stove, a generating-burner, a mixing-chamber, an induction-tube leading to the mixing-chamber, a vapor-supply pipe with a valve for controlling the same, supplemental non-generating burners, and pipe-connections between said burners and the mixing-chamber, and a connection between said chamber and the generating-burner, substantially as described.

3. In a vapor-stove, a generating-burner, a mixing-chamber, an induction-tube, a pipe leading from the mixing-chamber to the generating-burner, a vapor-supply pipe, a valve controlling the same, supplemental burners with pipe-connections to the mixing-chamber, and independent valves for each burner, substantially as described.



398,690. MECHANISM FOR PREVENTING THE PULSATION OF BURNING JETS IN VAPOR-STOVES. GEORGE W. BILLINGS, Cleveland, Ohio. Filed Jan. 24, 1888. Serial No. 297,466. (No model.)

Claim.—In combination with a vapor-burner, a stand-pipe, an auxiliary tube, F, within the stand-pipe and forming an annular chamber, H, between the said auxiliary tube and the stand-pipe, a coupling, *b*, for the attachment of the pipe connecting with the reservoir, and a branch coupling, E, having threaded bores of different diameters for the attachment of the stand-pipe and the annular tube F, substantially as described.

398,691. INITIAL LIGHTING DEVICE FOR GASOLINE-VAPOR STOVES. GEORGE W. BILLINGS, Cleveland, Ohio. Filed Jan. 24, 1888. Serial No. 297,467. (No model.)

398,691.

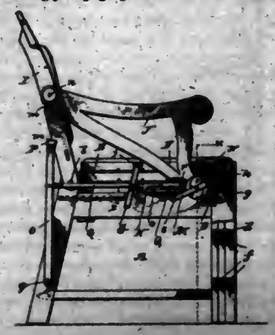
Claim.—1. As an improvement in vapor-stoves, the combination of the vapor-burner thereof with initial lighting devices having one or more cups provided with openings or perforations in their sides located above the surface of the gasoline, substantially as and for the purpose set forth.

2. In combination with a vapor-burner, the duplex cups G H, the receiver *g*, the dam *h*, separating said receiver from the cup G, and a passage, *a*, to the cup H, substantially as described.

3. In combination with a vapor-burner, initial lighting devices consisting of two cups, one of said cups being provided with a tube, *f*, in the center, said tube having an open bottom and a perforated upper portion, substantially as described.

4. In combination with a vapor-burner, the duplex cups H and G, secured to the stand-pipe of said burner, said cup G consisting of sections, the lower section having perforations *d'* in the sides and a tabular projection, *f*, and an adjustable connection between the upper and lower sections, substantially as and for the purpose set forth.

398,692. SHAKING-BOLT. HANS BUTTNER, Brunswick, Germany, assignor to C. Lüther, same place. Filed May 17, 1888. Serial No. 274,174. (No model.)

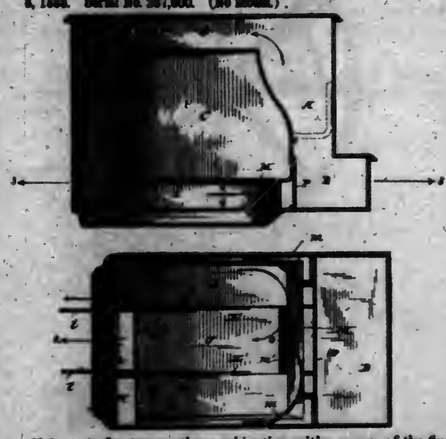


Claim.—1. The combination, with a horizontally-shaking sieve and its casing, of a bellows located at one end of said sieve and having its flexible leathering connected with the sieve and its casing, whereby the shaking of the sieve will actuate the bellows, substantially as described.

2. The combination, with a shaking sieve and its casing, of a bellows located at one end of said sieve and having its flexible leathering connected with the sieve and its casing, and a ceiling located close above and parallel to the sieve, whereby the shaking of the sieve will actuate the bellows and cause a current of air to flow along and between the sieve and ceiling, substantially as described.

398,693. FOLDING CHAIR. JAMES F. BUTLER, Lebanon, Pa. Filed Oct. 23, 1888. Serial No. 288,909. (No model.)

Claim.—1. The combination, with the pivoted back and the frame, of the arms pivoted at their rear ends to said back and at their front ends slidingly engaging the frame of the chair, and the

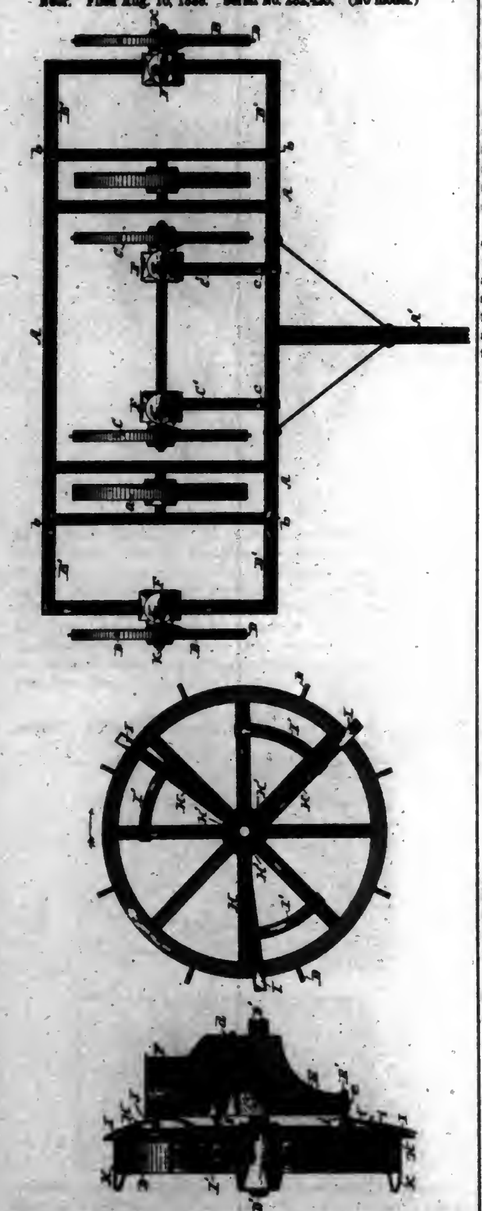


398,693.

brace pivoted at its lower end to the leg and pivotally connected between its ends to the arms and engaging said back to support the same, substantially as described.

2. The combination, with the frame and the back pivoted thereto, of the arms pivoted at their rear ends to said back and at their front ends slidingly engaging said frame, the uprights pivoted to the legs of the frame and connected at their upper ends by a cross-bar engaging said back, and the horizontal bars pivotally connected with said uprights and pivotally connected with and moving with said arms, substantially as shown and described.

398,694. STOVE. RICHARD BORNER, New Albany, Ind. Filed Oct. 6, 1888. Serial No. 287,003. (No model.)



Claim.—1. In a stove, the combination, with an oven, of the flues I I and J below the oven, and separated by the partitions L, except at one end of the stove, where the said flues communicate, and the sliding plates L', substantially as described.

2. In a stove, the combination, with an oven, of flues I I and J below the oven, the partitions separating such flues constituted in part by the sliding plates L' at their ends, and the curved deflecting-plates M, substantially as described.

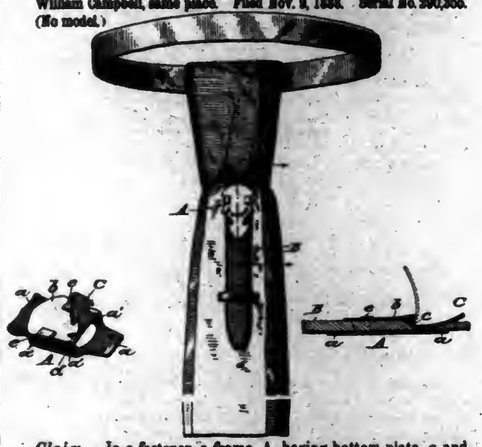
3. In a stove, the combination of the flues I I and J, an opening into the said flues closed by a door, and curved deflecting-plates M across the ends of the flues I, consisting of the parts *m* secured to the stove-plates, and the parts *m'* carried by the said door, substantially as described.

4. The combination, in a stove, of a hot-air flue, the walls whereof are arranged at angles to each other, the lugs *a* on the said walls, and the detachable curved plates secured behind the said lugs, substantially as described.

398,695. CORN-PLANTER. GEORGE M. DOLSON, Daly Branch, Nebr. Filed Aug. 10, 1888. Serial No. 282,426. (No model.)

Claim.—1. In a corn-planter, the combination, with the main frame provided with bearing-wheels, of the pivoted end and central subordinate frames, and the dropping-wheels carried by said subordinate frames, substantially as set forth.

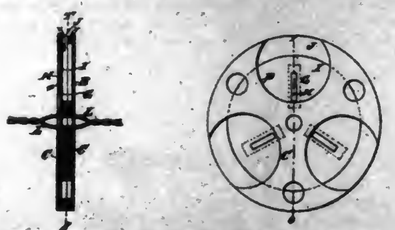
2. In a corn-planter, the combination, with the dropping-wheel, of the dropping-tubes secured to the spokes thereof and provided with scoops at their inner ends, and a seed-holder provided with a valve operated by said tubes for delivering grain into said scoops, substantially as set forth.



3. In a corn-planter, the combination, with a revolving seed-tube provided with the scoop H' at its inner end and a discharge-valve at its other end, of the seed-holder having a seed-valve operated by said tube, and a lower trip-roller for opening the said discharge-valve when the end of the tube is in the ground, substantially as set forth.

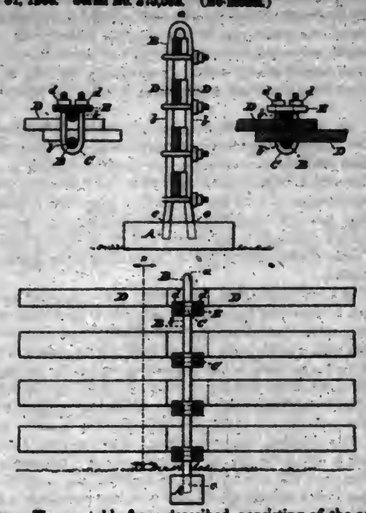
4. In a corn-planter, the combination, with a dropping-wheel, of the dropping-tubes secured to said wheel and provided with scoops at their inner ends and discharge-valves at their outer ends, the spring cam-plates secured to the spokes of the wheel and to the said discharge-valves, the lower trip-roller for bearing against the cam-plates and opening the valves as the wheel revolves, and a seed-holder provided with a valve for delivering seed into the said scoop, substantially as set forth.

5. In a corn-planter, the combination, with a dropping-wheel, of the dropping-tubes secured to the wheel and provided with scoops and discharge-valves, the spring cam-plates secured to the spokes of the wheel and to the said discharge-valves, the trip-roller for bearing against the cam-plates and opening the valves as the wheel revolves, and a seed-holder provided with a valve for delivering seed into the said scoops, substantially as set forth.



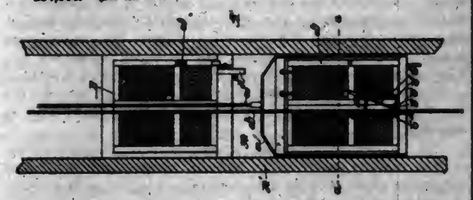
6. In a corn-planter, the combination, with the dropping-wheel, of the telescopic dropping-tubes secured to the wheel and provided with scoops H', the discharge-valves pivoted to the ends of the tubes and provided with springs for closing them, the spring cam-plate secured to the valves and to the spokes of the wheel, the trip-roller for opening the discharge-valves, and the seed-holders provided with a valve for delivering seed into the scoops, substantially as and for the purposes set forth.

398,696. NECKTIE-FASTENER. JACOB L. BRALLIER, Philadelphia, Pa., assignor, by direct and mesne assignments, to himself and William Campbell, same place. Filed Nov. 9, 1888. Serial No. 290,365. (No model.)



Claim.—In a fastener, a frame, A, having bottom plate, *a*, and sides *a' a'*, in combination with the spring-plate *b*, secured thereto by lugs *c*, and the clamp C, hinged to said side plates, *a' a'*, as described, and provided with a projection, *c*, adapted to engage with the under side of spring-plate *b*, substantially as hereinbefore set forth and described.

398,697. MUSICAL PNEUMATIC TOY. WILLIAM H. BROWN, Bolton, County of Lancaster, England. Filed Nov. 15, 1888. Serial No. 290,923. (No model.) Patented in England Sept. 5, 1888, No. 12,821.



Claim.—A musical revolving toy consisting of the cords L, the plain disk B, having the circular center pieces, C, fixed thereto and provided with the circular chambers or openings D, extending to their periphery, the ring J, secured to the periphery of the center pieces, the outer disk, E, having radial air-passages G and secured on said ring, and the circular reed-carrying plate I, fitted inside said peripheral ring between the center pieces and the outer disk having the air-openings, substantially as described.

398,698. FENCE-POST. WIRT H. BROWN, Sycamore, Ohio. Filed May 31, 1888. Serial No. 275,532. (No model.)

Claim.—The portable fence described, consisting of the anchor-base, the elongated centrally-bent rod B, having its branches attached to said base and forming the post, the lapped rails D between the branches of said post, the elongated U-shaped clamp-bolt C, having its branches separated by a narrow interval and extending from the bend around one branch of the post parallel to the plane of the post under the lap of the rails, the perforated plate I, engaging the other branch of the post, and the nuts *d d*, engaging the threaded ends of the clamp-bolt, whereby said ends can be drawn up uniformly and the branches of the post-rod braced and caused to become pressed into the wood of the rails, holding them securely, substantially as specified.

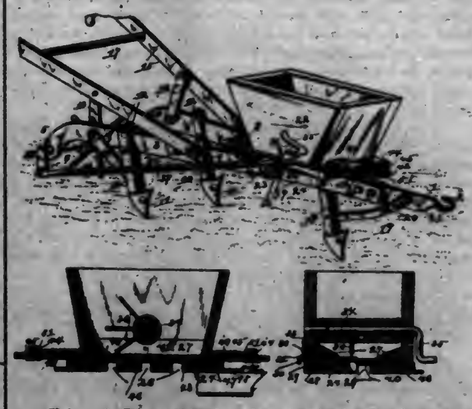
398,699. ELEVATOR. WILLIAM R. CABOT, West Medford, and RICHARDS M. BRADLEY, Boston, Mass. Filed Dec. 8, 1887. Serial No. 257,209. (No model.)

Claim.—1. In an elevator, the combination, with a car having a door and a shipping mechanism within the car, of a clamp or holder to engage the shipping mechanism, and a bolt connected to the said clamp or holder to operate simultaneously therewith, and adapted to lock the car-door when the shipping mechanism is free to be operated to put the car in motion and to unlock said door when the shipping mechanism is clamped, substantially as described.

2. An elevator comprising a shaft-door, an elevator-car provided with a door, a shipping mechanism within the car, a clamp or holder to engage the shipping mechanism, a bolt connected to the said clamp or holder to operate simultaneously therewith and adapted to lock the car-door when the shipping mechanism is free to be operated to put the car in motion, and to unlock said door when the shipping mechanism is clamped, a door-connection, substantially as described, to lock the car-door and shaft-door together when the car-door is substantially opposite the shaft-door, a locking device to lock said shaft-door, and a projection carried by the car to operate said locking device to permit the shaft-door to be opened when the car-door is substantially opposite the shaft-door, substantially as described.

3. In an elevator, a car-door, a^3, having guides supported at its outer side combined with a door of the elevator shaft or well provided with a stud or projection to co-operate with said guides to open the said doors when the car-door is substantially opposite the shaft-door, substantially as described.

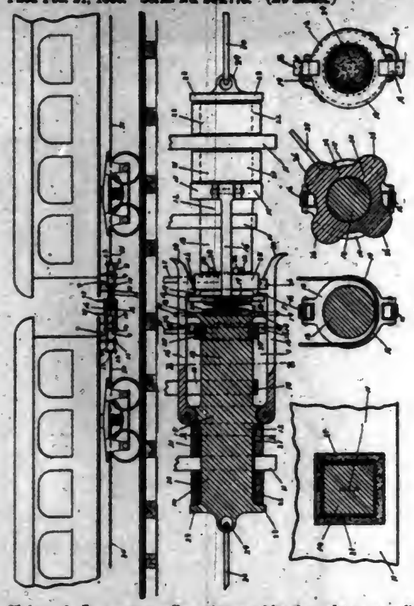
4. In an elevator, a car-door, a^3, and a shaft-door, B, combined with a locking device or door-connection, consisting of guides a^4 a^5, and a stud to engage said guides to unite the said doors together when substantially opposite each other, substantially as described.



398,700. TOOL-BOX. ELI CALDWELL, East Las Vegas, N. Mex. Filed Dec. 20, 1888. Serial No. 294,216. (No model.)

Claim.—1. A combination tool-box for the purpose set forth, comprising a box proper having a hinged door at one end opening sidewise, a till with tool-receptacles, and a lower transversely-arranged hinged door opening upward and communicating with a lower compartment, substantially as described.

2. A combination tool-box for the purpose set forth, comprising a box proper having a metallic rest-plate on the top thereof, and hinged doors at one end opening sidewise and upwardly, with devices for locking the same closed, and a till adapted to be withdrawn from and projected into said box, having tool-receptacles formed at one end, and an open space or receptacle formed between the rear of said tool-receptacles and the rear end of the said till, substantially as described.



398,701. COMBINED CULTIVATOR AND PLANTER. EDWARD D. CARTER, Celesta, Tex. Filed May 5, 1888. Serial No. 272,955. (No model.)

Claim.—1. The combination of the box having the slot and the three apertures in the side of the slot, as shown and described, the reciprocating seed-slide, and the sliding and adjustable plate covering the slot, as shown, and for the purpose specified.

2. The combination of the staple having one leg rigidly secured to the upper side of the forward central beam, and the sliding plate having the slot near its end and engaging with the free leg of the staple, as and for the purpose specified.

398,702. CAR-COUPLING. THOMAS C. CHAPPELL, Baltimore, MA. Filed Feb. 21, 1888. Serial No. 264,773. (No model.)

Claim.—1. In a car-coupling, the combination of two coupling-bodies, each of which is secured to the end of a railroad-car in position to engage the other when the cars are brought together, each of which is provided with a locking-arm hinged to it and a recess or a laterally-projecting flange upon its end adapted to engage the locking-arm of the other coupling, and a buffer consisting of a laterally-projecting flange on the end of the coupling, which is adapted to engage the locking-arm of the other coupling, whereby the couplings are united, substantially as described.

2. In a car-coupling, the combination of two coupling-bodies, each of which is secured to the end of a railroad-car in position to engage one another when the cars are brought together, each of which is provided with a locking-arm hinged to the coupling-body, and a recess or a laterally-projecting flange upon its end adapted to engage the locking-arm of the opposite coupling, and the ends of which are armed with elastic buffers adapted to engage one another and resist the shock of impact of the couplings, substantially as described.

3. In a car-coupling, the combination of two coupling-bodies, each of which is secured to the end of a railroad-car in position to engage the other when the cars are brought together, and each of which is provided with a locking-arm hinged to it, and a recess or a laterally-projecting flange upon its end adapted to engage the locking-arm of the other part of the coupling, whereby the couplings are united, each coupling-body being attached at its rear end to the draft-rod of the car, to each end of which a coupling is attached.

4. In a car-coupling, the combination of two coupling-bodies, each of which is secured to the end of a railroad-car in position to engage the other when the cars are brought together, and each of which is provided with a locking-arm hinged to it, and a recess or a laterally-projecting flange upon its end adapted to engage the locking-arm of the other part of the coupling, whereby the couplings are united, in combination with a releasing device which consists of a ring encircling the coupling and provided on its periphery with cams or lugs having inclined faces which bear upon the under side of one or all the locking-arms, and which is provided with means for turning said ring, whereby the arm or arms will be raised and the coupling unlocked when the cams are forced beneath them.

5. In a car-coupling, the combination of two coupling-bodies, each of which is secured to the end of a railroad-car in position to engage the other when the cars are brought together, and each of which is provided with one or more locking-arms hinged to it, and a recess or recesses or a laterally-projecting flange upon its end adapted to engage the locking arm or arms of the other part of the coupling, whereby the couplings are united, each locking-arm being provided with a circular spring surrounding the locking-arms, whereby they are retained in contact with the flange or recess of the opposite coupling.

6. In a car-coupling, the combination of two coupling-bodies, each of which is secured to the end of a railroad-car in position to engage the other when the cars are brought together, and each of which is provided with a locking-arm hinged to it, and a recess or a laterally-projecting flange upon its end adapted to engage the locking-arm of the other part of the coupling, whereby the couplings are united, in combination with a rigid ring encircling the locking-arms, and provided with means for advancing the ring upon them when they are locked and withdrawing it when it is desired to open them.

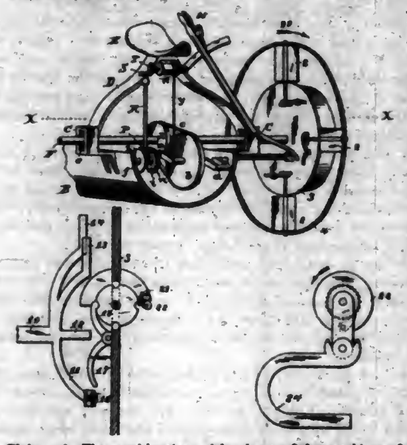
7. In a car-coupling, the combination of two coupling-bodies, each of which is secured to the end of a railroad-car in position to engage the other when the cars are brought together, and each of which is provided with a locking-arm hinged to it, and a recess or a laterally-projecting flange upon its end adapted to engage the locking-arm of the other part of the coupling, whereby the couplings are united, the ends of said couplings being provided with projecting pins or lugs which enter corresponding holes or depressions in the opposite part of the coupling.

8. In a car-coupling, the combination of two coupling-bodies, each of which is secured to the end of a railroad-car in position to engage the other when the cars are brought together, and each of which is provided with a locking-arm hinged to it, and a recess or a laterally-projecting flange upon its end adapted to engage the locking-arm of the other part of the coupling, whereby the couplings are united, the ends of said couplings being provided with projecting jaws which engage the opposite part of the coupling and serve to center it.

9. In a coupling, the combination of two coupling-bodies, each of which is secured to the end of a railroad-car in position to engage the other when the cars are brought together, and each of which is provided with a locking-arm hinged to it, and a recess or a laterally-projecting flange upon its end adapted to engage the locking-arm of the other part of the coupling, whereby the couplings are united, each coupling-body being suspended by a flexible suspending device, which consists of a rigid frame consisting of vertical rods connected together at their lower ends, and upon these rods slide blocks, above and below which are helical springs encircling the rods and maintaining the blocks midway of the rods, and the blocks are also perforated with horizontal holes, through which pass freely horizontal rods secured to the suspending-ring which encircles the coupling-body, and this horizontal rod is encircled by helical springs which bear between the sliding blocks and the suspending-ring, substantially as described.

10. In a car-coupling, the combination of two coupling-bodies, each of which is secured to the end of a railroad-car in position to engage the other when the cars are brought together, and each of which is provided with a locking-arm hinged to it, and a recess or a laterally-projecting flange upon its end adapted to engage the locking-arm of the other part of the coupling, whereby the couplings are united, a suspending device for the couplings, which consists of a ring hung on the under side of the car, the interior of which is beveled, so as to bear upon the coupling-body only at its center, whereby the coupling-body is enabled to rock inside of the ring, substantially as described.

11. In a car-coupling, the combination of two coupling-bodies, each of which is secured to the end of a railroad-car in position to engage the other when the cars are brought together, each of which is provided with a locking-arm hinged to it, and a recess or a laterally-projecting flange upon its end adapted to engage the locking-arm of the other coupling, and buffers secured to the ends of said couplings and adapted to engage one another and resist the shock of impact, a pair of buffers encircling each coupling-body and bearing between flanges upon the coupling-body and a rigid part of the car placed intermediate between said buffers, with means whereby said locking-arms may be raised and the coupling unlocked, means for retaining the locking arm or arms in contact with the flange or recess in the opposite coupling, a device fixed to the end of a car supporting each coupling-body in position opposite to the other coupling-body attached to the end of another car in a similar manner, and the draft mechanism of the car secured to the coupling-body, substantially as described.



12. In a car-coupling, the combination of the two parts of the coupling, each of which is connected to the end of a railroad-car in position to engage the other when the cars are brought together, and a suspending device for said coupling, which consists of a rigid frame secured to the end of the car and a series of springs operating between the frame and the coupling, whereby the coupling is capable of radial motion and is self-centering.

13. In a car-coupling, the combination of two coupling-bodies, each of which is secured to the end of the car in position to engage the other when the cars are brought together, and a suspending device fixed to the end of the car supporting each coupling-body, and mechanism operating between the coupling and suspending device, whereby the coupling is permitted partial spherically-radial motion, substantially as described.

14. In a car-coupling, the combination of two coupling-bodies, each of which is secured to the end of a railroad-car in position to engage the other when the cars are brought together, and each of which is provided with a locking arm or arms hinged to it, and a recess or a laterally-projecting flange upon its end adapted to engage the locking arm or arms of the other coupling, the arm or arms on the two parts of the coupling being placed on a line which is at an inclination of forty-five degrees with the perpendicular, and the arms on opposite couplings being on opposite sides of the perpendicular, substantially as described.

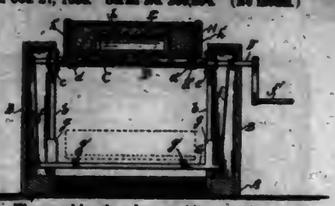
15. A car-coupling consisting of two coupling-pieces, each supported in a ring or strap, said ring or strap suspended by a series of springs, so that the ring may freely oscillate in any direction at right angles to the coupling-piece, while the coupling may freely reciprocate through the ring.

398,703. BOAT-PROPELLING MECHANISM. PAUL R. COLLINS, Lynn, Mass. Filed Apr. 26, 1884. Renewed Aug. 16, 1888. Serial No. 211,070. (No model.)

Claim.—1. The combination, with a boat, of the outriggers forming a bearing for the shaft F, the paddle-wheels consisting of air-tight chambers and outer rings, the paddles having bearings in the plate 3 and the said ring, and means, substantially as described, for operating said wheels to propel the boat, substantially as described.

2. The combination, with the boat, of the paddle-wheels consisting of air-tight chamber and ring, movable feathering-paddles between said chamber and ring, and means, substantially as described, under the control of the operator adapted to engage said paddles and hold the same during a part revolution of the wheel, and means, as described, to automatically release the same, substantially as set forth.

3. The combination of a wheel having movable feathering-paddles, substantially as described, the wheel 18, connected to the shaft of the paddle and notched as described, the pawl 17, pivoted to the plate 3, one end thereof engaging with the notches of the wheel 18, and means, substantially as described, adapted to engage the passage end of said pawl intermittingly and lift the same to release the wheel 18, substantially as described.



4. In a boat of the class described, the arm 10, connected to the boat and extending horizontally outward, having a branch, 11, and the lever 15, having the stud 16, combined with the wheel 18 and pawl 17, whereby in the revolution of the paddle-wheel the said pawl 17, holding the paddle-blade, comes in contact with the stud 16, thereby acting upon the wheel 18 to turn the paddle, substantially as described.

5. The combination, in a boat of the class described, of the shaft carrying the paddle-wheels, the air-tight chambers having face-plate 3, and the ring 4, of larger diameter than the plate 3 and in line therewith, the said plate and ring forming bearings for feathering paddle-blades having their movement between the plate 3 and ring 4, substantially as described.

6. In a boat of the class described, having the arm 10 connected thereto, with branch arms 12, 13, and 14, the combination of the wheel 18, pawl 17, and cam 21, carried by the plate 3, whereby when the said cam 21 strikes the arm 14 the said pawl 17 is lifted by the arm 13, thus allowing the cam to roll in passing the end of the arm 14 and effecting the half-turn of the paddle-blade.

7. The combination, in a boat of the class described, with the arm 10, having the branch 14, of the plate 3, carrying the wheel 18, pawl 17, and cam 21, with its spring-arm 24 and wheel 22, whereby the friction is avoided in the movement of the cam 21 over the arm 14 and straining prevented by the action of the spring-arm 24, substantially as described.

398,704. MOLDING-MACHINE. THOMAS A. CORRIGAN, Chicago, Ill. Filed Oct. 27, 1888. Serial No. 289,864. (No model.)

Claim.—The combination, in a molding-machine, of the mold-board D, bearings *d d*, set-screw *d'*, stationary hollow shaft C, shaft F, extending through the hollow shaft C, and having a wiedlam attached thereto, bar G, having cross-bars *g' g'*, flexible connections *f f*, for connecting said bar G with the shaft F, and parts *g g*, arranged in suitable slots in the frame of the machine for maintaining said bars *g' g'* in a horizontal position, substantially as shown and described.

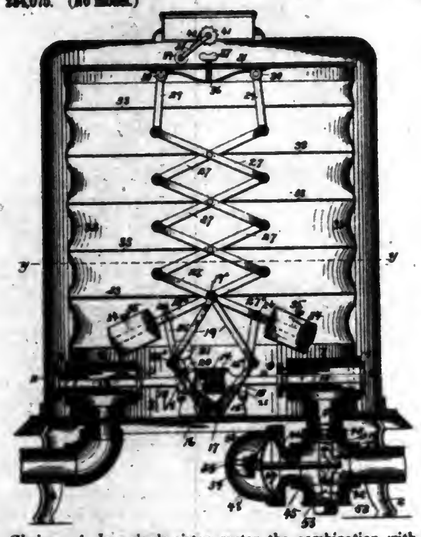
398,705. WHIFFLETREE. HENRY COURTAD, Sandusky, Ohio. Filed Aug. 2, 1888. Serial No. 281,603. (No model.)

Claim.—1. A spring-whiffletree consisting of like halves A A, each integrally cast in one piece with the component part of a rule-joint connecting said halves together by means of a hollow bushing, and having the front and rear abutments, *c*, the spring D, centrally secured to said whiffletree, the shackles E, connecting the ends of the spring with the whiffletree, the wood filling *f*, secured in apertures of the whiffletree, and the shackle-bolts *g*, secured in said wood filling, substantially as described.

2. A new article of manufacture, a whiffletree consisting of like halves, each integrally cast in one piece with the component part of a rule-joint having front and rear abutments, *c*, a hollow bushing connecting them together, the spring D, the shackles E, the recess *h* in the rule-joint, and the bolt A, engaging with its head into said recess and centrally securing the spring to the whiffletree, substantially as described.

398,706. GATE. WILLIAM H. COX, Virden, Ill. Filed Nov. 8, 1888. Serial No. 290,276. (No model.)

Claim.—1. In combination, the sliding gate, the fastening on the gate-post, a latch pivoted on the gate and having a weight on its end to hold the latch normally out of engagement with the fastening, and a holder on the gate arranged to engage with the latch when the same engages with the fastening to counteract the force of the weight, substantially as described.



2. In combination with a sliding gate, a suitable fastening device on the gate-post, a gravity-latch on the gate, and a hooked lever for holding the same in locked position, substantially as described.

3. In combination with a sliding gate, a fastening device on the gate-post, a pivoted latch of angular form, having its front end hooked and its rear end weighted, and a hooked lever under spring-tension above the same, the latch and lever being adapted to co-operate and automatically lock the gate in place, substantially as described.

4. In combination with the sliding gate, an automatically-operating latch, a hooked lever for holding said latch in locked position, and operating-cords therefrom to supporting-posts on the side of the road, substantially as described.

5. In combination with a sliding gate, locking means consisting of a pivoted latch having hooked front ends rounded on the upper side and weighted rear end having projecting pins, a pivoted lever having hooked lower end and rounded faces adapted to co-operate with the pins on the weighted end of the latch, and operating-cords extending from the upper end of the hooked lever to supporting-posts on the side of the road, substantially as described.

398,707. GAS-METER. JOHN W. CULMER, New Brighton, Pa., assignor to John H. Logan, same place. Filed Aug. 29, 1888. Serial No. 284,076. (No model.)

Claim.—1. In a single-piston meter, the combination, with an outer case or shell and a piston and its bellows, of a meter-base ring having an annular flange for the attachment of the bellows, said flange provided with valve-ports and arranged to form a portion of the wall which divides the inner or bellows chamber from the outer or shell chamber, substantially as and for the purposes specified.

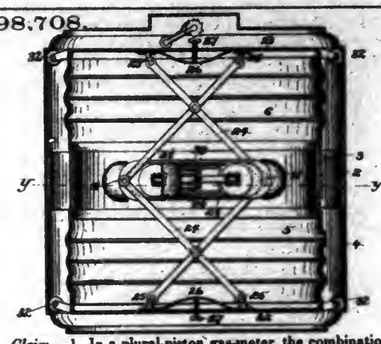
2. In a gas-meter, the combination, with a bellows and its piston and base, of parallel lazy-tongs mechanism, substantially as and for the purposes specified.

3. In a gas-meter, the combination, with a bellows and its piston, of a lazy-tongs and counter-weights, substantially as and for the purposes specified.

4. In a gas-meter, the combination of a bellows and its piston, with a lazy-tongs mechanism, and with interposed adjustable pivot-blocks which connect the lazy-tongs levers with the piston-head, substantially as and for the purposes specified.

5. In a gas-meter, the combination, with a bellows and its piston, of a lazy-tongs, plate 36, slides 30, and set-screw 37, substantially as and for the purposes specified.

6. In a gas-meter, the combination, with the bellows and its piston, of a lazy-tongs mechanism having adjustable connections with said piston, a spindle actuated thereby, a weighted drop-lever tripped or actuated by the spindle, and a valve arranged to be shifted by the fall of the drop-lever, substantially as and for the purposes specified.



7. In a gas-meter, the combination, with a bellows, of a lazy-tongs, geared levers operated thereby, a spindle operated by the geared levers, a weighted lever loose on the spindle, a disk secured to the spindle and having pins which straddle the weighted lever, and a valve actuated by the weighted lever, substantially as and for the purposes specified.

8. In a gas-meter, the combination of a base, a piston, a bellows which connects the base and piston, a lazy-tongs movement and adjustable weights arranged on the lower members of the lazy-tongs, substantially as and for the purposes specified.

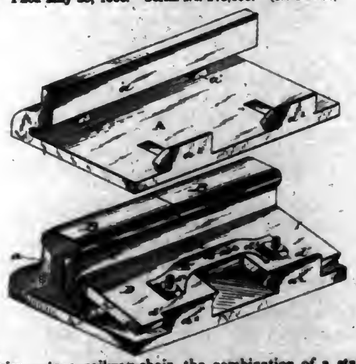
9. In a gas-meter, the combination of an inner and an outer meter or measuring-chamber, T-inlet and T-outlets which extend between the inner to the outer chambers, double puppet-valves therefor, a stem which connects the double puppet inlet-valve and the double puppet outlet-valves, and mechanism for actuating the valve-stem, substantially as and for the purposes specified.

10. In a gas-meter, the combination of an outer shell, an inclosed piston and bellows forming two chambers, inlet-ports and outlet-ports extending between the same, a double puppet inlet-valve, a double puppet outlet-valve, a slotted valve-stem which connects the two double puppet-valves, and is provided with strikes, a pivoted weighted drop or gravity lever, and lazy-tongs mechanism for actuating the drop or gravity lever from the bellows, substantially as and for the purposes specified.

398,708. PLURAL-PISTON GAS-METER. JOHN W. CULMER, New Brighton, Pa., assignor to John H. Logan, same place. Filed Aug. 29, 1888. Serial No. 284,076. (No model.)

Claim.—1. In a plural-piston gas-meter, the combination, with a shell-ring, a shell or case attached thereto, and a series of bellows and pistons, of a bellows-ring arranged concentrically with the shell-ring and provided with valved passages which connect the interior and exterior of said bellows-ring, said bellows-ring forming a common attachment for the series of bellows, substantially as and for the purposes specified.

2. In a plural-piston meter, the combination of concentric case-ring and bellows-ring, an inlet-passage which extends through the annular chamber between said rings, said passages terminating in valve-boxes having ports on both sides of the inner ring, and double puppet-valves arranged to control the ports of said inlet and outlet passages, substantially as and for the purposes specified.

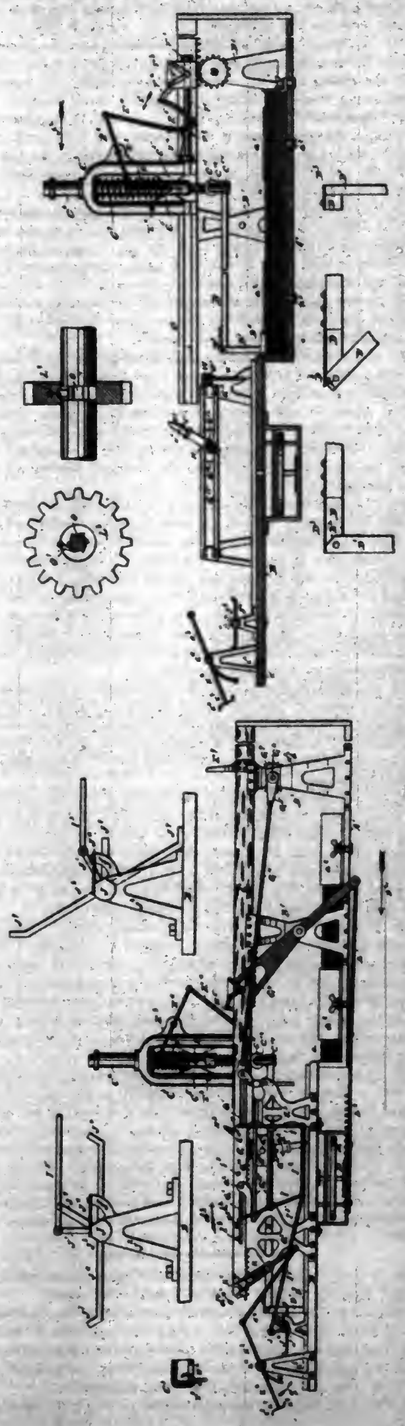


3. In a gas-meter, the combination of concentric shell-ring and bellows-ring, valve passages or boxes having ports on both sides of the inner ring, said boxes arranged parallel, double puppet-valves, a rock-lever for coupling said valves, and a gravity-lever for actuating the rock-lever from the bellows-pistons, substantially as and for the purposes specified.

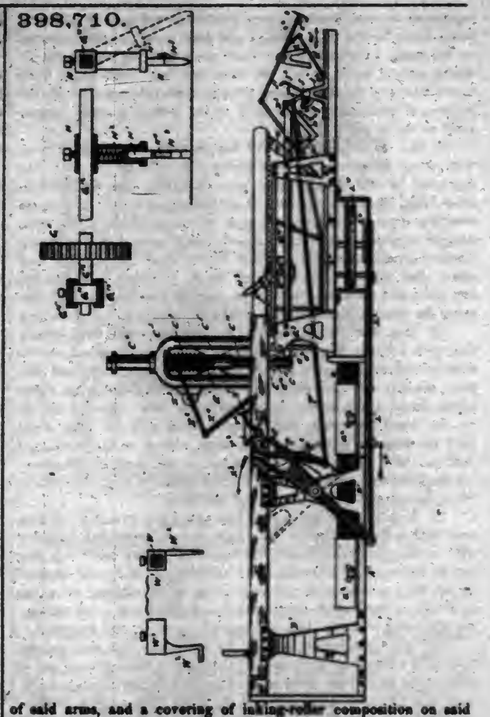
4. In a gas-meter, the combination, with a central base, of a plurality of pistons, a single lazy-tongs mechanism which connects the several pistons, and inlet and outlet valves centrally arranged and actuated by the expansion and contraction of the lazy-tongs, substantially as and for the purposes specified.

5. In a gas-meter, the combination, with central concentrically-arranged shell-ring and bellows-ring, of plural piston-heads, a lazy-tongs mechanism which connects the piston-heads, and inlet and outlet valves arranged in the inner or bellows ring and actuated by the lazy-tongs, substantially as and for the purposes specified.

6. In a gas-meter, the combination, with a single case having centrally-arranged inlet and outlet valves, of a plurality of bellows, a lazy-tongs mechanism which connects the several pistons or bellows heads, and adjustable connections for uniting the ends of the lazy-tongs mechanism with each of the several heads or pistons, substantially as and for the purposes specified.



398,709. RAIL JOINT OR CHAIR. CHARLES M. CULP, South Bend, Ind. Filed May 25, 1888. Serial No. 275,055. (No model.)



Claim.—In a railway-chair, the combination of a stationary cheek, a removable cheek for holding the rails against the stationary cheek, a clamp for holding the removable cheek in position against the rails, the edges of which are beveled or inclined, and projections or shoulders formed on the base-plate, the inner faces of which are inclined from their tops to their bottoms toward the stationary cheek, against which the clamp presses when the nuts are turned, thereby causing the removable cheek to press against the rails and hold the same in position, substantially as described.

398,710. SHEET-FEEDING MACHINE FOR PRINTING-PRESSES. JACOB C. DARNELL and SAMUEL DARNELL, Cincinnati, Ohio. Filed Feb. 20, 1888. Serial No. 264,552. (No model.)

Claim.—1. In a sheet-feeding machine for printing-presses, the combination, with a frame, of a reciprocating carriage, bars supported by said carriage, arms hinged to said bars, blocks on swinging ends

of said arms, and a covering of inking-roller composition on said blocks, substantially as shown and described.

2. In a sheet-feeding machine for printing-presses, the combination, with a frame, of a carriage, bars on said carriage, arms pivoted to said bars, sheet-lifting blocks on the swinging ends of said arms, and springs on the bars resting on the upper ends of said pivoted arms, substantially as shown and described.

3. In a sheet-feeding machine for printing-presses, the combination, with a frame, of a carriage, bars on the same, arms pivoted to the ends of said bars, said arms having the inner corners at the upper ends beveled, sheet-lifting blocks on the swinging ends of said arms, and springs secured on the bars and resting on the upper ends of said arms, substantially as shown and described.

4. In a sheet-feeding machine for printing-presses, the combination, with a frame, of a carriage mounted to slide on said frame, a sheet-lifter carried by said carriage, sheet-shifters operated by parts of the carriage, and sheet-retainers operated by parts of the carriage, substantially as set forth.

5. In a sheet-feeding machine for printing-presses, the combination, with a frame, of a carriage mounted to slide on said frame, sheet-lifters carried by said carriage, a table on which the sheet can be placed, a rail mounted to slide laterally on said table to shift the sheets laterally, sheet-wipers operated by the carriage, and sheet-retainers operated by the carriage, substantially as shown and described.

6. In a sheet-feeding machine for printing-presses, the combination, with a frame, of a carriage mounted to slide on said frame, sheet-lifters carried by said carriage, a transverse beam sliding with the carriage on the frame and connected therewith, levers pivoted on the frame and operated by the ends of said beam, a laterally-movable sheet-shifting rail operated by intermediate power-transmitting members from said pivoted levers, paper-wipers operated by the carriage, and paper-retainers operated by the carriage, substantially as shown and described.

7. In a sheet-feeding machine for printing-presses, the combination, with a frame, of a carriage sliding on the same, a transverse beam moving with said carriage and connected therewith, a platform for receiving the sheets, sheet-lifters carried by the carriage, pivoted levers operated by the ends of said beam, a laterally-movable paper-shifting rail operated by suitable intermediate power-transmitting members from said pivoted levers, sheet-wipers operated by the carriage, sheet-stops operated from the carriage, sheet-retainers operated by the carriage, and a sheet-shifter at the end of the platform, also operated from the carriage, substantially as herein shown and described.

8. In a sheet-feeding machine for printing-presses, the combination, with a frame, of a carriage mounted to slide on the same, bars

supported by said carriage, arms pivoted to the ends of said bars, paper-lifting blocks on the ends of said arms, a rocking shaft mounted on the frame, bars fixed on said shaft and projecting toward the pivoted arms and serving to tilt the same, and fixed arms on the frame in the tracks of the said pivoted arms on their return-stroke for the purpose of swinging the arms back to the normal position, substantially as shown and described.

9. In a sheet-feeding machine for printing-presses, the combination, with a frame, of a carriage mounted to slide on the same, bars supported by said carriage, arms pivoted to the ends of said bars, sheet-lifting blocks on the ends of said arms, a rocking-shaft, sheet-retaining arms on said shaft, a rack on the carriage, a cog-wheel adapted to engage said rack, a slide on the frame, a connecting-rod connecting said slide with a crank on the shaft carrying the cog-wheel, pins on the slide, connected levers on which said pins can act, and a rod connecting said levers with an arm on the shaft carrying the sheet-retaining arms, substantially as shown and described.

10. In a sheet-feeding machine for printing-presses, the combination, with a frame, of guide-rails on the same, a carriage mounted to slide on said rails, a platform, a rock-shaft extending across said platform, arms on said rock-shaft, stops on the ends of said arms, a slide on the frame, a pin on the slide, a swinging lever on which the pin can act, a rod connecting said swinging lever with the arms of the shaft carrying the arms having the stops, a rack on the carriage, a shaft provided with a crank, a cog-wheel on said shaft, a rod connecting the slide with said crank, and sheet-retaining arms operated by the slide, substantially as shown and described.

11. In a sheet-feeding machine for printing-presses, the combination, with a frame, of guide-rails on the same, a carriage mounted to slide on the guide-rails, sheet-lifters supported by said carriage, a slide on the frame, paper-retaining arms, and arms having stops operated by the slide, a rack on the carriage, a cog-wheel adapted to engage said rack, a crank-shaft carrying said cog-wheel, and a rod connecting the crank with the slide, substantially as shown and described.

12. In a sheet-feeding machine for printing-presses, the combination, with a frame, of guide-rails on the same, a carriage mounted to slide on the guide-rails, sheet-lifters supported by the carriage, a platform, said platform being provided at its end with a recess forming the shoulder, a rock-shaft having arms, stop-lugs on said arms, which stop-lugs can swing against the shoulder formed by the recess, a slide on the frame, levers for operating the swinging stop-lug arms from the carriage, and mechanism, substantially as herein described, for operating the slide from the carriage, substantially as shown and described.

13. In a sheet-feeding machine for printing-presses, the combination, with a frame and a platform, of rails on the frame, a carriage mounted to slide on said rails, a rack on said carriage, a cog-wheel, a crank-shaft carrying the cog-wheel, the slide G on the frame, a connecting-rod connecting said slide with the crank-shaft, the pins I^3 and I^4 on the slide, the connected pivoted levers I and I', the shaft J, having the arms J^6, the crank J' on the shaft J, and the rod I^5, connecting the crank of the shaft J with the rods I I', substantially as shown and described.

14. In a sheet-feeding machine for printing-presses, the combination, with a frame and platform, of rails on the frame, a standard mounted to slide on the rails, a sheet-lifter supported by said standard, a transverse beam, F^6, connected with the sliding standard, the lever P, the slide G, mechanism, substantially as herein shown and described, for operating said slide from the standard, the levers I I', the rocking shaft J, the arms J^6 on the same, the rod I^5, connecting the crank-arm on said shaft J with the rods I I', and the connecting-rod P', connecting another crank on said shaft J with the lever P, substantially as shown and described.

15. In a sheet-feeding machine for printing-presses, the combination, with a frame and platform, of rails on the frame, a sliding standard on said rails, a rocking shaft above the platform, paper-retaining arms on said rocking shaft, and independent levers on opposite sides of the frame connected with said rock-shaft, substantially as shown and described.

16. In a sheet-feeding machine for printing-presses, the combination, with a frame and platform, of rails on the frame, a sliding standard on the rails, sheet-lifters supported by the standard, a rocking shaft at the end of the platform, arms having stop-lugs on said shaft, a slide connected with the rocking shaft, a hinged plate on said slide, beveled projections on the platform acting on said hinged plate, paper-retaining arms, and mechanism, substantially as herein shown and described, for operating the shaft carrying the arms having the stop-lugs and the shaft carrying the paper-retaining arms from the sliding standard, substantially as shown and described.

17. In a sheet-feeding machine for printing-presses, the combination, with a frame and platform, of a fixed rail on the platform, a longitudinal transversely-movable rail on the platform, guide-rails on the frame, a sliding standard supported by the guide-rails, a transverse beam supported by the guide-rails and connected with the sliding standard, levers pivoted to the side of the frame, on which levers the ends of the transverse beam can act, racks connected with the levers, cog-wheels engaging said racks, cams on the shafts of the cog-wheels, a pin on the movable rail on the platform, on which pin one of the cams acts, angle-levers at the fixed rail, a rod connecting the angle-levers, and a pin on said rod, on which pin the other cam acts, substantially as shown and described.

18. In a sheet-feeding machine for printing-presses, the combination, with a frame and platform, of the guide-rails C, the sliding standard C^3, the sliding beam F^6, connected therewith, the two levers L, pivoted on the frame and actuated by the ends of the beam F^6, the racks L^2, connected with the levers L, the cog-wheels L^3, engaged with the racks L^2, the cams L^4 and M, the movable rail L^{11}, the rod L^5, the spring N^7, the pin L^6, the fixed rail M^6, the angle-levers N, the rods N^4 and N^5, the rod M^3, the pin M', and the springs N^7, substantially as herein shown and described.

19. In a sheet-feeding machine for printing-presses, the combination, with a frame, of rails, a standard mounted to slide on said rails, bars supported by the standard, hinged arms on the ends of the bars, paper-lifters on said arms, a rock-shaft having cams that can abut against the sheet-lifting arms, a shaft, W, the arms W^2 on the same, pins W^3 on the paper-lifters, and mechanism, substantially as herein shown and described, for operating the rocking shaft from the sliding standard, substantially as shown and described.

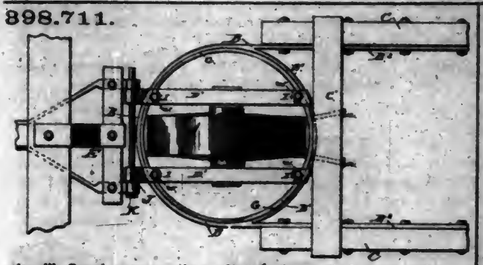
20. In a sheet-feeding machine for printing-presses, the combination, with a frame, of rails on the same, a standard mounted to slide on the rails, a sheet-lifter supported by the sliding standard, a rocking shaft, wipers on said rocking shaft, a cog-wheel on the rocking shaft, a slide on the side of the frame provided with a rack engaged with said cog-wheel, and mechanism, substantially as shown and described, for operating the slide from the standard, substantially as shown and described.

21. In a sheet-feeding machine for printing-presses, the combination, with the frame, of rails on the same, a sliding standard on the rails, sheet-lifters suspended from the standard, the slide G on the frame, which slide is provided with a rack, G^{10}, the cog-wheel G^{11}, engaged with the rack G^{10}, the rails G^{12}, the adjustable bearings G^{14}, the shaft G^{13}, mounted in said bars G^{14} and carrying the wheel G^{11}, the sleeves H, having hollow arms, the pieces H' in said arms, the hinged pieces H^3 on the pieces H', and mechanism, substantially as shown and described, for operating the slide G from the sliding standard, substantially as shown and described.

22. In a sheet-feeding machine for printing-presses, the combination, with a frame, of rails, the sliding standard C^3 on the rails, the sliding tube C^3 in the standard, the spring C^7, pressing the tube downward, the rod C^9 in the tube C^3, the spring pressing the rod C^9 downward, and sheet-lifters supported from said rod C^9, substantially as shown and described.

23. In a sheet-feeding machine for printing-presses, the combination, with a frame, of rails, the sliding standard C^3 on the rails, the sliding tube C^3 in the standard, having the jaws C^8, of which one is provided with a notch, E^7, a spring for pressing the tube downward, sheet-lifters supported by said rod, a latch pivoted on the standard for locking the tube C^3 in the raised position, and the arm E^9 on one of the rails for tripping said latch, substantially as set forth.

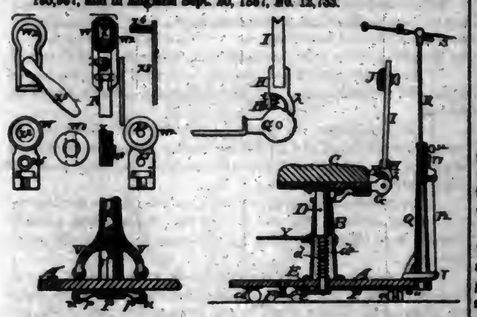
24. In a sheet-feeding machine for printing-presses, the combination, with a frame, of rails, a sliding standard on the rails, a tube mounted to slide in the standard, sheet-lifters supported by said tube, angle-levers pivoted on parts of the standard and connected by intermediate levers with the sliding tube, a transverse beam mounted to slide on the rails, a rod projecting from the standard through the transverse beam, and arms on the transverse beam to act on the angle-levers, substantially as shown and described.



25. In a sheet-feeding machine for printing-presses, the combination, with a frame, of rails, a sliding standard on the rails, a tube mounted to slide in the standard, sheet-lifters supported by said tube, angle-levers pivoted on parts of the standard and connected by intermediate levers with the sliding tube, a transverse beam mounted to slide on the rails, a rod projecting from the standard through the transverse beam, and arms on the transverse beam to act on the angle-levers, a latch for locking the tube in raised position, and an arm on one of the rails for tripping said latch, substantially as shown and described.

398,711. HARVESTING-MACHINE. JAMES DRAPER, Stockton, Cal. Filed Oct. 18, 1888. Serial No. 287,507. (No model.)

Claim.—1. The combination, with the sills C and the transverse beam C', of the exterior ring, B B', having the extensions B^2 welded thereto and secured to said sills, the bolts *a*, passing through the rear of said ring and securing it to the transverse beam, and an inner ring within the outer ring, substantially as herein described.



2. The combination of the outer stationary ring, B B', secured to

398,711.

the sills C and transverse beam C' of the frame, the inner ring, G, turning within the outer one, the plates D', secured to the top of the inner ring and extending beyond the edges of the outer one, and the angular plates D, secured to the bottom of the inner ring and extending under the outer ring and the eyes J, to which the tongue is connected, the journal-boxes H, and the axle of the bearing-wheel A, turning therein, substantially as described.

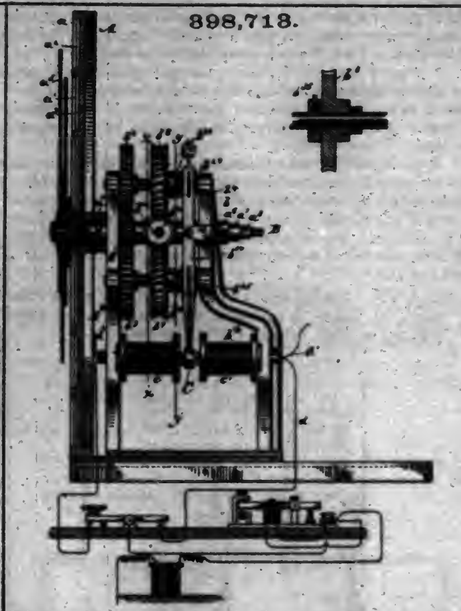
398,712. PHOTOGRAPHIC CHAIR. THEODORE BRUSAN, Cleveland, Ohio. Filed Jan. 9, 1888. Serial No. 260,202. (No model.) Patented in Canada Aug. 31, 1887, No. 27,531; in France Sept. 20, 1887, No. 183,967, and in England Sept. 20, 1887, No. 12,733.

Claim.—1. In a photographer's chair, the combination, with a platform supported on casters, of a hollow pedestal supporting a revolving seat, having a central spindle setting in said pedestal upon a spring, said spindle also connected with and operating a brake-lever and pad, substantially as described.

2. In a photographer's chair, the combination, with the seat C, of an adjustable back-rest consisting of a bracket, G, having a ratchet-toothed head, an arm-socket, H, having a pawl, A, and joined to the head G by links H^2, arm I, and adjustable pad J, all constructed to operate substantially as described.

3. In a photographer's chair, the combination, with the platform A, of the bar P, having crôss-arms *p p*, provided with rollers *n n*, the hollow post Q, having arms V, provided with rollers, and the lever T, connected by rod T^2 to hand-lever T^3, all constructed to operate substantially as described.

4. The combination, with rods R and S of the head-rest, of the adjustable swivel-clamp consisting of the two plates W W^2, each having a recess for embracing the head of rod R, and having the recesses X^3 and X^4, the disk W^2, having a recess in one side and in communication with hole X, through which rod S passes, and a journal projection, X^2, and a hand-lever screw, X^6 X^5, for screwing with threaded hole X^4 of plate W, for binding and clamping the disk W^2 and rod S and the head of rod R together, substantially as shown and described, and for the purpose specified.



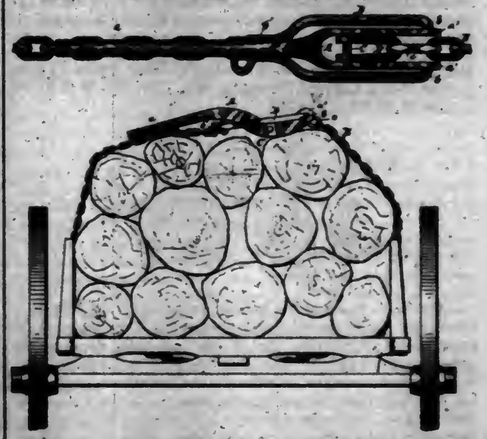
5. The rod Y, tubular rod Z, extension-rod Z^2, held by set-screw *x'*, and rod Z^3, attached to and held by swivel-clamp Z^4, and having adjustable curtain-canopy, in combination with chair-pedestal E, all constructed to operate substantially as described.

398,713. STOCK-INDICATOR. JOHN A. ROSS, Boston, Mass., assignor, by direct and mesne assignments, to Edwin Shepleigh, same place, and Howard Wilson Morton, Kemptville, Nova Scotia. Filed Mar. 2, 1888. Serial No. 265,915. (No model.)

Claim.—1. In a stock-indicator, the combination of a dial, a series of hands mounted on concentric sleeves, a main gear-wheel mounted on each sleeve, a gear-wheel meshing therewith and mounted on a second shaft, a worm-wheel also mounted on the shaft, a worm operating the worm-wheel, and a lever caused to vibrate by an electric current and operating said worm-wheel, substantially as described.

2. In an indicator, a dial, a hand mounted on a shaft carrying a gear-wheel, gear-wheels meshing therewith mounted on independent shafts, each caused to rotate in one direction with the shaft upon which

398,713.



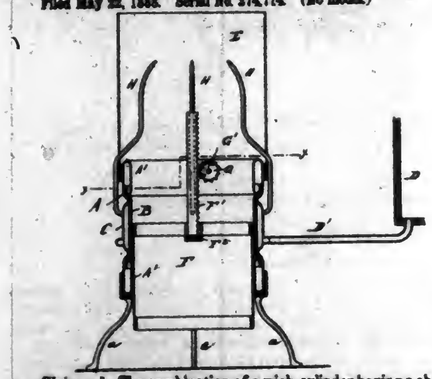
it is mounted, a worm-wheel mounted upon a shaft, a worm meshing with the worm-wheel, a lever mounted on the worm-shaft and carrying a pawl engaging to rotate upon said worm-shaft, and a magnet whose armature is carried by said lever, substantially as described.

3. In an indicator, a main shaft carrying a hand and a main gear-wheel, gear-wheels mounted on the independent shafts, worm-wheels also mounted on the independent shafts, a worm, and clutches engaging the worm-wheels to throw them into or out of engagement, said clutches being operated by movement of a lever actuated by a current of electricity, substantially as described.

4. In an indicator, the combination of a main shaft carrying the main gear-wheel, independent shafts carrying gear-wheels, worm-wheels also mounted on the independent shafts, the worm engaging the worm-wheels, clutches carried by a lever attached to said shafts, and a double magnet electrically connected, between which the lever extends, and means whereby a current of electricity may be caused to pass through either magnet for the purpose of operating the lever, substantially as described.

398,714. SELF-LOCKING LOAD-BINDER. WILLIAM M. FARR, Olean, N. Y. Filed Oct. 2, 1888. Serial No. 286,961. (No model.)

Claim.—1. The binder and locker herein described, consisting of a forked lever, a chain attached thereto at one end within said fork, and an open link movable on and over the end of said lever and provided at its outer end with a socket wherein said chain can be engaged, substantially as set forth.



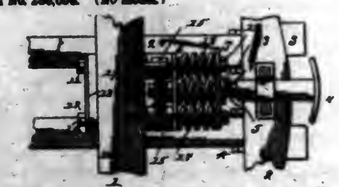
2. The lever A and chain E, attached at one end thereto, and the

link B, pivoted at one end to said lever and at its opposite end contracted, whereby there is provided a means for engaging the free end of the chain in and to the link, substantially as set forth.

3. The combination of the lever A, having the curved forked part, the chain E, attached at one end inside the said forks, the link B, pivoted at its bent ends in the ends of the lever-forks, its opposite end, *b'*, formed into a socket, *b''*, all substantially as and for the purposes set forth.

4. The binder and locker consisting of a forked lever, chain, and link, the several parts constructed and all combined as hereinbefore described, and the ends of the lever being curved, whereby when the lever-fork and the link are shut or folded together, the fulcrum-point of the lever being thrown outside of the line of draft, the draft upon the chain attached to the end of the link and to the clevis holds it fast or locks it.

398,715. AIR-HEATING APPARATUS. CHARLES P. FERY, Philadelphia, Pa., assignor of one-half to William G. Topin, same place. Filed May 22, 1888. Serial No. 274,714. (No model.)

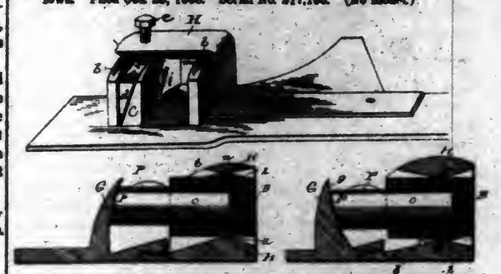


Claim.—1. The combination of a wick-cylinder having a channel, an asbestus or other wick supported by the wick-cylinder, a chimney applied to the upper end of the wick-cylinder, and a vertically-adjustable interior cylinder for regulating the size of the flame, substantially as set forth.

2. The combination of a wick-cylinder, a wick supported at the upper and lower ends by said cylinder, an annular channel formed in the wick-cylinder outside of the wick, a pipe for supplying liquid fuel to the same, upwardly-extending tubes for conducting the vapors from said channel, and a chimney at the upper end of the wick-cylinder, substantially as set forth.

3. The combination, with a wick-cylinder, a wick supported at the upper and lower ends by said cylinder, an annular channel in the wick-cylinder extending around the wick, a pipe for supplying liquid fuel to said channel, a chimney applied to the upper end of the wick-cylinder, a vertically-adjustable interior cylinder for regulating the size of the flame, and vapor-tubes connected to said channel and extended in upward direction into the chimney, substantially as set forth.

398,716. DRAW-BAR FOR RAILWAY-CARS. SAMUEL C. FISHER and CHARLES C. FISHER, Steubenville, Ohio. Filed Sept. 22, 1888. Serial No. 286,068. (No model.)



Claim.—1. In a draw-bar, the combination of the coupler-head, a coupler-bar loosely secured thereto, apertured follower-plates on the coupler-bar, rods extending through the said plates, springs on the rods between the plates, buffers behind the plates, and bolts for holding the buffers in position, substantially as described.

2. In a draw-bar, the combination of the coupler-head, a coupler-bar loosely secured thereto, apertured follower-plates on the coupler-bar, rods extending through the said plates, springs on the rods between the plates, buffers behind the plates, bolts for holding the buffers in position, and L-shaped braces beneath the rods, substantially as and for the purpose specified.

3. The combination of the buffers, bolts for holding the same in place, and L-shaped braces secured to the said bolts, substantially as and for the purpose specified.

4. The combination, with a coupler-head, of a movable bar carrying a spring, substantially as described.

398,717. PITMAN-CONNECTION. FRANK FORBES, St. Ansgar, Iowa. Filed Oct. 26, 1888. Serial No. 287,183. (No model.)

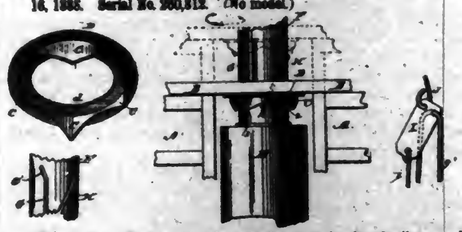
Claim.—1. In combination with the pitman, the knife-head having vertical bearing-sides adapted to confine the pitman snugly, and having its upper and lower portions cut away from a central bearing-point to allow free tilting movement of the knife-head and knife, substantially as described.

2. In combination with the pitman, the hollow knife-head having the bearing-sides and the bearing-edges *a a*, the upper and lower portions of the said head being cut away from the said edges to allow for the tilting of the knife-head and knife, substantially as described.

3. In combination, the pitman, the knife-head having the curved edges, and the bearing-box having bearing-lugs, substantially as described.

4. In combination, the pitman, the bearing-box B, having the curved surface *i*, and the knife-head having bearing-sides and the edges *a a*, the upper and lower portions being cut away from said edges, substantially as described.

5. In combination, the pitman, the knife-head, and the bearing-box having retaining-lugs, and an opening, *m*, extending partially through it to afford a bearing for the pitman, substantially as described.



6. In combination with the pitman, the knife-head having vertical bearing-sides, and the bearing-box adapted to receive the end of the pitman and confined snugly by the bearing-walls of the head, portions of said head being cut away above and below to allow free tilting movement of the knife-head and knife, substantially as described.

7. In combination, the pitman, the knife-head, and the bearing-box removably held by the pitman and head, substantially as described.

8. In combination, the pitman, the knife-head constructed to permit tilting movement thereof up and down, and a guide or retaining plate having a curved face, *g*, adapted to allow said tilting movement, but to prevent displacement of the pitman during the same, substantially as described.

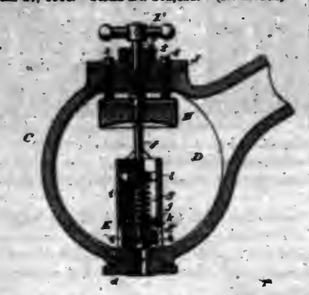
9. In combination, the pitman, the knife-head connected thereto in such a manner as to permit up-and-down tilting movement, a projection, *p*, on the pitman, and a guide-plate, G, having a face curved on the line of the tilting movement, substantially as described.

398,718. GATE. GEORGE FORD, New Harmony, Ind. Filed Jan. 16, 1888. Serial No. 260,812. (No model.)

Claim.—1. The combination of the gate having inclines, and bearings on which said inclines may rest and down which they may slide in the turning of the gate, said bearings being movable from their normal position in a direction reverse to that in which it is desired to open the gate, whereby as the gate is lifted the bearing may be moved from position to engage one incline to position for engagement by an incline in rear thereof, substantially as set forth.

2. In combination with a tube suitably supported and having an inclined or spiral slot inclined toward its upper end in a direction reverse to the direction of movement of the gate, the gate having inclines, a rod or bar movable in said inclined slot and extended to provide a bearing for the inclines of the gate, and a lifter for elevating the gate and the rod, all substantially as set forth.

3. The combination of the tube suitably supported and having



vertical slots and inclined slots, the gate having inclines, the lifting-shaft extended through the vertical slots and having its ends engaging the gate, the shaft extended through the inclined slots and having its ends arranged to be engaged by the inclines of the gate, and a lifter for the said two shafts, substantially as set forth.

4. The combination, with a gate having inclines, of bearings for such inclines down which the latter may slide, such bearings being movable, and inclined guides for said bearings, whereby when elevated such bearings will be also retracted and the gate when lowered will be partially turned by the movement of said bearings to their normal positions, and also by the sliding of its inclines down said bearings, all substantially as and for the purposes specified.

5. The combination of a gate, a lifter for said gate, bearings onto which said gate is lowered after being lifted by the elevator, such bearings being movable from their normal position rearwardly with reference to the direction of movement of the gate, and inclined guides for said bearings, down which such bearings move in the operation of the invention, substantially as set forth.

6. The combination of the gate having inclines, the tube having vertical slots and inclined slots, the shaft having its ends extended through the vertical slots and engaging the gate, the shaft extended at its ends through the inclined slot in position to be engaged by the inclines of the gate, connections between such shafts, and means for elevating the same, substantially as set forth.

398,719. STEAM-TRAP. EDWARD R. GOLD, New York, N. Y. Filed Jan. 27, 1888. Serial No. 262,122. (No model.)

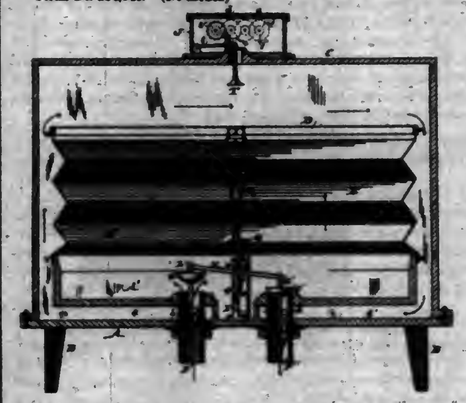
Claim.—1. The combination, with a steam-heating system, of an automatic trap consisting of a drainage-valve connected with the steam-heating pipe or vessel and opening inwardly, and a tension device arranged to exert a pressure against said valve tending to open it, but insufficient to resist the normal steam-pressure in said pipe or vessel, whereby said valve is closed when steam is turned on and opens automatically when the steam-pressure ceases.

2. The combination, with a steam-pipe coupling for the steam-heating pipes of a railway-car, of an automatic trap applied to the coupling-head, consisting of a valve opening inwardly, with its seat arranged to drain the liquid from the normally-lowest portion thereof, and a tension device arranged to exert a pressure against said valve tending to open it, but insufficient to resist the normal steam-pressure within the pipes.

3. The combination, with a steam-pipe coupling for the steam-heating pipes of a railway-car, of an automatic trap applied to the coupling-head, consisting of a valve-seat at the normally-lowest part of the head, a valve opening inwardly from said seat, a retracting-spring tending to open the valve, but insufficient to resist the normal steam-pressure, a valve-stem, guides for said stem, and a stop for limiting the opening movement of the valve.

4. The combination, with a steam-heating system, of an automatic trap consisting of a drainage-valve connected with the steam-heating pipe or vessel and opening inwardly, and a tension device arranged to exert a pressure against said valve tending to open it, but insufficient to resist the normal steam-pressure in said pipe or vessel, and a screw arranged when turned to force said valve to its seat, whereby the automatic operation of the valve may be prevented at will.

5. The combination, with a steam pipe or vessel, of an automatic trap consisting of a valve-seat, a tubular standard borne by said seat, a valve opening inwardly, a valve-stem within said standard, a transverse partition in said standard forming a stop for limiting the opening movement of the valve, a spring tending to open the valve reënforced against said partition, and an adjusting-nut screwing on the valve-stem and receiving the tension of said spring, whereby the latter may be adjusted.



6. The combination, with a steam pipe or vessel, of an automatic trap consisting of a valve-seat, a tubular standard connected thereto and formed with an internal ledge or shoulder, a washer or disk placed within said standard against said shoulder, a valve opening inwardly, a valve-stem fixed to said valve and extending axially through said standard, a guiding-nut screwed on said valve-stem, and a spring tending to lift said valve reënforced against said washer and resting against said guiding-nut.

7. An automatic trap consisting of a valve opening inwardly and a tension device tending to open said valve, combined with a thermo-expansive device arranged relatively to said trap, so that upon its expansion by heat its movement shall be communicated to and shall close said valve, an adjustable stop to limit the movement of said expansion device away from said valve, and a screw connected to said thermo-expansive device and adapted to move the latter toward or from the valve, whereby by turning said screw the valve may be forced to its seat.

8. A hose-coupling head formed with a circular opening in its upper side, a cap closing said opening, a thermo-expansive vessel within the chamber of the coupling-head, a screw passing through said cap for vertically adjusting said vessel, and an automatic trap within the chamber of the coupling-head, consisting of a seat at the normally-lower side thereof, a valve opening inwardly and arranged relatively to said thermo-expansive vessel, so that the expansion of the latter will force it to its seat, and a tension device arranged to exert a pressure tending to open said valve.

398,720. WITHDRAWN.

398,721. GAS-METER. JOSEPH J. HARRELL, New Brighton, Pa., assignor to John H. Logan, trustee, same place. Filed Aug. 28, 1888. Serial No. 284,040. (No model.)

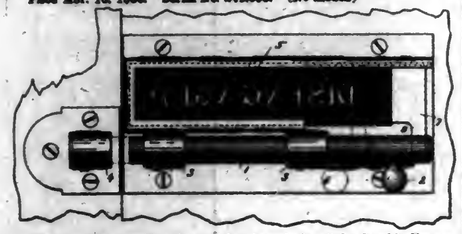
Claim.—1. In a meter, the combination, with an outer case, of a bellows which divides the meter into an inner or bellows chamber and an outer or case chamber, a bellows-bottom arranged within the outer case and having passages which lead into and from the case-chamber, as at *a a'*, inlet and outlet pipes which extend through the case and the bellows-bottom and are provided with ports which connect with the passages leading to the case-chamber, as at *b b'*, and valves for controlling said pipes and their ports, substantially as and for the purposes specified.

2. In a meter, the combination, with an outer case, of a bellows arranged therein, and which divides the meter into an inner or bellows chamber and an outer or case chamber, a bellows-bottom, inlet and outlet pipes which pass through the case and bellows-bottom, said pipes having ports which connect with the case-chamber, and sleeve-valves arranged in said pipes and connected with each other and with the bellows, so as to be simultaneously and reversely operated, substantially as and for the purposes specified.

3. In a meter, the combination, with an outer case, of a bellows arranged therein and which divides the meter into an inner or bellows chamber and an outer or case chamber, inlet and outlet pipes which pass through the outer case and into the bellows, said pipes provided with ports which connect with the outer or case chamber, puppet-valves which control the pipes, and sleeve-valves which control the ports in said pipes, said several valves connected with each other and with the bellows, substantially as and for the purposes specified.

4. In a meter, the combination of a bellows, a gas-inlet pipe to admit gas to said bellows, a pipe to allow gas to escape from said bellows, a valve for each of said pipes, a connection between said valves, whereby one closes when the other opens, and trip mechanism operated by the bellows to actuate said valves to alternately admit gas to the bellows and allow it to escape therefrom, said trip mechanism and valves being located wholly within the bellows.

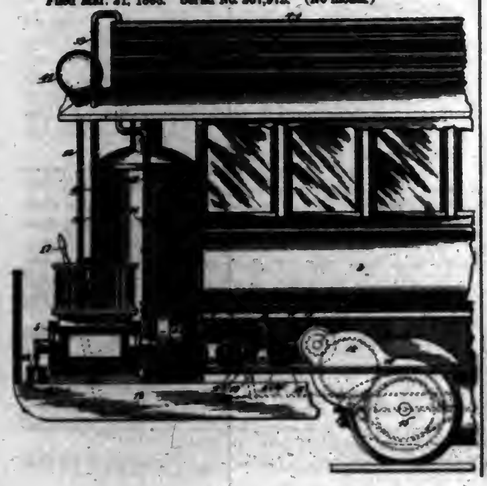
5. The combination of a bellows, pipes to admit gas to and from



the bellows, a registering device operated by the bellows, valves for gas inlet and outlet, a pivoted valve-lever connecting said valves, so as to open one simultaneously with the closing of the other, and vice versa, a pivoted arm to press on the lever upon either side of its fulcrum, a spring acting upon said pivoted arm to hold it against the lever, a trip-lever adapted to shift said arm, and a flexible connection between the trip-lever and the bellows, whereby the movements of the bellows alternately operate the valves.

6. The combination of a bellows, pipes to admit gas to and from the bellows, a registering device operated by the bellows, valves for gas inlet and outlet, a pivoted valve-lever connecting said valves, so as to open one simultaneously with the closing of the other, and vice versa, a pivoted arm to press the lever upon either side of its fulcrum, a spring acting upon said pivoted arm to hold it against the lever, a trip-lever adapted to shift said arm, a flexible connection between the trip-lever and the bellows, whereby the movements of the bellows alternately operate the valves, and an adjustable striker to control the time of action of said trip-lever carried by the bellows.

7. The combination of a bellows, pipes to admit gas to and from the bellows, a registering device operated by the bellows, valves for gas inlet and outlet, a pivoted valve-lever connecting said valves, so as to open one simultaneously with the closing of the other, and vice versa, a pivoted arm to press on the lever upon either side of its fulcrum, a spring acting on the valve-lever to hold it in one of its extreme tilted positions, and a trip device actuated by the bellows for operating said valve-lever.



8. In a meter, the combination of the chamber A, having the interior bellows, E, inlet-pipe F, having ports *h*, outlet-pipe F', having ports *h'*, valves G and *g* for the inlet-pipe, connected together, valves G' *g'* for the outlet-pipe, connected together, a connecting valve-lever, K, for operating said valves, a trip mechanism, substantially as shown, for rocking said valve-lever, a chain-connection, R, carried by the bellows for actuating the trip mechanism, and a registering mechanism operated by movements of the bellows.

398,722. INDICATOR-BOLT. SAMUEL HARRIS, New York, N. Y. Filed Apr. 18, 1888. Serial No. 271,053. (No model.)

Claim.—The combination, with a door-bolt, of the fixed indicator-plate 5, bearing the word "Disengaged" or equivalent word, and a slide, 7, connected to the bolt and operated thereby, so as to cover the first syllable of the word when the bolt is advanced and uncover it when the bolt is retracted, thus giving positive and opposite indications with the respective positions of the bolt, as explained.

398,723. CAR-MOTOR. THADDEUS W. HERRMANN, Chicago, Ill. Filed Mar. 31, 1888. Serial No. 267,972. (No model.)

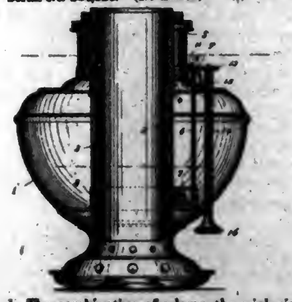
Claim.—1. The combination, in a car-motor, of a continuously-running engine, a shaft in axial line with the engine-shaft, a clutch connecting said shaft with the engine-shaft, driving mechanism connecting the first-named shaft to the car-axles, a brake, and a single lever connected to and operating said clutch and brake.

2. The combination of the continuously-running engine 5, the clutch 8, the shaft 42, and gearing connecting the same to the car-axle, the cross-shaft 44, having the clutch-fork 43 and arm 19 thereon, the brake-operating rod 20, the driver's lever 17, and connecting-rod 18.

3. The combination of the casings 16 and 12, pivotally connected to each other and inclosing the train of gearing and the slide 11, as and for the purpose set forth.

4. The combination, in a car-motor, of an engine upon the platform outside the car, a shaft at one side of the car extending longitudinally beneath the seats and driven through a clutch-connection by said engine, gearing connecting said shaft to the car-axles, a brake, and a single lever connected to and operating both the brake and the clutch, substantially as described.

398,724. NAIL-BOX. GAY HENDRICKS, Beardstown, Tex. Filed Nov. 15, 1888. Serial No. 290,896. (No model.)



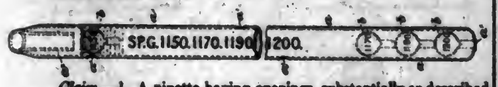
Claim.—1. The combination, with the counter and the support for the nail-box, composed of a fixed and a pivoted guide-rail, of the bin mounted on the said support and limited in its forward movement by engaging with a portion of the said pivoted guide-rail, substantially as described.

2. The combination, with the counter and the nail-box support composed of a fixed and a pivoted guide-rail, of the bin mounted on the said support and having its bottom inclined downwardly from each end and meeting on a line near its rear end, substantially as and for the purpose described.

3. The combination, with the counter and the nail-box support composed of a fixed guide-rail having a downwardly-beveled end, *f*, and a pivoted guide having an upwardly-projecting end, *f'*, of the bin adapted to rest on the fixed guide and on the end *f'* of the pivoted guide, said end *f'* forming a stop to limit the forward movement of the bin when the latter is tilted, substantially as described.

4. The combination, with the counter having the leg-sections A, the back D, and the cross-bar G, and the supports for the nail-box, composed of the fixed sections F^3, having the inclined ends *f*, and the pivoted sections having the inclined ends *f'*, which constitute guide-rails, of the bin having its bottom inclined downwardly from each end, substantially, as shown, and having side rollers, for the purpose described.

398,725. WICK-RAISER FOR LAMPS. LEONARD HENKLE, Rochester, assignor to Charles Stanford Upton, New York, N. Y. Filed Sept. 1, 1888. Serial No. 284,238. (No model.)



Claim.—1. The combination of a lamp, the wick-ring and draw bar, having screw-threaded connection, a shaft having bearing in the fount and geared to the upper end of the draw-bar by means of spur-wheels 13 14, and a shell or chimney-support having a lip or projection for holding the draw-bar in its bearing, substantially as set forth.

2. The combination of the fount having slot at top opening into the aperture 10 of the fount, the wick-raising draw-bar occupying said slot, and the shell or chimney-support having a lip or projection bearing against and holding the draw-bar laterally in its bearing, substantially as set forth.

3. The combination of the fount, draw-bar screwing into the wick-raiser, having bearing in the fount and provided with a collar for turning it, the shell or chimney-support, and a lip or projection on said shell or support bearing laterally against the draw-bar and downward on its collar, whereby it is held rigidly in place when turned for raising or lowering the wick, substantially as explained.

398,726. SPECIFIC-GRAVITY APPARATUS. JAMES J. HICKS, Hatton Gardens, County of Middlesex, England. Filed June 13, 1888. Serial No. 276,910. (No model.)

Claim.—1. A pipette having openings, substantially as described and shown, provided with bubbles of different specific gravity confined therein in such a manner as to permit them to rise in the order of their gravity, the lightest first.

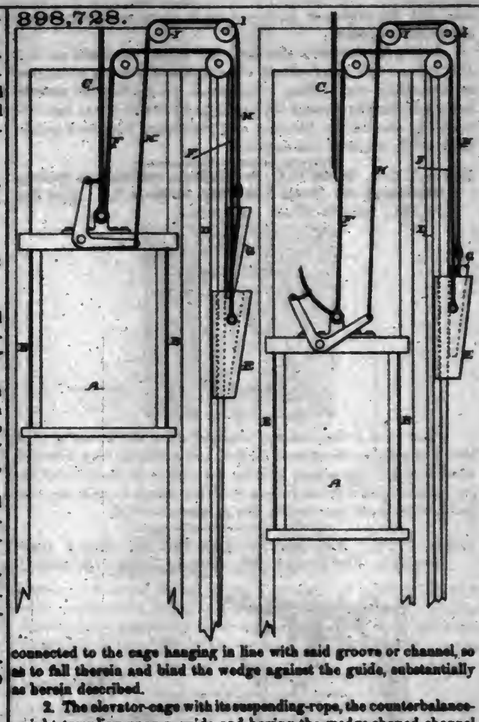
2. The combination of bubbles of different specific gravity with a pipette chamber or container inclosing the same and provided with openings to permit of the free passage of the liquid to be tested into and out of said pipette chamber or container and with a hook, by which the said instrument can be suspended in the liquid to be tested, substantially as herein shown and described.

3. A pipette having openings, substantially as described and shown, provided with bubbles of different specific gravity and of various colors or patterns confined therein in such a manner as to permit them to rise in the order of their gravity, the lightest first.

4. A pipette chamber or container having openings, substantially as herein described and shown, provided with bubbles, one above another, with the heaviest bubble at the bottom, and gradually decreasing in specific gravity toward the top.

398,727. FOLDING OR KNOCKDOWN CRATE. ALONZO D. HOPPER, Bergen Point, N. J. Filed Aug. 2, 1888. Serial No. 281,735. (No model.)

Claim.—1. A folding crate comprising separate upper and lower frames held together by pivoted braces engaging slots in the frames, side and end pieces having indentations, and pins on the inner side of the top and bottom frames to engage the indentations in the side and end pieces, substantially as described.



2. A folding crate comprising top and bottom frames, A and B, pivoted braces E, engaging slots in the top and bottom frames, folding side and end pieces, and spring-catch *o* on one frame and pin *o'* on the other frame, whereby when the crate is folded the frames will be kept together, substantially as described.

3. A folding crate or box comprising separate upper and lower frames having slots in their opposite ends, cross-braces centrally pivoted to each other and engaging at their ends the slots in the frames and serving, when in their extended or vertical position, to maintain the frames apart, corner-braces *m* on one frame, and folding side and end pieces provided with indentations adapted to engage with projections on the upper and lower frames, as set forth.

398,728. SAFETY ATTACHMENT FOR ELEVATORS. HENRY O. HOOPER, San Francisco, assignor of one-half to John Brannan, Eureka, Cal. Filed Nov. 1, 1883. Serial No. 289,722. (No model.)

Claim.—1. The combination, with an elevator-cage and its suspending-rope, of a counterbalance-weight connected with the cage and traveling upon a guide, and having a wedge-shaped groove or channel adjacent to the guide, and the independent suspended wedge

398,728.

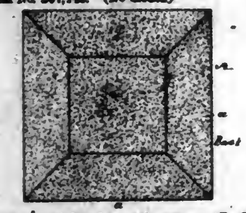
connected to the cage hanging in line with said groove or channel, so as to fall therein and bind the wedge against the guide, substantially as herein described.

2. The elevator-cage with its suspending-rope, the counterbalance-weight traveling upon a guide and having the wedge-shaped channel adjacent to the face of said guide, in combination with a wedge, the rope by which the wedge is suspended above the wedge-shaped channel, and a lever one end of which is connected with the wedge-suspending rope and the other with the cage-rope, substantially as and for the purpose herein described.

3. The counterbalance-weight traveling upon a guide and having the wedge-shaped groove or channel adjacent to the guide, the wedge adapted to fit said groove and bind between the guide and the weight, the rope passing over pulleys at the top of the elevator-frame and connecting the channeled weight with the elevator-cage, and the second rope connecting the wedge-shaped weight with one arm of a lever, the opposite end of which is connected with the suspending-rope of the elevator-cage, so as to hold the wedge suspended above the groove or channel in the traveling weight and to allow the wedge to fall into the said groove or channel upon the breakage of the cage-suspending rope, substantially as herein described.

4. The elevator suspended and traveling between guides, and the counterbalance-weight connected with the elevator and traveling upon a guide, and having the wedge-shaped groove or channel formed between it and the guide, in combination with the two-part wedge having an elastic filling between the two parts, said wedge being suspended above the groove or channel in the weight, so as to be allowed to fall therein, substantially as herein described.

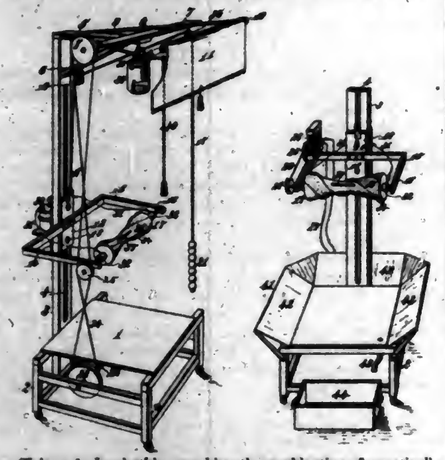
398,729. FUEL-BURNER. HUBERT H. HULL, Jersey City, N. J. Filed Apr. 21, 1888. Serial No. 271,440. (No model.)



Claim.—1. In a fuel-burner, a wire-cloth case formed of a blank which is bent to a cylindrical or analogous shape, united on the longitudinal edges, and overlapped at the ends, the overlapped portions being fastened together, substantially as shown and described.

2. In a fuel-burner, the wire-cloth case formed of a blank the longitudinal edges of which are united by bending the transverse strands of one edge around a longitudinal strand of the other edge, and the ends of which are split longitudinally and overlapped inwardly to the

case, with the overlapped portions fastened together, substantially as shown and described.



3. In a fuel-burner, a wire-cloth case formed of a blank the ends of which are split longitudinally and overlapped inwardly to the case, in combination with a filling of absorbent non-combustible material and staples passing through the overlapped portions of the case into the filling material for fastening said overlapped portions together, substantially as shown and described.

398,730. GLASS TILE. HOWARD ISHARD and FRANCIS A. STAPSER, Glassborough, and THOMAS C. DUFFIELD, Woodbury, N. J. Filed Mar. 14, 1888. Serial No. 267,148. (No model.)

Claim.—As a new article of manufacture, a tile formed of glass having a plain or ornamental surface and a ground back and side, whereby a dull appearance is given the surface of the tile, and the ground back and sides serve as a fastening means for said tile, substantially in the manner and for the purpose described.

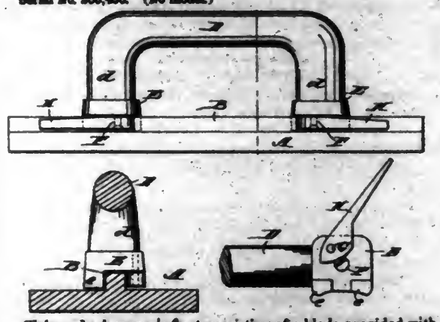
398,731. ELECTRICAL BATHING-MACHINE. JACK W. JAMES, Cuba, Tenn. Filed June 14, 1888. Serial No. 277,091. (No model.)

Claim.—1. In a bathing-machine, the combination of a vertically-adjustable rotary brush provided with electrodes, an electric battery vertically adjustable with said brush and connected with the brush-electrodes by suitable conductors, and means for rotating said brush, substantially as described.

2. In a bathing-machine, the combination of a rotary brush, yielding electrodes carried by said brush, an electric battery, and conductors connecting said battery with the yielding electrodes on the brush, substantially as described.

3. In a bathing-machine, the combination of an upright having a vertical guideway, a counterbalanced frame supported in said guideway, and a rotary brush journaled in said frame, substantially as described.

4. In a bathing-machine, the combination of a vertically-adjustable frame, a rotary brush journaled in said frame and provided with electrodes, an electric battery supported by said frame, and conductors connecting said battery and electrodes, substantially as described.



5. In a bathing-machine, the combination of a platform having folding sides, a perforated water-can or shower device suspended above said platform, a vertically-adjustable rotary brush provided with electrodes, an electric battery, and conductors between said battery and electrodes, substantially as described.

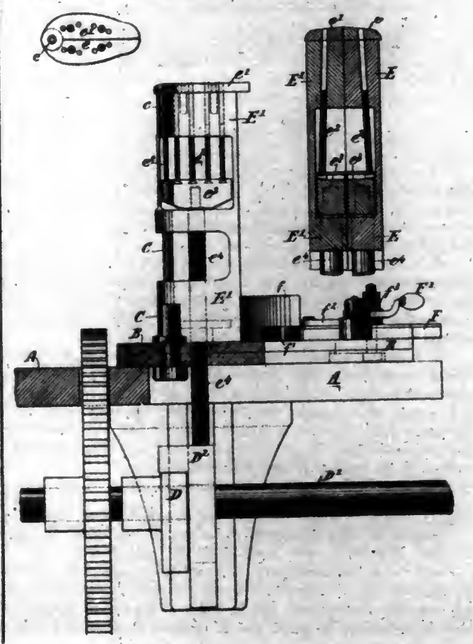
6. In a bathing-machine, a rotary brush provided with diagonal rows of bristles alternating with sponge or fiber, substantially as described.

7. In a bathing-machine, a rotary brush having a slot for the insertion of a towel, substantially as described.

8. In a bathing-machine, the combination, with a rotary brush, of a detachable rubber pad, 45, having teeth 46, substantially as described.

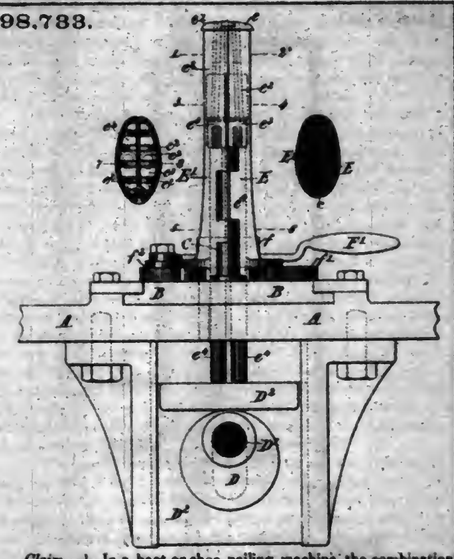
398,732. MASON'S FLOAT. GEORGE KAUTZ, Albany, N. Y., assignor to himself and Lewis A. Kautz, same place. Filed Aug. 22, 1888. Serial No. 283,460. (No model.)

Claim.—1. A mason's float consisting of a blade provided with a ridge, in combination with a handle and a pivoted clamp for binding the handle and ridge aforesaid, substantially as shown and described.



2. A mason's float consisting of a blade provided with a ridge, in combination with a handle, the respective ends of the handle being provided with a cam and lugs, *e e*, forming a recess for the reception of the ridge aforesaid, substantially as shown and described.

3. A mason's float consisting of a blade provided with a ridge, in combination with a handle, the respective ends of the handle being provided with a cam-lever and lugs, substantially as shown and described.



4. A handle for a mason's float, consisting of the bridge-body D *d d*, the caps E E, fixed to the ends *d d* aforesaid, each cap E being provided with one or more lugs, *e*, and a cam-lever, H, substantially as shown and described.

5. A mason's float consisting of the bridge-body D *d d*, the caps E E, fixed to the respective ends *d d* aforesaid, each cap E being provided with one or more lugs, *e*, and a cam-lever, H, in combination with a blade having a ridge, substantially as shown and described.

398,733. MACHINE FOR HEELING BOOTS OR SHOES. JOHN KRATZ, Bagnal, near Stoke-upon-Trent, County of Stafford, England. Filed Sept. 17, 1888. Serial No. 285,571. (No model.) Patented in England Dec. 11, 1883, No. 5,707; in France Jan. 12, 1884, No. 158,686; in Germany Jan. 22, 1884, No. 28,731; in Belgium Mar. 11, 1884, No. 64,474; in Italy Apr. 30, 1884, XXXIII, 190; in Spain June 20, 1884, No. 4,043, and in Austria-Hungary Oct. 27, 1884, No. 27,014.

398,733.

Claim.—1. In a boot or shoe nailing machine, the combination of a laterally-expanding post for supporting and centering the work, with receptacles at top for receiving the nails, and a set of drivers for supporting the nails in their receptacles, and means for thrusting up the nail-drivers to press the nails into the work, as and for the purpose above set forth.

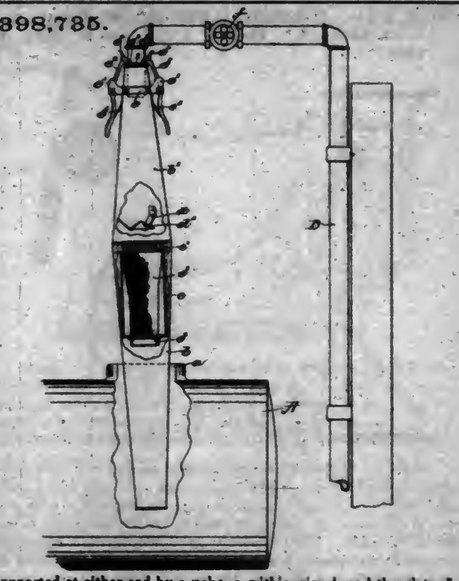
2. In a boot or shoe nailing machine, the combination, with a laterally-expanding post, of a presser-plate, rods, as *e*, drivers for thrusting the nails into work carried by the post, and an eccentric for raising the drivers operating upon the presser-plate and said rods substantially as specified.

3. In a boot or shoe nailing machine, the combination, with an expanding post formed with nail-receptacles inclining inward, of nail-drivers loosely attached to cross-heads carried by rods that are actuated by a vertically-sliding support, as and for the purpose above described.

398,734. MANUFACTURE OF SOFT HATS. JOHN R. KNAGGS, Bethnal Green, County of Middlesex, assignor to William Henry Greenwood, London, England. Filed Dec. 19, 1888. Serial No. 294,104. (No specimens.) Patented in England Sept. 17, 1888, No. 13,620.

Claim.—1. In the manufacture of soft felt or similar hats, the process herein described of proofing the hat-body, which consists in applying thereto a compound or mixture composed of a solution of shellac, gum-mastic, collodion, rubber, bisulphide of carbon, oil, and turpentine, and subsequently blocking and applying plush or similar fabric to the proofed body, substantially as set forth.

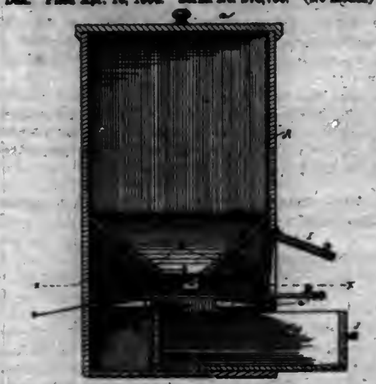
2. The process herein described of manufacturing soft felt or similar hats, which consists in preparing and proofing the hat-body, then blocking the same, then applying thereto a lather mixture composed of a solution of shellac, ammonia, mastic, thus, turpentine, rubber, bisulphide of carbon, and collodion, and finally applying a covering of plush or other fabric, substantially as set forth.



3. The process herein described of manufacturing soft felt or similar hats, which consists in preparing the hat-body and proofing it by applying thereto a compound or mixture composed of a solution of shellac, gum-mastic, collodion, rubber, bisulphide of carbon, oil, and turpentine, then blocking the body and applying thereto another mixture composed of a lather solution of shellac, ammonia, mastic, thus, turpentine, rubber, bisulphide of carbon, and collodion, and finally covering the same with plush or other fabric, substantially as set forth.

398,735. CONDUCTOR FOR STAND-PIPES. JOHN B. KENNEDY, Lynn, Mass. Filed Aug. 16, 1888. Serial No. 282,893. (No model.)

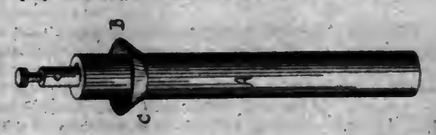
Claim.—1. The conductor or conveyer herein described, consisting of the tapering pipes *b b'*, joined at their larger ends by the collar *d'*, the tubular strainer *c*, distributer-plate *d'*, independent of and above said strainer, the yoke *c*, within one of the said pipes and attached to said collar to support said strainer at its ends, and the collar *c*, attached to the lower end of said yoke and containing a foraminous plate to form the bottom of the strainer, as and for the purpose set forth.



2. The conductor or conveyer herein described, consisting of the tapering pipes *b b'*, joined at their larger ends, the tubular strainer *c*,

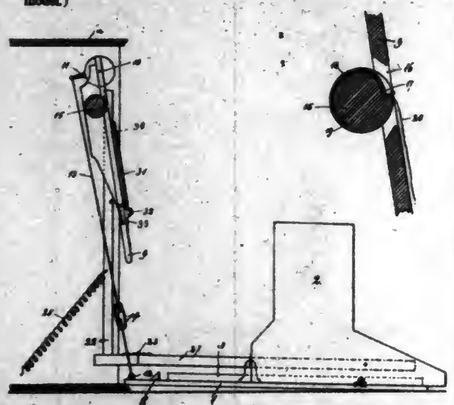
398,735.

supported at either end by a yoke, *c*, within pipe *b*, and the plate *d'*, above said strainer, combined with the engaging device comprising the ears *d'*, rigidly attached to the end of said pipe, spring-controlled levers *c*, pivoted thereto, and the projections *c*, by which to partly inclose and engage the discharge end or nozzle of a stand-pipe, as and for the purpose set forth.



398,736. FLOUR-CHEST. GEORGE KIRCHGRABER, St. Lawrence, Dak. Filed Apr. 16, 1888. Serial No. 270,709. (No model.)

Claim.—1. A flour-chest sieve consisting of the side pieces, C C, covered at the ends by woven wire, and the cross-pieces F F, supporting a bottom of woven wire, pockets *c c'* being thus formed to extend above and below the sieve-bottom.

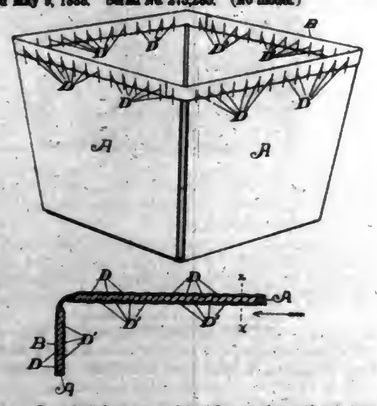


2. The combination of a flour-chest having side cleats, G G, and a sieve having cross-pieces F F, extended to rest on them, the cleats and cross-pieces on each side being separated by an intervening space, as shown, whereby the sieve may be put in or taken out, as described.

398,737. MERCURY-HOLDER FOR BATTERY-RINGS. WILLIAM P. KOOMBEY, Brooklyn, N. Y., assignor to the Koomgey Electric Company. Filed Aug. 13, 1888. Serial No. 282,626. (No model.)

Claim.—The combination of the zinc element of a galvanic battery and a cup partly or wholly of elastic material to hold a small quantity of mercury and attached to the zinc at or below the surface of the battery-liquid, substantially as described.

398,738. TYPE-WRITER CABINET AND COPY-HOLDER. CHAS. A. LEE, Herkimer, N. Y. Filed Sept. 10, 1887. Serial No. 249,305. (No model.)

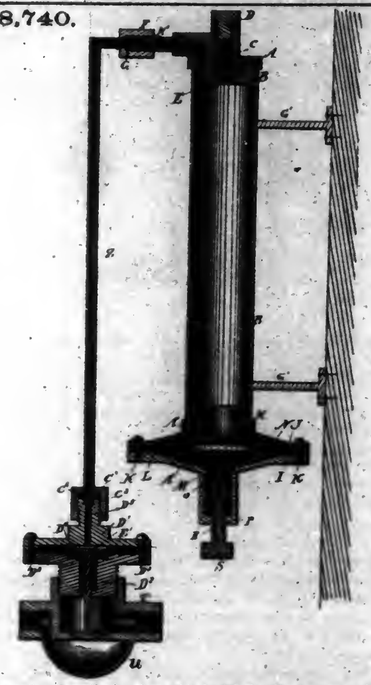


Claim.—1. A type-writer case having a swinging door and a type-writer mounted thereon, in combination with a swinging board journaled in the case having a bar mounted on the free ends of arms pivoted to the board and springs for holding the bar adjustably to the face of the board, a roller pivoted to the board having a clamping-bar held to the roller by a spring and adapted to receive the end of a copy-paper between the roller and bar, the crank-arm attached to the board, and a rod connecting the crank-arm and the door, substantially as set forth.

2. A type-writer case having a swinging door and a type-writer adjustably mounted thereon, in combination with a swinging board journaled in the top of the case having a bar mounted on the free ends of arms pivoted to the board and springs for holding the bar adjustably to the face of the board, a roller pivoted in the board having a clamping-bar held to the roller by springs for clamping the copy-paper and rolling it upon the roller, a ratchet-wheel on the roller, a movable rack engaging the ratchet-wheel, and a rule-jointed lever pivoted to the swinging door for operating the rack, substantially as set forth.

3. A type-writer case having a swinging door and a type-writer adjustably mounted thereon, in combination with a paper-holding device consisting of a swinging board journaled in the case, a device for holding the paper to the board, the crank-arm, and the connecting-rod connecting the crank-arm and the swinging door.

398,739. FRUIT-BOX. JOHN G. LETTELIER, Los Angeles, Cal. Filed May 9, 1888. Serial No. 273,285. (No model.)

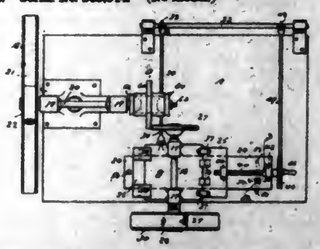


Claim.—In a fruit-box comprising the wooden strips A A and the trough B, fitted upon the ends of the strips, the creases D in the strips of wood, and the edges of the trough arranged alternately upon opposite sides thereof and extending from the edges of the trough toward, but not to, the end of the wooden strips within the trough and forming oppositely-alternating arches the bases and crowns of which fit upon and sustain each other.

398,740. THERMOSTAT. WILLIAM R. LEWIS, Corry, Pa. Filed Feb. 23, 1888. Serial No. 265,025. (No model.)

Claim.—1. In a thermostat, the combination, with a reservoir

398,740.



constructed as described and provided with the diaphragm at its lower end, of the threaded nut beneath the diaphragm and the right-and-left-threaded regulating-screw tapped in the bottom of the said reservoir and engaging the said nut, substantially as specified.

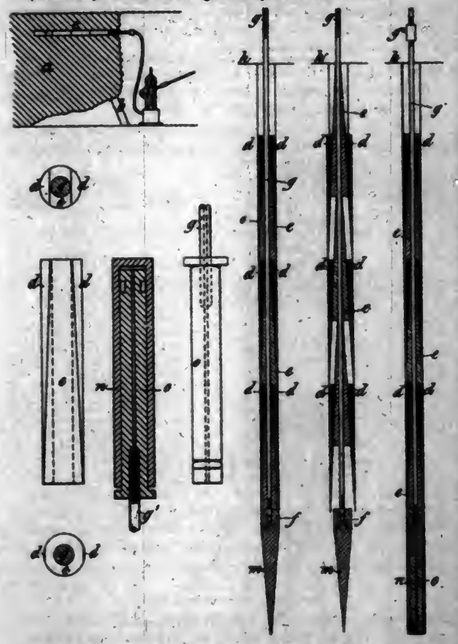
2. The combination, with a reservoir constructed as described, of the cap in the upper end of the said reservoir having a filling-aperture and the lateral branch provided with an outlet-aperture, the pipe Z, connected to the said branch, and the valve-regulating device secured to the lower end of the said pipe, substantially as specified.

3. In a thermostat, the combination, with the reservoir having the diaphragm at its lower end, threaded nut below the diaphragm, and the right-and-left-threaded regulating-screw, of the cap having the inlet and outlet aperture, the valve-regulating device, and the pipe Z, connecting the said valve-regulating device with the outlet-aperture of the reservoir, substantially as specified.

398,741. MACHINE FOR GRINDING ROTARY DISK CUTTERS. JOHN L. MORRISON and AMOS D. ROWE, Holyoke, Mass. Filed Sept. 18, 1888. Serial No. 285,314. (No model.)

Claim.—1. In a machine for grinding rotary cutter-disks, substantially as described, the combination, with a rotary holder-shaft on which to center the disk, of a carriage having mounted thereon a rotary grinding-wheel adjusted for a bearing by its edge against the face of said cutter-disk, and said carriage and grinding-wheel having a reciprocating traverse oblique to the plane of the disk-face, substantially as described.

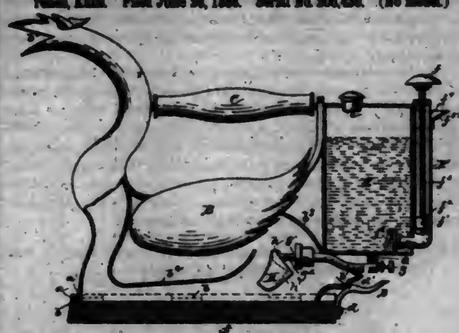
2. In a machine for grinding rotary cutter-disks, substantially as described, the combination, with a rotary holder-shaft on which to center the disk, of a carriage having mounted thereon a rotary grinding-wheel adjusted for a bearing by its edge against the face of said cutter-disk, and said carriage and grinding-wheel having a reciprocating traverse oblique to the plane of the disk-face, and also mounted for a slide in the direction of the axis of said holder-shaft, substantially as described.



3. The combination, with the rotary holder-shaft on which to center a cutter-disk, of a longitudinally-sliding carriage, 25, having thereon the traverse grinding-carriage *g*, linked at one end to the said carriage 25, and carrying the rotary grinding-wheel, a tilting lever, 33, and a connecting-rod between said lever and said grinding-carriage, substantially as and for the purpose described.

4. The combination, with the rotary holder-shaft on which to center a cutter-disk, of a longitudinal slideway, 24, a carriage, 25, adapted to slide on said way, the grinding-carriage mounted for a transverse slide on said carriage 25, and by one end linked thereto, a tilting lever, 33, and a connecting-rod between said lever and said grinding-carriage, and a screw-shaft having a screw engagement with said carriage 25, and a fixed bearing for free rotation on the slideway 24, and provided with a crank-handle, substantially as described.

5. The combination, with the rotary holder-shaft on which to center a cutter-disk, of a longitudinal slideway, 24, a carriage, 25, adapted to slide on said way, a screw-shaft, 40, having a screw engagement with said carriage 25, and a fixed bearing for free rotation on the slideway 24, and provided with a ratchet-wheel, the grinding-carriage mounted for a transverse slide on the carriage 25, and by one end linked thereto, a rocker-shaft, 32, having thereon the swinging levers 33 and 48, the connecting-rod 34 between the lever 33 and the grinding-carriage, and the pallet-rod 47, connected by one end to the said lever 48 and engaging by its other end the said ratchet-wheel, substantially as and for the purpose described.



6. The combination, with the carriage 25 and the grinding-carriage constrained for a curvilinear traverse thereon, substantially as described, of the eccentric 36 and rocker-shaft 32, the lever 33, intermediately fixed on said rocker-shaft, the connecting-rod 34, connected to the said grinding-carriage and to the upper end of said lever 33, and the connecting-rod 35, by one end engaging said eccentric and by its other connected to the lower end of said lever 33, all substantially as and for the purpose described.

398,742. APPLIANCE FOR BREAKING LOOSE OR SPLITTING ALL KINDS OF MINERALS. ENOCH MOULD, White Barn, near Newcastle, County of Stafford, England. Filed Feb. 16, 1888. Serial No. 264,309. (No model.) Patented in England July 13, 1886, No. 9,123.

Claim.—In mechanism for breaking and splitting coal, the combination, with the screw-threaded rod *g*, of the inner series of separate centrally-bored and internally-threaded wedges, *e*, superimposed one upon another around said rod and having their points turned outward all in the same direction, and the outer series of expanding wedges, *d*, surrounding the wedges *e* and having their points turned inward in a direction opposite to that of the inner wedges, *e*, whereby all the outer wedges, *d*, are simultaneously expanded at distinct points by the outward longitudinal movement of said inner wedges, substantially as described.

398,748. SELF-HEATING SAD-IRON. WILLIAM H. MULL, Lawrence, Kans. Filed June 26, 1888. Serial No. 278,420. (No model.)

Claim.—In the herein-described sad-iron, the oil-reservoir E, provided with the safety-plug *e* and air-pump F, connected therewith, and provided with the drip-cup f^3, air-inlet f^4, and outlet-valve f^5, hinged to its lower extremity, in combination with oil-pipe G, having valve *g*, the burner *g'*, secured to the inner end of the pipe G and provided with perforations g^2, the wedge-shaped spreading device H, secured to the end of the burner, the shield b^3, secured within the iron and located in close proximity to said spreading device, the base-plate A, and the hollow body portion B, provided with inlet and outlet ports b^3 and b^4, all arranged and adapted to operate substantially as described.

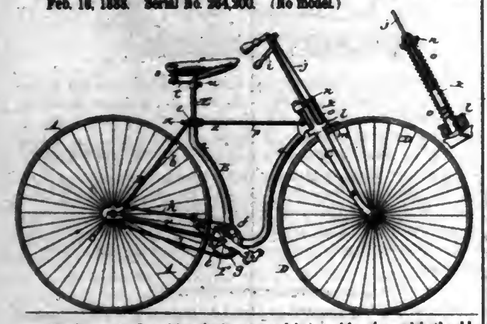
398,744. MAGNETIC REGULATOR. SAMUEL R. NUTTING, Chicago, Ill., assignor to the Nutting Electric Manufacturing Company, same place. Filed Dec. 3, 1887. Serial No. 256,926. (No model.)

Claim.—1. In a dynamo-electric machine or motor, an automatic governor moving toward the pole-pieces by the attraction of their magnetism against a resistance which increases more rapidly than said attraction, and diminishing the action of the pole-pieces on the armature as it approaches them, the planes of the governor and the pole-pieces being parallel, and the distance between them being variable, according to the varying attraction of the magnetism, substantially as described.

2. In a dynamo-electric machine or motor, an automatic governor moving toward the pole-pieces by the attraction of their magnetism against a resistance which increases more rapidly than said attraction, and also against the resistance of a retractor, which as the magnetism of the pole-pieces diminishes withdraws the governor, the planes of the governor and the pole-pieces being parallel, and the distance between them being variable, according to the varying attraction of the magnetism, substantially as described.

3. In a dynamo-electric machine or motor, the combination of an automatic governor, a bearing on which it is mounted, and links connecting the governor to fixed points, whereby the governor approaches toward and recedes from the pole-pieces in a spiral rotation, substantially as described.

4. In a dynamo-electric machine or motor, the combination of an automatic governor, a bearing on which it is mounted, a retractor, and links connecting the governor to fixed points, said links tending to a position parallel to the bearing of the governor as it reaches the point of its nearest approach to the pole-pieces, whereby the governor approaches the pole-pieces in a spiral rotation of increasing resistance, substantially as described.



5. In a dynamo-electric machine or motor, the combination of an automatic governor, moving in spiral rotation toward the pole-pieces by the attraction of their magnetism, and brushes to effect the connection in the circuit, said brushes being connected with the governor and rotatable therewith, substantially as described.

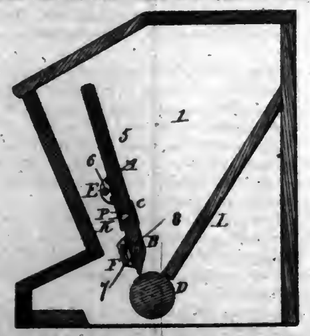
6. In a dynamo-electric machine or motor, the combination of an automatic governor, moving in spiral rotation toward the pole-pieces by the attraction of their magnetism, and brushes to effect the connection in the circuit, said brushes being connected with the governor and rotatable therewith in a direction that will move their ends

away from a line central between the pole-pieces as the governor approaches them, and toward a line central between the pole-pieces as the governor recedes from them, whereby the brushes co-operate with the governor in regulating the strength of the current in the circuit, substantially as described.

7. In a dynamo-electric machine or motor, the combination of an automatic governor moving toward the pole-pieces by the attraction of their magnetism against a resistance which increases more rapidly than such attraction, a spring-retractor, and an arm connecting the governor with the spring-retractor, whereby as the magnetism diminishes the retractor withdraws the governor from the pole-pieces, the planes of the governor and the pole-pieces being parallel, and the distance between them being variable, according to the varying attraction of the magnetism, substantially as described.

398,745. BICYCLE. HERBERT S. OWEN, Washington, D. C. Filed Feb. 16, 1888. Serial No. 264,200. (No model.)

Claim.—1. In a bicycle-frame, and in combination with the U-shaped bar *a*, the two carrying-arms for the rear wheel, each arm consisting of a continuous rod bent to an angular form, its two extremities rigidly attached to the bar *a* and its central or angular portion adapted to receive the axle of the wheel.



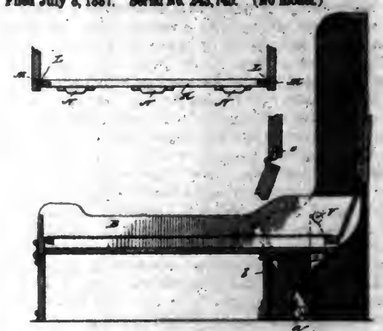
2. In a bicycle-frame, the wheel-carrying arms *b b'*, formed in a single piece and bent to form the axle-receiving slot *c*.

3. In combination with the brake-shoe, its tubular standard, the operating-rod *j*, and nut *n*.

4. In a brake for bicycles and the like, the brake-shoe having the tubular standard, in combination with the operating-rod adjustably secured thereto.

5. In a bicycle or tricycle, the seat consisting of the standard E, bent laterally at its upper end, the arm *t*, springs *s*, and flexible seat *r*.

398,746. FEED-REGULATOR. CARLISLE D. PATTERSON, Girard, Kans. Filed June 16, 1888. Serial No. 277,396. (No model.)

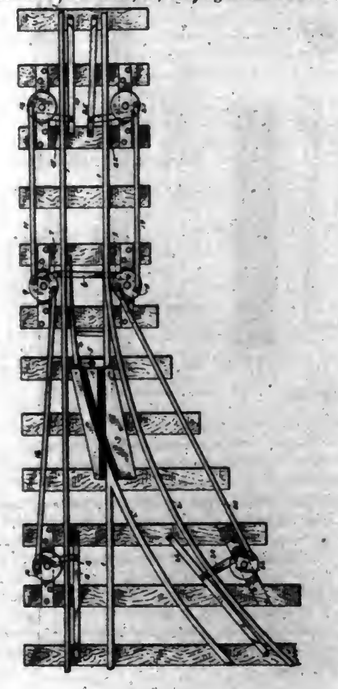


Claim.—1. In a feed-regulator, the combination of the hopper, the feed-roller arranged transversely therein, and the valve arranged above the roller and consisting of an upper section pivoted to and extending between the sides of the hopper and a lower section hinged to the upper section and also pivoted to and extending between the sides of the hopper, as set forth.

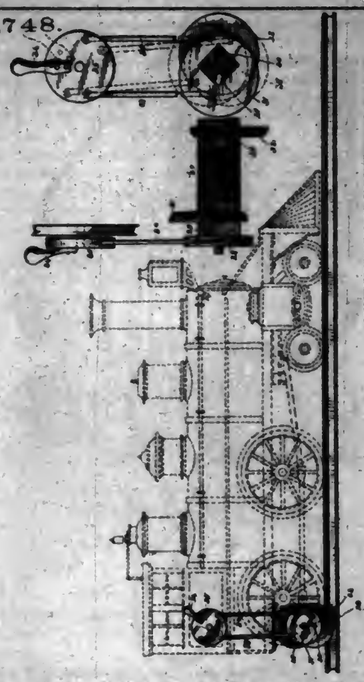
2. In a feed-regulator, the combination of the hopper and the valve arranged therein and consisting of an upper section pivoted to the sides of the hopper, the lower section hinged to the upper section and also pivoted to the sides of the hopper, and the guard secured to the upper section and projecting over the space between the adjacent edges of the two sections, as set forth.

3. The combination of the hopper, the valve pivoted in the hopper and composed of the upper valve-section having the brackets E on its front side, the said brackets being pivotally secured to the hopper, the lower valve-section hinged to the upper section, the brackets F on the front side of the said section and having the slots 7, and the retaining pins or screws passing through said slots into the casing of the hopper, as specified.

398,747. UPRIGHT OR FOLDING BED. DAVID J. POWERS, Chicago, Ill., assignor to the Union Wire Mattress Company, of Illinois. Filed July 8, 1887. Serial No. 243,745. (No model.)



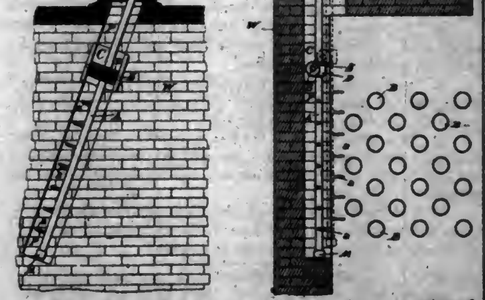
Claim.—1. In a folding bed, curved cams or plates vertically placed and facing to the rear on the stationary section of the bed, rollers attached to the sides of and near the inner end of the movable section adapted to engage with and travel against the rear faces of the cams, and arms that are pivoted to the folded section of the bed as a support for the latter, which are movably supported at or near the lower portion of the stationary section, so that when the bed is unfolded said arms incline outwardly and when the bed is folded their position is vertical, or approximately so.



2. In a folding bed, a movable section and a stationary section in which the movable section is supported on pivotal arms near the head thereof, and is provided with rollers or wheels, in combination with cams fixed to the stationary section, said cams having, respectively, an upper and lower seat or ogee curve adapted for partial retention of said wheels in either the raised or lowered position of the movable section, substantially as set forth.

398,748. AUTOMATIC RAILWAY-SWITCH. JOSHUA RENNER, Hagerstown, Md., assignor of one-half to Thomas E. Mittag, same place. Filed Jan. 4, 1888. Serial No. 259,775. (No model.)

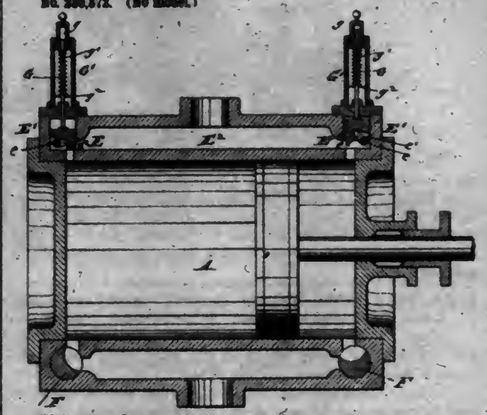
Claim.—A device for actuating an automatic switch of the kind described, consisting of a shaft, 27, carrying eccentrics 31 32, an end



398,748.

disk, 28, attached to said shaft, a disk, 35, provided with a hand-lever, and rods connecting the two disks, substantially as described.

398,749. BOILER-TUBE CLEANER. HARVEY D. RICE, Brooklyn, and ERNST VOLKMANN, New York, assignors to The Abendroth & Root Manufacturing Company, of New York, N. Y. Filed Aug. 1, 1888. Serial No. 281,653. (No model.)

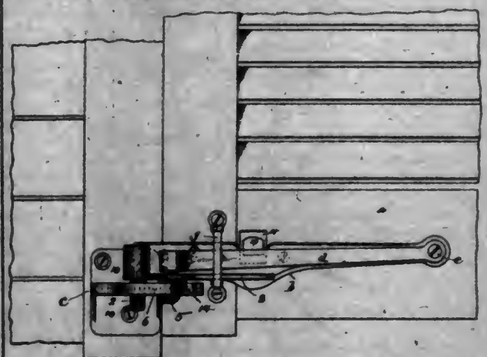


Claim.—The combination of a boiler-tube cleaner constructed, as described above, with a recess or pocket, P, in the side wall of the fire-chamber at right angles with the direction of the boiler-tubes, and a suitable mechanism, substantially as described, for revolving said cleaner and throwing it out of the recess P, as and for the purposes set forth.

398,750. ROLL-PAPER HOLDER AND CUTTER. ABBOTT G. ROSS, Cincinnati, Ohio. Filed July 23, 1888. Serial No. 280,758. (No model.)

Claim.—In a paper-roll holder of the character described, the combination, with the standards and their guides, of the friction-bar bearing directly on the roll of paper, and the tearing-knife supported on said friction-bar, but projecting in a plane above the same, so as to leave a clear space between the two and permit the web of paper to pass over the friction-bar and under the tearing-knife, whereby when the paper is drawn upward against the edge of the knife to sever it the remaining end will drop down by gravity away from the knife, in position to be grasped when the next sheet is desired to be removed, substantially as described.

398,751. VALVE-MOTION FOR CORLISS STEAM-ENGINES. GEORGE ROTHERMUNDER, New York, N. Y. Filed Nov. 3, 1888. Serial No. 289,572. (No model.)



Claim.—1. The combination, with a steam-cylinder and steam-chest, said steam-chest being provided with transverse guide-boxes, of spring-pressed rectilinear reciprocating inlet-valves, oscillating spindles operated by a bell-crank connection with the wrist-plate, and toes in said spindles engaging recesses of the valves, substantially as set forth.

2. The combination, with a steam-cylinder and steam-chest, said steam-chest being provided with transverse guide-boxes, of rectilinear reciprocating inlet-valves, oscillating spindles operated by a bell-crank connection with the wrist-plate, toes on said spindles engaging recesses of said valves, and spring-actuated rods that press on the top of said valves, substantially as set forth.

3. The combination, with a steam-cylinder and steam-chest having transverse guide-boxes, of rectilinear reciprocating inlet-valves guided in said boxes, oscillating spindles operated by a bell-crank connection with the wrist-plate, toes on said spindles engaging recesses of said valves, spring-actuated rods that press on the top of said valves and pass through the top plates of the valve-boxes, and guide-casings for said presser-rods, substantially as set forth.

398,752. LOCK-HINGE. CHARLES J. SEYMOUR, Brookline, Mass. Filed May 14, 1888. Serial No. 273,822. (No model.)

Claim.—In a locking-hinge, the combination of the fixed member composed of the horizontal plate or web having the central pintle-receiving socket, 12, the concentrically-arranged latch-receiving sockets 7 8 9, and the vertical ears or flanges 10 10, the swinging member composed of a shank or arm secured to the outside of a blind and having a pintle, 2, at one end and bent or offset near said pintle, and provided with the rib 3, having an orifice, 4, and the latch *d*, pivoted at one end to one end of the swinging member, and having at its swinging end the downwardly-projecting stud or bolt 5, adapted to pass through the orifice of the rib 3 and enter one of the sockets of

the fixed member, and also provided near its swinging end with the handle 13, adapted to project through the blind, all arranged and operating substantially as set forth.

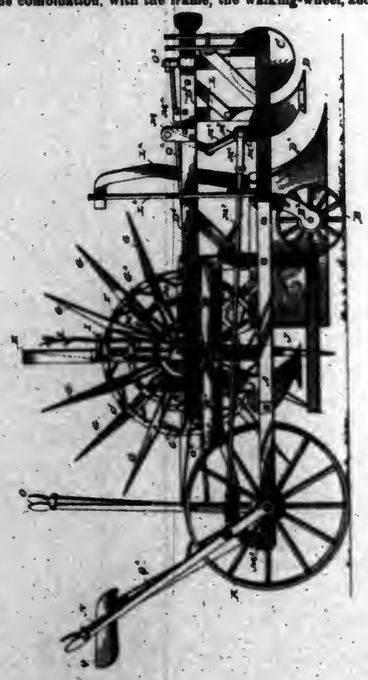
398,753. GRINDSTONE-FIXTURE. JOHN J. STUFFLE, Belleville, Tex. Filed Mar. 16, 1888. Serial No. 267,365. (No model.)

Claim.—In a fastening for grindstones, the combination of the shaft having the rounded collar and the screw-threaded portion, the stone fitting with its central perforation upon the shaft, the washer having the concave aperture fitting upon the collar, the washer having the set-screws, and the nut upon the threaded part of the shaft clamping the washers upon the stone, as shown, and for the purpose specified.

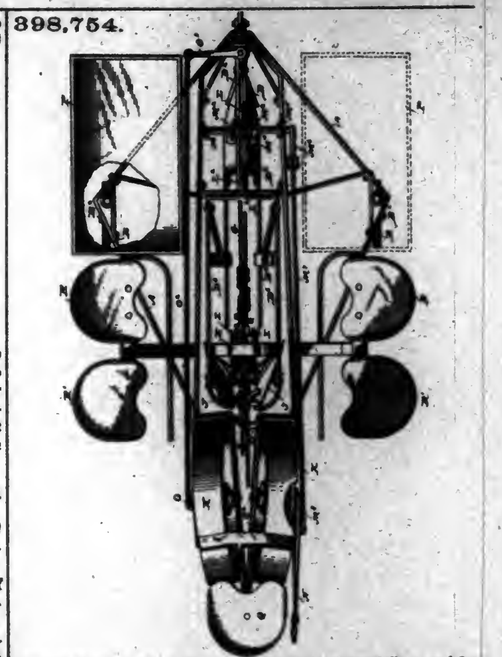
398,754. TREE-PLANTING MACHINE. THOMAS A. STRATTON, Lincoln, Nebr. Filed June 2, 1888. Serial No. 275,867. (No model.)

Claim.—1. The combination, with the walking-wheel provided with legs extended beyond the rim of said wheel, of the springs acting on said legs, substantially as described.

2. The combination, with the walking-wheel and its clamps, of stationary clamps in the path of the clamps on the wheel, substantially as and for the purpose described.



3. The combination, with the walking-wheel and the automatically-operating clamps carried thereby, of the stationary clamps in the path of the clamps on the wheel, substantially as described.



4. The combination, with the walking-wheel and its clamps, of the archway over said wheel, and a clamp on said archway, substantially as described.

5. The combination, with the walking-wheel, of clamps arranged alternately upon opposite sides of said wheel, the archway over said wheel, and the stationary clamps upon opposite sides of said archway, substantially as and for the purpose specified.

6. The combination, with the frame and the walking-wheel, of the plow, the subsoiler to the rear of the plow, and a coverer to the rear thereof, substantially as and for the purpose specified.

7. The combination, with the frame, the walking-wheel, and the

plow, of the subsoiler to the rear of the plow, substantially as and for the purpose specified.

8. The combination, with the frame and the walking-wheel, of the cutter, the plow to the rear of the cutter, and the subsoiler in the rear of the plow, substantially as described.

9. The combination, with the walking-wheel and the frame, of the cutter, the plow, the subsoiler to the rear of the plow, and the coverer to the rear of the subsoiler, substantially as described.

10. The combination, with the frame and the walking-wheel, of the plow and the subsoiler arranged in different horizontal planes, substantially as and for the purpose specified.

11. The combination, with the walking-wheel and the frame, of the rotary cutter, the plow, and the subsoiler, all upon different horizontal planes, substantially as shown and described.

12. The combination, with the frame and walking-wheel, of the cutter, plow, and subsoiler, and provisions for adjusting them simultaneously, substantially as described.

13. The combination, with the stationary frame, of the movable frame and the plow, subsoiler, and walking-wheel carried by said movable frame, substantially as described.

14. The combination, with the stationary frame, of the movable frame, the rotary cutter, the plow, the subsoiler, the walking-wheel, and the coverers, all carried by said movable frame, substantially as described.

15. The combination, with the stationary frame and the movable frame and its accessories, of the lever N, the crank-shaft M, the links M^2 M^3, and the rod M^1, substantially as described.

398,755. METALLIC THERMOMETER. JOHANN SUDMANN, Hamburg, Germany. Filed Dec. 12, 1887. Serial No. 257,656. (No model.)

Claim.—1. The combination, in a thermometer, of a supporting-frame having a bracket, a metallic strip secured at one end to the same, an indicator and its gearing mounted upon said support, a disk operating said gearing and having the fork-shaped drivers c c', pin l, and the pitman-connection between said drivers and metallic strip, substantially as set forth.

2. In a metallic thermometer, the combination of the pins l with the driving-disk d, having radial slots v, the movable plate d', provided with slots u, crossing those of the driving-disk, the pitmen c c', and

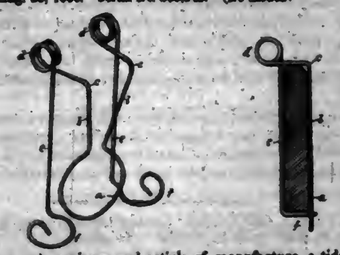
the thermometric strips, substantially as set forth, and for the purpose specified.

3. The combination, in a thermometer, of the movable frame A, thermometric strip connected at one end to the same, disk having the other end of said strip connected thereto, gearing and pointer operated by said disk, and the stationary bed-plate B, carrying the dial-work, substantially as set forth.

4. In a metallic thermometer having the driving mechanism secured to a movable frame, A, and the dial-work mounted on a stationary bed-plate, B, the combination of the eccentric c with the said stationary bed-plate and the said movable frame A, substantially as set forth, and for the purpose specified.

398,756. PACKING FOR PISTON-RODS. FRED P. SWAIN, Chicago, Ill. Filed Oct. 16, 1888. Serial No. 288,402. (No model.)

Claim.—1. The combination, substantially as set forth, of a metal wearing-ring composed of sections tongued together and an elastic backing-ring of greater breadth than the metal ring and connected thereto.

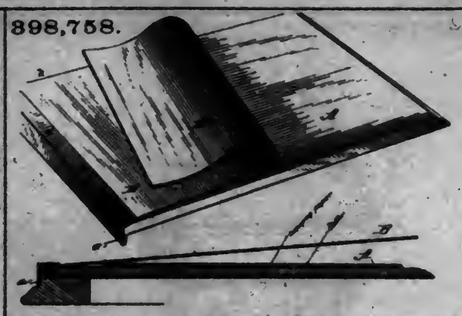


2. The combination, substantially as set forth, of a series of independent metallic wearing-rings having a bearing on the rod and an equal series of elastic backing-rings of greater breadth than the metal rings and each connected to its respective metal ring, whereby said metal rings are kept apart or spaced upon the rod.

3. The combination, substantially as set forth, of a series of independent metallic wearing-rings having a bearing on the rod, an equal series of elastic backing-rings of greater breadth than the metal rings and each connected to its respective metal ring to keep said metal rings apart, and one or more cork rings in the spaces between the metal rings.

4. The combination, substantially as set forth, of a metal wearing-ring, an elastic backing-ring, and a bridge-piece over the joint of the metal ring, between it and its backing, to protect the backing and keep the joint clear.

5. The combination, substantially as set forth, of a metal wearing-ring composed of segments tongued together, an elastic backing-ring, and a bridge-piece over each joint of the metal ring.

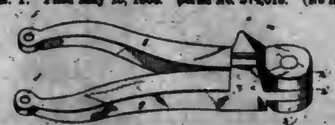


398,757. TIDY-HOLDER. JEROME B. SWEETLAND, Pontiac, Mich. Filed Aug. 23, 1888. Serial No. 283,545. (No model.)

Claim.—As an improved article of manufacture, a tidy-holder formed of a single piece of wire and consisting of a ring, a, the upwardly and outwardly extending portions b b, these two wires being bent abruptly backward at c, the horizontal spring-coil d d, formed on the ends of the said portions b b, the depending spring-actuated clamping-limbs e e, formed of continuations of the coils d d, these limbs leaving the coils at the front side thereof and projecting straight downward, thereby throwing the coils back out of the way, and the horizontal scrolls f f, formed on the lower ends of the limbs e e, substantially as herein shown and described.

398,758. PRESS-COPYING DEVICE. HUGO THUN, Grand Rapids, Mich. Filed Oct. 20, 1887. Serial No. 252,900. (No model.)

Claim.—1. In combination, the base-plate and a covering-flap connected thereto, said flap being flexible and arranged to cover the



plate, and by reason of said flexibility to lie directly upon all parts of the paper underneath, whereby pressure may be applied to all parts uniformly, substantially as described.

2. A device for copying letters, consisting of a base-plate and a flexible sheet, said sheet being movable in its relation to the base-plate and adapted to be used in connection therewith, substantially as described.

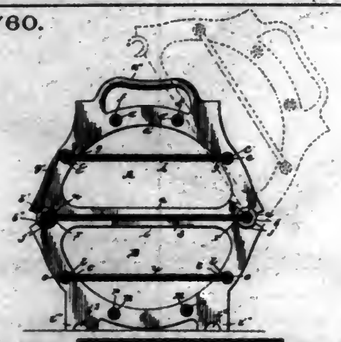
3. In the described device for copying letters, consisting of a base-plate and flexible sheet connected therewith and covering the upper surface, a flange extending downwardly from one end thereof, all substantially as described.

398,759. WIRE-STRETCHER. FREDERICK J. TOWNSEND, Painted Post, N. Y. Filed May 15, 1888. Serial No. 274,013. (No model.)

Claim.—1. The hereinbefore-described wire-stretcher, consisting of the lever having the curved bottom slot formed in one end, the nose-iron having teeth on one end and its other end curved or rounded, the staple provided with the hook and eye, the chain provided with a swivel-link, the elongated links connected with said swivel-link, the tongs having its handles connected with said elongated links, and the corrugated jaws projecting laterally from said handles, one of said jaws extending beyond the other and tapering to a blunt point, as set forth.

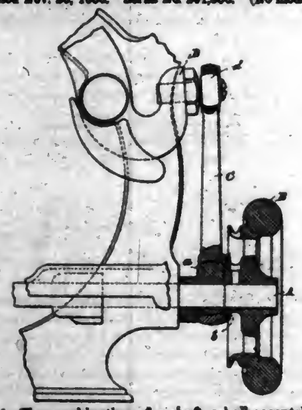
2. The combination, in a wire-stretcher, of the lever, the tongs having laterally-projecting jaws, one of which extends beyond the other and tapers to a blunt point, and a chain for connecting said lever and tongs, substantially as described.

3. The combination, in a wire-stretcher, of the lever, the tongs having laterally-projecting jaws, one of which projects beyond the other, and each of which is recessed on its inner face, the corrugated plates having the countersunk perforations adapted to fit said recesses, screws for securing said plates in the recesses, and a chain connecting said lever and the handles of the tongs, substantially as described.



4. The combination, in a wire-stretcher, of the tongs having the corrugated jaws projecting laterally therefrom, the faces of said corrugated jaws curving diagonally from corner to corner, and the corrugations trending backward at an acute angle to the body of the tongs, substantially as described.

5. The hereinbefore-described tongs for a wire-stretcher, consisting of the handles pivotally secured together at one end, and having the laterally-projecting jaws, said jaws having recesses formed in their contiguous faces, the plates adapted to fit said recesses and curving diagonally from corner to corner on their upper surfaces and having corrugations formed on said curved faces, said corrugations trending at acute angles rearwardly from the handles of the tongs, substantially as described.

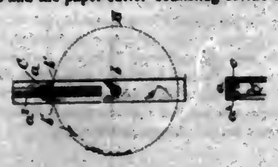


398,760. DISH-WASHER. STEPHEN WILES, Chicago, Ill. Filed July 16, 1888. Serial No. 280,130. (No model.)

Claim.—A dish-washer basket consisting of a top and bottom section hinged together on one side, having the top section formed of rigid end pieces, cushioned top rods, sectional cushioned side rods at the front and rear, and cushioned cross-wires from side rod to side rod, dividing the top lengthwise into regular spaces, and having the lower section formed of rigid end pieces, sectional cushioned front and rear side rods, sectional cushioned front and rear intermediate rods, cushioned bottom rods, and cushioned cross-wires for the front and rear top and intermediate side rods, dividing the bottom lengthwise into regular spaces coinciding with the spaces of the top section, substantially as and for the purpose specified.

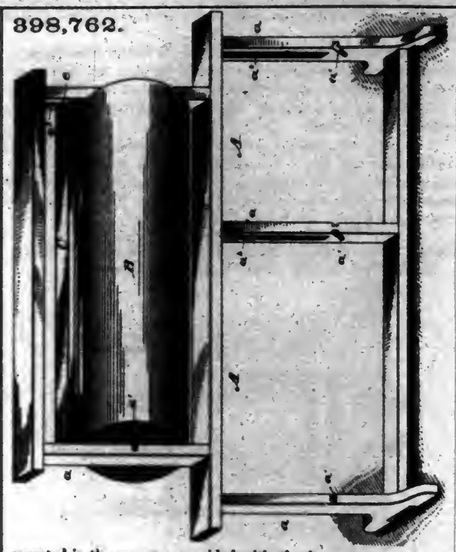
398,760.

398,761. CONNECTING-ROD. CHARLES H. WILLOUX, New York, N. Y., assignor to the Willcox & Gibbs Sewing Machine Company, same place. Filed Nov. 20, 1888. Serial No. 291,336. (No model.)



Claim.—1. The combination of a shaft, a ball-eccentric thereon, a connection-rod mounted on said eccentric and adapted to convey motion to a vibratory part, and a part—such as a flange—having a surface adjacent to said connection-rod, the latter being provided with a raised portion or edge on each side of the eccentric touching or nearly touching said adjacent part, and being cut away from the surface of said part on both sides of said raised portion or edge, so that said rod can oscillate on said eccentric on an axis parallel with said edge, but is prevented from oscillating in any other direction, substantially as described.

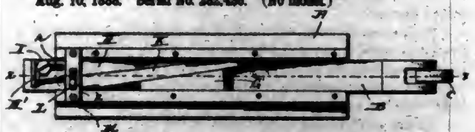
2. The combination of the shaft, ball-eccentric, vibrating lever, connection-rod for communicating motion from said eccentric to said lever and provided with an annular counterbored recess on one face, and a wheel on said shaft having a flange extending into said recess, the face of said recess adjacent to said flange being formed with a raised portion or edge touching or nearly touching said flange, and being cut away from the latter at an angle, so that the connection-rod can oscillate on an axis parallel to said raised portion or edge, but is prevented from oscillating on an axis perpendicular thereto, substantially as described.



398,762. ROLL-PAPER HOLDER AND CUTTER. GUSTAV WIEHEIN, Carlyle, Ill., assignor to Abbott Q. Ross, Cincinnati, Ohio. Filed July 31, 1888. Serial No. 281,578. (No model.)

Claim.—1. In a paper holder and cutter, the combination, with the roll of paper, of a weighted bar having a cutting edge or edges pressed by gravity against the periphery of said roll, and guides for the cutter-bar arranged in planes substantially parallel to the plane in which the cutter-bar presses against the roll, whereby binding of the cutter-bar is prevented during its up and down movements, due to any irregularity in the contour of the roll, substantially as described.

2. In a paper holder and cutter, the frame having the vertical grooves or ways and the paper-cutter consisting of the bar of metal



398,762.

mounted in the grooves, provided with the lower concave face, and bearing on the roll, substantially as described.

398,763. DOOR-CHECK. OWEN T. BOZER, Fort Worth, Tex. Filed Aug. 10, 1888. Serial No. 282,426. (No model.)

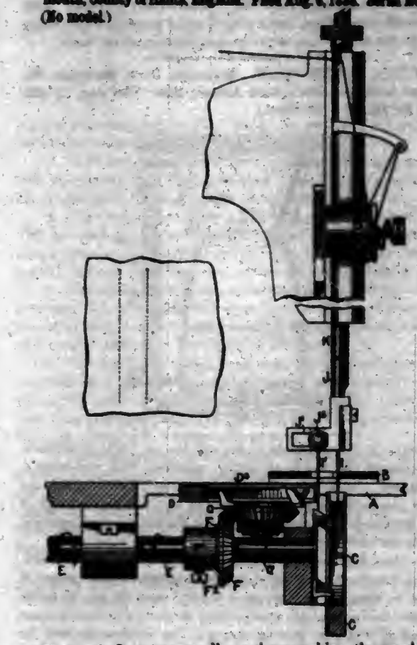
Claim.—1. In a door-stop, the combination, with a sliding bolt provided with a wedge-plate, of the longitudinally-movable catch or slide mounted on the bolt and the laterally-movably bar located between the adjacent sides of the wedge-plate and catch or slide, substantially as specified.

2. In a door-stop, the combination, with the sliding bolt provided with a wedge-plate, G, of the longitudinally-movable catch or slide having one of its edges adjacent to and parallel with the wedge-plate and the adjustable bar located between the adjacent edges of the wedge-plate and catch or slide and provided with a pin sliding in a suitable guide-slot, substantially as specified.

3. In a door-stop, the combination, with a sliding bolt provided with a wedge-plate, G, of the catch or slide H, mounted on the bolt and capable of a limited longitudinal movement, and the adjustable bar K, arranged between the adjacent edges of the wedge-plate and the catch or slide and tapered toward its lower end to fit the edges of the wedge-plate and catch or slide, the said adjustable bar being provided with a stud which operates in a suitable transverse guide-slot, whereby the bar is held from longitudinal movement, substantially as specified.

4. In a door-stop, the combination, with the spring-actuated sliding bolt provided with a wedge-plate, G, of the tapered catch or slide H, provided with a toe-hold, H', and the adjustable bar K, arranged between the wedge-plate and the catch or slide, substantially as specified.

398,764. CHECK-LOOP. EDWARD BARNARD, Rome, N. Y. Filed Nov. 16, 1888. Serial No. 291,052. (No model.)



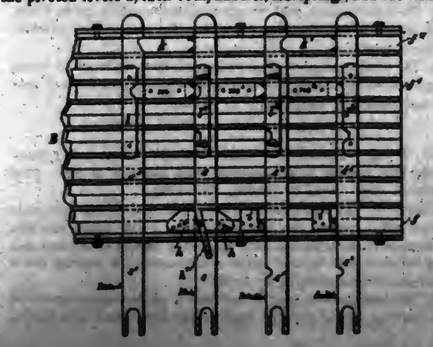
Claim.—1. In a checkrein-loop, the flat ear C, having a checkrein ring or bar attached thereto and provided with forwardly or inwardly turned hooks or tongues, and the flexible loop bearing at its ends against opposite sides of the said ear and provided with perforations engaging the hooks or tongues, substantially as and for the purpose specified.

2. The plate or ear C, having a checkrein ring or bar attached to its front end and provided with the hooks or tongues E E, and the loop D, bearing at its ends against opposite sides of the plate or ear

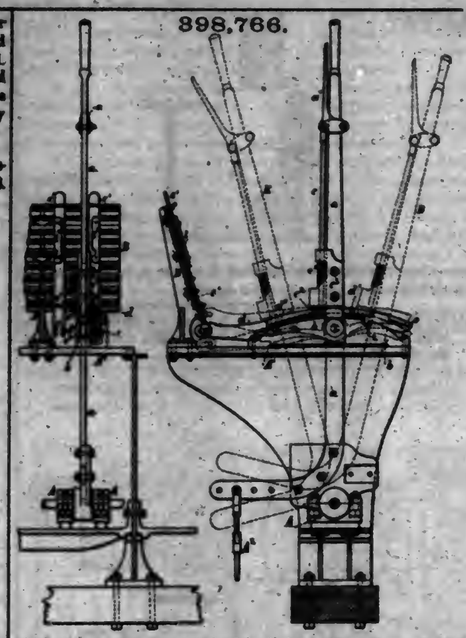
C and provided with the perforations *d d*, engaging the said hooks or tongues, and also with notches *d' d'*, engaging the rear side of the said checkrein ring or bar, substantially as and for the purpose specified.

3. As an improved article of manufacture, the herein-described checkrein hook or bar having a flat plate or ear provided on opposite sides with integral hook-shaped points or tongues E E, substantially as specified.

398,765. SEWING-MACHINE. EDWARD C. BEAR, Southland, Portsmouth, County of Hants, England. Filed Aug. 6, 1888. Serial No. 282,080. (No model.)



Claim.—1. In a two-needle sewing-machine, the combination, with the needle-operating mechanism of a two-needle sewing-machine and its two needles, of a shuttle-operating shaft carrying the usual shuttle for co-operating with one of the needles, a second shuttle arranged in a plane at right angles to the plane in which the first-named shuttle operates for co-operating with the second needle, and means for driving the second shuttle from the shuttle-shaft, all substantially as and for the purposes set forth.



2. The combination, with the needle-operating mechanism of a two-needle sewing-machine and its two needles, of a shuttle-operating shaft carrying the usual shuttle for co-operating with one of the needles, a second shuttle arranged at right angles to the first-named shuttle for co-operating with the other needle, a spindle, G', on which said shuttle is mounted, a gear on said spindle, and a second gear on the shuttle-operating shaft and engaging with the first-named gear, all substantially as and for the purpose set forth.

398,766. INTERLOCKING APPARATUS FOR RAILROAD SIGNALS AND SWITCHES. THOMAS W. DUDLEY, Long Island City, N. Y. Filed May 20, 1882. Serial No. 276,266. (No model.)

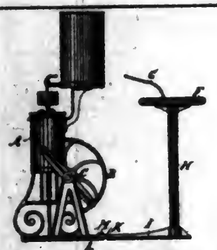
Claim.—1. The combination, in an interlocking apparatus, with the pivoted levers *a*, their rods, handles, and springs, and the frame to

398,766.

which the same are connected, of the lock-box frame B, set at a slight inclination from the vertical line, the locking-bars *c c'*, moving up through the same, the horizontal sliding bars *f f' f²*, the beveled lugs *h* upon the upper face of the bars *f*, the ribs *h'* upon the bars *e*, and dogs *i* upon the bars *f* and adapted to engage notches in the bars *d'*, and mechanism, substantially as specified, for operating the bars *c d'*, substantially as set forth.

2. The combination, in an interlocking apparatus, with the pivoted levers *a* and the frame to which the same are connected, of the lock-box frame B, set at a slight inclination from the vertical line, the locking-bars *c d'*, moving up through the same, the horizontal sliding bars *f f' f²*, the beveled lugs *h*, ribs *h'*, and dogs *i*, the bolt-bars *k k'*, the interlocking bars *l l' P P*, and the interlocking bolts *m m' m²*, and mechanism, substantially as specified, for operating the bars *c d'*, substantially as set forth.

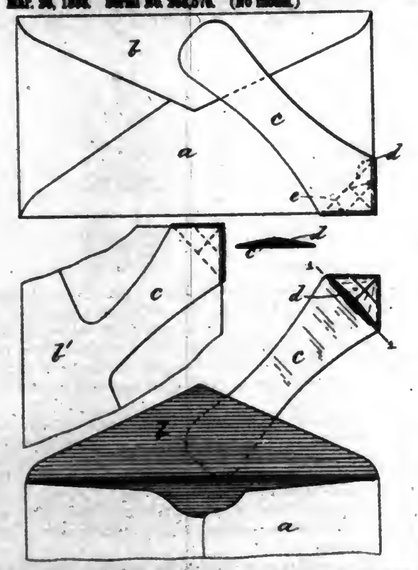
3. The combination, in an interlocking apparatus, with the pivoted levers *a* and the frame to which the same are connected, of the lock-box frame B, set at a slight inclination from the vertical line, the locking-bars *c d'*, moving up through the same, and the horizontal sliding bars *f f' f²*, moving through the grooves of the same, the interlocking bars *l l' P P*, connected upon the faces of the bars *c d'* and notched at convenient places, the interlocking bolts *m m' m²*, riveted upon one of the sliding bars *f'*, and having beveled elevated ends passing over the edges of the bars *c d'* and engaging with the notches or with the edges of the interlocking bars *l l' P P*, and mechanism, substantially as specified, for operating the parts, substantially as set forth.



4. The combination, in an interlocking apparatus, with the lock-box frame, the sliding bars passing through the grooves thereof, and the locking-bars *c d'*, passing across through said frame, of beveled lugs *h* upon one or more of the sliding bars *f*, the ribs *h'* on one or more of the locking-bars, the pivoted swinging ribbed segments *d*, to the slotted ends of which the lower ends of the locking-bars are directly pivoted, and mechanism, substantially as specified, for moving one of the locking-bars, and by said rib *h'* shifting the sliding bars, substantially as set forth.

5. The combination, in an interlocking apparatus, with the pivoted levers *a* and the frame to which the same are connected, of the lock-box frame B, the locking-bars *c d'*, moving up through the same, the horizontal sliding bars *f f' f²*, the interlocking bars *l l' P P*, and the interlocking bolts *m m' m²*, and mechanism, substantially as specified, for operating the locking and sliding bars, substantially as set forth.

398,767. MOTOR. CARL C. BONNESEN, Copenhagen, Denmark. Filed Apr. 2, 1888. Serial No. 269,498. (No model.) Patented in Norway Mar. 5, 1888, No. 861; in Italy Mar. 6, 1888, No. 23,105; in France Mar. 8, 1888, No. 189,123; in Belgium Mar. 8, 1888, No. 80,871, and in Denmark May 28, 1888.



Claim.—In centrifugals, the combination of the adjustable seat F and bed-plate I, with the double cranks E E, gearing B N, shaft O,

398,767.

worm-wheel P, worm Q, upright shaft R, holder A, and bed-plate L, substantially as and for the purpose described.

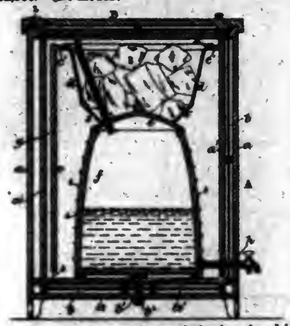
398,768. ENVELOPE. JESSE J. OGAN and BENNY A. SAID, St. Louis, Mo., assignors of one-third to Frank H. Hite, same place. Filed Mar. 26, 1888. Serial No. 268,576. (No model.)

Claim.—The combination of a tongue or tag projecting from the flap of an envelope and having a pocket, with the body of the envelope, substantially as and for the purpose described.

398,769. ELECTRIC-CIRCUIT COUPLER. STANLEY G. G. CURRIE, Philadelphia, Pa., assignor to the United Electric Improvement Company, Gloucester City, N. J. Filed Sept. 20, 1888. Serial No. 286,715. (No model.)

Claim.—1. The combination of the circuit-terminals and the cases of different lengths and widths, inclosing the terminals and insulated therefrom, substantially as hereinbefore set forth.

2. The combination, substantially as hereinbefore set forth, of the handle, two dissimilar cases secured thereto, insulating material, and circuit-terminals of different polarities similarly arranged in each case, and projecting from the insulating material, but protected by the case.

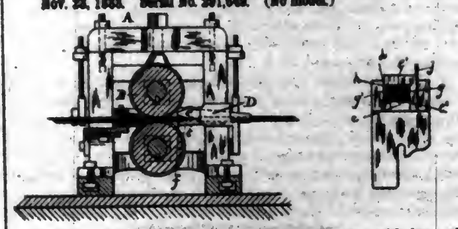


3. The combination, substantially as hereinbefore set forth, of two handles, two dissimilar cases secured to each handle, each case being adapted to interlock with the corresponding one of the opposite handle, insulating material in each handle, circuit-terminals of different polarities similarly arranged in each case, projecting from the insulating material and protected by the case.

4. An electric-circuit coupler, consisting of the combination, substantially as hereinbefore set forth, of the circuit-terminals and two dissimilar cases, arranged side by side, inclosing the circuit-terminals and extending beyond their outer ends.

5. The combination, substantially as hereinbefore set forth, of an electrical conductor projecting from a car, a handle connected therewith, two dissimilar cases connected with the handle, insulating material therein, circuit-terminals projecting from the insulating material, but protected by the case, and a corresponding handle carrying dissimilar cases, and circuit-connections on the adjacent car.

6. The combination, substantially as hereinbefore set forth, of the dissimilar overlapping cases, the symmetrically-arranged interlocking circuit-connections, and a stop, *d*, which prevents interlocking except with the connections in the proper relation, as set forth.



398,770. WATER-COOLER. NATHANIEL DAVIS, Montpelier, Vt., assignor to George L. Davis, North Andover, Mass. Filed Aug. 12, 1888. Serial No. 282,502. (No model.)

Claim.—1. The jacket or casing and the jar *f* and its outlet *h*, extended through the jacket or casing, combined with the cover *c*, for the jar, and the ice-chamber *d*, located immediately above the said cover, the cover forming the bottom of the ice-chamber, and an inlet-pipe for the said jar extended through the ice-chamber, substantially as shown and described.

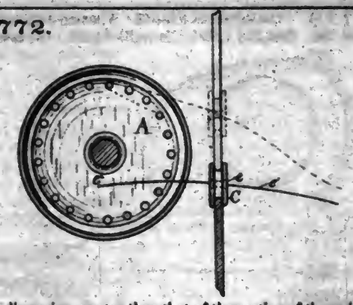
2. The jacket or casing having the walls subdivided as described, and having the inner partition, *e*, terminating above the bottom of said jacket to form an air-passage, combined with the jar, its outlet *h*, the cover, the ice-chamber immediately above and in close contact with it, and an inlet-pipe passing through the ice-chamber into the jar, substantially as described.

398,771. GUIDE FOR ROLLING-MILLS. PATRICK L. DAY, Cleveland, Ohio, assignor to the American Wire Company, of Ohio. Filed Nov. 23, 1888. Serial No. 291,649. (No model.)

Claim.—1. The combination, with an open-top guide-box, of a guide seated therein, substantially as set forth.

2. The combination, with an open guide-box and a guide fitting therein, of a detachable fastening connecting the two together, substantially as set forth.

3. The combination, with an open guide-box and a guide fitting therein, of a frictional fastening connecting the two together, substantially as set forth.



4. The combination, with an open guide-box and a guide fitting therein, of a wedge detachably fitted between adjacent walls of said guide and guide-box, substantially as set forth.

398,772. DEVICE FOR REELING WIRE. PATRICK L. DAY, Cleveland, Ohio, assignor to the American Wire Company, of Ohio. Filed Nov. 23, 1888. Serial No. 291,650. (No model.)

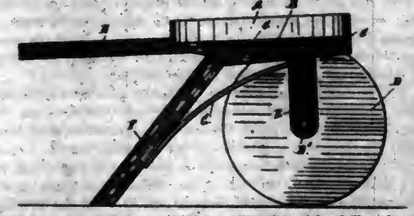
Claim.—1. The combination, with a reel and a reel face-plate provided with a vertical slot, of a guide fitted in the latter, said slot being located in the same line with the central portion of the reel, and having its lower end located below a horizontal line passing above the reel-axis, substantially as set forth.

2. The combination, with a reel and a guide-support provided with a vertical slot, of a guide fitted in the latter, said slot having

398,772.

vertical dimension greater than that of the portion of the guide which fits therein, substantially as set forth.

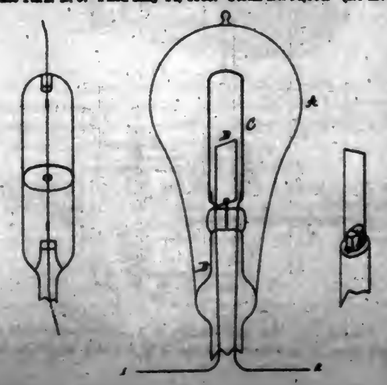
3. The combination, with a reel and a guide-support provided with an opening, of a guide having an annular bearing which loosely fits in said opening, substantially as set forth.



4. The combination, with a reel and a guide-support provided with an opening, of a guide having its central portion loosely fitted in said opening, and having front and rear flanges which respectively overlap the corresponding walls of the slot, substantially as set forth.

5. The combination, with a reel and a guide-support provided with a vertical slot, of a guide having an annular bearing loosely fitted in the latter, said slot having its vertical dimension greater than that of said annular bearing, substantially as set forth.

6. The combination, with a reel and a guide-support provided with a vertical slot, of a guide having its central portion fitted in said slot and of less vertical dimension than the latter, said guide provided with front and rear flanges respectively overlapping the corresponding walls of said slot, substantially as set forth.

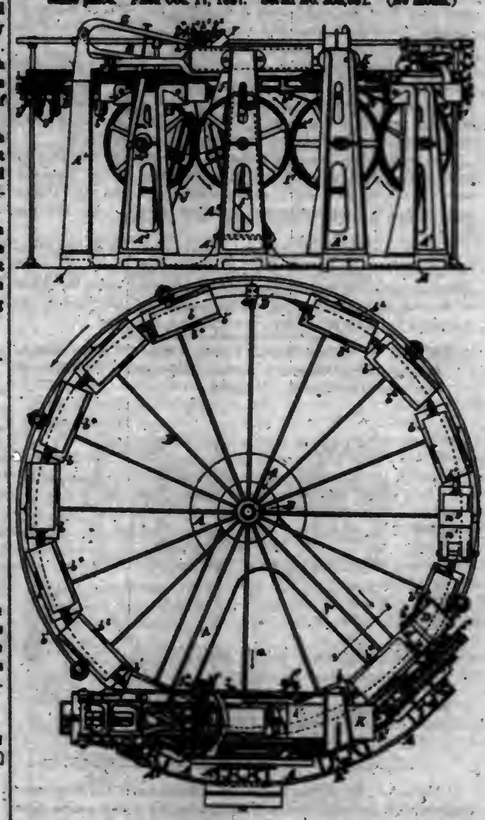


7. The combination, with a reel and a guide-support provided with a vertical slot formed in the same line with the central portion of the reel, of a guide having its central portion loosely fitted in said slot and of less vertical dimension than the latter, said guide formed with front and rear flanges respectively overlapping the corresponding faces of the slot-walls, substantially as set forth.

398,773. WHEELBARROW. JOHN DUPUY, San Francisco, Cal. Filed July 17, 1888. Serial No. 280,194. (No model.)

Claim.—In a wheelbarrow, the combination of the thills or handles B B, the hopper A, carried thereby, the vertically-depending hangers E E, secured to the outer ends thereof, the large wheel D, whose axle is journaled in said hangers, the inclined legs F F, secured to handles B B, and the stiffening-braces G G for the legs, substantially as described.

398,774. INCANDESCENT ELECTRIC LAMP. THOMAS A. EDISON, Menlo Park, N. J. Filed May 14, 1888. Serial No. 94,891. (No model.)



Claim.—1. In an incandescing electric lamp, the combination, with the incandescing conductor, of solid insulating material interposed between its terminals and adapted to prevent the formation of an arc between said terminals, substantially as set forth.

2. In an incandescing electric lamp, the combination, with the arched or looped conductor, of an insulating-plate interposed between the terminals of said conductor and adapted to prevent the formation of an arc between said terminals, substantially as set forth.

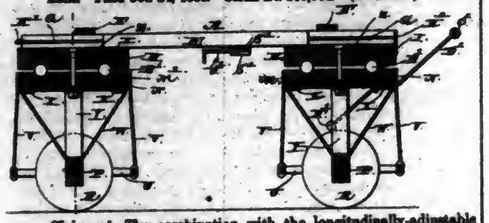
3. In an incandescing electric lamp, the combination, with the arched or looped conductor and the glass stem or wire support, of an insulating-plate interposed between the terminals of said conductor and supported from said wire support and adapted to prevent the formation of an arc between said terminals, substantially as set forth.

4. In an incandescing electric lamp, the combination, with the arched or looped conductor and the glass stem or wire support, of an insulating-plate having its edge inserted in the glass of said support and extending up between the terminals of said conductor and adapted to prevent the formation of an arc between the terminals, substantially as set forth.

398,775. MACHINE FOR LABELING CANS. MARTIN V. B. BRIDGE, Boston, Mass., assignor of nine-twentieths to Albert Leavitt, same place. Filed Oct. 17, 1887. Serial No. 252,681. (No model.)

Claim.—1. The can-carrier F, provided with one or more clamps, f^3, each mounted on a spindle provided with a pinion, f^5, which is connected to the spindle by a friction-brake, and one or more racks, f^4, the spindles of the clamps f^3 being movable endwise through the pinions f^5, all arranged and operating substantially as and for the purpose set forth.

2. The herein-described combination of a pack-carrier with pasting apparatus and the wiper n^2, mounted to engage the pasty surface of the pack on the carrier, all arranged and operating substantially as and for the purpose set forth.



3. In combination, the endless pack-carrier, pasting apparatus, and can-carrier, all arranged and operating substantially as described.

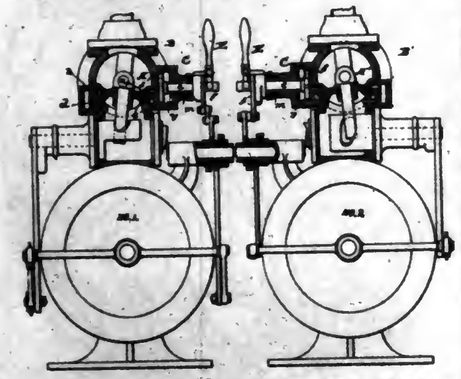
4. The pack-holder *h*, in combination with the clamp-screw h^2 and a cord, 2, and spring 3, or its equivalent, for elevating the pack-holder, and means, substantially such as described, for tightening and releasing the clamp.

5. In a can-labeling-machine, a can-carrier moving in guides, in

combination with a pack-holder arranged to bring the surface of the pack when in the holder slightly inclined to the guides of the car-carrier, all substantially as and for the purpose specified.

398,776. BIER. JOHN W. FINCH and JOHN R. PARK, Clay Centre Kans. Filed Oct. 24, 1888. Serial No. 289,004. (No model.)

Claim.—1. The combination, with the longitudinally-adjustable members B C, of the tabular sleeves I', secured on the sides of one of the members, and the rods K', secured to the other member, and having their arms engaging the sleeves, substantially as described.



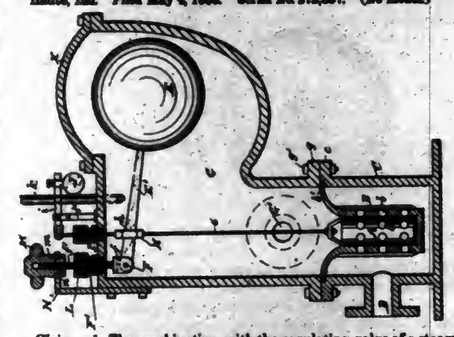
2. The combination, with the members B C, having the overlapping bars E, of the clamp-arms S', engaging the sides of the members, and the lever U', connected eccentrically to the inner ends of the said clamping-arms, substantially as described.

3. The bier having the body provided with the plates at its ends, the trucks having the circular disks or plates, the king-bolts centrally pivoting the trucks under the body-plates, and the anti-friction wheels engaging grooves in the opposing sides of the body and truck plates and concentric with the king-bolts, substantially as described.

4. In the truck, the combination of the plate, the standards depending therefrom, the axle secured to the lower ends of the standards, and the braces W and Y, arranged at right angles with relation to each other and connecting the plates with the axle, substantially as described.

5. The combination of the plate, the standards depending therefrom, the axle secured to the lower ends of the standards, and the W-shaped brace Y, having its central portion arranged under the center of the plate and its outer ends bearing against the outer sides of the standards and secured thereto, substantially as described.

398,777. STEAM-ENGINE VALVE. PERCY R. FOSTER, Brooklyn, N. Y., assignor to Marshall T. Davidson, same place. Filed June 26, 1888. Serial No. 278,313. (No model.)



Claim.—1. In a duplex engine, the combination of auxiliary-valve chests having flat valve-faces and communicating with the main-valve chests through ports, flat-faced auxiliary valves fitted to the said valve-faces, to and from which they are adjustable, and provided with ports adapted to register with the aforesaid ports, and connections with the engines whereby the said auxiliary valves are rocked, substantially as set forth.

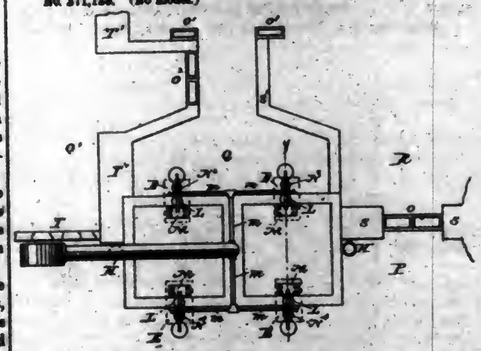
2. In a duplex engine, the combination of the auxiliary-valve chests having flat valve-faces and communicating with the main valves through steam-ports, the flat valves B^3, fitted to the said valve-faces and provided with steam-ports, and sliding and oscillating rods upon which the said valves are mounted, substantially as set forth.

3. In a duplex engine, the combination of the auxiliary-valve chests having flat valve-faces perforated to form the steam-ports *f*, *e*, and *e'*, the flat valves B^3, fitted to the said valve-faces below the ports *f* and covering the ports *e* and *e'*, and provided with the ports *n* and *n'*, adapted to be brought to register with the ports *e* and *e'*, and the sliding and oscillating rod upon which the valves are mounted, substantially as set forth.

398,778. STEAM-BOILER FEEDER. WINFIELD O. GORDON, Terre Haute, Ind. Filed May 4, 1888. Serial No. 273,237. (No model.)

Claim.—1. The combination, with the regulating-valve of a steam-boiler feeder, of a lever and a float for operating the valve, and a hand-actuated screw for altering the position of the fulcrum of the said lever, thereby permitting the water-level of the boiler to be changed, substantially as and for the purpose set forth.

2. The combination, with the regulating-valve of a steam-boiler feeder, of a lever and a float for operating the valve, an adjustable fulcrum for said float-lever, and a weight for counterbalancing the said valve and float when the float is supported at any desired water-level, substantially as and for the purpose set forth.

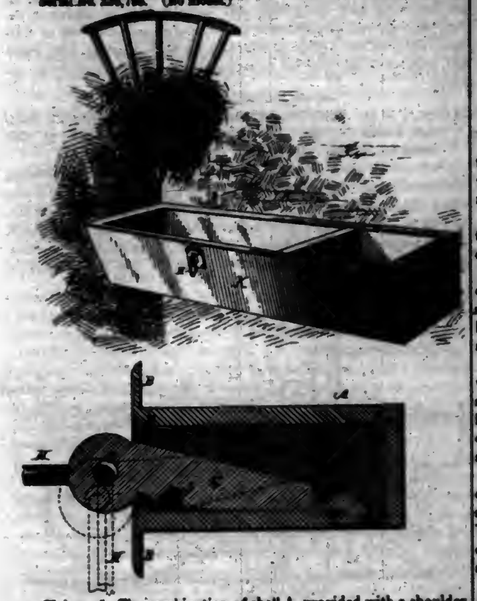


3. The combination, with the regulating-valve of a steam-boiler feeder, of a lever and a float for operating the valve, and an adjustable fulcrum for the said float-lever, substantially as and for the purpose set forth.

4. The combination, with the regulating-valve of a steam-boiler feeder, of the valve-stem connected to the valve, the float, the float-lever operatively connected to the said valve-stem, the vertical screwed spindle provided with a fulcrum-pin for the float-lever, and a revoluble screw-threaded sleeve for adjusting the position of the vertical spindle, substantially as and for the purpose set forth.

5. The combination, with the regulating-valve of a steam-boiler feeder, of the valve-stem connected to the valve and provided with a yoke, the float, the float-lever provided with an enlargement engaging with said yoke, the screwed spindle projecting through the float-casing and provided with a fulcrum-pin for the lever at its lower end, a standard secured outside the float-casing, and a revoluble screw-threaded sleeve journaled in the standard for operating the said spindle, substantially as and for the purpose set forth.

6. The combination, with the regulating-valve of a steam-boiler feeder, of the valve-stem connected to the valve, the float, the float-lever operatively connected to the said valve-stem, the vertical screwed spindle provided with a fulcrum-pin for the float-lever, a revoluble screw-threaded sleeve for adjusting the position of the vertical spindle, a lever pivoted to the end of the valve-stem, a stand pivotally supporting the said lever, and a weight upon the free end of the said lever for counterbalancing the regulating-valve and other moving parts when the float is supported at the water-level, substantially as and for the purpose set forth.



398,779. SUPPLY OF WATER TO WATER-MOTORS. JOHN H. HAGERTY, Lowell, Mass. Original application filed Jan. 16, 1888, Serial No. 260,850. Divided and this application filed Apr. 19, 1888. Serial No. 271,129. (No model.)

Claim.—1. The combination of a water-motor with a water-supply area, R, in which the water is of variable height by means of the supply-pond P, the waste-pond or drainage area Q', the intermediate discharge-pond, Q, the dams S S'-T T, and gates O O' O^2, substantially as described.

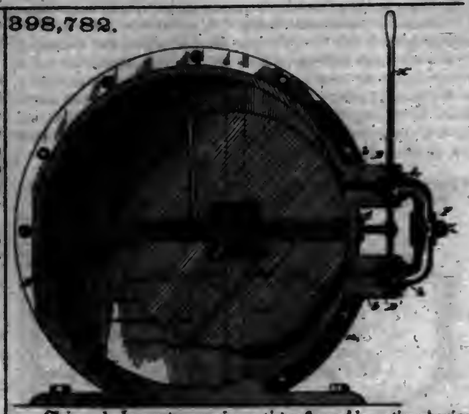
2. The combination of the supply-pond P and the drainage area Q' with a water area in which the water is of variable height by means of the dam S and gate O and dam T and the interposed water-motor and waste-pond Q, said waste-pond Q being separated from the water area R by the dam S' and from the drainage area Q' by the dam T, and connected at will with said water area R by the gates O' and with the drainage area Q' by the gate O^2, all in combination with each other, substantially as and for the purpose described.

398,780. HITCHING DEVICE. MATTHEW HIRST, Philadelphia, Pa., assignor to Louis De Geer, New York, N. Y. Filed Feb. 7, 1887. Serial No. 226,788. (No model.)

Claim.—1. The combination of shell A, provided with a shoulder to stay the bolt C, tilting bolt C, a catch, D, to engage with said shoulder, and depressor F, bearing upon said bolt to depress the inner end and elevate the outer end thereof, substantially as described.

2. The combination of shell A, having a recess, E, provided with a shoulder to stay the bolt C, tilting bolt C, provided with a friction-wheel and having a catch adapted to engage with said shoulder, and depressor F, bearing upon bolt C to depress the inner end and elevate the outer end thereof, substantially as described.

398,781. ADJUSTABLE ANGLE-TROWEL. FRANCIS T. HOVEY, Homer, N. Y. Filed Dec. 5, 1888. Serial No. 292,730. (No model.)



Claim.—A corner-trowel consisting of the hinged leaves, the overlapping short arms and their securing-bolts and nuts, the overlapping long arms, the handle E, and the securing and strengthening headed rod, and nut *f'*, substantially as set forth.

398,782. ROTARY ENGINE. LEWIS C. HINES, Hinsdale, assignor, by direct and mesne assignments, to Ramsey B. Ayres, Hammondsport, N. Y., John H. Hosie, Scranton, Pa., and the Hosie Motor Company, (Limited.) Filed Mar. 2, 1888. Serial No. 266,716. (No model.)

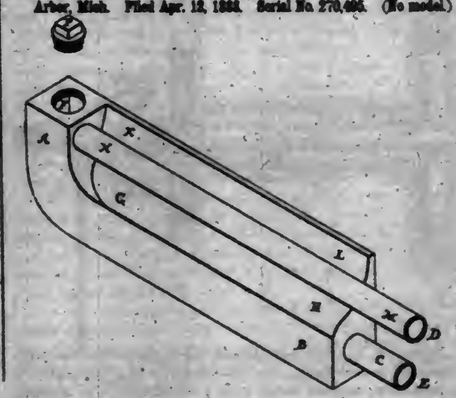
398,782.

Claim.—1. In a rotary engine, a piston formed in sections having their inner edges constructed to loosely interlock with each other, whereby such sections are connected together, and yet may move to a limited extent independently of each other, substantially as set forth.

2. In a rotary engine, the casing and the head having a way for the piston, combined with said piston fitted to the way and formed of sections loosely yoked together, substantially as set forth.

3. In a rotary engine, the combination of the casing, the head or drum having a way for the piston, and the sectional piston fitted to said way, and having its sections provided at their inner edges with interlapping portions, whereby they are yoked together, substantially as set forth.

4. The combination of the casing, the drum or head having a way for the piston and provided with steam ports or channels intersecting said way, and the piston formed in sections having bearings in advance of their inner ends, such bearings facing toward the outer ends of the piston, whereby steam acting on said bearings may operate to draw the pistons inward, substantially as set forth.



5. In a rotary engine, the combination of the casing, the head or drum having channels $n' n^2$ and a way for the piston, and the piston-sections O' O^2, the section O' being provided at its inner end with a T-like head, and the section O^2 having at the opposite sides of its inner end L-shaped portions engaging the T-head of the section O', substantially as set forth.

6. The combination, with the casing and the head or drum therein, of the independent valve-chambers communicating with the casing on opposite sides of the abutment, independent steam and exhaust valves in each of said chambers, a lever connecting the exhaust-valve of one chamber with that of the other, and a lever connecting the steam-supply valve of one chamber with that of the other, all substantially as and for the purposes specified.

7. In a rotary engine, the combination, with the head or drum, of the piston-section sliding therein and provided with a bearing arranged and adapted to receive steam-pressure in such manner as to draw the piston-section inward, substantially as and for the purposes specified.

8. The combination of the casing, the drum having way *n* and ports or channels $n' n^2$, and the sectional piston constructed to provide steam-chambers P P', substantially as set forth.

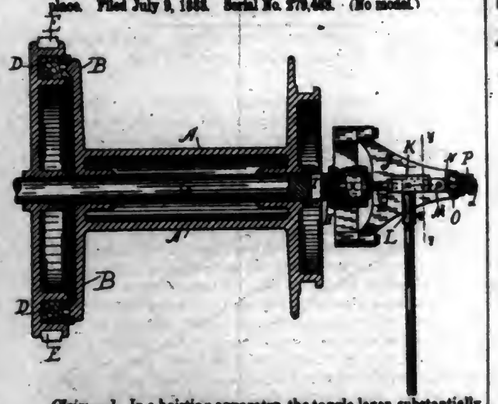
398,783. WATER-FRONT FOR STOVES. TITUS P. HUTZEL, Ann Arbor, Mich. Filed Apr. 12, 1888. Serial No. 270,495. (No model.)

Claim.—A water-back casting, A B, as shown, with a curved and sloping surface, H G K L, which is adapted to have the outlet-pipe N M of the water-back pass in front of it, with an offset at the end A, as represented, for receiving this outlet-pipe N M, a clean-out hole, F, to facilitate cleaning and molding said casting A B, with its closing device, as the plug P, and an inlet for the pipe C, in combination with the said outlet-pipe N M, detachably secured, for the purposes specified, as shown and described.

398,784. HYDRAULIC JACK. FRANK I. JOYCE, Dayton, Ohio. Filed Apr. 12, 1888. Serial No. 270,499. (No model.)

Claim.—1. In a hydraulic jack, the ram-head 11, having both inlet-valve 22 and outlet-valve 14 placed therein, as and for the purposes specified.

2. In a hydraulic jack, the combination, with the chambers 25 and 26, of the ram-head 11, having an inlet-valve chamber, 19, and a passage, 24, leading from the extreme side of the chamber 25 to the inlet-valve chamber 19, to permit the working of the jack in a horizontal or inclined as well as in a perpendicular position, substantially as described.



3. In the pump of a hydraulic jack, the combination, with the ram-head 11, having inlet and outlet valves located therein, and a side passage, 24, provided with valve 22, of a plunger, 1, having the inverted cup-packing 2', for the purpose of securing a perfect vacuum in the plunger-chamber, substantially as described.

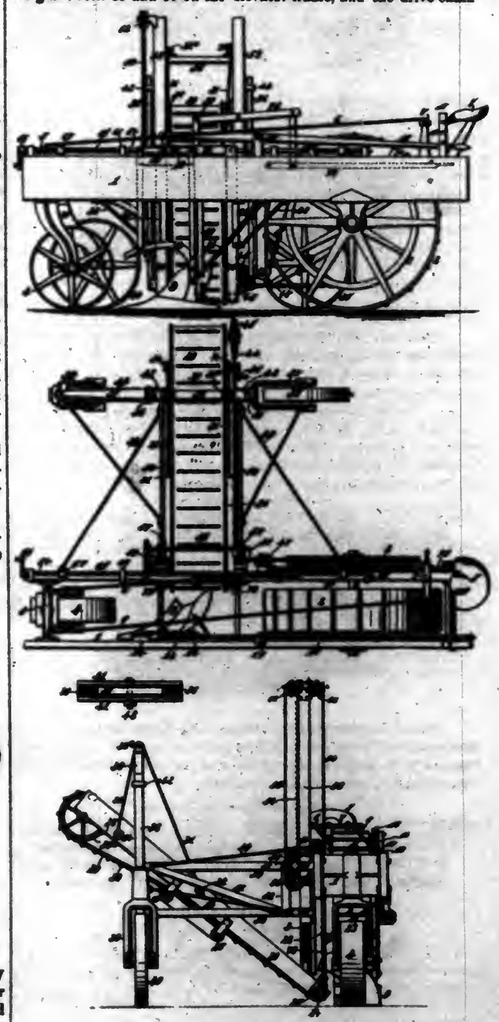
4. In a hydraulic jack, the combination, with the chambers 25 and 26, of the ram-head 11, having valve-chambers 15 and 19, plunger-chamber 17, and passages 24 and 18, leading from the chamber 25 through said valve-chambers to the plunger-chamber, the valves 14 and 22, having stems 13 and 23, the valve-springs 12 and 21, and the plunger 1, having an inverted cup-packing, 2', and provided with a lug, 28, substantially as described.

5. In a hydraulic jack, the combination of the tubes C H, the chambers 25 and 26, the ram-head 11, having valve-chambers 15 and 19, plunger-chamber 17, and passages 24 and 18, leading from the side of the upper chamber, 25, through the valve-chambers 19 and 15, into the plunger-chamber, the valves 14 and 22, having stems 13 and 23, the nuts 10 and 20, and springs 12 and 21, for supporting said valves, the plunger 1, provided with lug 28 and packing 2 and 2', and the packing 30 and nut 31 at the lower end of the ram-head, substantially as described.

6. In a hydraulic jack, the combination, with the head J and plunger 1, of the bosses K L, the rock-shaft 4, having journals 5, supported in said bosses and provided with cranks 6 and 9, the packing-rings M N, and the jam-nuts P Q, substantially as described.

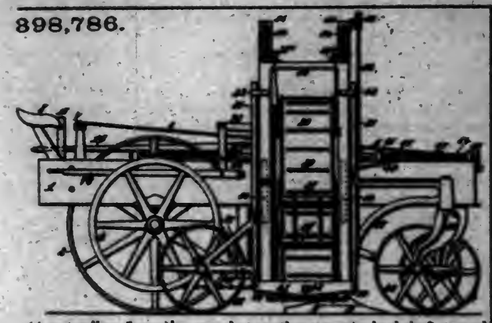
398,785. HOISTING APPARATUS. HUGH KENNEDY, San Francisco, Cal., assignor to Leon C. Marshutz and Thomas C. Cantrell, same place. Filed July 9, 1888. Serial No. 279,462. (No model.)

Claim.—1. In a hoisting apparatus, the toggle-lever, substantially as described, in combination with the follower or stem H and the bar I, a rope-drum mounted loosely upon a driving-shaft and provided with a frictional ring, and a corresponding frictional ring on the driving-gear, substantially as set forth.



2. The combination of the driving-gear and loosely-mounted rope-drum provided with intermediate frictional surfaces, the hollow-ended shaft, the bar I, the follower, the toggle-lever, and the adjustable bolt N, substantially as described.

3. The combination of the plate J, provided with a guide, K, and a collar, O, the adjustable bolt, the toggle-lever, the follower, the bar I, the driving shaft, the loosely-mounted rope-drum, the frictional rings, and the driving-gear, substantially as described.



4. In a hoisting apparatus, the combination of the driving-gear and loosely-mounted rope-drum provided with intermediate frictional rings, a hollow-ended shaft, a follower adapted to have a longitudinal motion through said shaft and adapted to throw the drum into or out of contact with the driving-gear, a toggle-lever to depress or relieve the follower, an adjustable bolt to compensate for wear of frictional surfaces, and a plate attached to the shaft-bearings, with guide and collar and carrying an adjusting-sleeve, all substantially as set forth.

398,786. DITCHING AND GRADING MACHINE. DAVID D. KUHLMAN, Kansas City, Mo. Filed Apr. 9, 1888. Renewed Jan. 28, 1889. Serial No. 297,838. (No model.)

Claim.—1. In a ditching and grading machine, the combination of a main frame, 1, having a ground-wheel, 2, the shaft of which is provided with a sprocket-wheel, 3, a rising-and-falling elevator-frame pivoted at its lower end and provided at its upper end with a drum-shaft having a sprocket, 48, the endless web passing around the drum-shaft, the guide-rolls 45 and 46 on the elevator-frame, and the drive-chain

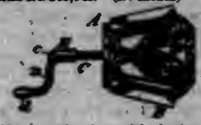
398,786.

44, extending from the sprocket on the ground-wheel shaft to and around the guide-rolls, and thence extending laterally along the elevator-frame to the sprocket on the said drum-shaft, substantially as described.

2. In a ditching and grading machine, the combination, with a machine-frame having a ground-wheel and a sprocket on the shaft of said wheel, of a laterally-inclined vertically-adjustable elevator-frame, an elevator-shaft on said frame geared to the sprocket, wheeled side bars or uprights pivotally connected to a pair of bolster-plates at their lower ends, and an upright frame connected by a central pivotal bearing to the bolster-plates and having loops in which the side bars may rise and fall, substantially as described.

3. In a ditching and grading machine, the combination, with a machine-frame supported by a ground-wheel, of an elevator-frame having its lower end pivotally connected to supports on said machine-frame, wheeled side bars supporting a frame within which the outer end of the elevator-frame lies, cords connected to the latter frame and passing over the friction-rolls on the inclosing-frame, and a windlass-shaft on the elevator-frame to which the other ends of said cord are connected, substantially as described.

4. The combination of the main frame having a ground-wheel journaled therein and a laterally-extending elevator connected at its lower end with the main frame, a plow located in advance of the ground-wheel and beside the lower end of the elevator, a vertically-adjustable frame comprising upright parallel arms connected, respectively, at their lower ends with the front and rear portions of the plow-beam, a bar connecting the upper ends of said arms, and a lever pivoted on the main frame and pivoted to the connecting-bar to simultaneously raise or lower the parallel arms, substantially as described.



5. In a ditching and grading machine, the combination, with a machine-frame, of an elevator pivotally connected at its lower end to an adjustable frame on said machine-frame, a wheeled frame within which the outer end of the elevator is adjustable, bracing-frames connecting the wheeled frame to the machine and having slide-loops embracing racked uprights, and said braces having pinions meshing with racks on the uprights, and an actuating-shaft on the machine-frame, having a sprocket geared to a sprocket on the shaft carrying said pinions by a chain running over pulleys at the top of one of the uprights and over a pulley on the machine-frame, substantially as described.

6. In a ditching and grading machine, the combination, with a machine-frame, of an elevator mechanism having its supports pivotally connected at their lower ends to an adjustable frame on the machine-frame, a wheeled frame within which the outer ends of the elevator-supports are adjustable vertically, uprights on the machine-frame having racks, bracing-frames movable on said uprights and rigidly connected at their outer ends to the wheeled frame, a shaft on the bracing-frames having pinions meshing with the racks on the uprights and having a sprocket, a chain running on pulleys above and below said sprocket and gearing with the latter, an actuating-shaft on the machine-frame having reverse screw-threads and carrying a sprocket moving said chain, diagonal braces connected at their outer ends to the bracing-frames, and travelers moving on the reverse threads of the actuating-shaft to which the inner ends of said braces are connected, substantially as described.

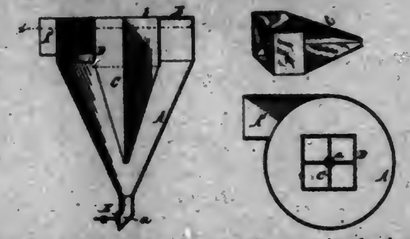
7. In a ditching and grading machine, the combination, with a machine-frame, of an elevator mechanism having its supports pivotally connected at their lower ends to supports on said frame, a vertical frame inclosing the outer end of the elevator-frame, cords connected at one end to the elevator-frame and passing over friction-rolls on the vertical frame, a windlass-shaft on the elevator-frame, to which the other ends of said cords are connected, a bolster-frame centrally pivoted to the lower end of the vertical frame, side bars pivoted to the ends of the bolster-frame and held by loops on the vertical frame, and wheels bracketed to the side bars and supporting the latter, substantially as described.

8. In a ditching and grading machine, the combination, with a machine-frame, of an elevator-frame having its lower end pivotally connected to an adjustable frame on the machine-frame, vertically-adjustable bracing-frames intermediate between the machine-frame and the wheeled supports carrying the outer end of the elevator-frame, and a shaft on the machine-frame having reverse screw-threads and diagonal braces connected at one end to the outer ends of the bracing-frame and at the other ends to travelers moving on the reverse threads of the shaft, substantially as described.

398,787. BAR-RING OR OTHER JEWELRY. ADOLPH LUTEY, New York, N. Y., assignor to A. Lutey & Co., same place. Filed Feb. 24, 1888. Serial No. 265,145. (No model.)

Claim.—1. The combination, with the base, of a stem projecting therefrom and a laterally-projecting fastening crank-arm borne by said stem, and constructed to be adjustable toward and from the base.

2. The combination, with the base, of a stem projecting therefrom and a laterally-projecting fastening crank-arm borne by said stem, and constructed with a screw-thread, whereby it is adjustable toward and from the base.



3. The combination, with the base, of a screw-threaded stem projecting rigidly therefrom and a laterally-projecting fastening crank-arm screwing on said stem, and thereby adjustable toward and from the base.

4. The combination, with the base, of a screw-threaded stem projecting rigidly therefrom and a laterally-projecting fastening-arm constructed with an internally-threaded sleeve screwing on said stem, whereby the arm is adjustable toward and from the base.

5. The combination, with the base, of a screw-threaded stem projecting rigidly therefrom and terminating in a head or enlargement and a laterally-projecting fastening-arm screwing on said stem, whereby it is adjustable toward and from the base and its separation from the stem is prevented.

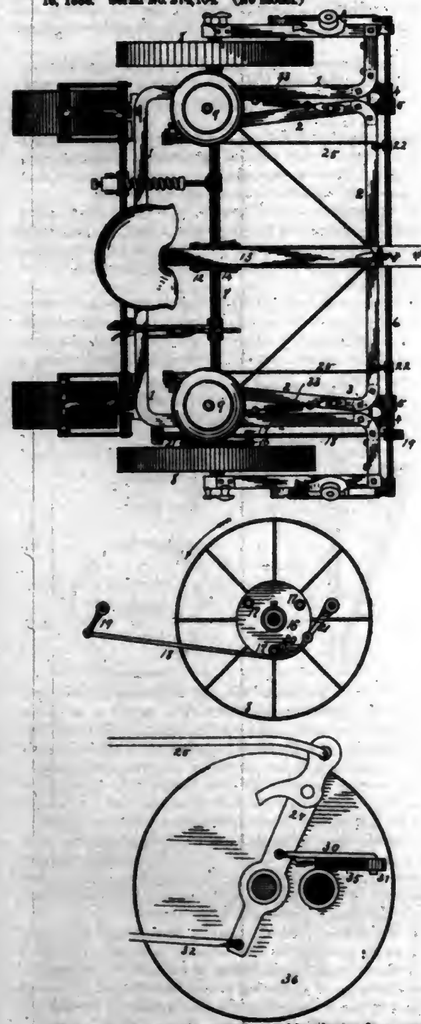
6. The combination, with the base, of a stem projecting therefrom and a laterally-projecting fastening-arm borne by said stem and constructed to be adjustable toward and form the base, and the outer portion of said arm turned rearwardly to form a handle by which to turn or hold the arm.

398,788. DUST-COLLECTOR. JOHN G. MUNDY, Jackson, Mich., assignor to the Knickerbocker Company, same place. Filed Dec. 1, 1888. Serial No. 292,944. (No model.)

Claim.—1. The combination, with the separating-chamber provided with means whereby the dust-laden air is caused to assume a whirling motion in the same, and having an outlet for the purified air and a dust-discharge, of a wind-break arranged across the path of the whirling air-current in the axial portion of the separating-chamber, whereby the whirling motion of the air is broken in the axial portion of the separating-chamber and the air is caused to move in a straight course toward and through the air-outlet, substantially as set forth.

2. The combination, with the separating-chamber provided with means whereby the dust-laden air-current is caused to assume a whirling motion in the same, and having an outlet for the purified air and a dust-discharge, of a radial wind-break arranged in the axial portion of the separating-chamber, substantially as set forth.

3. The combination, with the tapering separating-chamber provided with means whereby the dust-laden air is caused to assume a whirling motion in the same, and having an outlet for the purified air and a dust-discharge, of a tapering wind-break arranged across the path of the whirling air-current in the axial portion of the separating-chamber, substantially as set forth.



4. The combination, with the separating-chamber provided with means whereby the dust-laden air is caused to assume a whirling motion in the same, and having an outlet for the purified air and a dust-discharge, of a tube arranged in the air-outlet, and a wind-break arranged in said tube, substantially as set forth.

5. The combination, with the separating-chamber provided with means whereby the dust-laden air is caused to assume a whirling motion in the same, and having an outlet for the purified air and a dust-discharge, of a tube arranged in the air-outlet, and a wind-break extending from said tube into the separating-chamber, substantially as set forth.

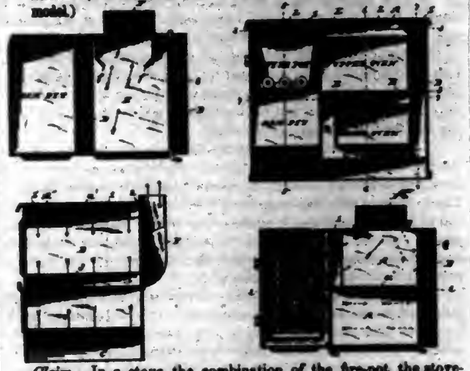
6. The combination, with the separating-chamber provided with means whereby the dust-laden air is caused to assume a whirling motion in the same, and having an outlet for the purified air and a dust-discharge, of a flat-sided tube arranged in the air-outlet, and a wind-break arranged in the axial portion of the separating-chamber, substantially as set forth.

7. The combination, with the separating-chamber provided with means whereby the dust-laden air is caused to assume a whirling motion in the same, and having an outlet for the purified air and a dust-discharge, of a flat-sided tube arranged in the air-oulet, and intersecting tapering wind-break plates having their large ends secured in said tube and having their tapering portions projecting from said tube into the separating-chamber, substantially as set forth.

398,789. CORN-PLANTER. FRANK P. MURPHEY, Decatur, Ill., assignor of one-half to William D. Chamberlain, same place. Filed May 16, 1888. Serial No. 274,104. (No model.)

Claim.—1. In corn-planters, in combination, a frame comprising an inner part and an outer part, composed each of a continuous bar, and brackets at the front angles of each part forming hinge-connections, as set forth.

2. In corn-planters, in combination, the frame comprising outer part, 1, and inner part, 2, the brace-bar 3 for the outer part, and brackets 4 5, adapted to form hinge-connections at the front of both parts, as set forth.



3. In corn-planters, in combination, the drill-disk attached to a wheel and provided with projections, the bar with the trip projection adapted to the projections of the disk, the arm pivoted to the bar and to the planter-frame, and means for imparting the motion of the bar to the seed-depositing mechanism of the planter, as set forth.

4. In corn-planters, in combination, the disk 16, having projections, the check-row shaft 6, the arm 19 on the check-row shaft, constructed as specified, the bar 18, having trip projection 20, and the arm 21, pivoted to the planter-frame and to the bar 18, as set forth.

5. In corn-planters, in combination, the seed-disk having ratchet-teeth, the lever having a pawl adapted to the teeth, and the oscillating second drop connected with the lever, as set forth.

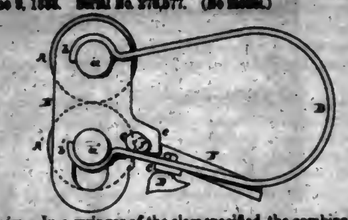
6. In corn-planters, in combination, the oscillating second drop having the upper projection, 31, the curved lower termination, 37, and the face projection 38, ledge 40 in the shank, lever 27, adapted to operate the seed-disk, and the rod to connect the second drop with the lever, as set forth.

398,790. COOKING-STOVE. JOHN U. MOORE and WILLARD J. ANDREWS, St. Louis, Mo. Filed Feb. 9, 1888. Serial No. 263,545. (No model.)

Claim.—In a stove, the combination of the fire-pot, the stove-top, the upper flue, A, extending across beneath said top, the upper and lower ovens disposed beneath said upper flue, A, the vertical flue B, leading from flue A down the end of the stove, the lower flue, C, leading thence back beneath the lower oven, the short vertical flue D, leading thence upward past the end of the lower oven, the intermediate lateral flue, E, leading thence between the ovens and connecting with said vertical flue B, and the smoke-flue F, communicating with the rear of the upper and intermediate lateral flues, A and E, with the damper 2 between the smoke-flue and flue A, and the damper 3, for opening flue E into flue B at will, as and for the purpose set forth.

398,791. LOOM-TEMPLE. JAMES NUTTALL, Fall River, Mass. Filed Apr. 19, 1888. Serial No. 271,233. (No model.)

Claim.—1. In combination, the temple-roller, the spring-operated sliding bar, the holding-shell, and the bearing-spring for preventing looseness of the sliding bar, substantially as described.

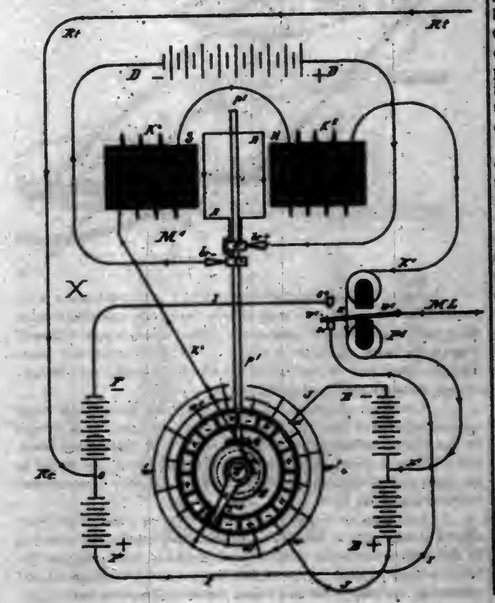


2. In combination, the temple-roller, the spring-operated sliding bar, the holding-shell, and the bearing-spring serving to prevent looseness of the sliding bar and adapted to form a spring-catch to hold the bar at its rearward position, substantially as described.

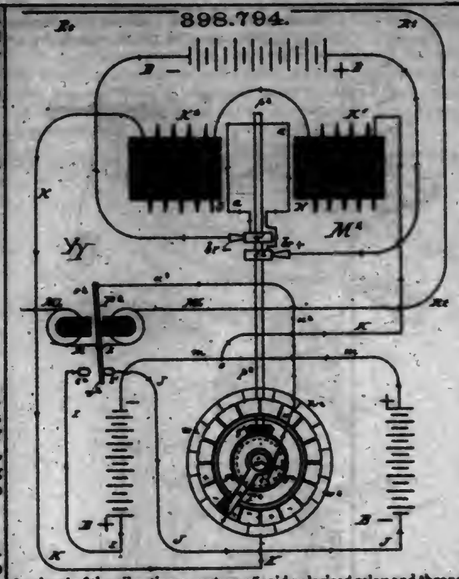
398,792. SAW. ALONZO OAKES, Taylor, Wis., assignor of one-half to Arthur B. Ellison, same place. Filed May 26, 1888. Serial No. 275,141. (No model.)

Claim.—The saw having the forwardly-inclined teeth B, bifurcated at the lower ends to form V-shaped cutting-points C, the latter being inclined laterally in opposite directions and beveled or sharpened on opposite sides, and the forwardly-inclined clearing-teeth D, arranged one between each pair of teeth B, said clearing-teeth being slightly shorter than the teeth B, and having their lower sides inclined upward and rearward, and provided at their lower front corners with the square chisel-edges F, substantially as described.

398,793. CLOTHES-WRINGER. LEWIS C. PARKER, Cincinnati, Ohio, assignor of one-half to Robert Simpson, Jr., same place. Filed June 9, 1888. Serial No. 276,577. (No model.)



Claim.—In a wringer of the class specified, the combination, with cheek-pieces, each having a hole for the axle of one roll and a slot for the axle of the other, and a pivot-bearing adjacent to one arm of the spring, of an apron having end pivots resting in said bearings, each pivot bearing a cam arranged to engage one arm of the spring when the apron is swung upward for the purpose of separating the rolls, substantially as shown and described.



398,794. SYSTEM OF SYNCHRONIZING ELECTRIC MOTORS. FRANCIS J. PAYEN, New York, N. Y., assignor to J. M. Seymour, same place. Filed Aug. 1, 1888. Serial No. 281,701. (No model.)

Claim.—1. The system described for producing the synchronous movement of electric motors at distant points, comprising a main-line circuit connecting said points, electric motors at said points having their armatures and field-coils connected in separate independent circuits, one to a source of direct and the other to a source of alternating current, the supply of current in said alternating circuit being controlled by said main-line circuit and by polarized relays or vibrators included in said line-circuit.

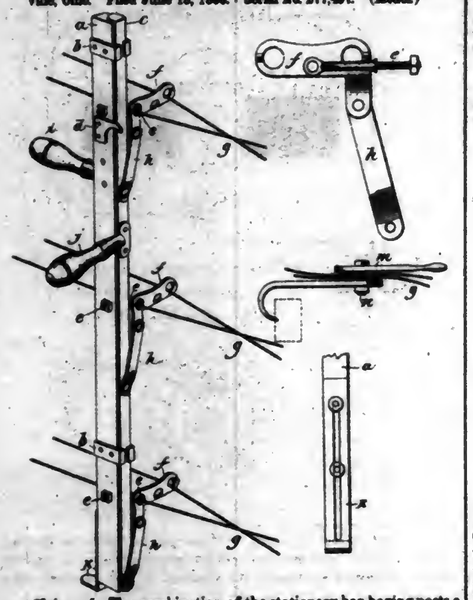
2. A device for producing the synchronous rotation of electric motors at distant points, comprising an electric motor at one point having its field-coils connected through a polarized relay or vibrater and a revolving trailing brush driven by the armature of said motor to the parts of a fixed reversing-commutator, the alternate segments of which are connected to sources of current of opposite polarity, the armature-coils of said motor being connected in a continuous direct-current circuit, the reversals of current in said field-coils corresponding to the passage of the revolving trailing brush from one segment of the fixed commutator to the next and to the half-revolutions of the armature to which it is geared, the main-line circuit being connected to the

398,794.

fixed end of the vibrating armature of said polarized relay and through the latter and its contact-stops and the return-circuit to a separate source of alternate currents as the armature of said polarized relay vibrates.

3. A device for producing the synchronous rotation of electric motors, comprising an electric motor at one point having its field-coils connected through a polarized relay to a source of alternate currents, the armature of said polarized relay being connected to a main-line circuit extending to one or more distant points, the said main-line circuit connected in series to the coils of other polarized relays or vibrators, the armatures of which are connected through their contact-stops and sources of alternate currents connected thereto to the field-coils of the electric motors at said points, whereby the alternations of current in the said field-coils of the distant electric motors are made to correspond in period to the vibrations of the armatures of said polarized relays.

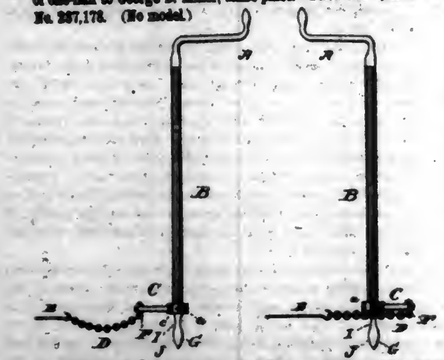
4. In an apparatus for producing synchronous movements at different distant points, electric motors at said points having their armature and field circuits separately connected, one to a source of continuous direct current and the other through the vibrating armature and contact-stops of a polarized relay or vibrator and a fixed contact-brush and revolving trailer to the parts of a fixed reversing-commutator, the segments of which are connected by the vibrating armature of said polarized relay or vibrator to sources of current of opposite polarity, whereby the current in the alternating circuit of said motors is reversed at each vibration of said armature and at each passage of the revolving trailing brush from one segment of the fixed reversing-commutator to the next.



5. In a system for synchronizing electric motors, the combination of a governing-motor at one station, a current-reverser driven by the moving part of said motor, each reversal of current corresponding to a half-revolution of said moving part, a line-circuit traversed by reverse currents corresponding to the reversals produced by the current-reverser, a series of relays at distant stations operated by the line-currents, and a series of governed or driven motors at the distant stations, one magnetic element of each of which is excited by current of constant direction, and the other magnetic element of which is excited by reversed currents controlled by the relays.

398,795. NUT-LOCK. MORGAN PENETRACKER, Washington, D. C., assignor of one-half to Albert P. Kingsley, same place. Filed Nov. 20, 1888. Serial No. 291,327. (No model.)

Claim.—The combination, with the bolt having the longitudinal grooves and the nut, of the washer adapted to slip freely on the bolt, and having the wires to fit in the grooves, said wires being adapted to be bent outward over the face and sides of the nut to lock the latter, substantially as described.



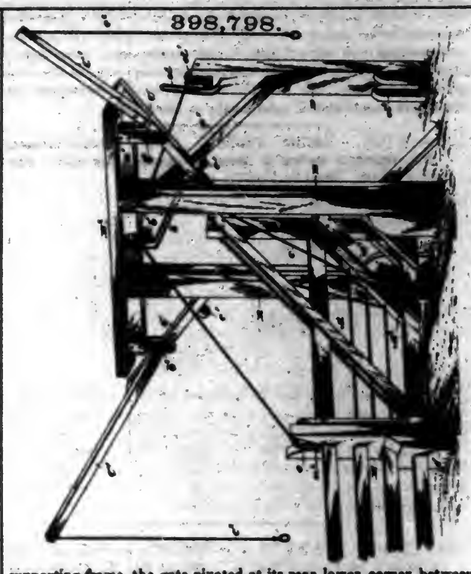
398,796. FENCE-MAKING MACHINE. LEWIS FISHER, Martinsville, Ohio. Filed June 18, 1888. Serial No. 277,407. (Model.)

Claim.—1. The combination of the stationary bar having posts *e*, rotary disks *f*, pivoted to the posts, having openings for the wires and having slots communicating with the openings, the slots being arranged at an angle to the direction of the openings, and sliding bar *c*, connected to the disks by links *h*, all substantially as and for the purpose set forth.

2. The combination of the hook *l* with the lever *m*, having lugs, the two connected by a bolt, as and for the purpose specified.

398,797. CAR-BRAKE. HOMER L. PHELPS, Athens, Pa., assignor of one-half to George D. Miller, same place. Filed Oct. 4, 1888. Serial No. 287,173. (No model.)

Claim.—1. The combination, with the crank-shaft having a narrowed spindle at its lower end, of the arm standing at right angles thereto above said spindle and removably secured by a bolt passing through said arm and shaft, substantially as specified.

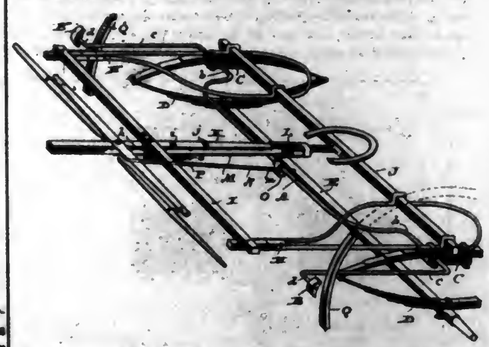


2. The combination, with the crank-shaft having a winding-spindle at its lower end, the chain, and the brake-rod, of the removable arm seated on said shaft above the spindle, and having the series of adjusting-openings, and having the enlarged portion provided with a perforation, and the transverse fastening-bolt, substantially as specified.

398,798. GATE. WILLIAM G. PIERCE, Sacramento, assignor of one-half to Max Mierson, Placerville, Cal. Filed Sept. 6, 1888. Serial No. 284,698. (No model.)

Claim.—1. In a gate of the character described, the combination of the supporting-frame, the gate pivoted therein, the operating-levers, a way or ways arranged diagonally across the rear lower corner of the gate, the automatic gravitating catch mounted thereon, and connections between the inner ends of the operating-levers and the catch, substantially as described.

2. In a gate of the character described, the combination of the



398,798.

supporting-frame, the gate pivoted at its rear lower corner between the lower ends of the side posts of said frame, the diagonally-arranged way, the automatic gravitating catch mounted thereon, the operating-levers pivoted on the frame, a spool or pulley journaled in the top of the frame between the side posts, connections between the inner ends of the operating-levers and the catch, and a weight, as *f*, connected to the upper free corner of the gate by a rope passing over the pulley on the frame, substantially as described.

3. In a gate of the character described, the combination of the supporting-frame, the gate connected thereto at its rear lower corner by a pivot, a way consisting of a metal rod strained diagonally between the hinge-post and bottom rail of the gate, and an automatic catch mounted on said way, consisting of a rectangular metal block having a central eye to receive said way, substantially as described.

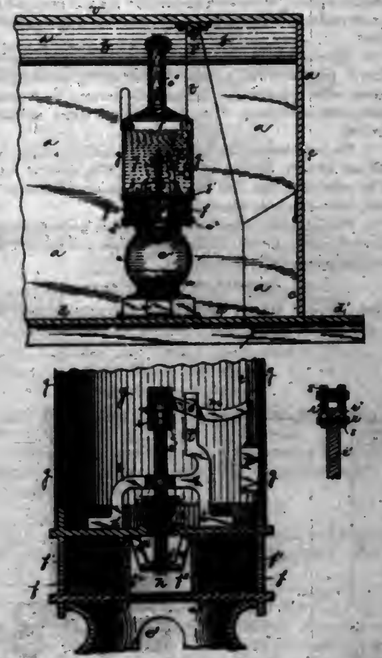
398,799. WAGON-BRAKE. PAUL PUSCHEL, Milwaukee, Wis. Filed Nov. 22, 1888. Serial No. 291,822. (No model.)

Claim.—1. A carriage or wagon brake that comprises a horizontal beam shaped at both ends to form forwardly-extended cranks, shoes carried by the cranks, stationary guide-loops arranged to loosely support the beam, and a longitudinal rod or rods uniting said beam with the draft-gear of the vehicle to which the brake may be connected, substantially as set forth.

2. A carriage or wagon brake that comprises a horizontal beam terminated at both ends in forwardly-extended cranks, shoes carried by the cranks, stationary guide-loops arranged to support the beam, and a rod or rods adjustably connected to said beam and united to the draft-gear of the vehicle to which the brake may be connected, substantially as set forth.

3. A carriage or wagon brake that comprises a horizontal beam shaped at both ends to form forwardly-extended cranks, shoes carried by the cranks, stationary guide-loops arranged to loosely support the beam, a plate secured to the vehicle-tongue, and a longitudinal rod connecting the plate with said beam, substantially as set forth.

4. A carriage or wagon brake that comprises a horizontal beam terminated at both ends in forwardly-extended cranks, shoes carried by the cranks, stationary guide-loops arranged to support the beam, a rod or rods for uniting said beam with the draft-gear of the vehicle, to which the brake may be connected, and a spring or springs arranged to normally hold said draft-gear in such position that the shoes are away from the adjacent wheels, substantially as set forth.

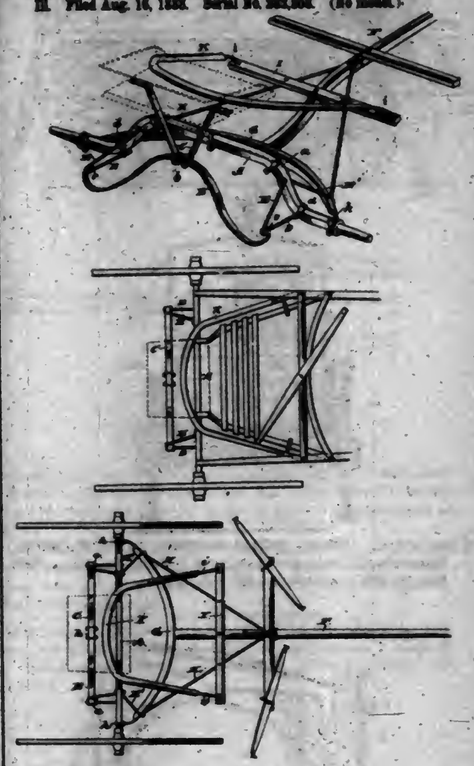


5. A carriage or wagon brake that comprises a horizontal beam shaped at both ends to form forwardly-extended cranks, shoes carried by the cranks, stationary guide-loops arranged to loosely support the beam, a plate secured to the vehicle-tongue, a supporting-loop for the tongue, a spiral spring connecting the plate and supporting-loop, and a longitudinal rod uniting said plate and beam, substantially as set forth.

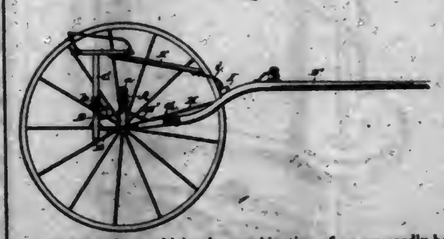
6. A carriage or wagon brake that comprises a horizontal beam terminated at both ends in forwardly-extended cranks, shoes carried by the cranks, stationary guide-loops arranged to support the beam, and a rod uniting said beam with the tongue of the vehicle, to which the brake may be applied, in combination with a socket arranged to receive the butt of said tongue, substantially as set forth.

7. In a vehicle, the combination of vertical rods having their upper ends terminated in horizontal forwardly-extended guide-loops and their lower ends provided with horizontal forward extensions clipped to an axle of the vehicle, goose-necks forming continuations of said extensions and terminated in spring-shackles, a horizontal beam loosely supported in the guide-loops and shaped at both ends to form forwardly-extended cranks, shoes carried by the cranks, thills secured to the spring-shackles, and rods connecting said shackles and beam, substantially as set forth.

8. In a vehicle, the combination of vertical rods having their upper ends terminated in horizontal forwardly-extended guide-loops and their lower ends provided with horizontal forward extensions clipped to an axle of the vehicle, goose-necks forming continuations of said extensions and terminated at both ends in forwardly-extended cranks, straps connecting the shackles and lower horizontal extensions of the vertical rods, a horizontal beam loosely supported in the guide-loops and shaped at both ends to form forwardly-extended cranks, shoes carried by the cranks, thills connected to said spring-shackles, and rods uniting these shackles and the beam, substantially as set forth.



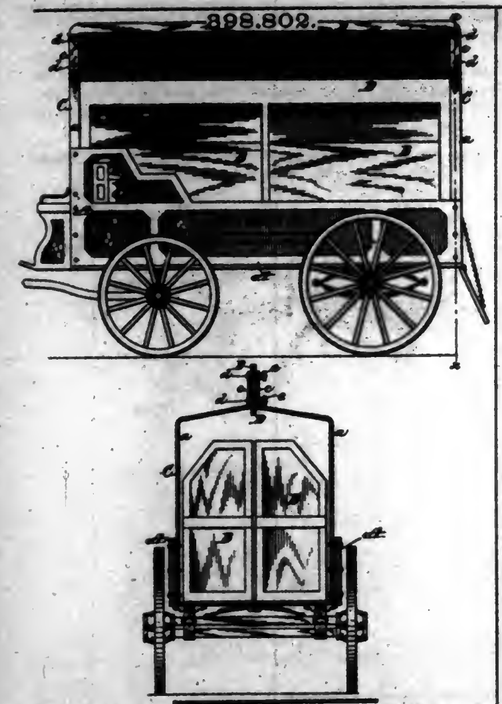
398,800. SAFETY CAR-STOVE. ABRAM REESE, Pittsburg, Pa., assignor to C. L. Magee, Robert Pitcairn, and C. McF. Reed, all of same place. Filed May 13, 1887. Serial No. 238,053. (No model.)



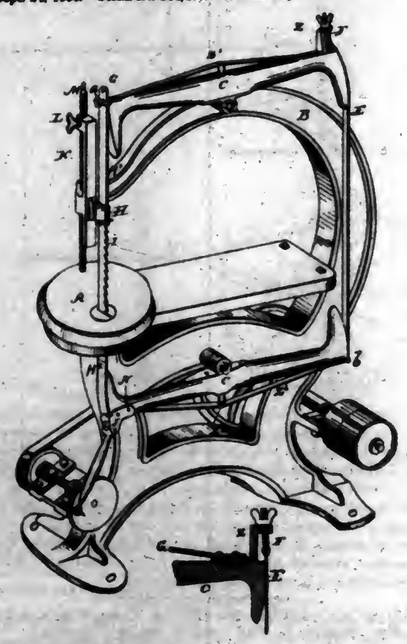
Claim.—1. In safety car-stoves, the combination of the stove, the water-reservoir located above the stove, the valve closing communication between said reservoir and stove, the operating-lever, and a sliding joint connecting the valve and lever, substantially as and for the purposes set forth.

2. In safety car-stoves, the combination of the stove, the reservoir located above the stove, the valve closing communication between them, the lever *m*, connected to the valve by a sliding joint, and the weight *n* for operating the lever, substantially as and for the purposes set forth.

398,801. TWO-WHEELED VEHICLE. FRANK RUDOLPH, Beaver, Ill. Filed Aug. 16, 1888. Serial No. 282,898. (No model.)



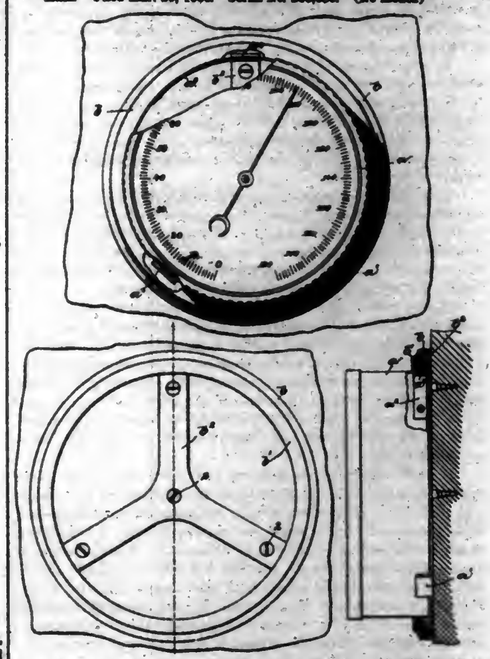
Claim.—In a vehicle, the combination of an upwardly-bowed axle, a semi-elliptical spring, B, connected to the axle by rearwardly-extending horizontal bars D, connected to clips on the axle, and brace-rods E, which extend from the outer ends of the rods D upwardly and inwardly and bolted to said axle, a bar, C, secured to the said spring B, and having outwardly-spreading bent ends adapted to be secured to and support the seat, the pole or thills having a cross-bar, I, secured thereto, the circle-bar K, secured to the seat, having spring-extensions *i*, attached to the cross-bar I, the curved bar G, and the brace-rods H and E, substantially as described.



398,802. ADVERTISING-VEHICLE. THOMAS F. SCANLAN, Boston, Mass. Filed Dec. 26, 1888. Serial No. 294,660. (No model.)

Claim.—In an advertising-vehicle, the combination, with the body, of a series of supporting-frames, C, each composed of two portions, *a a*, having at their upper ends vertical offsets *c*, forming jaws, a detachable sign, D, supported by and fitting within said jaws, and extending centrally over the body of the vehicle in the direction of its length, and means for detachably securing said sign within the jaws of the supporting-frames, substantially as and for the purpose set forth.

398,802.

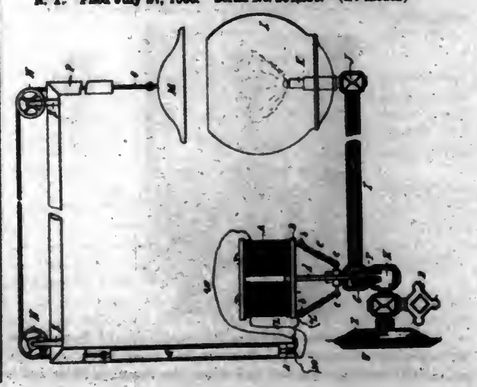


398,803. SCROLL-SAWING MACHINE. CALVIN W. SEDWICK, Callensburg, Pa., assignor of one-half to R. R. Elliott, same place. Filed Sept. 24, 1886. Serial No. 214,465. (No model.)

Claim.—The within-described scroll-sawing machine, consisting of the main supporting-frame having the overhanging arm B, the upper and lower oscillating beams, C C, each provided with bracing-straps and straining-posts, the straining-strap, its adjusting screw F, the bracket Z, the two straps H' H², the slide H, the adjustable guide, the saw I, the vertical back guide forming part of the arm B and provided with vertical apertures, the adjustable pressure-rod, and the set-screw for securing said rod, substantially as specified.

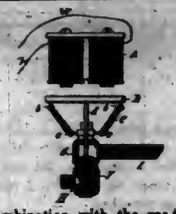
398,804. HOLDER FOR THERMOMETERS OR OTHER INDICATORS. THOMAS W. SHEFFIELD, Peabody, Mass., assignor to Edgar W. Upton and Henry G. Rice, same place, and Herbert Torrey, Hanover, Mass. Filed Mar. 29, 1888. Serial No. 269,089. (No model.)

Claim.—1. The case *a*, combined with the frame having a continuous flanged rim or frame adapted to receive the side wall of the case and locking devices concealed and protected by said flange, substantially as described, for permanently locking the case in position.



2. The case *a* and the flanged frame or rim *b*, combined with an automatic locking device concealed within the said case, and by which the said case is locked to the rim permanently, substantially as described.

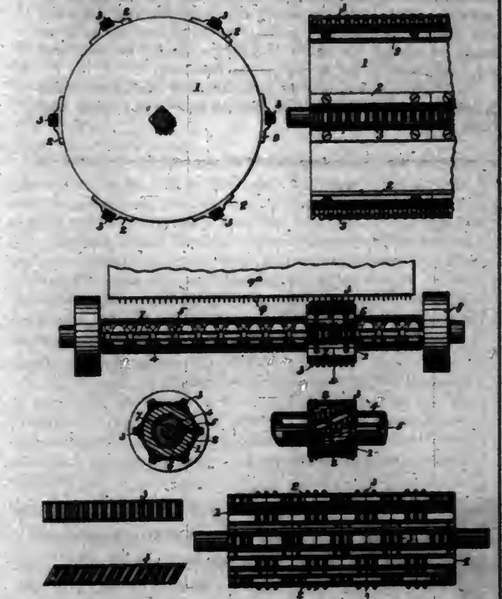
3. The case having rigid and yielding locking devices concealed within it, combined with a frame or rim having a continuous flange adapted to be engaged and permanently secured by fastenings concealed by the said flange when placed in the frame, substantially as described.



4. The case having the lugs *a'* and a yielding locking device, a^4, combined with the continuous flanged rim *b*, to which it is attached, and by which the lugs and yielding device are concealed and protected, substantially as described.

5. The case, the flanged rim *b*, having the spider b^5 within it, and concealed locking devices to connect the case and rim or holder permanently, substantially as described.

398,805. GAS-EXTINGUISHER. ADAM STRIEBLER, New York, N. Y. Filed July 27, 1888. Serial No. 281,238. (No model.)

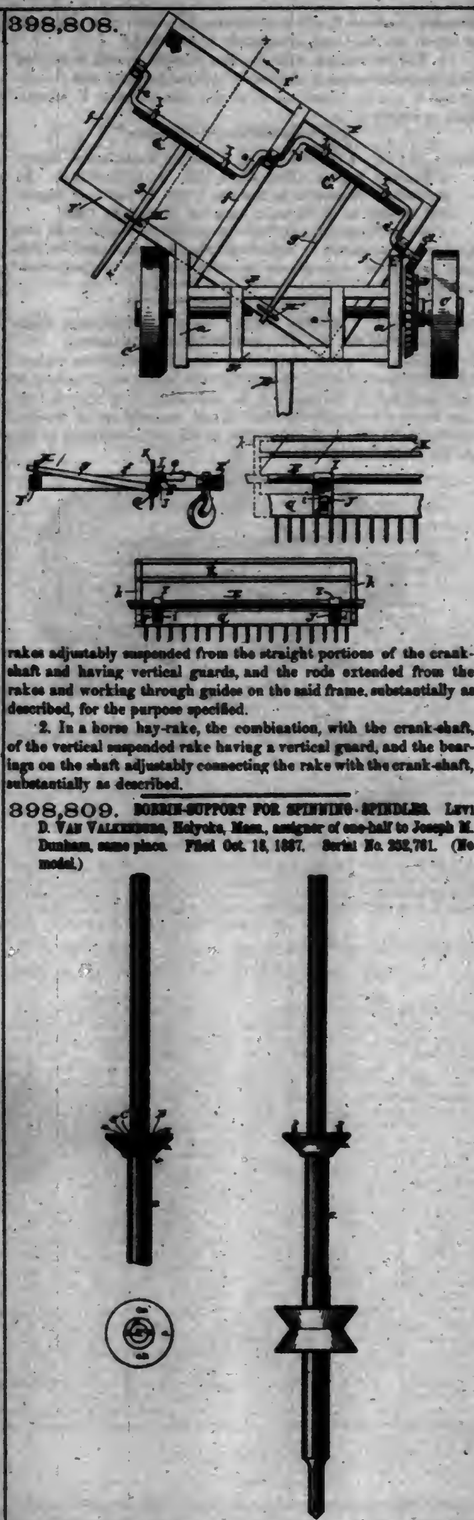


398,805.

Claim.—The combination, with the gas-fixture G H I J K L, hereinbefore described, of the key F, perforated as specified, and working in the joint G H of said fixture, the stem *d*, connecting the said key F and the armature B, the armature B, mounted on the end of the stem *d* and working on the poles of the electro-magnet A, the spring C, connecting the eyes *b* of the armature and the eyes *c* of the gas-fixture, the electro-magnet A, mounted so as to operate on the armature B, as specified, and connected with the circuit-closer R by the wires *w* and *x*, the circuit-closer R, connected with the magnet A and a battery, as specified, the weight Q, working upon said circuit-closer, the weight M, hanging over the globe of said gas-fixture and connected with the weight Q, the cord O, connecting the weight M and Q and passing over the pulleys N N, and the pulleys N N, mounted so as to accommodate the cord O, all substantially as and for the purpose set forth.

398,806. APPARATUS FOR GRINDING THE CARDS OF CARDING-ENGINES. JOHN STEAD, Lindley, near Huddersfield, County of York, England. Filed July 17, 1888. Serial No. 280,160. (No model.)

Claim.—In an apparatus for grinding card-teeth, a grinding-roller carrying readily-removable and suitably-spaced toothed grinding-strips, substantially as and for the purpose described.



398,807. INSECTICIDE. JAMES TOBLINSON, near Morrison, Va. Filed Dec. 19, 1888. Serial No. 294,101. (No specimens.)

Claim.—The herein-described composition, consisting of kerosene, lard, lye, insect-powder, tobacco, and water, for the purpose and in or about the proportions described.

398,808. HORSE HAY-RAKE. ELWOOD TUBB and JACOB B. RUNSTROM, Manchester, Iowa; said Tubb assignor to said Runstrom. Filed Aug. 20, 1888. Serial No. 283,208. (No model.)

Claim.—1. The herein-described horse hay-rake, composed of the main frame, the wheels, the gear-wheel D, connected with one of the wheels, the rake-frame having middle cross-bar and set at an oblique angle to the draft of the machine and connected at one front corner with the main frame, the crank-shaft journaled at its ends and midway of its ends in the rake-frame and having one end extended and provided with a pinion which meshes with the said gear-wheel, the

398,808.

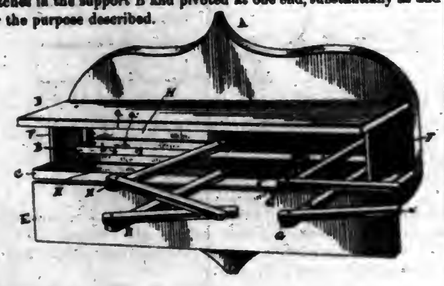
rakes adjustably suspended from the straight portions of the crank-shaft and having vertical guards, and the rods extended from the rakes and working through guides on the said frame, substantially as described, for the purpose specified.

2. In a horse hay-rake, the combination, with the crank-shaft, of the vertical suspended rake having a vertical guard, and the bearings on the shaft adjustably connecting the rake with the crank-shaft, substantially as described.

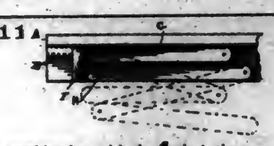
398,809. BOBBIN-SUPPORT FOR SPINNING-SPINDLES. LEVI D. VAN VALKENBURG, Holyoke, Mass., assignor of one-half to Joseph M. Dunham, same place. Filed Oct. 18, 1887. Serial No. 252,761. (No model.)

Claim.—1. The combination, with the screw-threaded spindle, of the interiorly-threaded button or bobbin-support A and the interiorly-

threaded check-nut B, said button being chambered on its upper side to receive the check-nut, substantially as described.



2. The combination, with the screw-threaded spindle, of the interiorly-threaded button A, chambered at G and provided with the pins or lugs D, and the check-nut B, formed with the slots H, substantially as described.



398,810. ARTIFICIAL FUEL. LEOPOLD WAGER, London, County of Middlesex, England. Filed May 1, 1888. Serial No. 272,618. (No specimens.) Patented in England Dec. 1, 1887, No. 16,901; in Belgium Feb. 23, 1888, No. 80,750, and in Spain Feb. 22, 1888, No. 7,959.

Claim.—The herein-described composition of matter to be used for fuel as a substitute for coal, consisting of coal-dust, sawdust, clay, sand, solution of saltpeter, and tar, substantially in the proportions specified.

398,811. CLOTHES-DRIER. DAVID L. WOOTHERSTON, Toledo, Ohio. Filed Mar. 21, 1888. Serial No. 268,057. (No model.)

Claim.—1. The herein-described rack, composed of the back A, the two supports B and C, the pairs of rack-bars G and H, pivoted at their inner ends to the supports, the end pieces, F, pivoted at their rear edges, the door E, the shelf D, and the supports *b b*, fitted in notches in the support B and pivoted at one end, substantially as and for the purpose described.

2. The combination, with the back A, the supports B and C, and the pairs of rack-bars G and H, adapted to fold between the supports, of the supports *b b*, fitted in notches in the support B, and adapted to be turned down and brace the support B when the rack-bars are opened, substantially as described.

3. The combination of the back A, the support B, and the pairs of rack-bars G and H, each rack-bar composed of a series of folding sections, the rack-bar G being pivoted near the inner edge of the support and folding against the back A, and the rack-bar H pivoted near the outer edge of the support and folding on the rack-bar G, the two rack-bars folding in opposite directions and in different vertical planes.

REISSUES.

10,988. PROCESS OF PURIFYING IRON. GEORGE G. MULLINS, Los Angeles, Cal., assignor to the Mullins Silicated Iron and Steel Company, East St. Louis, Ill. Filed Feb. 21, 1883. Serial No. 264,875. Original No. 370,401, dated Sept. 27, 1887.

Claim.—1. The process of purifying and improving iron by the introduction to the melted mass of iron, at the proper heat, of pulverized silica, which consists in adding silica when the iron is at a suitable white heat, subsequently puddling the charge until blue and green flames are emitted, then finally working the metal in the usual manner, substantially as and for the purpose described.

2. That improvement in the manufacture of iron which consists in adding silica to the molten iron when the latter is at a proper heat as set forth.

DECISIONS

OF THE

COMMISSIONER OF PATENTS

AND OF

UNITED STATES COURTS IN PATENT CASES.

DECISIONS OF THE U. S. COURTS.

Supreme Court of the United States.

PATTEE PLOW COMPANY *v.* KINGMAN & COMPANY *et al.*

Decided February 4, 1889.

1. PATTEE—CULTIVATORS—REISSUE No. 6,080.

Reissue Letters Patent No. 6,080, granted to James H. Pattee October 6, 1874, for an improvement in cultivators, *Held* to have been illegally expanded. Even if valid, when limited to what alone could be claimed as new, is not infringed by the appellee.

2. REISSUES—ENLARGEMENT OF ORIGINAL PATENT.

It is well settled that a reissue can only be granted for the same invention intended to be embraced by the original patent, and the specification cannot be substantially changed, either by the addition of new matter or the omission of important particulars, so as to enlarge the invention as intended to be originally claimed.

3. KENDALL—CULTIVATORS.

The essential characteristics of Letters Patent No. 174,684, granted March 14, 1876, to Thomas W. Kendall, for an improvement in cultivators, are the rigidity of the runners and the resulting automatic action, and are not infringed by the appellee's machine, which does not contain runners constructed as the Kendall runners are, in the rigid form, and operated by the draft of the team to keep them off, or by the weight of the plows to keep them on, the ground, and so lacks the distinctive features of the Kendall patent, and which is not automatic, but requires manipulation every time the use is changed.

4. PATTEE—CULTIVATORS—No. 187,899.

Letters Patent No. 187,899, granted February 27, 1877, to Henry H. Pattee, for an improvement in cultivators covering the use of parallel bars and the attachment of the bars to the end-plates, embraces nothing that is not old and really nothing that is patentable, that is, which involves invention rather than mechanical skill.

APPEAL from the Circuit Court of the United States for the Eastern District of Missouri.

Mr. John R. Bennett for the appellant.

Mr. L. L. Bond and *Mr. E. A. West* for the appellees.

Mr. Chief Justice FULLER delivered the opinion of the Court.

This is an appeal from a decree of the Circuit Court of the United States for the Eastern District of Missouri, dismissing appellant's bill of complaint.

The bill charges appellees with infringement of the second claim of Reissue Letters Patent No. 6,080, dated October 6, 1874, which is a reissue of original Patent No. 124,218, to J. H. Pattee, dated March 5, 1872; of the first and second claims of original Patent No. 174,684, granted Thomas W. Kendall, March 14, 1876; and of original Patent No. 187,899, granted Henry H. Pattee, February 27, 1877; all for improvements in cultivators.

Appellee is an Illinois corporation, having a branch house in St. Louis, selling, among other things, cultivators manufactured by B. D. Buford & Co., at Rock Island, Ill., which are the alleged infringing machines.

The opinion of the circuit court was as follows:

Reissued patent 6,080, of 1874, second claim of which is under consideration, has, as to that claim, expanded the original beyond legal limits. Therefore, said reissued patent is void to the extent claimed, wherein the defendant is alleged to have infringed. Second, as to the Kendall patent No. 174,684, there is no infringement. Third, as to the Pattee patent of 1877, No. 187,899, said patent is void, there being no novelty of invention therein that is patentable.

The second specification of the original Pattee patent, No. 124,218, states that the invention consists—

in pivoting the wheels to the axle in such manner that the wheels may either one be advanced forward of the other, throwing the axle diagonal with the line of progression, while the wheels preserve the same relative position to the said line of progression.

The second specification of the reissue reads as follows:

It consists in *hinging the ends of the axle to plates, to which the draft animals are attached, and which are supported on wheels* in such manner that the wheels *are retained in the line of progression of the machine by the draft of the animals, and* may either one be advanced forward of the other, throwing the axle diagonal with the line of progression, while the wheels preserve the same relative position to the said line of progression.

The fourth specification of the original is:

It consists in the peculiar construction of the hitching device, allowing the draft animals to advance or recede, the one ahead or in the rear of the other, without influencing the plow-beams to the extent of the variation made by the said animals, all as hereinafter fully described.

The sixth specification of the reissue is:

It consists in the *arrangement* of a hitching device *with the draft-plates, which allow* the draft animals to advance or recede, the one ahead or in rear of the other, without influencing the plow-beams to the extent of the variation made by the said animals, all as hereinafter fully described.

The description of the accompanying drawings is given in the original and in the reissue, thus:

Original.	*Reissue.*
A is the axle, bowed or elevated at its central part. B B are plates secured to the ends of the axle A. The ends of the plates B B are *turned* outward, forming *snugs b b b b*. b^1 b^1 are snugs projecting inward from the plates B B. C C are *triangular-shaped draft-plates*, from which project snugs *c c c c*, corresponding with the snugs *b b b b*. D D are pins or bolts, passing through holes in the snugs *c c* and *b b*, and thereby pivoting the plates C C to the axle A. E E are the wheels. F F are the wheel-spindles, their inner ends shouldered, threaded, and secured in slots *e e* in the lower ends of the plates C C by nuts *f f*. G G are eveners, pivoted near their centers in the forward ends of the plates C C. H H are bars, their forward ends pivoted to the inner ends of the eveners G G, and their rearward ends pivoted to the snugs b^1 b^1. I I are hooks on the outer ends of the eveners G G, to which the draft animals are attached.	A represents the axle, formed as shown in the drawings, of an elevated central part, A, vertical side portions A^1 A^1, and *horizontal projections a a*, from each of the vertical side portions A^1. B B are draft-plates, with projecting forward ends *b*, to which the draft animals *may be attached direct* or by *any suitable* device, and with an enlarged rear end, from which project lugs b^1 b^1, corresponding with the *projections a a* of the axle A, to which they are hinged by vertical bolts C, as plainly shown in the drawings. D D are the supporting-wheels. E E are the wheel-spindles, their inner ends shouldered, threaded, and secured in slots *e* in the lower ends of the plates B by nuts e^1. G G are eveners, pivoted near their centers in the forward ends of the plates B. H H are bars, their forward ends pivoted to the inner ends of the eveners G G, and their rearward ends pivoted to lugs a^1 a^1, which project inwardly from the vertical parts A^1 of the axle. I I are hooks on the outer ends of the eveners G G, to which the draft animals are attached.

From this on the original and reissue specifications are substantially alike, the description of Fig. 1 of the reissue closing with the words—

It will be evident that the draft-plates B support and give direc-

tion to the course of the wheels, while the wheels in turn serve to support them.

The first claim of the original is for:

The axle A, having plates B hinged to the wheel-spindle plates C, so that the wheels are retained in the line of progression when one is in advance of the other, as set forth.

The second claim of the reissue is for:

The axle A, hinged to the wheel-spindle or draft-plates B B, so that the wheels are retained in the line of progression *by the draft of the animals*, when one is in advance of the other, substantially as described and for the purpose specified.

The third claim of the original is:

The evener-bars G G and bars H H, when combined and arranged to operate with the hinged axle A, plates C, and wheels E E, substantially as and for the purpose specified.

And the sixth claim of the reissue:

The evener-bars G and bars H, combined and arranged to operate with the hinged axle A, plates B, and wheels D, substantially as and for the purpose specified.

That purpose is stated in the second claim to be the retaining of the wheels "in the line of progression by the draft of the animals, when one is in advance of the other," and as this purpose can only be accomplished by the aid of the evener-bars G G and bars H H, that is, not by the combination of the second claim alone, but only by carrying into it the eveners and bars of the sixth claim, it follows that the latter must be brought into the former by intendment.

In the original patent the mode of attachment of the team to the cultivator is stated to be by the hooks I I—

on the *outer ends* of the *eveners* G G, to which the draft animals *are attached*—

while the reissue patent contains these words:

B B are draft-plates, with projecting forward ends *b*, to which the draft animals may be attached *direct*, or by any suitable device.

An examination of the machine discloses that the wheels are kept in the line of progression by the eveners G G and their connection, and when they are dispensed with, and the hitch made direct, the wheels follow the animals and may get out of the line of progression.

As it is admitted that if the eveners are elements of the second claim, the effect of their omission and of hitching directly to the draft-plates instead of to the eveners would be to enlarge the claim, and as in our judgment this is precisely what was done, the reissue must be held to have been illegally expanded.

It may also be observed that the connecting-bow in the original patent, called an axle, consists of a central curved portion with a plate attached to each end, and two spindle-plates, a combination of five parts. In the reissue the axle and side plates are treated as one part, making with the two spindle draft-plates three parts. There is, therefore, an omission in the latter combination which tends, by reducing the number of elements, to render its scope less narrow than that of the original.

As we have seen, the original first claim was for—

the axle A, *having plates B* hinged to the wheel spindle-plates C, so that the wheels are retained in the line of progression when one is in advance of the other, as set forth.

The second claim of the reissue is for—

the axle A, hinged to the wheel-spindle or draft-plates B B, so that the wheels are retained in the line of progression *by the draft of the animals*, when one is in advance of the other, substantially as described, and for the purpose specified.

The axle, having plates as described hinged to wheel spindle-plates, is not identical with an axle omitting the first-named plates, or having them so affixed as to become a constituent part thereof. The omission of the plates B and the addition of the direct draft are significant and material changes, and it is well settled that a reissue can only be granted for the same invention intended to be embraced by the original patent, and the specification cannot be substantially changed, either by the addition of new matter or the omission of important particulars, so as to enlarge the invention as intended to be originally claimed.

Passing to the question of infringement, it will be found that when the extent of the invention is determined, as it must be, by reference to the state of the art, the appellee's machine does not infringe in respect to those parts of the claim which can be held to have been unanticipated. It is alleged in the bill that in *Pattee* v. *Moline Plow Company*, in the United States Circuit Court for the Northern District of Illinois, the court sustained the validity of said Reissued Letters Patent No. 6,080. Upon referring to that case (10 Bissell, 377, and 9 Fed. Rep., 821, 22 O. G., 178) we find that Judge Blodgett held:

From the proof in this case it is quite clear to me that Pattee was not the first to conceive and embody in a working machine the idea of a tongueless straddle-row cultivator. The first machine shown in the proof which embodies this idea is that patented by Isaac Constant, in November, 1851. It is a tongueless straddle-row cultivator, with all the elements for a working machine of that description, and so arranged as to be what may be called in this art self-sustaining, that is, it will stand upon its own supports. This was also done by Arnton Smith in January, 1855; by Whitely in 1860 to 1865; by E. W. Vaugundy in February, 1864; by Pratt in October, 1864; and by Adam Young in November, 1866. All these show cultivators constructed without a tongue, with two plow-beams held together by a yoke, each plow drawn by its own draft animal and operating independently of the other.

The Constant patent here referred to is in this record and shows a tongueless cultivator, in which the inside beams move vertically and laterally, independent of each other, and each draft-animal is hitched to its own side, while the side supports are beams to which two cultivator-shovels are applied.

The Smith machine is a tongueless cultivator, in which two mold-board plows are connected together by a bar in front, not arched up in the center. A horse is to be attached to each plow, and the coupling so made as to allow an independent motion.

Of the Pratt patent Judge Blodgett says that Pattee's arched and jointed axle is fully anticipated by it in form of construction, function, and mode of operation. This Pratt patent shows a flexible, parallel, tongueless cultivator, in which each horse pulls his own side of the machine.

The patent to William Tasker of 1859 has an axle hinged to draft or spindle arms, having projecting bars so coupled that the wheels are retained in the line of progression by the draft of the animals. Tasker's fifth claim is:

The connecting of the wheel-stumps to a vertical spindle or spindles, capable of turning freely in vertical collar-bearings or sockets, as hereinbefore described.

The description as to this part of his machine is thus:

J J are adjustable stumps for carrying the running-wheels K K. These stumps pass through the overhanging lugs L L, formed at the top and bottom of each of the round spindles M M, which are contained in the vertical sockets N N (one of which is shown in section in Fig. 3) of the cast-iron frame C, and are free to turn therein, thereby enabling the stump of each wheel to swivel or lock round when turning the plow, as shown by the dotted lines in Fig. 2.

If Pattee's claim were merely for a combination of an axle, having an elevated central portion, with the wheel-spindles, so that the draft of the team controls the direction of the wheels, the Tasker patent anticipates it; but the combination differs from that in the arrangement by which the evener-bars are carried inwardly so as to connect with the arch or central part of the axle, making the axle a part of the evener so combined, and thus maintaining the parallelism of the wheels.

Appellee's machine does not have "the wheel-spindles or draft-plates" of the patent, nor the axle A with side-plates B, but it uses the Pratt axle of 1864. Nor in appellee's machine is the parallelism of the wheels maintained by the draft devices, nor are they retained in the line of progression by the draft of the animals, but turn as the animals may pull. The beam-frames of appellee's machine have nothing to do with the wheel-spindle. The snugs of Pattee's have nothing to do with the plow-beams. The differences are so great that interchangeability of the parts of the two machines would be utterly out of the question.

In our judgment the reissue if valid, when limited to what alone could be claimed as new, is not infringed by appellee.

The first and second claims of the Kendall patent, No. 174,684, are as follows:

1. The runners E, arranged to support the axle of a tongueless cultivator, with the plows D suspended therefrom, in manner substantially as described.

2. The combination of the runners E, plows D, hook-rods F, and axle A of a tongueless cultivator, substantially as and for the purpose specified.

As stated on behalf of appellant—

the second claim in said patent is a claim for substantially the same combination as recited in the first claim, but differently worded from the first claim—

and as the hang-up devices are necessary for the suspension of the plows, the two claims may be treated as one.

The invention is said in the specifications to consist of the use of runners attached to the truck frame or axle in such manner that they will not interfere with the operations of the machine when in use, and will act as supporting-runners for the axle when the rear ends of the plows are elevated and suspended thereon; and, second, in the combination of hooks or rods for suspending the plows on the axle, with said axle and plows.

The drawings show the axle, the wheels, the draft-plates, and the plows of an ordinary cultivator of the tongueless class. The runners, constituting as alleged the "main feature" of the improvement, are journaled on the outer ends of the spindles of the wheels, midway their lengths, and their forward ends curved inward, and secured to the draft-plates by a threaded end and nut, while their rear ends are extended backward and downward and curved in such position that when the plows are in operation in the field and the axle upright, the rear ends of the runners will be above and free from the surface of the ground, and when the rear ends of the plows are elevated and suspended by any means from the axle, the rear ends of the runners will rest upon the ground and support the axle from being pulled backward and downward. In short, as in the machines with a tongue, the plows are raised up and suspended from the tongue to keep them off the ground, so in the tongueless machine the plows are raised up and hooked on to the axle, and, to prevent their falling backward with the axle, runners are provided, connected with the axle and the hitching-arm of the machine, which sustain the axle when the plows are hooked on, but are themselves raised from contact with the ground by the draft when the plows are in use.

The runners are described as "journaled on the outer ends of the spindles," but it is also stated that they—

may be attached *rigidly* to any suitable part of the axle at one or more points of attachment, and extend backward in the same manner as described.

These runners, having the wheel spindle or axle for their fixed point of support, are necessarily rigid and unyielding, and work automatically, their rear ends being raised by the pulling of the team and lowered by the weight of the plow-beams when placed on the hooks.

The rigidity of the runners and the resulting automatic action are the essential characteristics of the patent, for tongueless wheel-cultivators with runners to keep the plows off the ground were common and well known in the art when it was issued.

It is contended by appellant that the true state of the art is contained in the prior patents of Poling of 1872 and Robertson of 1875, and while many others are exhibited, an examination of these will, we think, sufficiently establish the conclusion just expressed.

Poling's patent is for a tongueless cultivator, provided with runners, which are placed under the beams by hand, when the plows are being transported, and which are taken out and carried on the beams when the plows are in operation.

Robertson's patent is for a tongueless cultivator, with draft-plates, wheels, and beams, and runners pivoted to the beams near the axle, and arranged with set-screws to lock the plows up and let them down. It is immaterial to the operation of the runners whether they act directly on the plow-beams or through the axle.

In appellee's machine the runner is arranged upon the end of an arm which projects backward from the axle. When the plows are in use the runner is turned up out of the way. When the runners are used the plows are raised and the runners prevented from turning up by a catch on the arm. This machine does not contain runners constructed as the Kendall runners are, in the rigid form, and operated by the draft of the team to keep them off, or by the weight of the plows to keep them on, the ground, and so lacks the distinctive features of the Kendall patent. It is not automatic, but requires manipulation every time the use is changed. When the runner is put in use its rear extension is turned down by hand, and a locking-dog, hung within a slot in the arm, turned into position. When the runner is not to be used, it must be moved so as to release the dog and permit it to be thrown up, and the arm is then thrown upward and forward, the dog being allowed to drop so as to afford a support for the runner. This jointed runner with a lock cannot be held to be the Kendall rigid bar.

We agree with the circuit court that there is no infringement.

Patent No. 187,899 is described as being for a new and improved mode of constructing the arch or central and main part of straddle-row-cultivator beam yokes or axles, and of connecting the side parts thereto, and the invention as consisting—

in constructing said arch of curved adjacent bars of iron or steel, to the ends of which may be attached, by riveting, the cast-iron

parts for securing thereto the plows and wheels, and which may be strengthened by the use of stiffening-bolts.

The use of parallel bars is exceedingly common, and so far as the attachment of the bars to the end plates is concerned there is nothing new in that method.

The Burnham and Lathrop patent of 1866 shows a yoke connecting the plow-beams together, made with two parallel bars with end castings, put together with one bolt near the rear ends of the beams instead of with two bolts at the front ends, as in appellant's machine. The specification says:

The two frames G G are connected by an arched or semicircular yoke, H^2, the ends of which are pivoted to bars I I, which are secured on the tops of the plow-frames G G by pivots *e*, the bars being allowed to turn freely on the pivots *e*.

The Louden patent of 1876 has an arched axle of tubular wrought-iron, gas-pipe being stated to be very suitable, having end castings attached rigidly or cast thereon.

The Barr patent of 1872, and the Miller patent of the same year, show arched axles or beam-yokes of two or more parts. The Perkins patent of the same year shows the beams themselves made of parallel curved bars.

What is sought in all these patents is strength and lightness, together with cheapness and durability, but they are simply modes of construction. And that described in this patent embraces nothing that is not old and really nothing that is patentable, that is, which involves invention rather than mechanical skill.

Upon the whole case we are satisfied with the conclusions reached by the circuit court, and its decree is, therefore, affirmed.

U. S. Circuit Court—Western District of Pennsylvania.

TONDEUR *v.* CHAMBERS.

Decided January 10, 1889.

1. VALIDITY OF PATENT—OATH AS TO CITIZENSHIP.
   It is not a valid defense to a suit for the infringement of Letters Patent granted under the Revised Statutes that the patentee in his application therefor made oath that he was a citizen of the United States when he was not, such misstatement as to his citizenship having been made innocently through mistake, without any improper design whatever.

2. TONDEUR—GLASS-ANNEALING FURNACES.
   Letters Patent No. 258,156, dated May 16, 1882, for improvements in glass-annealing furnaces, granted to Cleon Tondeur, sustained, and the defendants adjudged to infringe the same. (Following *Tondeur* v. *Stewart*, 28 Fed. Rep., 561.)

Mr. J. Snowden Bell and *Messrs. W. Bakewell & Sons* for the complainant.

Mr. George J. Harding and *Mr. George Harding* for the defendants.

ACHESON, *J.*:

This is a suit for the alleged infringement by the defendants of Letters Patent No. 258,156, for improvements in glass-annealing furnaces, granted to Cleon Tondeur, the plaintiff, on May 16, 1882, a patent which this court already has had occasion to consider in the case of *Tondeur* v. *Stewart et al.*, (28 Fed. Rep., 561,) where there was a decree in favor of the patentee. The present defendants, however, were not parties to that suit, and, as some new proofs have been adduced by them, this case has been heard as if none of the questions involved had ever been passed on, and the conclusions I am about to announce have been reached after a re-examination of the grounds of the former decision and a careful consideration of the case in all its branches.

The patent discloses a device for transporting the sheets of glass from the flattening-wheel to the discharging end of the annealing-chamber, tunnel, or leer, consisting of two sets of parallel bars (designated *d* and *d'*) extending lengthwise through the leer and elevated above the bottom thereof, the bars of the respective sets being arranged side by side and alternately between each other, one set reciprocating longitudinally and conveying the glass, and the other set supporting the glass at certain times, whereby the sheets of glass are supported in and carried through the leer in substantially the same horizontal plane.

The specification shows and describes a series of transverse shafts to support the two sets of bars, each shaft being provided with two sets of arms, E' and E''', the arms E' carrying grooved wheels upon which the reciprocating or transmitting bars *d'* rest, and whereby they have a free rectilinear motion back and forth in the leer, while the supporting-bars *d* are made fast to the arms E''' by a hinge-joint. By means of a lever connected with one of the shafts one set of bars is raised and the other is lowered simultaneously to the extent altogether of about one inch, and thus the glass is shifted from one set of bars to the other; but, touching the motion of the bars *d*, the specification states, and the fact is, that it "is very small," (being limited to the short distance the lever moves the arm E''',) and "has no effect on the progress of the glass through the tunnel."

The described operation of the device is this: The ends of the reciprocating bars *d'* having been pushed into the flattening-furnace and a sheet of glass placed thereon, the operator at the outer end of the leer draws the bars *d'* outward the width of the sheet. Then by a motion of the lever he lowers the bars *d'* and raises the bars *d*, and thus the sheet is transferred from the bars *d'* to the bars *d*, upon which it rests while he pushes the bars *d'* back into the furnace. He then reverses the lever and the bars *d'* take up the sheet. A second sheet is then placed on the inner ends of the bars *d'*, and the two sheets are moved down the leer and deposited on the bars *d*, and the bars *d'* are again pushed back. This operation is repeated until a series of sheets extends throughout the leer, when they are discharged from the outer end one by one at each reciprocal movement of the bars *d'*.

The patent has 5 claims; but infringement of the first claim only is here asserted. That claim is as follows:

1. The combination of the bars *d d'*, arranged side by side and alternately between each other, the set *d* supporting the sheets of glass while the bars *d'* are pushed toward the leer or flattening-wheel *a*, and the set *d'* supporting the sheets of glass and moving them onward and through the tunnel, substantially as set forth.

The answer denies that the plaintiff was the first and original inventor of what was patented to him, and also denies infringement. To sustain the former defense the defendants rely not only upon the patents to Bievez and Bowen, which were mainly relied on to defeat the suit in *Tondeur* v. *Stewart et al.*, *supra*, but also upon Letters Patent dated November 25, 1873, granted to J. B. Boulicault, and several French patents, particularly the patent to A. M. Bouvy. Now, in respect to the first two mentioned

patents, I can discover no good reason for departing from the conclusion upon the question of anticipation expressed in the opinion of the court in the earlier case. Of the Boulicault patent it must be said that the drawings and specification in so far as they have any relation to the particular matter here in controversy are obscure. Moreover, there is some positive testimony tending to show that the construction thereby contemplated was a failure in practice; and so also there is evidence, especially the testimony of Henry L. Dixon, a furnace-builder and practical expert, which strongly impresses the conviction on my mind that the Bouvy device is impracticable for the proper annealing of sheets of glass. But, aside from these considerations, I think it can be confidently affirmed that not one of the several patents set up as anticipatory shows two sets of bars, one of them (the conveying set) having a reciprocating rectilinear motion, and the other set supporting the glass while the first set is pushed back into the furnace, which is an essential characteristic of the plaintiff's device. Notwithstanding, then, what prior inventors may have achieved, I am of the opinion that Tondeur's device possesses patentable novelty, and this conclusion is strongly sustained by the plaintiff's proofs—abounding and uncontradicted—showing the great utility of his patented invention and its immediate and very general adoption. The leers which had been commonly in use were the car-leer, in which the sheets of glass are transported through the annealing-tunnel on cars, and the hearth-leer, in which the sheets are moved along the floor of the leer, resting thereon except at the instant of transfer from place to place. But the plaintiff's improvement wrought a great change in the practice of the art to which it appertains. Glass-manufacturers generally have abandoned the old methods of transporting the glass through the annealing-tunnel, and have adopted the plaintiff's device, and a large number of them in various parts of the country have taken licenses from him. And, undoubtedly, the plaintiff's device secures more uniform and thorough annealing, resulting in a great saving of glass from breakage and also quicker work than any device or method previously employed for the like purpose. Now, while such facts as these may not be decisive of the question, they certainly go far to establish patentability. (*Smith* v. *Goodyear Dental Vul. Co.*, 93 U. S., 486; *Loom Co.* v. *Higgins*, 105 U. S., 580; *Consolidated Valve Co.* v. *Crosby Valve Co.*, 113 U. S., 158, 179.) Coming, then, to the question of infringement, we find that the defendants use two sets of elevated bars, and that the only difference (alleged to be material) in construction or mode of operation between their device and that described in the plaintiff's specification is that in the defendant's leers the bars which support the sheets of glass while the reciprocating bars are pushed toward the flattening-wheel are stationary, and the vertical movement for shifting the glass from one set of bars to the other is performed by the reciprocating bars alone. Is this difference sufficient to relieve the defendants from the charge of infringing the first claim of the patent? Certainly the variation is practically unimportant. As was said in *Tondeur* v. *Stewart et al.*, *supra*, most clearly the defendants' stationary bars perform the identical supporting function which the plaintiff's bars *d* perform, the only function, be it observed, assigned to those bars by the first claim. Then, again, it is evident that for the supporting of the sheets of glass by the bars *d* and the supporting and moving of them by the bars *d'* (the particular matters covered by the first claim) it is altogether immaterial whether the vertical movement is divided between the two sets of bars or is executed by the bars *d'* alone. The difference is not in principle, but in mere arrangement. In all essential particulars the plaintiff's described device and that employed by the defendants' are alike. They operate in substantially the same way and produce the same beneficial results. This, however, is not all, for not only do the defendants use and enjoy the substance of the plantiff's invention, but their bars come within the very terms of the first claim of the patent. Therefore, to escape the charge of infringement, the defendants are under the necessity of contending that the first claim of the patent shall be construed to mean two sets of movable elevating bars. To sustain this view, much stress is laid upon certain passages of the specification which treat of the shifting movement of the bars *d* and *d'*, and also upon the disclaimer to be found in the patent in the words following:

I am aware that movable bars and fixed temporary rests for the glass have long been in public use to move sheets of glass through an annealing-tunnel. Therefore I do not claim these.

Now, it may well be that the patentee considered the simultaneous change in the elevation of the two sets of bars as the most advantageous mode of shifting the glass from set to set, and this feature he has taken care to cover by the second claim of the patent. But the first claim calls for no such limitation as is insisted on, and its language is free from ambiguity. Why, then, should the court import into the claim a qualification not expressed—something wholly unnecessary to the therein-described operation—when the only practical effect would be to deprive a worthy inventor of the benefit of his patent?

The disclaimer was considered in the case of *Tondeur* v. *Stewart et al.*, *supra*, and the judgment of the court was against giving to it the effect here contended for. To that conclusion I must adhere. I will not repeat or much enlarge on what was said upon this subject in the former opinion. The disclaimer is to be read with reference to the prior state of the art, and it may and ought to be construed so that it may harmonize with the plainly-expressed terms of the first claim of the patent.

The claim follows directly upon the heels of the disclaimer—

But what I do claim is—
1. The combination of the bars *d d'*, &c.

The specification describes two sets of bars, one set having a temporary supporting function and the other set supporting and moving the sheets of glass through the leer. The first claim of the patent is for the combination of these two sets of bars arranged and cooperating in the manner and for the purpose defined. The claim should be interpreted with reference to the actual invention. The reasonable presumption is that, having a just right to cover and protect his whole invention, the patentee intended to do so. (*Winans* v. *Denmead*, 15 How., 341.)

The construction of patents should be liberal, so as to secure to inventors what they have created, if it can be done consistently with the language used. (*Turrill* v. *Railroad Co.*, 1 Wall., 491; *Klein* v. *Russell*, 19 Id., 433.)

Guided by these just principles, I must reject the construction the defendants would put on the first claim of the patent and hold them to be infringers thereof. But the defendants make the further defense (which was not set up in the prior suit) that the Letters Patent sued on are null and void, upon the ground that in the application for his patent the plaintiff made oath that he was a citizen of the United States, which he was not. The answer does not allege, nor is there any evidence to indicate, that the plaintiff was guilty of any fraud or that his oath was willfully false. On the contrary, it satisfactorily appears that he acted under an honest mistake and with no improper design whatever. The plaintiff left Belgium, his native land, in the year 1881, and came to the United States with the avowed intention of making this country thenceforth his permanent place of residence and citizenship, and he ignorantly supposed that by virtue of his residence and the residence of his family here he became a citizen. This mistake he did not discover until a long time after the grant of his patent. Now, the question raised, it will be perceived, is not whether the Letters Patent are voidable for the cause assigned at the suit of the Government. The position taken is that the patent is a nullity. In support of the proposition the defendants cite the case of *Child* v. *Adams*, (1 Fish., 189,) in which a similar defense was sustained by Judge Grier. But that case arose under and was governed by the patent act of 1836, which allowed the grant of Letters Patent to aliens only upon peculiar conditions, to which citizens were not subject. (5 Stats. at Large, 117.) By that act the patent-fee payable by a citizen was $30 only, whereas an alien was required to pay at least $300, and if a British subject $500; and by the stringent language of the act the fee was to be paid before the application for a patent could be considered by the Commissioner. (Section 9.) Then, again, an alien patentee was compelled "to put and continue on sale to the public, on reasonable terms, the invention or discovery for which the patent issued." (Section 15.) It was therefore, under that act of the highest importance that the applicant should truly disclose his citizenship, and section 6 required that before any inventor should receive a patent he should "make oath * * * of what country he is a citizen." The decision cited was expressly put upon the ground that an alien, whether through ignorance or intention, falsely swearing that he was a citizen in order to procure a patent not only failed to perform a condition upon which his right to a patent depended, but committed a fraud upon the Government. But the law governing the present case—*i. e.*, the patent act of 1870, as embodied in the Revised Statutes—abolished all such discriminations against aliens and placed them upon the same footing as citizens in respect to the grant of Letters Patent for inventions and the enjoyment of the privileges thereby secured. (R. S., secs. 4886, 4920, 4934.) Therefore, under the law as it stood when the plaintiff applied for and obtained his patent, the mistake in his statement as to his citizenship operated, and could operate, neither to his advantage nor to the detriment of the Government or the public. Furthermore, it is well worthy of notice that while section 4892 Revised Statutes requires the applicant for a patent to "make oath that he does verily believe himself to be the original and first inventor," &c., in respect to citizenship, the language is, "and shall state of what country he is a citizen." This change in phraseology seems to be intentional and to dispense with the necessity of an oath as to citizenship. At any rate, the citizenship of the applicant for a patent is no longer a matter of any real importance, and a mistake touching the same is harmless. I feel quite justified, then, in declining to apply to this case the rule which prevailed in *Child* v. *Adams*, *supra*. In the absence of express statutory provision avoiding a patent for a misstatement as to citizenship, it would be going to an extreme length, and, indeed, in the face of well-settled equitable principles, for the court to hold that a mere mistake in that regard, innocently made and working no sort of harm, should have such effect. In *Com. Mfg. Co.* v. *Fairbank Canning Co.*, (27 Fed. Rep., 78,) where it was urged that a patentee was estopped to deny that his American patent was for the same invention before patented by him in a foreign country by reason of his having made oath that such was the fact in his application for the former, it was held that if the inventor was laboring under a mistake as to this point his rights ought not thereby to be defeated or abridged. At an early day Judge Story held, in *Whittemore* v. *Cutter*, (1 Gall., 429,) that an error in the form of the oath of an applicant for a patent was immaterial; and in *Crompton* v. *Belknap Mills* (3 Fish., 536) the court said that even the entire failure to make the oath would not invalidate the patent. Upon the whole, then, I am of the opinion that the misstatement in the plaintiff's oath as to his citizenship is not an available defense to this suit.

Let a decree be drawn in favor of the plaintiff.

U. S. Circuit Court—District of Massachusetts.

THOMPSON *et al. v.* RAND-AVERY SUPPLY COMPANY.

Decided February 5, 1889.

SHOREY—MACHINE FOR FORMING STAPLE-SEAMS IN LEATHER—INFRINGEMENT.

The infringement of the third claim of Letters Patent No. 186,340, granted February 23, 1873, to Samuel W. Shorey, for an improvement in machines for forming staple-seams in leather by the use of defendant's rest or supporter, which has no incline or bevel, doubtful. Motion for injunction denied.

Mr. James E. Maynadier for the complainants.

Mr. H. D. Donnelly for the defendant.

COLT, *J.*:

In order to grant the motion for a preliminary injunction now prayed for I must be satisfied that the defendant uses the inclined or retreating anvil *n*, which is one of the elements of the third claim of the Shorey patent or its equivalent. Upon an examination of the papers before me I have considerable doubt whether defendant's rest or supporter, which has no incline or bevel, can be said to be the equivalent of the inclined anvil *n*, or whether the defendant can fairly be said to use the combination of devices or the equivalents contained in the third claim of the Shorey patent.

Judge Blodgett, in the case of these plaintiffs against the E. P. Donnell Manufacturing Company *et al.*, where the same question arose, refused an injunction, and after the opinion of Judge Wheeler in the case against the American Bank Note Co. (45 O. G., 347; 35 F. R., 203) he still refuses to modify his opinion. It further appears that Judge Shiras, of the district of Minnesota, denied similar motions in several cases brought by these complainants against different defendants. In view of the doubt in my mind on the question of infringement, I think I ought to follow the ruling of Judge Blodgett and Judge Shiras and deny the motion.

Motion denied.

The same order may be entered in the case of the complainants against L. P. Coffin.

The Official Gazette.

THE OFFICIAL GAZETTE is published every Tuesday, simultaneously with the weekly issue of patents. From January 1, 1872, (the commencement of its publication,) to June 30, 1883, it was published and bound in semi-annual volumes; since July 1, 1883, in quarterly volumes. All subscriptions must commence with the beginning of a volume; none taken for less than three months. Terms: To all subscribers within the United States and Canada, $5 per annum; to foreign subscribers, $7; single copies, 10 cents; bound semi-annual volumes, (prior to June 30, 1883,) full sheep, $4 per volume; bound quarterly volumes, (subsequent to July 1, 1883,) full sheep, $3.75 per volume. No club rates. *Payment in advance.* All orders should be addressed to "The Commissioner of Patents, Washington, D. C."

Indexes to Patents on Electricity.

Appendix No. 2 to the index to patents relating to electricity, covering the period of time from July 1, 1882, to June 30, 1883, has been issued, and is now for sale. These indexes, arranged alphabetically, numerically, and by classes, are completed to June 30, 1883, and comprise the following volumes:

Vol. 1. Index to patents relating to electricity granted by the United States prior to June 30, 1881, with an appendix, July 1, 1881, to June 30, 1882. One volume, 250 pages. In paper covers, $3; bound, $5.

Vol. 2. Appendix No. 2, July 1, 1882, to June 30, 1883. One volume, 50 pages. In paper covers, $1.50.

Vol. 3. Appendix No. 3, July 1, 1883, to June 30, 1884. One volume, 60 pages. In paper covers, $1.50.

Vol. 4. Appendix No. 4, July 1, 1884, to June 30, 1885. One volume, 60 pages. In paper covers, $1.50.

Vol. 5. Appendix No. 5, July 1, 1885, to June 30, 1886. One volume, 54 pages. In paper covers, $1.50.

Vol. 6. Appendix No. 6, July 1, 1886, to June 30, 1887. One volume, 52 pages. In paper covers, $1.50.

Indexes to Foreign Patents.

The following indexes to foreign patents have been translated, compiled, and published under the authority of the Commissioner of Patents, and may be obtained as a Patent Office publication at the prices given below:

INDEX TO FRENCH PATENTS, 1791 to 1876, inclusive, (subject-matter, one volume, 935 pages, bound in cloth	$10 00
INDEX TO ITALIAN PATENTS, 1848 to May 1, 1882, (subject-matter,) one volume, 120 pages—	
Bound half-turkey	2 50

DESIGNS.

18,943 and 18,944.—BRUSH OR MIRROR BACK.—*Henry Berry*, Shelton, Conn., assignor to *The Derby Silver Company*, same place. Applications filed January 14, 1889. Serial Nos. 296,296 and 296,297. Term of patents 7 years.

18,945.—GAS OR OIL STOVE.—*Theodore W. Burger*, Dunellen, N. J., assignor to *Burger & Lee*, New York, N. Y. Application filed July 5, 1888. Serial No. 279,122. Term of patent 14 years.

18,946.—FONT OF COMBINATION TYPE ORNAMENTS.—*John Graham*, Chicago, Ill. Application filed January 5, 1889. Serial No. 295,571. Term of patent 3½ years.

18,947 and 18,948.—RUG.—*Thomas E. Meagher*, Philadelphia, Pa., assignor to *Schofield, Mason & Co.*, same place. Applications filed February 8, 1889. Serial Nos. 299,161 and 299,162. Term of patents 3½ years.

18,949.—BATH-TUB.—*Francis J. Torrance*, Allegheny, Pa. Application filed February 9, 1889. Serial No. 299,299. Term of patent 14 years.

18,950.—STAIR-BUTTON.—*David Walker*, Newark, N. J. Application filed December 3, 1888. Serial No. 292,576. Term of patent 14 years.

TRADE-MARKS.

[Certificates of registration of Trade-Marks numbered 8,191 and upward are registered under the act of March 3, 1881.]

16,327.—PHOTOGRAPHIC PAPERS, INSTRUMENTS, SPECIALTIES, AND SUPPLIES.—*American Aristotype Co.*, Jamestown, N. Y. Application filed January 14, 1889. Used since December 22, 1888.
"The word 'ARISTO.'"

16,328.—WATCHES AND THEIR COMPONENT PARTS.—*Anc. Fque. Vacheron & Constantin, (Limited,)* Geneva, Switzerland. Application filed January 25, 1889. Used since January 1, 1869.
"The representation of two crosses of the Maltese type, the outer edge of the arms of one cross being straight and the equivalent edge of the arms of the other cross being essentially triangular."

16,329.—BEER OF A LIGHT COLOR AND SUPERIOR QUALITY.—*The Bergner & Engel Brewing Company*, Philadelphia, Pa. Application filed December 11, 1888. Used since June 1, 1882.
"The word 'TANNHÄEUSER.'"

16,330.—SHEETINGS AND SHIRTINGS.—*Boott Cotton Mills*, Lowell, Mass. Application filed January 22, 1889. Used since December 1, 1868.
"The word 'SIGNAL.'"

16,331.—COTTON-BATS.—*William J. Caldwell*, Reading, Pa. Application filed January 23, 1889. Used since November 1, 1888.
"The word 'GEM.'"

16,332.—COTTON-BATS.—*William J. Caldwell*, Reading, Pa. Application filed January 23, 1889. Used since May 1, 1888.
"The word 'MAMMOTH.'"

16,333.—METAL ROOFING.—*The Canton Steel Roofing Company*, Canton, Ohio. Application filed January 2, 1889. Used since October 1, 1886.
"A diamond or lozenge shaped figure having located therein a circle, rolls of roofing partly unwound, and within the circle a monogram consisting of the letters 'C S R Co.'"

16,334.—BITTERS.—*Elijah T. Cooper*, Allegheny, Pa. Application filed January 8, 1889. Used since October 2, 1888.
"A monogram of the initials 'E T C.'"

16,335.—SOAP.—*Joseph Crosfield & Sons*, Warrington, county of Lancaster, England. Application filed January 23, 1889. Used since January 1, 1881.
"The word 'UNIVERSAL.'"

16,336.—WASHING COMPOUND.—*Marie Perkins Evans*, New Orleans, La. Application filed January 24, 1889. Used since January, 1887.
"The word 'WATERLINE.'"

16,337.—COLLARS, CUFFS, NECK-WEAR, SHIRTS, AND UNDERWEAR.—*Simon Hayem, Aîné*, Paris, France. Application filed November 13, 1888. Used since 1830.
"The words 'MARQUE DE FABRIQUE' on the upper and 'MAISON FONDEE EN 1830' on the lower side of an oval band, the capital letters 'H' and 'A' on the left and right hand, respectively, of the representation of a phenix or bird with outspread wings arising out of a bed of flame, and the words 'MAISON DU PHENIX' above the oval."

16,338.—SHOE-ELASTIC.—*Herbert & Rapp Company*, Boston, Mass. Application filed January 19, 1889. Used since December 15, 1888.
"A heart-shaped device within which, in any style of lettering, are the words 'HUB' on one line, 'GORE' on a second line, and any single letter of the English alphabet on a third line in the apex of the figure."

16,339.—BISCUITS, CRACKERS, WAFERS, AND SIMILAR ARTICLES.—*Holmes & Coutts*, New York, N. Y. Application filed January 21, 1889. Used since December 5, 1888.
"A mottled border or frame surrounding the display-face of the packages of biscuits, crackers, and wafers."

16,340.—STOVE-POLISH.—*Gaylord M. Jackson*, Los Angeles, Cal. Application filed January 11, 1889. Used since 1886.
"A bust portrait of 'GAYLORD M. JACKSON' and the word 'JACKSON'S' and the word 'POLISH.'"

16,341.—CEMENT FOR MAKING BLACKBOARD-SURFACES.—*John K. Knox*, Skaneateles, N. Y. Application filed January 11, 1889. Used since October 8, 1886.
"The word 'HORNSTONE.'"

16,342.—LAUNDRY AND TOILET SOAP.—*B. A. Lynde & Son*, Buffalo, N. Y. Application filed February 6, 1889. Used since January 29, 1889.
"The word 'TRUTH.'"

16,343.—ILLUMINATING-OIL.—*Mather Brothers*, Albany, N. Y. Application filed January 14, 1889. Used since 1871.
"A star inclosed by a triangle which is partly surrounded by an incomplete ring."

16,344.—MEDICAL COMPOUNDS FOR THE CURE OF FEMALE DISEASES.—*John A. McGill*, South Bend, Ind. Application filed January 24, 1889. Used since December, 1888.
"The letters 'O B.'"

16,345.—MAPLE-SIRUP.—*George D. Powell*, Brooklyn, N. Y. Application filed September 28, 1888. Used since October 12, 1886.
"The word 'SAP' and the representation of a maple-leaf."

16,346.—WHISKY.—*John Power & Son*, Dublin, Ireland. Application filed July 31, 1888. Used since 1791.
"The letter 'P' within a diamond or lozenge shaped figure."

16,347.—FLAVORING EXTRACTS FOR FOOD.—*Price Baking Powder Company*, Chicago, Ill. Application filed January 11, 1889. Used since November 15, 1888.
"The representation of a bottle in outline, a label secured thereto, and a star and curved line on the label."

16,348.—CHEWING-GUM.—*H. D. Smith & Co.*, Cincinnati, Ohio. Application filed January 14, 1889. Used since March 1, 1888.
"The compound word 'YLANG-YLANG.'"

16,349.—EXPLOSIVES.—*The Smokeless Powder Company, (Limited,)* London, England. Application filed January 8, 1889. Used since March 24, 1888.
"A device which may be described as follows: On the right-hand side a figure representing a volunteer or soldier in uniform. In the center two concentric circles shown on a white rectangular space, between which circles are the words 'SMOKELESS POWDER COMPANY, LIMITED.' In the central circle are four blackened circles having the following white letters shown thereon—namely, 'S S,' 'S R,' 'S B,' 'S M.' Around the blackened circles are also the words 'SPORTING,' 'RIFLE,' 'MILITARY,' 'BLASTING.' On the left-hand side a figure representing a sportsman carrying a gun. The two figures are shown as standing on the banks of a piece of water."

16,350.—PLOWS.—*South Bend Iron Works*, South Bend, Ind. Application filed January 19, 1889. Used since 1870.
"The words 'THE OLIVER.'"

16,351.—CLOVER SEED.—*Chas. Stager & Co.*, Toledo, Ohio. Application filed January 21, 1889. Used since June 2, 1888.
"The word 'BUCKEYE.'"

16,352.—ROAD-WAGON THE BODY OF WHICH IS SUPPORTED BETWEEN SIDE BARS BY CROSS-SPRINGS.—*Rufus M. Stivers*, New York, N. Y. Application filed December 14, 1888. Used since June, 1882.
"The word 'RUNABOUT.'"

16,353.—MEDICINE FOR THE CURE OF INDIGESTION, DYSPEPSIA, AND LIVER COMPLAINT.—*E. M. Thomas Manufacturing Company*, Jersey City, N. J., and New York, N. Y. Application filed February 4, 1889. Used since January 9, 1889.
"The word 'VITALIA.'"

16,354.—SPIRAL OR VOLUTE SPRINGS FOR WATCHES.—*Usine Genevoise de Dégrossissage D'or*, Geneva, Switzerland. Application filed November 9, 1888. Used since September 15, 1888.
"The representation of a bowed arrow."

16,355.—BALANCE-WHEELS FOR WATCHES.—*Usine Genevoise de Dégrossissage D'or*, Geneva, Switzerland. Application filed November 9, 1888. Used since May 29, 1888.
"The representation of a straight arrow."

16,356.—LIQUID MEDICINE FOR EXTERNAL AND INTERNAL USE.—*Frank A. Wright*, Lewiston, Me. Application filed December 29, 1888. Used since 1861.
"The words 'MAGNETIC ELECTRIFIER.'"

LABELS.

5,832.—Title: "BOLLING'S CRYSTAL CREAM" (FOR CUTICLE OINTMENTS.)—*The Bolling Drug Company*, Little Rock, Ark. Application filed September 11, 1888. (Trade-Mark Registered.)

5,834.—Title: "BALDWIN'S PERFECTION SALVE."—*Joseph B. Brock*, Riverton, Va. Application filed February 7, 1889.

5,835.—Title: "BALDWIN'S PERFECTION SKIN-CURE."—*Joseph B. Brock*, Riverton, Va. Application filed February 7, 1889.

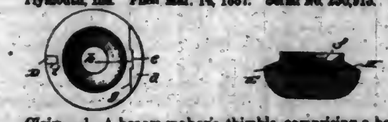
5,836.—Title: "CARTY'S AGUE CURE."—*William C. Carty*, Graniteville, Mo. Application filed November 30, 1888.

5,837.—Title: "THE COTTON OIL PRODUCT CO'S BATH SOAP."—*The Cotton Oil Product Company*, New York, N. Y. Application filed February 6, 1889.

5,838.—Title: "GUARANTEE" (FOR RUBBER AND OIL CLOTHING.)—*Dunlap, Lawton & Hall*, Chicago, Ill. Application filed February 11, 1889. (Trade-Mark Registered.)

5,839.—Title: "MELILOTUS CREAM" (FOR A COMPOUND FOR THE COMPLEXION.)—*Thomas H. Field*, Chicago, Ill. Application filed January 10, 1889.

5,840.—Title: "PROTECTION CHECK" (FOR BLANK BANK CHECKS.)—*George A. Libbey*, Kansas City, Kans. Application filed January 21, 1889.

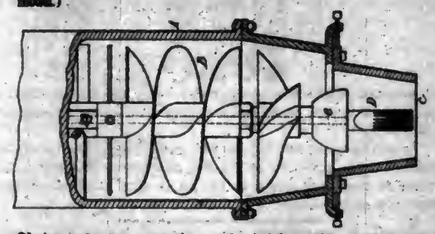


5,841.—Title: "SERRATED RIBBON" (FOR TYPEWRITER RIBBONS.)—*Adelbert P. Little*, Rochester, N. Y. Application filed February 5, 1889.

5,842.—Title: "YOUNG'S INDIAN SALVE."—*Frances E. Young*, New York, N. Y. Application filed February 6, 1889.

PATENTS

GRANTED MARCH 5, 1889.



398,812. BROOM-MAKER'S THIMBLE. DANIEL W. ALBERT, Plymouth, Ind. Filed Mar. 14, 1887. Serial No. 230,913. (Model.)

Claim.—1. A broom-maker's thimble comprising a base-section and a top section of hard metal and a disk of a softer metal confined between the respective sections, substantially as specified.

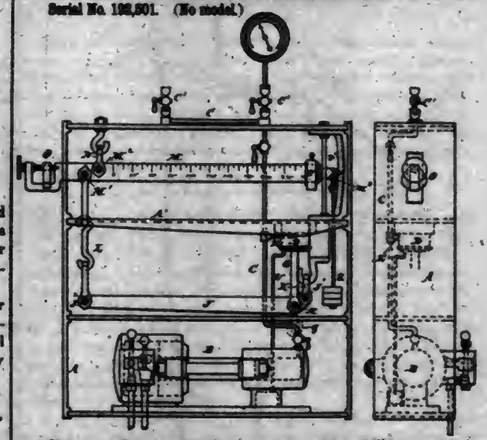
2. The combination, with the plano-convex section, of the section connected therewith and having a flaring aperture and its inner side provided with an annular groove, and the disk arranged at the base of the aperture, substantially as specified.

398,813. ATTACHMENT FOR BRICK-MACHINES. PHILIP G. BENSON, Aurora, Ill. Filed Sept. 1, 1888. Serial No. 284,319. (No model.)

Claim.—1. As an attachment for brick-machines, the grooved blade D as made with continuous and gradually-deepening grooves and ribs on its opposite surfaces, all terminating in one thin zigzag or corrugated edge, as shown and described, and adapted to be held stationary at or near the exit-mouth of the machine, as set forth.

2. In combination with a brick-making machine, a stationary bar reduced at its outer end to a thinned blade, D, having unbroken longitudinal grooves extending to a thin terminal edge of the blade, all as set forth, such blade being located to project beyond the extremity of the clay-propelling mechanism, all substantially as set forth.

398,814. ELECTRICAL TRAMWAY. HENRY T. BLAKE, New Haven, Conn. Filed Nov. 30, 1888. Serial No. 292,292. (No model.)



Claim.—1. An electrical conductor-conduit composed of a base, of wood or other non-conducting material, a metallic electrical conductor-strip laid in said base below its upper surface, a depression or channel in said base above said conductor, a strip or flap of flexible non-conducting material attached by one of its edges along the upper surface of said base and overlying said channel, and a strip of flexible non-conducting material attached to the under side of said flap and filling the mouth of said channel as a continuous plug and adapted to be lifted by a plow-shaped trolley, or by any other suitable device acting upon said plug or flap, all in the manner as described.

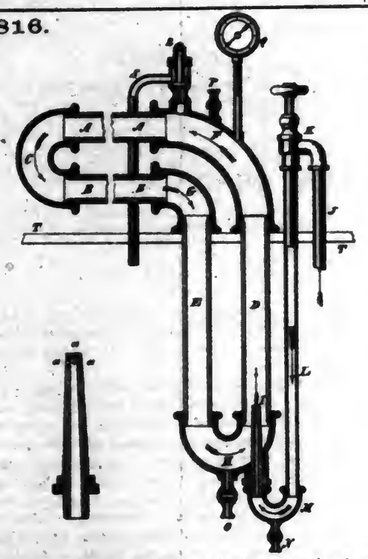
2. The devices described and shown as a covering for any slotted conduit, consisting of a flap of flexible material attached along one of its edges to the upper surface of said conduit, so as to cover such slot, a strip of flexible material attached to the under side of such flap and closing the slot of the conduit as a continuous plug and adapted to be lifted and replaced in the manner shown and described, and weighting-plates attached to the upper side of the flap, all as shown and described.

3. A conduit for an electrical railway and other uses, consisting, first, of a base, of wood or other suitable non-conducting material, having its upper surface rounded or roof-shaped, and having a channel cut in said upper surface, at the bottom of which the electric conductor is laid; second, a flexible flap overlying said upper surface and attached thereto along one of its edges, and, third, weighting-plates secured to said flap, which extend across said channel and whose under surface conforms to the curved or roof-shaped surface of said base, and thereby causes the said flap to conform, when in position, to such shape, so as to form a curved, roof-shaped, or sloping covering over said base, which is held in place by said weighting-plates, except when lifted by the passage of the trolley, all in the manner and for the purpose described.

398,815. APPARATUS FOR TESTING STEAM OR OTHER PRESSURE GAUGES. JOHN D. BOWMAN, Altoona, Pa. Filed Feb. 10, 1886. Serial No. 192,501. (No model.)

Claim.—1. In a gage-testing apparatus, substantially as specified, the combination of the chamber D, having piston F, supported on the scale-levers J M, with the fluid-conduit C extending above the piston and having at its top cocks C, to which the gages are attached.

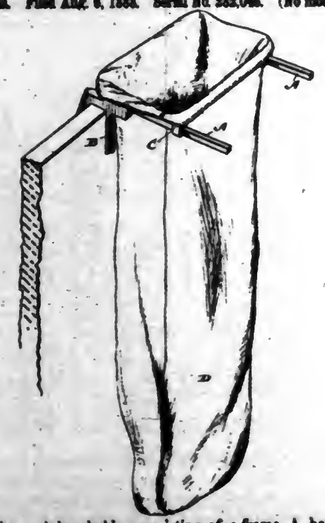
2. In a gage-testing apparatus, substantially as specified, the combination of a force-pump, B, the fluid-conduit C, leading to the gages, a chamber, D, communicating with said conduit, the piston F, of known area, and the levers J M, arranged to support the piston and weigh the pressure on its surface.



3. In a gage-testing apparatus, substantially as specified, the combination, with the chamber D and piston F, of the annular gutter S, having drip-pipe U, with the saucer-shaped ring T, secured upon the rod G and having its depressed rim over the gutter S.

398,816. RAILWAY-CAR HEATER. WILLIAM DEBERTY, New York, N. Y., assignor to John B. Gray, same place. Filed May 2, 1887. Serial No. 236,814. (No model.)

Claim.—1. The combination, with a radiator-pipe having a depending loop, the two forming a complete circuit of pipes for a heating medium, of a jet-pipe extending within the loop, and a suitably-governed valve on the circuit, substantially as described.



2. The combination, with a radiator-pipe having a depending loop, the two forming a complete circuit of pipes for a heating medium,

398,816.

of a jet-pipe extending within the loop, having a closed end and side perforations, and a suitably-governed valve on the circuit, substantially as described.

398,817. BAG-HOLDER. WILLIAM R. BURRAGE, Toronto, Ontario, Canada. Filed Aug. 6, 1888. Serial No. 282,046. (No model.)

Claim.—A bag-holder consisting of a frame, A, having downwardly-projecting jaws B, and an upwardly-bent side, *a*, extended above the top of said jaws, in combination with the studs or fingers C, adjustably fitted onto the frame A, and arranged in conjunction with the bent side *a*, to hold open the mouth of the bag D they are supporting, substantially as and for the purpose specified.

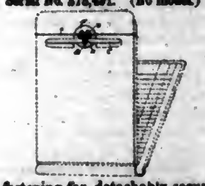
398,818. SPARK-CONDUCTOR. KENT H. CARPER, Salem, Va. Filed Dec. 7, 1888. Serial No. 292,899. (No model.)

Claim.—1. In a spark-conductor, the flue provided with the branch tubes extending out from the conductor and slightly inclined in the direction of the draft to re-enforce the same, and provided with flaring or bell-shaped mouths, substantially as described.

2. In a spark-conductor having a flue and discharge-pipes suitably connected thereto and placed at suitable distances along said flue, and provided at their lower ends with weighted valves controlled as described.

3. A spark-conductor having the flue provided with the wire-gauze bottom and the trough secured beneath said gauze bottom, substantially as described.

4. A spark-conductor having a reversible flue-section provided



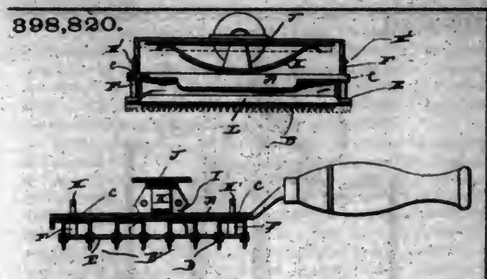
398,818.

with a central support having a swiveled clamp, and the end supports provided with curved clamping-arms hinged to the base, substantially as described.

5. In a spark-conductor, the wire-gauze receptacle detachably connected to the rear end of the flue and having its bottom constructed of gauze and hinged to one of its sides and held normally closed by a spring, substantially as described.

398,819. FASTENER. ARTHUR I. COLTON, Cleveland, Ohio. Filed June 28, 1888. Serial No. 278,491. (No model.)

Claim.—1. A fastening for detachably securing an elastic band to book, file-case, wrapper, or other article, such fastening consisting substantially of an elastic tongue fastened to and extending across a hole in the cover, flap, or casing of such article, the free end of the tongue overlapping the inside of such cover, flap, or casing, or an attachment thereof, to prevent the tongue from bending outward through such holes, substantially as set forth.

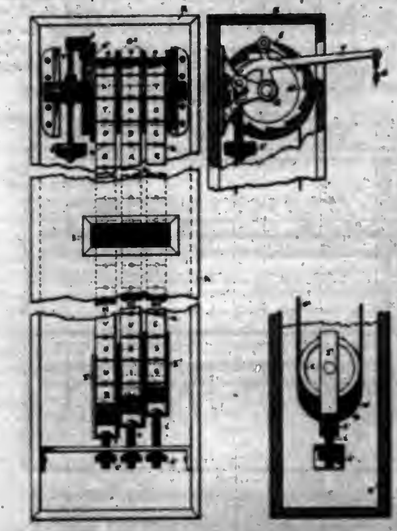


2. In a fastening for an elastic band, the combination, with a suitable hole in the cover, flap, or casing, for instance, of a book, wrapper, or other article, and a tongue fastened to and extending across a hole in and the free end of the tongue overlapping on the inside of such cover, flap, or casing, of a re-enforcing band secured around such hole, such tongue and re-enforcing band being preferably integral, substantially as set forth.

398,820. CURRY-COMB. WELLS R. DAVIS, Alberta, Mo. Filed Nov. 22, 1888. Serial No. 291,561. (No model.)

Claim.—1. The combination, with the curry-comb having the slots C at its corners, of the cleaning-frame having the guide-pins at its corners projecting through said slots and a spring secured to the comb and acting on the cleaning-frame to hold it normally withdrawn, as set forth.

2. The combination, with the curry-comb having stationary teeth and provided with the slots C at its corners, of the cleaning-frame having a series of longitudinally-slotted bars fitting snugly upon the teeth of the comb, and provided at its corners with guide-pins pro-

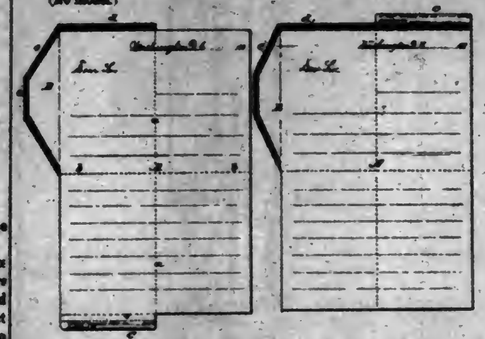


398,820.

jecting through the slots C, and a spring to hold the cleaning-frame normally withdrawn, as set forth.

3. The combination, with the curry-comb having slots C at its corners, of the side bars, E, the guide-pins erected on said side bars at the ends of the same and extending through the said slots C, and provided with shoulders H and the projections H', adapted to contact with the opposite sides of the curry-comb, the cross-bars secured to the side bars, E, and fitting upon the teeth-bars of the curry-comb, the standards erected on the side bars, the cross-bar extending between said standards, and the spring secured on the curry-comb and bearing against said cross-bar, as set forth.

398,821. TALLYING APPARATUS FOR GRAIN-HOPPERS. JOHN A. DENUYL, Toledo, Ohio. Filed May 31, 1888. Serial No. 275,009. (No model.)



Claim.—1. In a registering apparatus for measuring grain, the combination, with a sprocket-drum and ratchet-wheel, pawl, and lever for intermittently rotating the drum, of endless belts of different lengths operating upon the sprocket-drum, these belts being lettered, and a casing inclosing the belts, such casing having a sight-hole through which one letter of each belt may be read at a time, substantially as set forth.

2. In a registering apparatus for measuring grain, the combination, with a motor consisting, essentially, of a casing located inside a hopper, such casing having a depressible false bottom and induction and eduction openings, of a sprocket-drum, ratchet-wheel, pawl, and lever for intermittently rotating the drum, endless belts of different lengths operating on the drum, and a flexible connection between the depressible false bottom of the casing and the lever, substantially as set forth.

3. In registering apparatus for weighing grain, the combination, with a sprocket-drum and ratchet-wheel, pawl, and lever for intermittingly rotating the drum, substantially as indicated, of belts, preferably of metal, and operating upon the sprocket-drum, the different belts having unequal numbers of equal spaces, the spaces of each belt being lettered without alphabetical order, the letters being placed in different relations on the different belts, and a casing inclosing the belts, such casing having a sight-hole through which one letter of each belt may be read, the relation of parts being such that the lettered spaces of the belt are successively brought before the sight-hole with each stroke of the ratchet, lever, and pawl, substantially as set forth.

398,822. COMBINED LETTER-SHEET AND ENVELOPE. HENRY A. DUTELL, Roanoke, N. Y. Filed Jan. 12, 1887. Serial No. 224,162. (No model.)

Claim.—The combined letter-sheet and envelope having the gummed flap B and edge *d* extending outside the outline of the body part of the sheet, and having a projecting tag, C, for the return address, adapted to overlap and extend beyond the edge *d* and expose on the front of the folded sheet or envelope a part of the inner face of the sheet, as described.

398,823. CARTRIDGE. STEPHEN H. REMER, London, England. Filed June 20, 1888. Serial No. 278,619. (No model.)

Claim.—In combination with a fire-arm cartridge and its primer, the shell of the cartridge having an external primer-recess and a flame-hole in its base, a combined ignition-tube and decapper consisting of a rearwardly-removable imperforate tube, fully open at both ends, fitted to said flame-hole, extending to the front of the main charge, with its rear end projecting as an anvil within said recess, and provided with a shoulder or shoulders to prevent its displacement forward, substantially as hereinbefore specified.

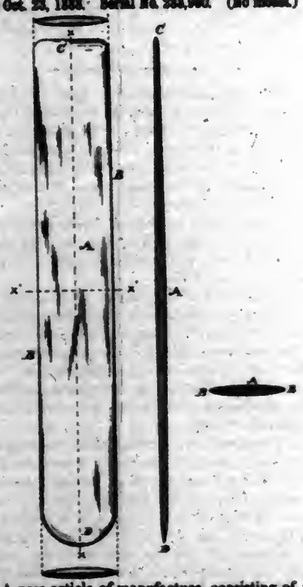
398,824. RAILROAD-SCALES. HARVEY L. FISHER and JAMES W. BALLARD, Toledo, Iowa, assignors of one-third to Leander Clark, same place. Filed Sept. 25, 1886. Serial No. 214,571. (No model.)

Claim.—1. In an attachment for platform-scales, the combination of the series of transverse rock-shafts F, the crank-arms on the outer ends of the said shafts, the links connecting said crank-arms, the rock-shaft I, the three-armed lever on said shaft, links connecting said lever with the crank-arms, the hinged levers on the rock-shafts F, adapted to support the platform of the scale, the operating-lever mounted on the platform, and the link connecting the same with the three-armed lever, as set forth.

2. The combination of the platform, the bearings R, secured to the under side thereof, the transverse rock-shafts arranged below the platform, the hinged levers comprising the lower members secured rigidly on the rock-shafts, and the upper members supported by the lower members and adapted to engage the bearings R when the two members are in alignment and be disengaged therefrom when the members are at an angle to each other, and mechanism for rotating the rock-shafts, as set forth.

3. In an attachment for platform-scales, the hinged lever comprising the lower member, S, having the transverse groove T in its upper end and provided with the arm U, and the upper member having its lower end journaled in the groove T, a pin projecting from said upper member through the arm U, and a spring coiled around said pin beyond the arm U and secured on said pin, as set forth.

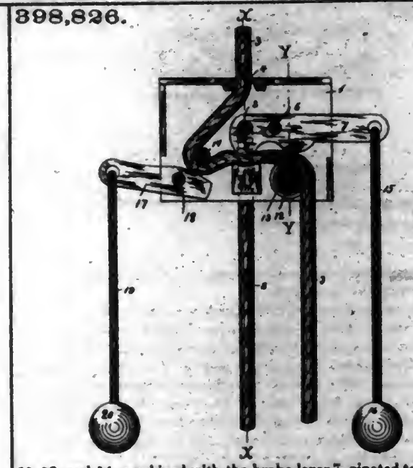
4. The combination, with the platform, of the base-plate Y, secured thereto, the bearing-plate Z, secured to said base-plate and having the flanges *g* A, and the concave recess between said flanges, the wedge adjustably secured between the base-plate and the bearing-



398,824.

plate, the hinged levers engaging the concave recess in the bearing-plate, and mechanism for operating said levers, as specified.

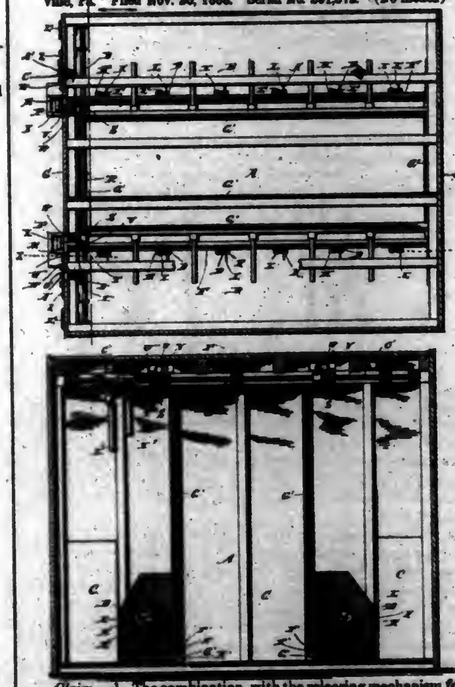
398,825. BLANK-BOOK TOOL. JONATHAN C. FORMAN, Cleveland Ohio. Filed Oct. 23, 1888. Serial No. 288,960. (No model.)



Claim.—A new article of manufacture, consisting of an aluminum-alloy tool, having the plate A, of an elliptical form in cross-section, with blunt edges B B, a curved terminal, D, and a straight end, C, having round corners and blunt edges, substantially as herein set forth, and for the purpose described.

398,826. FIRE-ESCAPE. CHARLES M. FOWLER, Salem, Mass. Filed Nov. 21, 1888. Serial No. 291,480. (No model.)

Claim.—1. The herein-described fire-escape, consisting of the frame 1 2, adapted to slide on the life-line 3, and having rope-guides

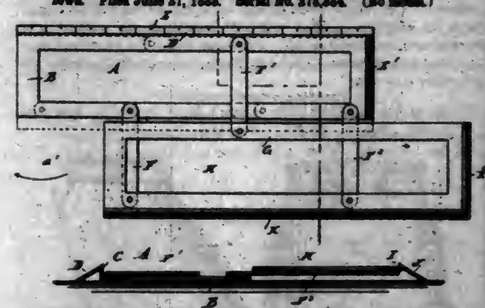


398,826.

11, 13, and 14, combined with the brake-lever 7, pivoted to the frame and having the brake projections 9 and 10, and the rope or chain 8, attached to said brake-lever, as and for the purpose set forth.

2. The herein described fire-escape, consisting of the frame 1 2, adapted to slide on the life-line 3, and having rope-guides 11, 13, and 14, combined with the pivoted main brake-lever 7, having the supporting rope or chain 8 attached to it and having the brake projections 9 10, as described, and the auxiliary brake-lever 17, substantially as and for the purpose set forth.

398,827. HORSE-RELEASING DEVICE. ELIAS L. FOX, Shannonville, Pa. Filed Nov. 20, 1888. Serial No. 291,372. (No model.)



Claim.—1. The combination, with the releasing mechanism for detaching the horses in their stalls, of the shaft R, having the drums S and ratchet-wheel T, the cords or ropes attached to the said drums, the weights X, attached to said ropes and adapted to operate the releasing mechanism, the detent engaging the ratchet-wheels on the shaft, the combustible cords, the weights I', suspended thereby, and the slack cords connecting the said weights to the detent, whereby when one of the combustible cords is parted its weight I' will drop and trip the detent from the shaft R, for the purpose set forth, substantially as described.

2. The combination of the doors having the latches, the levers B', to trip the latches, the shaft R, having a ratchet-wheel, the detent to engage the same, the weights to rotate the shaft when released, the cords C', connecting the levers B' to the shaft, the combustible cords E', and the weights I', suspended thereby, the said weights being connected to the detents, substantially as described.

3. The combination, with the releasing mechanism having the movable rods F, of the cross-heads M, attached to the said rods, the shaft R, having the ratchet-wheel, the detent to engage the same, the combustible cords, the weights suspended thereby, the slack cords connecting the said weights to the detent, for the purpose set forth, the guide-boxes P, the cords V, wound on drums on shaft R, and the weights X, guided in the boxes P and attached to said cords V, the said weights having the wedge-shaped points Y at their lower ends adapted to engage the cross-heads when they descend, and thereby to operate the rods F, substantially as described.

398,828. PARALLEL-RULER. SHERMAN M. GEE, Council Bluffs, Iowa. Filed June 27, 1888. Serial No. 278,224. (No model.)

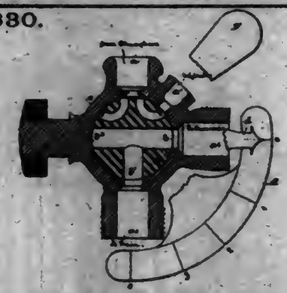
Claim.—1. A parallel-rule comprising a blade connected by links with a second blade extending parallel with the first blade, both blades being provided with inclined flanges having graduations, substantially as shown and described.

2. In a parallel-rule, the combination, with a blade provided with a rectangular frame having on one side an inclined flange provided on top with a graduation, of links pivotally connected with the said blade, and a second blade pivotally connected to the said links, and also provided with a rectangular frame having an inclined flange provided on top with a graduation, substantially as shown and described.

3. A parallel-rule comprising a blade connected by links with a second blade extending parallel with the first blade, said links being connected alternately with the opposite and corresponding edges of the two blades, substantially as and for the purpose specified.

398,829. PIPE-COUPLING FOR AIR-BRAKES. THEODORE H. HARRISON, Fort Wayne, Ind. Filed June 21, 1888. Serial No. 277,736. (Model.)

Claim.—1. In pipe-coupling for air-brakes, the combination, with interlocking lugs connected with the respective members of the coupling and located in pairs, respectively, on the lower and upper sides of the coupling, the lower lugs having longer and more inclined engaging faces than the upper lugs, of tubular sections of the coupling, such tubular sections trending upward from the axis of the coupling, substantially as set forth.



2. In a pipe-coupling, the combination of the two members, each provided with a guiding-lug, A^3, and with lugs A', having extended overlapping projections a' a', and with lugs A^2, having short overlapping faces a^2 a^2, substantially as set forth.

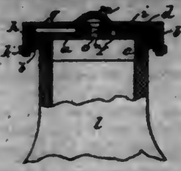
398,830. COMBINATION-VALVE FOR OPERATING AIR-BRAKE MECHANISMS. THEODORE H. HARRISON, Fort Wayne, Ind. Filed June 21, 1888. Serial No. 277,738. (No model.)

Claim.—1. In a valve for air-brake mechanism, the combination, with a valve-casing having ports connected, respectively, with the train-pipe, with the reservoir, and with the brake-cylinder, and a port leading to the outer air, of a valve located in said casing and provided with three main ports for connecting the reservoir and train-pipe and the train-pipe with the outer air, and two smaller ports for connecting the reservoir and engine-cylinder and the engine-cylinder and outer air, substantially as set forth.

2. The combination, with a casing having ports a, a', a^2, and a^3,

398,830.

of the valve having port j j, port i i', and port b, b', and b^2, and a handle for turning the valve, substantially as set forth.

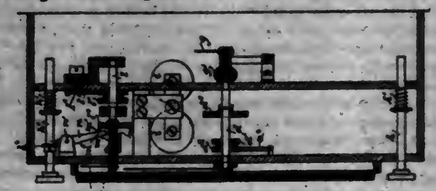


398,831. PLOW-STANDARD CAP. EDWARD S. HARTMAN, Allegheny Pa. Filed Dec. 14, 1888. Serial No. 293,540. (No model.)

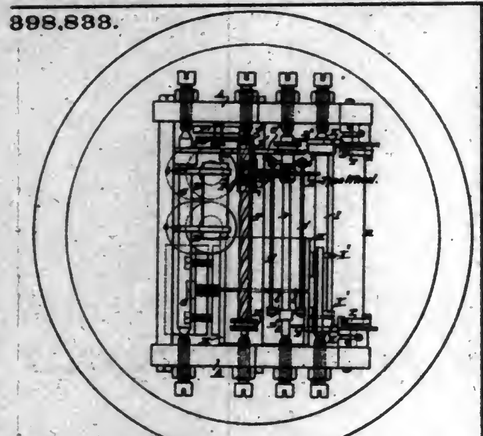
Claim.—1. A plow-standard cap consisting of sheet metal having its long edges bent, the two ends of said bent edges folded upon the body thereof, and projecting cheeks between said two ends, the inner end of said cheeks being twisted, substantially as and for the purpose described.

2. The combination of a plow-beam and a plow-standard with a standard-cap consisting of a sheet-metal blank having its two longest edges provided with lugs and said lugs bent and twisted to embrace the plow-standard, substantially as and for the purpose described.

398,832. BOTTLE-STOPPER. RICHARD HERRMANN, Berlin, Germany. Filed Oct. 15, 1888. Serial No. 288,192. (No model.)



Claim.—A bottle-stopper consisting of a plate, a, having the opening c and pivoted eccentrically thereon, the plate d, having the opening n and the eccentric slot e, and the lid g, having the pin i and turning concentrically on plate a, as and for the purposes herein shown and set forth.



398,833. PRINTING-TELEGRAPH. FREDERICK H. W. HOUSE, London, England. Filed May 29, 1886. Serial No. 278,494. (No model.) Patented in England Feb. 19, 1887, No. 2,126.

Claim.—1. The combination, substantially as hereinbefore set forth, of the rotating finger g, the type-wheel, electro-magnetic devices for actuating the rotating finger and the type-wheel step by step and in unison, a single electric circuit including the electro-magnetic devices for actuating the rotating finger and the type-wheel, a circuit-breaker in said circuit, the finger-keys, the print-frame, its electro-magnetic actuating devices, and a second electric circuit including the finger-keys, the rotating finger g, and the print-frame-actuating devices.

2. The combination, substantially as hereinbefore set forth, of the rotating finger g, the shaft on which it is mounted, the notched wheel carried by said shaft, but insulated from the finger g, the circuit making and breaking lever engaging with said notched wheel, the propelment-lever, the ratchet on the shaft of the finger g, with which the propelment-lever engages, its electro-magnet, the type-wheel, its electro-magnetic actuating devices, and an electric circuit including the

398,833.

type-wheel-actuating devices, and the electro-magnet which actuates the propelment-lever.

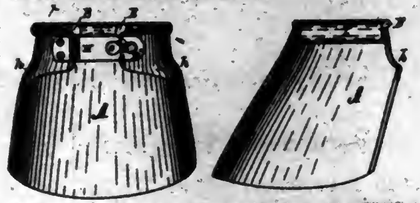
3. The combination, substantially as hereinbefore set forth, of the type-wheel, the shaft on which it is mounted and on which it is free to slide, electro-magnetic devices for revolving the type-wheel, the screw-shaft, the print-frame, connections between the print-frame and the screw-shaft, whereby the screw-shaft is revolved to advance the type-wheel on its shaft, the coiled spring, gearing between the spring and screw-shaft, the shifting-pin D^2 on the type-wheel shaft, and connections between the pin and the screw-shaft, whereby the movement of the print-frame at a predetermined position of the pin D^2 is caused to automatically release the screw-shaft to allow its reverse movement by the spring with which it is geared.

4. The combination, substantially as hereinbefore set forth, of the type-wheel, the shaft on which it is mounted and with which it revolves, electro-magnetic devices for revolving the shaft, the screw-shaft connected with the type-wheel for moving it back and forth on its shaft, the print-frame, connections between the print-frame and the screw-shaft for revolving it, the rotating finger of the transmitter, the finger-keys engaging therewith, an electric circuit including the finger-keys, rotating finger, and the print-frame-actuating devices, one of said keys being arranged to actuate the print-frame to release the connections between the print-frame and the screw-shaft when the finger is depressed.

5. The combination, substantially as hereinbefore set forth, of the type-wheel, the type-wheel shaft on which the type-wheel is free to slide, the screw-shaft, the nut on the screw-shaft, connections between the nut and the type-wheel, the coiled spring, gearing between the coiled spring and the screw-shaft, the oscillating printing-frame, the toothed wheel on the end of the screw-shaft, the pawl engaging with the toothed wheel, a lever, on one end of which said pawl is mounted and having its opposite end connected to the printing-frame, the retaining-pawl M, the jointed levers connecting said pawl to the printing-frame, the pin D^2 on the type-wheel shaft, and the pivoted arm O^2, with which said pin engages to release the pawls from the type-wheel, for the purpose specified.

6. In an electric type-writer, the combination of parts constituting the indicator and by which the indicator is brought to zero, consisting in the combination of the magnet *i*, lever *k*, shaft *l*, and wheel *l'*, disk *F*, sleeve *m*, and disk *m'*, engaging with *F*, key k^x, finger *n*, cam m^x, and pointer m^4.

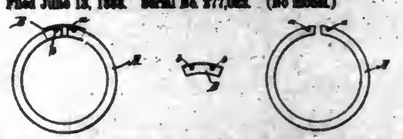
7. In an electric type-writer, the combination of parts for bringing back the type-wheel to the commencement of a line, consisting in the combination of the type-wheel, the shaft on which it is mounted, a pin, D^2, on the shaft, the piece O, moved thereby, the printing-frame K, the lever P, connected therewith, the retaining-pawls L^2 and N, also connected with the lever P, the screw F, the nut F', the spring F^1, and the connecting-gear.



8. In an electric type-writer, the combination of parts for advancing the paper at the end of each line, consisting in the combination of the type-wheel, the driving-shaft on which it is mounted, the pin D^2 on the driving-shaft, the piece O, moved thereby, the filling-piece U, the piece O, connected with the filling-piece U, the pin K^2 on the printing-frame, the arm S^2, the paper-driving pawl, and the lever on which said pawl is carried and which carries the arm S^2.

9. In an electric type-writer, the combination, substantially as hereinbefore set forth, of the type-wheel, the print-frame, the magnet for operating the print-frame, the screw-shaft, connections between the screw-shaft and the type-wheel, the pawls engaging with the screw-shaft, the levers connecting the pawls with the print-frame, the pivoted arm O^2, the pin D^2 on the type-wheel shaft engaging at times with the arm O^2, and the springs for returning the type-wheel to zero.

10. In an electric type-writer, the combination, substantially as hereinbefore set forth, of the type-wheel, the print-frame, the magnet for operating the print-frame, the screw-shaft, connections between the screw-shaft and the type-wheel, the pawls engaging with the screw-shaft, the levers connecting the pawls with the print-frame, the pivoted armature O^2, the pin D^2 on the type-wheel shaft engaging at times with the arm O^2, the spring for returning the type-wheel to zero, the pusher U, the paper-roll, the pawl for operating the paper-roll connected with the pusher U, and connections between the pusher and the pivoted arm O^2, whereby the pusher is disconnected from the paper-roll-actuating pawl.



11. The combination, substantially as hereinbefore set forth, of the rotating finger, the type-wheel, electro-magnetic devices for rotating the finger and actuating the type-wheel, the printing-frame, the finger-keys, electro-magnetic devices for actuating the printing-frame, and an electric circuit including said actuating devices and the finger-keys, the indicator included in the printing-circuit and actuated step by step in correspondence with each actuation of the printing-frame, and connections between one of the finger-keys and the indicator for returning it to zero.

398,834. HORSE-BOOT. JAMES B. HOYT, Troy, N. Y. Filed June 7, 1888. Serial No. 276,297. (No model.)

Claim.—In a calking-boot, the combination, with the upper or body part, A, made of sheet metal and adapted to fit the exterior of the hoof at the front and sides, of the non-metallic ring L, made to line the interior of the upper or body part near its top and having the head B resting on the latter, and the hinged hasp H, made with the slot S, arranged on one of the rear side edges of the body part, and the pin P on the other side edge of the boot, substantially in the manner as and for the purposes set forth.

398,835. KEY-RING. ROBERT H. INGERSOLL, New York, N. Y. Filed June 13, 1888. Serial No. 277,062. (No model.)

Claim.—The combination, with a key-ring constructed of spring metal and provided with inclined notches *a*, placed in the upper edges of both ends, of a detachable clasp, B, constructed so as to fit over and cover the notches and ends of the ring and provided with cross-bars *b*, adapted to engage with the notches *a* and to be securely locked therein by the resiliency of the ring, substantially as described.

398,836. SWITCH FOR PNEUMATIC TUBES. CHARLES A. LIEB, New York, N. Y. Filed Nov. 23, 1888. Serial No. 291,644. (No model.)

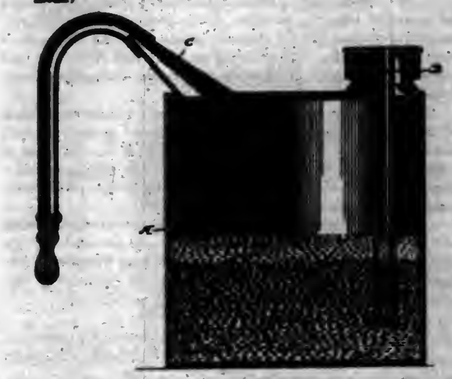
Claim.—1. The combination, with a main tube and a branch tube, of a pivoted switch, a solenoid, substantially as set forth, and a latch which holds the switch in its position as set until the carrier passes the switch, one end of which latch enters the branch pipe in the path of the carrier, substantially as set forth.

2. The combination, with a main-line tube and a branch tube, of a switch operated by a solenoid provided with a spring for its retraction, and a latch constructed and arranged to hold the switch in its closed position, and which is released by the passage of the carrier past it, substantially as set forth.

3. The combination, with a main-line tube and a branch tube, of a pivoted switch, one end whereof is within the main-line tube and the other end whereof is connected to the core of a solenoid, and a spring-actuated latch constructed and arranged to hold the switch in its position, as set forth, one end whereof lies within the branch tube and in the path of the carrier, substantially as and for the purposes set forth.

398,837. RIBBON-SHIELD FOR TYPE-WRITING MACHINES. GEORGE H. LOEBE, Jr., St. Louis, Mo. Filed Mar. 1, 1888. Serial No. 265,854. (No model.)

Claim.—A type-writer ribbon-shield having a hammer-hole with elevated surfaces at the sides of the hammer-hole, so as to form a depression thereat, substantially as described, and for the purpose specified.

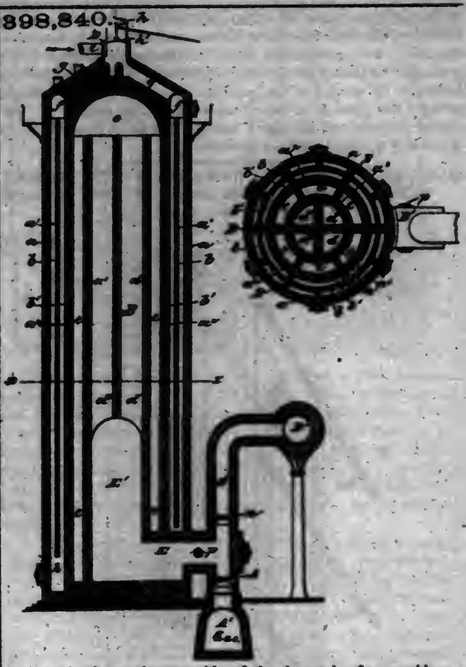


398,838. COUPLING FOR WATER-CLOSET BOWLS, &c. HERBERT MACHIN, Trenton, N. J., assignor to the Equitable Pottery Company, same place. Filed Nov. 15, 1888. Serial No. 290,872. (No model.)

Claim.—1. In a coupling for water-closet bowls, the crockery lip A', having the oval hole *d'* and undercut recesses d^3, the latter each formed with a square offset at one edge, and the coupling-pipe B, having wings B', each having a corresponding offset, in combination with each other and with a filling, *m*, adapted to tighten the joint, while the locking of the wings holds the parts together, as herein specified.

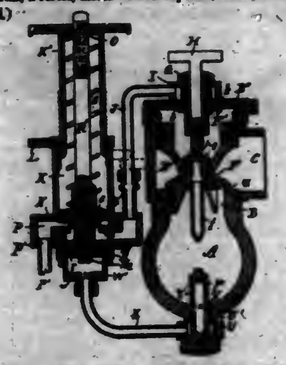
2. The bowl A, having a lip, A', with the oval aperture *d'* and recesses d^3, the latter having each a square offset, in combination with a screw-threaded coupling-pipe, B, having wings B', each with a square offset, and with the nut C and elastic washer D, all arranged to serve substantially as herein specified.

398,839. REMEDY FOR CATARRH, &c. SAMUEL MALIN, Wilton Place, Ohio. Filed Oct. 6, 1887. Serial No. 251,574. (No specimens.)



Claim.—A medical compound consisting of a mixture of tar, balsam of fir, and an oil, as oil of hemlock, substantially in the proportions named, together with an alkaline solution, substantially as described.

398,840. HOT-BLAST STOVE. HORACE MASSEDEN and WALTER CROOKE, Parish of Millom, County of Cumberland, England, assignors to George W. McClave and Louisa Schuler, executrix, both of Pittsburg, Pa. Filed Oct. 29, 1886. Serial No. 217,686. (No model.) Patented in England Mar. 24, 1881, No. 1,312.

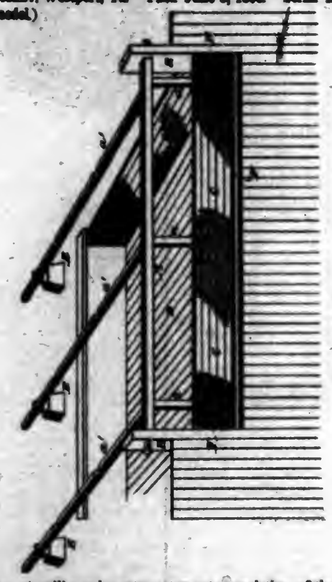


Claim.—1. A vertical hot-blast stove constructed with a gas-inlet leading to an uptake flue or flues arranged centrally of the stove, a suitable number of downtake flues outside of the central flue, and a final uptake flue or flues outside of the downtake flues, a chimney-flue leading therefrom at the top of the stove, and valves at the gas-inlet and at the chimney adapted to control the flow of air and gas to and from the stove, substantially as described.

398,840.

2. A vertical hot-blast stove having wall-work arranged to form an odd number of passes, a discharge-flue with which the upper passes are connected, a cold-blast inlet at the top of the stove, an uptake flue or flues arranged centrally of the stove and provided with a gas-inlet and constituting the first pass, a hot-blast outlet at the base of the stove, and valves arranged in conjunction with the air-blast, gas-inlet, and hot-blast outlet, substantially as described.

398,841. RELIEF-VALVE FOR STEAM FIRE-ENGINES. ALVARADO MAYNE, Detroit, Mich. Filed Sept. 27, 1888. Serial No. 286,348. (No model.)



Claim.—1. The combination of the cylinder W', suitably connected with the water-way A, the pressure-piston R, working in the cylinder W' and secured on the piston-rod or valve-stem E', the piston or valve seat *r*, the piston-rod or valve-stem E', provided with the screw *m*, and carrying the piston R and valve N, and extending through the cylinder K and the cap K', the cylinder K, the cylinder-cap K', the valve-chamber P, with inlet and outlet pipes, the valve N, the valve-seat *n*, and the coiled spring S, substantially as shown and described.

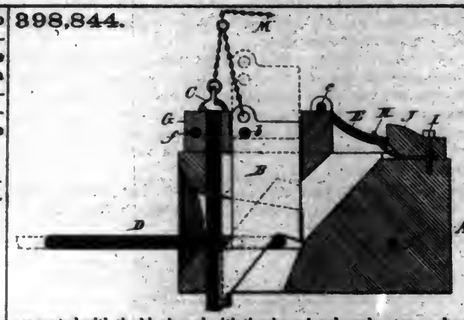
2. The combination of the water-way, the cylinder B, containing the relief-valve F, the enlarged portion B' of the cylinder B, containing the piston F' on the relief-valve F, the relief-valve F and piston F', vertically perforated, the conduit from the relief-valve, the perforated cylinder-cap B'', the cap I over the perforations in the cylinder-cap B'', the gland G, holding in place the cap I, the screw-stem

M, governing the relief-valve, the pipe J, leading from the cap I to the valve-chamber P in cylinder K, the small cylinder K, the valve-chamber P and its outlet, the valve N in the small cylinder K, the graduated valve-stem R', the small cylinder-cap K', provided with an orifice for the passage of the graduated valve-stem R', the pressure-spring S, the piston R on foot of valve-stem R', the cylinder W', containing piston R, and the pipe k, leading from the cylinder W' to the water-way A, substantially as described.

398,842. MILL-POND WASTE-WATER GATE. WILLIAM T. MCCLOSKEY, Westport, Pa. Filed June 5, 1888. Serial No. 276,162. (No model.)

Claim.—A mill-pond waste-water gate consisting of the beam A, pivoted in posts B B, the breast C, connected by arms *a* with said beam, and the bars *a'*, attached to said beam, said bars being provided with movable weights on their free ends, as and for the purpose set forth.

398,843. DEVICE FOR SETTING TIRES ON WAGON OR OTHER WHEELS. NATHAN B. MCCREARY, Rockport, and ALFRED T. MCCREARY, St. Joseph, Mo. Filed Apr. 30, 1888. Serial No. 272,511. (No model.)

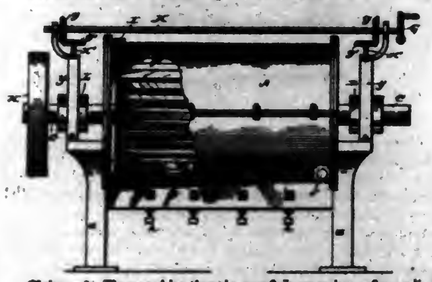


Claim.—In a tire-setting device, the combination, with the outer vessel, B, formed substantially V shape in cross-section, of a vessel, as A, within said other vessel, of substantially the same shape but smaller than the same, movable supports, as C, located within the vessel B, their ends resting on the edges of the same and their centers formed to conform to the shape of the under side of the vessel A, whereby the inner vessel is held in position in the center of the outer vessel, and legs supporting the outer vessel, substantially as described.

398,844. CAR-COUPLING. THOMAS O. MCMURTRAY, Yazoo, Miss. Filed May 26, 1888. Serial No. 275,246. (No model.)

Claim.—1. The combination, with the draw-head, of a block resting thereon, a coupling-pin passing vertically through said block and draw-head, and oblique arms having their ends pivoted, respectively, to said block and draw-head, whereby the coupling-pin may be withdrawn independently of the block or by raising the arms, substantially as described.

2. The combination, with the slotted draw-head, of a coupling-pin, a slotted movable block mounted on the draw-head, a weighted slide capable of independent bodily vertical movement in said block, and a series of arms connected with said block and with the draw-head, substantially as and for the purposes described.

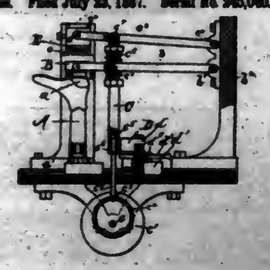


3. In combination with the draw-head, a movable block, G, a coupling-pin, and a weighted slide carried by said block, pivoted arms

connected with the block and with the draw-head, and a stop or check lug, J, provided with a spring, said lug being in position to stop the movement of the said block on said pivoted arms, substantially as set forth.

4. The combination of a movable block, G, mounted on the draw-head, and a coupling-pin carried by said block, a detent, L, pivotally connected with the coupling-pin, and adapted to connect with a catch, *l*, with which said block is provided, substantially as set forth and described.

398,845. REFINING PULP-ENGINE. JOSHUA HORTON, Jr., Portneuf, Quebec, Canada. Filed June 25, 1888. Serial No. 278,078. (No model.) Patented in Canada Apr. 4, 1888, No. 26,797.



Claim.—1. The combination, in a refining-engine, of a cylinder-roll, a suitably-mounted shaft, fly-bars secured to said roll, with their edges uniformly distant from the roll's axis of rotation, a cylindrical case inclosing said roll with its fly-bars, and a series of knives set in the bottom of said case obliquely to the outer edges of the fly-bars, substantially as set forth.

2. In a refining-engine, the combination of a cylinder-roll, a shaft and means for adjusting the same, fly-bars secured to said roll, with their edges parallel to and uniformly distant from the roll's axis of rotation, a cylindrical case inclosing said roll with its fly-bars, and a series of knives set in the bottom of said case, substantially as described.

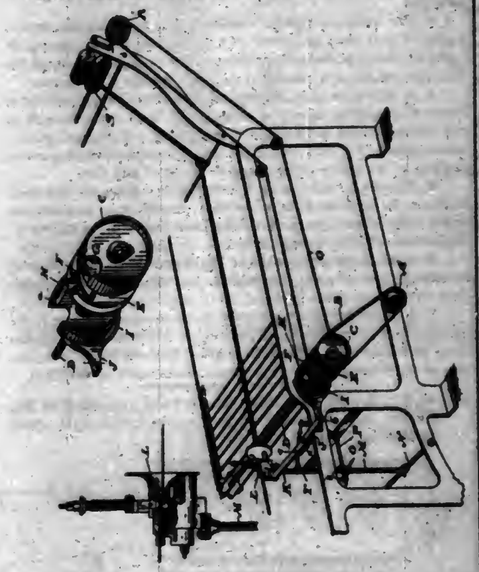
3. In a refining-engine, the combination of a cylinder-roll, a shaft and means for adjusting the same, fly-bars secured to said rolls, with their edges parallel to and uniformly distant from the roll's axis of rotation, a cylindrical case inclosing said roll with its fly-bars, and a series of adjustable knives set in the bottom of said case, substantially as and for the purpose set forth.

4. The combination, with the fly-bar cylinder, of the shaft C, sliding bearings L, the case A, inclosing said cylinder and provided with the bed-plates F, having knives *b* oblique to the fly-bars, the guides Y, the threaded rods K', engaging the bearings L, and the crank-rod K, connected by gearing to the rods K', substantially as described.

398,846. HEEL-NAILING MACHINE. FREDERICK F. RAYMOND, 2d, Newton, Mass. Filed July 23, 1887. Serial No. 245,049. (No model.)

Claim.—1. The combination of a last or work support, the vertically-movable templet B, the vertically-movable block *d'*, the gang of drivers *e*, carried thereby, and an actuating cam or crank, connected with said block or templet by means of a connecting-rod having a yielding connection with the templet-support and connected with the block *d'*, to communicate its full movement thereto, substantially as described.

2. The combination of the templet or work support, the lever *b*, carrying the templet B, the lever *b'*, carrying the head *d'* and drivers *e*, and devices for simultaneously moving the said levers in the same direction, substantially as described.

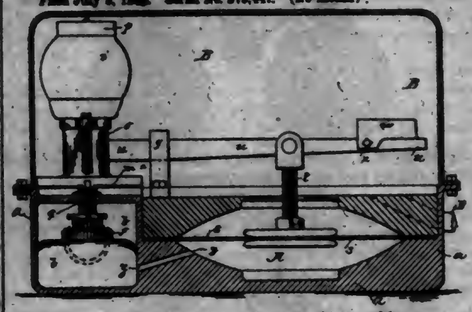


398,847. METHOD OF RESTORING FULLED WOOLEN FABRICS TO THEIR ORIGINAL DIMENSIONS. ROBERT C. ROTHERFORD, New York, N. Y. Filed Sept. 28, 1887. Serial No. 250,906. (No specimens.)

Claim.—1. The method of restoring felted woolen fabrics to their original dimensions, which consists in stretching the fabric while subjected to moist heat at a temperature of about 212° Fahrenheit, substantially as specified.

2. The herein-described method of restoring shrunken woolen fabric, which consists in first exposing the fabric to the action of steam to soften the fibers, then stretching the steamed fabric to the desired extent while it is in a moist and heated condition, and finally drying the steamed and stretched fabric, substantially as set forth.

3. The herein-described method of restoring shrunken woolen fabric, which consists in first forcing steam through the fabric, then stretching the steamed fabric to the desired extent while it is in a moist and heated condition, and then subjecting the stretched and steamed fabric to a hot ironing to dry it, substantially as set forth.



398,848. FEED-REGULATOR FOR MACHINES FOR SPINNING HEMP, &c. GEORGE RYAN, Brantford, Ontario, Canada. Filed July 7, 1888. Serial No. 279,305. (No model.)

Claim.—1. A nipper, L, a pivoted bar, M, carrying said nipper, and a spring, T, for holding the same in position, in combination with the pivoted lever K, having one end connected to the nipper, a bell-crank, J, connected to the opposite end of the lever K, the revolving shaft D, the inwardly-beveled flanged wheel I, movably mounted on said shaft and connected with the bell-crank, a pulley, E, a lever, H, and a pawl, F, carried by said pulley E, and a ratchet-wheel carried by said shaft D, and a pulley, as C, also mounted on said shaft, for receiving the motive power, substantially as described.

2. A nipper, L, a pivoted bar, M, carrying said nipper, and a spring, T, for holding the same in position, and the adjustable stops O, in combination with the pivoted lever K, having one end connected directly to the nipper, a bell-crank, J, connected to the opposite end of the lever K, the revolving shaft D, the inwardly-beveled flanged wheel I, movably mounted on said shaft and connected with the bell-crank, a pulley, E, mounted on shaft D, a lever, H, and pawl F, carried by the pulley E, a ratchet-wheel mounted on said shaft and engaged by the pawl, and a pulley, also mounted on said shaft, for receiving the motive power, substantially as described.

398,849. PRESSURE-REGULATOR. CHARLES ROGERS, Allegheny, assignor of one-half to Isaac Vance and T. I. Vandergrift, Pittsburg, Pa. Filed July 2, 1888. Serial No. 278,447. (No model.)

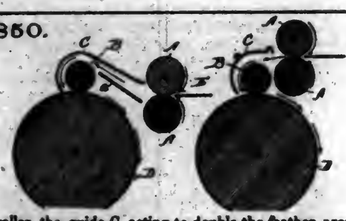
Claim.—1. In a pressure-regulator, the high and low pressure chambers *b c*, separated by a wall or bench, *d*, having a valve-seat, a valve, *f*, fitted on said valve-seat, a separate chamber, *i*, communicating with the high-pressure chamber, another separate chamber, A, communicating with the low-pressure chamber, a balancing plunger or plug, *k*, operating in the chamber *i* and connected with the valve *f*, and a diaphragm in the chamber A, and having intermediate connections with the valve-stem, substantially as and for the purpose described.

2. In a pressure-regulator, the high-pressure chambers *c i*, communicating with one another through an intermediate contracted passage, *o*, the low-pressure chambers *b* A, also communicating with one another through a separate passage, *z*, a valve, *f*, for establishing communication between the high and low pressure chambers *b c*, a balancing plug or plunger, *k*, in the high-pressure chamber *i*, connected with the valve, and a flexible diaphragm in the low-pressure chamber A, and connected by an adjustably-weighted lever with said valve, substantially as and for the purpose described.

3. In a pressure-regulator, the combination of the high and low-pressure chambers *b c*, another elevated chamber, *i*, communicating with the low-pressure chamber, a valve, *f*, for establishing communication between the high and low pressure chambers, a balancing plunger or plug operating in the chamber *i* and connected to the valve-stem, and a diaphragm located in the upper part of the low-pressure chamber and connected with the valve-stem, substantially as and for purpose described.

4. In an apparatus for the purpose set forth, the combination consisting of the valve *f*, having V-shaped openings *i* formed below the seat of the same, the balance plunger or plug *k* connected thereto and operating at the base of a spherical chamber, *i'*, the flexible disk *n*, secured to the top of the plunger or plug *k*, the passage *j*, connecting the high-pressure chamber *c* with the said spherical chamber *i'*, and the diaphragm *m*, properly attached to the valve-stem *l*, whereby a gas-tight connection is made and an atmospheric balance is formed, as and for the purpose described.

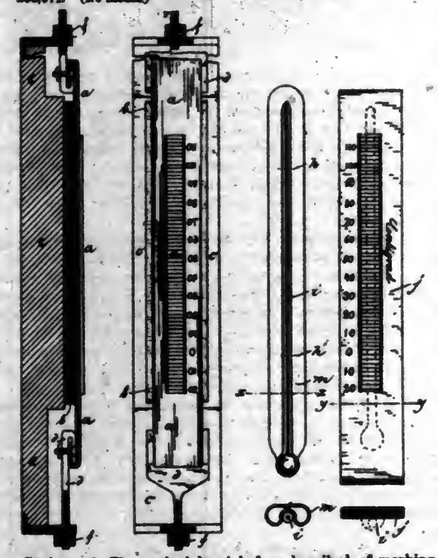
5. In a pressure-regulator, the combination of the high and low pressure chambers *b c*, a valve, *f*, for establishing communication between said chambers, another elevated chamber, *i*, communicating with the high-pressure chamber, a plunger or plug operating in the chamber *i* and connected to the valve-stem to move with the valve, and a flexible disk, *n*, secured to the plunger or plug and extending at its edges beyond the plunger or plug to bear against the wall of said chamber *i*, substantially as described.



6. An apparatus for the purpose described, consisting of the valve *f*, provided with V-shaped openings *i* below the seat *h*, the balance plunger or plug *k*, connected thereto, the spherical chamber *i'* and disk *n*, secured to the top of the balance-valve *k*, the passage *j*, leading from the high-pressure chamber *c* to that above the balance plunger or plug *k*, the small diaphragm *m*, attached to the valve-stem *l*, the high and low pressure chambers *b c*, the relief-valve *q*, the large diaphragm *s*, having a passage, *z*, communicating with the low-pressure chamber *b* and the space beneath the same, and the weighted lever *w*, connected to the diaphragm *s* and to the valve-stem *l*, having an intermediate post or bearing, *y*, between the same, substantially as described.

398,850. MACHINE FOR PREPARING FEATHERS FOR DUSTERS. JONAS J. SAHR, Hartland, Wis. Filed Dec. 11, 1886. Serial No. 221,247. (No model.)

Claim.—1. The combination, with the feed-rolls, of the idle-roller, the guide C, acting to double the feather around said roller, and a sand-paper cylinder, substantially as set forth.

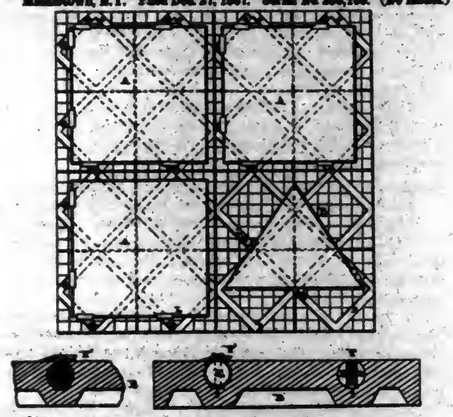


2. The combination of the feed-rolls and the inclined floor *a* with

398,850.

the idle-roller, the guide C, acting to double the feather around said roller, and the sand-paper cylinder, substantially as set forth.

398,851. METHOD OF GRADUATING THERMOMETERS. HERMANN SCHULER-RENER, Rochester, Pa. Filed Mar. 22, 1888. Serial No. 268,071. (No model.)



Claim.—1. The method hereinbefore described of marking a graduated scale for measuring-instruments, which consists in locating on the article or articles to be marked two or more determined points of the scale, then adjusting lengthwise a graduated elastic printing device until the corresponding points on it are the same in distance with the said determined points on the article to be marked, and then applying the printing device to the article in such position that the determined points on the article shall register with the corresponding points on the printing device and impressing said printing device to produce upon the article the intermediate graduated marks which form the scale, substantially as and for the purposes described.

2. The method hereinbefore described of marking a graduated scale for measuring-instruments, which consists in locating on a straight article which is to be marked two or more determined points of the scale, then adjusting lengthwise a graduated elastic printing device until the corresponding points on it are the same in distance with the said determined points on the article to be marked, and then applying the printing device, to the article in such position that the determined points on the article shall register with the corresponding points on the printing device, and rolling the said article on the axis of its length transversely to the line of marks on the printing device, whereby the marks at the said fixed points of the printing device and the intermediate graduated marks shall be imprinted on the article simultaneously, substantially as and for the purposes described.

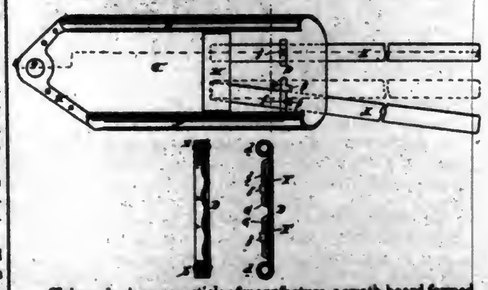
3. The method hereinbefore described of marking a graduated scale for measuring-instruments whose scale-marks are of variable degrees of length and are arranged in a line, which consists in locating on the article to be marked two or more determined points on the scale, and then applying thereto a printing device of elastic and flexible material which is provided with graduated printing-marks corresponding in number and relative distance to those desired to be produced on the scale, the said printing device being applied in such position that the said determined points on the article shall register with the corresponding points on the printing device, and impressing said printing device to produce upon the article the intermediate graduated marks which form the scale, substantially as and for the purposes described.

398,852. STEREOTYPE-PLATE HOLDER. WILLIAM G. SLAWSON, Middletown, N.Y. Filed Dec. 27, 1887. Serial No. 258,160. (No model.)

Claim.—1. A stereotype-plate holder consisting of a number of rectangular grooved sections, the grooves extending continuously through the sections and so located in adjacent sections as to register at the edges of the sections.

2. The combination, with a grooved plate-holder, of adjustable and detachable filling-pieces entering said grooves, said filling-pieces resting on the bottom of the grooves and extending to the top of said grooves and being flush with the surface of the block, substantially as described.

3. The combination, with a holder having undercut grooves and a channel at the bottom thereof, of a filling-piece bearing against the upper shoulders of the groove, and a set-screw passing through the filler and bearing in a channel in the lower portion of the groove.



4. A stereotype-plate holder made in sections having a series of intersecting grooves, the unit of whose design is a rectangular unit of any adopted length and width, each unit having four diagonal grooves across its face, all of equal length, the opposite ones parallel, the grooves meeting at the middle of the respective sides of said unit.

5. The combination, with a holder of the character described having undercut grooves, of a swiveled clasping-piece on a follower in this groove, and a set-screw holding the follower in the groove independently of the clasping-piece.

6. A stereotype-plate holder of the character described, having an enlarged groove and a perpendicular slot extending a little deeper than said groove, as set forth.

7. A holder having a groove therein, a two-part follower in the groove, having a holding-catch thereon, the two parts of the follower being held apart by a spring, and a fastening device for the rear section of the follower, all in combination, substantially as described.

398,858. SWATH-BOARD FOR MOWING AND REAPING MACHINES. ANNA B. SMITH, Pittsburg, Pa. Filed Feb. 20, 1887. Serial No. 228,971. (No model.)

Claim.—1. As a new article of manufacture, a swath-board formed of sheet metal, having its upper and lower edges rolled over outwardly to strengthen and stiffen it laterally without obstructing the passage of the grass over the inner face of the swath-board.

2. As a new article of manufacture, a swath-board formed of a single thickness of sheet metal cut and bent to suitable form, and having a metal fork secured to its point, the fork being of the outline of the front end of the board, so as to stiffen that edge.

3. As a new article of manufacture, a swath-board formed of sheet metal, having its upper and lower edges rolled over outwardly to strengthen and stiffen it laterally without obstructing the passage of the grass over the inner face of the swath-board, and having a metal fork, E, secured to and shaped to fit and re-enforce its front end.

4. The combination, with a swath-board, of a socket, H, secured to the outside of said board, a dividing-stick having a lug, *f*, the forward end of said dividing-stick resting within said socket, and the swath-board being provided with a slot, G, or its equivalent, for engagement with the lug *f*, as and for the purpose specified.

5. The combination, with a swath-board, of a socket, H, secured to the outside of said board, a metal dividing-stick having a lug, *f*, the forward end of said stick resting within said socket, and the swath-board being provided with a slot, G, having detents *g*, or its equivalent, for engagement with the lug *f* and for regulating its inclination, as and for the purpose specified.

6. As a new article of manufacture, a swath-board formed of sheet metal cut and bent to suitable form and having a metal fork secured to its point, the fork being of the outline of the front end of the board, so as to stiffen that edge, and the upper and lower edges of the board being re-enforced, as described.

7. As a new article of manufacture, a swath-board formed of sheet metal longitudinally corrugated and cut and bent to suitable form and having a metal fork secured to its point, the fork being of the outline of the front end of the board, so as to stiffen that edge, and the upper and lower edges of the board being re-enforced, as described.

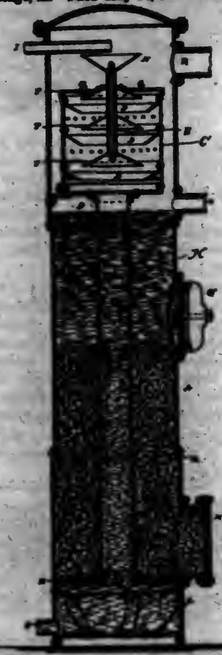
398,854. WALKING-STILT. GEORGE P. SMITH, Bridgeport, Conn. Filed June 2, 1888. Serial No. 276,542. (No model.)

Claim.—In a stilt, the combination of the standard, a step-bracket provided with a downwardly-beveled wedge-shaped plate bearing against the standard, and a ring encircling both the plate and the standard, whereby the weight of the user locks the bracket in any position on the standard by wedging the plate between the ring and the standard, substantially as set forth.

398,855. ROTARY ELEVATOR FOR RAISING LIQUIDS. RICHARD SMITH, Boston, Mass. Filed July 2, 1888. Serial No. 278,782. (No model.)

Claim.—1. An elevator for raising liquids, composed of a central rotary shaft, a band wound spirally thereabout, the width of said band being transversely of the shaft, a vertical strip, 7, on the edge of said band, a series of buckets attached consecutively along one of the faces of said band obliquely thereto, and an inclosing-tube, substantially as herein set forth.

2. An elevator for raising liquids, composed of a central shaft, a helical band transversely thereabout, and a series of consecutive buckets laterally secured to said band and to the shaft, the receiving end of each bucket being contiguous and tangent to the surface of the band, the discharge end being upraised from the latter and with the discharge and receiving ends radially disposed of the shaft, substantially as specified.



3. The combination, with a cylindrical tube, 3, open at both ends, of a rotary rod, 5, centrally therein, a continuous helical band, 6, affixed thereon, and a series of buckets, 8, the bottom of the latter being obliquely disposed of the band 6, to which they are affixed, and said buckets being provided with vertical strips 13, which connect the upper edge of each bucket with the lower edge of the next succeeding one, as and for purposes herein specified.

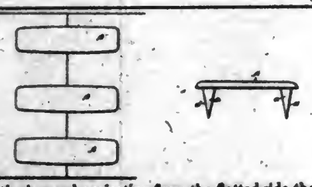
4. In combination with a stationary tube, 3, connected with a supply and discharge, a revoluble liquid-elevator, 4, composed of a shaft, 5, a helical band, 6, thereon, with its flange or strip 7 on its exterior edge, and the series of buckets 8, having bottom boat plates, 9, arranged consecutively along one side of the said band, as herein described.

5. The fixed hollow tube 3, open at both ends, a revoluble elevator, 4, inclosed within, having a central actuating-shaft, 5, and a helical band, 6, with its flange 7, combined with a series of consecutive buckets, 8, formed by the boat plates 9, the receiving end of said buckets being tangent with the band, the discharge end upraised from said band, and the pieces 13 radially of the shaft, which unite the discharge end of one bucket with the receiving end of the next adjacent bucket, all operating as herein set forth and stated.

6. An elevator for raising liquid matter, consisting of a central shaft, a helical band thereupon, a continuous lip secured to the outer edge of said band and disposed parallel with the longitudinal axis of the shaft, and a series of buckets attached consecutively along one of the faces of said band, obliquely thereto, substantially as herein explained.

398,856. FEED-WATER PURIFIER AND HEATER. WILLIAM H. SMITH, Chicago, Ill. Filed May 21, 1888. Serial No. 274,543. (No model.)

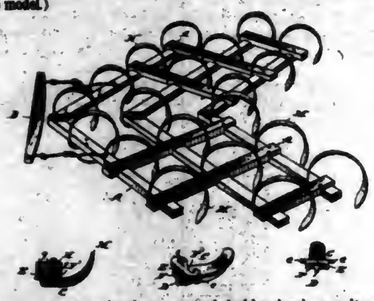
Claim.—1. In a feed-water purifier, the combination, with the outer cylinder having an inlet-pipe for admission of water, of an interior cylinder located below the inlet-pipe and provided interiorly with central and circumferential deflectors alternately arranged, whereby the water in its passage is thrown back and forth from and toward the center, substantially as and for the purpose described.



2. In a feed-water purifier and heater, the combination, with the outer shell provided at its upper part with steam and water inlet pipes, of an interior perforated cylinder, C, supported within the shell, with an annular space between the two, said cylinder C having interior deflectors for spreading and spraying the water in its passage, substantially as described.

3. In a feed-water purifier and heater, the combination, with the outer shell or case having at its upper part steam and water inlet pipes and in its lower part a perforated diaphragm, N, and above the latter filtering material and an outlet, of an interior perforated cylinder, C, supported within the shell or case, with an annular space between the two, said cylinder C having interior deflectors and communicating through a pipe, K, with the chamber below the diaphragm N, substantially as described.

398,857. BELT-FASTENER. JAMES SNOW, Cleveland, Ohio. Filed Oct. 18, 1888. Serial No. 288,442. (No model.)

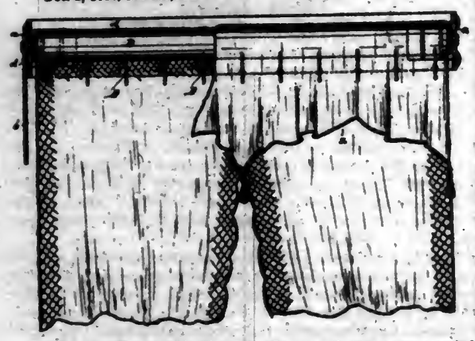


Claim.—A belt-fastener consisting of a narrow metal bar, the same having a flatted and convex side, with a conical tooth located

898,857.

near each end of the bar and projecting from the flatted side thereof, each tooth having a flatted side, substantially as shown, for reducing the point thereof to a thin edge suitable for clinching, substantially as set forth.

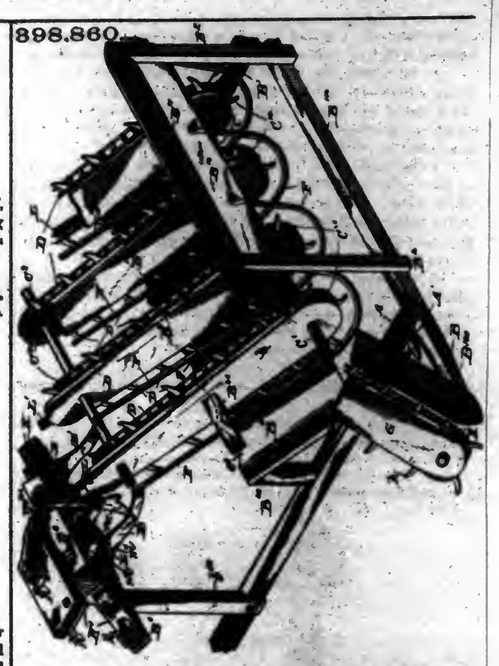
898,858. SPRING-TOOTH HARROW. PRATT A. SPIKER, Marshall, Mich. Filed Sept. 29, 1887. Renewed July 25, 1888. Serial No. 281,066. (No model.)



Claim.—1. A spring-harrow-tooth holder having on its under side a rib forming a runner, its upper side provided with a slotted bearing-lug, and the set-screw and plate, all combined and adapted for use in connection with a spring harrow-tooth and its beam, as shown and described.

2. A spring-harrow-tooth holder consisting of rib forming a runner on its under side, its upper portion provided with a slotted and recessed bearing-lug, a plate, and a set-screw, in combination with a harrow-beam and a spring harrow-tooth, as shown and described.

3. In a spring-harrow-tooth holder, the combination, with the harrow-beam, of a holder provided on its under surface with a rib forming a runner, the upper portion of said holder provided with a slotted and recessed bearing-lug, and the spring-tooth passing through the slotted portion of the lug and connected to the holder, and also adjustable thereon by means of a set-screw connecting the harrow-beam and holder, as shown and described.



898,859. CURTAIN-FIXTURE. JULIE STEINHAGEN, Boitenhagen, Mecklenburg, Germany. Filed Nov. 24, 1886. Serial No. 219,773. (No model.) Patented in Germany July 30, 1886, No. 36,184; in England Nov. 12, 1886, No. 14,679; in Belgium Dec. 6, 1886, No. 75,488; in Austria-Hungary Mar. 26, 1887, No. 43,097 and No. 11,144; in Sweden Apr. 27, 1887, No. 1,029; in Denmark Oct. 29, 1887, No. 370, and in France Dec. 2, 1887, No. 180,044.

Claim.—The combination of a frame and bearings a carried thereby with the rod B, turning in said bearings, the projecting hooks D on the outer face of said rod, and the lever b, attached to said rod for turning it, substantially as set forth.

898,860. CORN-HARVESTER. JOHN F. STEWARD, Chicago, Ill. Filed Feb. 28, 1888. Serial No. 265,343. (No model.)

Claim.—1. In a corn-harvester, in combination with the sickle,

an open-topped cradle or stalk-receptacle located immediately in the rear of the sickle and having its bottom extended stubbleward to form a guide for the stalks, and a conveying mechanism overhanging the stalk-receptacle and the stubbleward extension thereof and traveling in vertical planes and moving stubbleward in its lower course, substantially as set forth.

2. In a corn-harvester, in combination with the sickle, an open-topped cradle or stalk-receptacle located immediately in the rear of the sickle and having its bottom extended stubbleward to guide the delivery of the stalks, and a conveying mechanism comprising endless chains overhanging said receptacle and traveling in vertical planes and moving stubbleward in their lower course, the grainward or receiving end of said chains being located in direct line rearward from the sickle substantially as set forth.

3. In a corn-harvester, in combination with the sickle and grainward divider, an open-topped stalk-receptacle located immediately in the rear of the sickle and having its grainward edge located as far grainward as the vertical plane of the stubbleward edge of said divider and considerably above the level of the sickle, the boundary of said receptacle extending thence downward and thence stubbleward, whereby said receptacle constitutes a cradle to receive the stalks from the sickle, and a conveying mechanism comprising endless toothed chains traveling in vertical planes and moving stubbleward in their lower course, their receiving or grainward end overhanging said stalk-receptacle, substantially as set forth.

4. In a corn-harvester, in combination with the sickle, a stalk-receptacle located immediately in the rear of the sickle, comprising a series of parallel bars located one behind the other in the rear of the vertical plane of the sickle and extending stubbleward across the path of the incoming stalks, and conveying-chains overhanging such receptacle and having teeth depending between said bars, such chains traveling stubbleward in their lower course, substantially as set forth.

5. In combination with the sickle, a stalk-receptacle located immediately in the rear thereof, comprising a series of parallel bars located one behind the other in rear of the vertical plane of the sickle, each commencing at a point grainward from the path of the incoming stalks and considerably above the level of the sickle and extending thence downward and stubbleward to form a cradle to receive and guide the stalks as they fall from the sickle, and a series of conveying-chains overhanging said series of parallel bars and having teeth depending between them and traveling stubbleward in their lower course, substantially as set forth.

6. In a corn-harvester, in combination with the sickle, the outside divider-frame, the parallel bars F, secured to the upper portion of said divider-frame in a series one behind another, the foremost bar being located a short distance rearward from the vertical plane of the sickle and without intervening mechanism, said bars extending from said divider-frame downward and stubbleward in the rear of the vertical plane of the sickle, and thence farther stubbleward beyond the vertical plane of the stubbleward end of the sickle, and suitably secured to the harvester frame-work, and the conveying-chains overhanging said series of bars throughout the last-mentioned portion of their extent, whereby the stalks severed by the sickle and falling upon the downward and stubbleward portion of said bars are by said portion guided within reach of said chains and thence farther conveyed by the latter, substantially as set forth.

7. In a corn-harvester, in combination with the stalk-receptacle in the rear of the sickle, having its bottom extended stubbleward to support and guide the stalks, conveying mechanism overhanging said extension, and the bars L', located and extending substantially parallel to said extension and overhanging the same, forming a rigid throat for the passage of the stalks, the conveying mechanism comprising chains which have teeth projecting into said throat, substantially as set forth.

8. In combination, substantially as set forth, the parallel bars F, forming a stalk-receptacle in the rear of the sickle and extending thence stubbleward and upward, the elevating mechanism comprising chains traveling in vertical planes parallel with said bars and overhanging the same, and the receptacle *c*, located beyond the delivery end of the elevating mechanism, substantially as set forth.

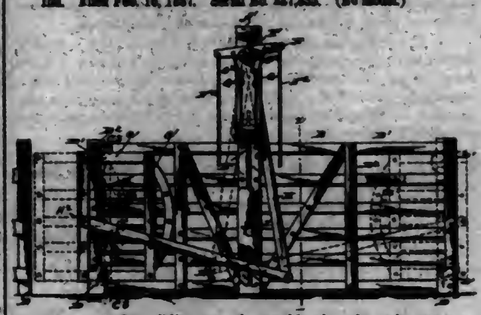
9. In combination, substantially as set forth, the harvester-frame comprising the grainward divider-frame and a fore-and-aft bar located at a distance stubbleward from said divider-frame, the parallel bars F, secured one end to the upper part of said divider-frame and connected at the other end to said fore-and-aft bar and depressed between said divider-frame and said fore-and-aft bar to form a stalk-receptacle, and the conveying-chains overhanging said series of bars F, the receiving end of said conveying-chains being located in said depression, substantially as set forth.

10. In combination, substantially as set forth, a harvester-frame comprising the grainward divider-frame and a fore-and-aft bar located at a distance stubbleward from said divider-frame, the parallel bars F, and the brackets E, the former secured at the grain end to the upper portion of said divider-frame and the latter secured at the stubble end to said fore-and-aft bars, the stubble end of the bars F being secured, respectively, to the brackets E, the bars F being depressed between said divider-frame and said fore-and-aft bar to form a stalk-receptacle behind the sickle, and said brackets being upwardly concave between their ends to form a secondary receptacle, and conveying mechanism overhanging the bars F and operating between said receptacles, substantially as set forth.

11. In a corn-harvester, in combination with the gatherer and the sickle, a stalk-receptacle or cradle located in the rear of the sickle and endless conveying-chains overhanging said receptacle and traveling stubbleward in their lower course, substantially as set forth.

12. In combination with the sickle, the gatherer operating from a point forward of the vertical plane of the sickle rearward past said vertical plane, a stalk-receptacle in the rear of the sickle, overhung at its forward end by the gatherer, and a conveying mechanism overhanging said receptacle and operating stubbleward therefrom, substantially as set forth.

13. In combination with the sickle, a stalk-receptacle in the rear thereof, and conveying-chains overhanging the receptacle and traveling stubbleward in their lower course, the receiving end of said chains being in the path of the incoming stalks, the gatherer having its delivery end overhanging the forward chain and the receptacle, substantially as set forth.



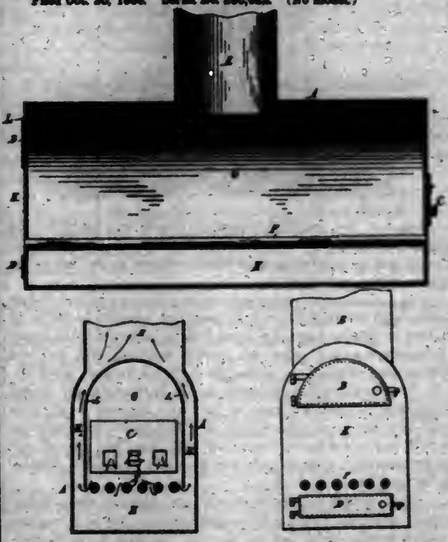
14. In combination with the sickle, a series of parallel bars extending from a line grainward of the path of the incoming stalks stubbleward across said path, a series of conveying-chains overhanging said series of bars and operating stubbleward in planes substantially parallel thereto, having their receiving ends in the path of the incoming stalks, and the gatherer operating from a point forward of the vertical plane of the sickle to a point in the rear of said plane and overhanging at its said rear end the foremost of said conveying-chains, substantially as set forth.

15. In combination with the sickle, the grainward divider-frame, and the stubbleward divider, the bars F, secured to the outside divider-frame considerably above the level of the sickle and sloping thence downward and extending across the path of the incoming stalks behind the sickle to form a receptacle for said stalks, and the conveying-chains overhanging such receptacle, and the gatherer supported upon the inside divider and at its rear end overhanging the foremost of said conveying-chains, substantially as set forth.

16. In combination with the stalk-receptacle behind the sickle and the conveying-chains overhanging the same and operating stubbleward therefrom in their lower course, packers operating near the vertical plane of the foremost of said chains at its delivery end, substantially as set forth.

17. In combination with a stalk-receptacle in the rear of the sickle, the overhanging elevating-chains operating stubbleward therefrom, and the receptacle *c* at the delivery end of said elevating-chains, the packers located and operating in the vertical plane of the foremost of said elevating-chains and overhanging said receptacle *c*, substantially as set forth.

898,861. SLIDING GATE. GEORGE W. STEWART, Rising Sun, Ind. Filed Feb. 16, 1887. Serial No. 227,833. (No model.)

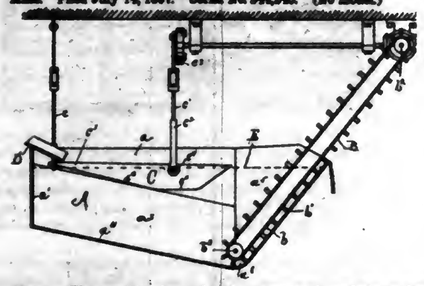


Claim.—1. In a sliding gate, the combination of a main gate provided with tracks, uprights having rollers adapted to receive said tracks, a smaller gate mounted and adapted to reciprocate within one end of the main gate, a rock-shaft journaled in the uprights and provided with rock-arms for operating the same, and a jointed arm connected to the rock-shaft and pivoted to the smaller gate, substantially as specified.

2. In a sliding gate, the combination of a main gate provided with tracks, uprights having rollers adapted to receive said tracks, smaller gates mounted at each end of the main gate, a rock-shaft journaled in the uprights and provided with rock-arms for operating the same, and a jointed arm connected to the rock-shaft and pivoted removably to one of the gates and adapted to be pivoted to the other, substantially as specified.

3. The combination, in a sliding gate, of a main gate having a notch and carrying a smaller gate at one of its ends, uprights for supporting the main gate, provided with a gravity-latch adapted to take into said notch and with a rock-shaft having rock-arms one of which is loosely connected with said latch, and a pivoted arm connecting the rock-shaft with the smaller gate, substantially as specified.

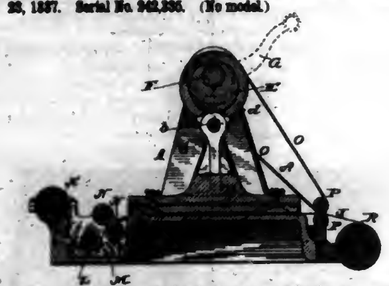
898,862. SMOKE-PREVENTING STOVE. JOHN STOTT, Aurora, Ill. Filed Oct. 30, 1888. Serial No. 289,982. (No model.)



Claim.—1. A smoke-preventing stove adapted for burning bituminous coal, having within its outer case an inner arched plate, I, placed substantially parallel with such case and connected with both end plates of the stove, such plate having no opening therein, and provided with opposite vertical sides both extending down to the under side of the grate, leaving a free heating and flue passage from the under side of the grate up and between such sides and the entire inner side of the case, which is above the grate, the plate constituting,

with the grate, the combustion-chamber and serving to compel all the products of combustion to pass downward through the ignited fuel.

2. In combination with outer shell, A, having the top outlet, E, the arched plate L, applied relatively to the shell as set forth and leaving a continuous flue-passage around the whole surface of the plate, and a grate located between the two lower ends of said plate and extending through the stove and supported at both ends in and by the end plates of the stove, all substantially as described.



3. In combination, the shell A, having outlet E, plate L, applied thereto and to the grate, as shown and described, feed-door B, draft-door C at the opposite side or end of the stove and provided with a regulating-register, and a tight-fitting door for the ash-pit, the construction also compelling the air to pass downward through the fuel and grate, all substantially as set forth.

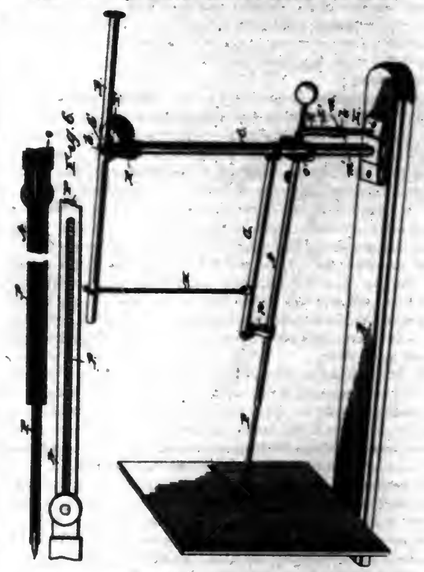
398,863. ORE-CONCENTRATOR. CHARLES H. TAYLOR, Boston, Mass. Filed July 14, 1887. Serial No. 244,240. (No model.)

Claim.—The combination, with the water-tank and the inclined bottomed pan C, shallow and narrow at its receiving end and wider and deeper at its discharging end, said pan being pivoted at its receiving end, of the yoke c^3, attached to said pan, the eccentric and pitman by which said pan is suspended and reciprocated vertically, and the eccentric and pitman for giving lateral movements to said pan, substantially as set forth.

398,864. APPARATUS FOR OBTAINING DUPLICATE COPIES OF WRITINGS. CHARLES A. THOMPSON, New York, N. Y. Filed June 28, 1887. Serial No. 242,335. (No model.)

Claim.—1. In a manifold printing or transferring apparatus, the combination of a platen reciprocating in suitable ways, an opposite bed-plate, and an imprinting stencil-sheet secured to the face of the platen, as shown and set forth.

2. The combination, with a body or plate having attached thereto a stencil-sheet, substantially such as described, adapted to move up and down in suitable ways, of a liquid-tank and base-plate, and means for conveying a strip of paper, &c., through said liquid-tank and over said base-plate, substantially as described, for the purpose specified.



3. The combination, with a body or plate having attached thereto a stencil-sheet, substantially such as described, adapted to move up and down in relation to a base-plate, of a liquid-tank and squeezer-rolls N N, and means for conveying a strip of paper, &c., through said tank, between said squeezer-rolls and over said base-plate, substantially as described.

4. In a manifold printing or transferring apparatus, the combination of a platen reciprocating in suitable ways and having an imprinting stencil-sheet upon its face, an opposite bed-plate, a paper-roller, and a suitable dampening-tank and rollers for dampening and squeezing the strip or web of paper unwound from said roller at one side of the bed-plate, and feed-rollers at the other side of the bed-plate, as shown and set forth.

5. In a manifold printing or transferring apparatus, the combination, with a reciprocating platen having an imprinting-sheet upon its face and an opposite bed-plate, of a liquid-tank at one side of the bed, having a guide-roller within it, squeezing-rollers above the tank, and two feed-rollers at the opposite side of the bed-plate bearing against each other, as shown and set forth.

6. In a manifold printing or transferring apparatus, the combination of the bed-plate having the tank at one side, the platen reciprocating against the bed in suitable ways, the revolving drive-shaft having the eccentric-disk having its strap pivotally connected to the platen, the paper-roller and guide and squeezing rollers at the tank, and the feed-rollers at the opposite side of the bed having belt-connection to the drive-shaft, as shown and set forth.

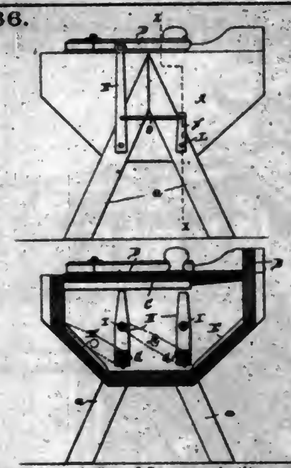
398,865. DRAWING APPARATUS. DAVID K. WADE, McPherson, Kans. Filed Sept. 1, 1888. Serial No. 284,942. (No model.)

Claim.—1. The combination, with the revoluble standard, of the telescope swiveled at the upper end of the standard and provided with a segmental rack, F, the transverse shaft provided with a spur-wheel engaging the said rack, the tubular arm pivoted at its inner end and connected at its outer end to the telescope, and the pencil-bar mounted in the tubular arm, substantially as specified.

2. The combination, with the revoluble standard and the telescope mounted on the standard, of the pencil-bar mounted eccentrically with the telescope and connected thereto at its free end, substantially as specified.

3. The combination, with the revoluble standard and the telescope mounted thereon, of the vertical shaft arranged in rear of and adjacent to the standard, the tubular arm mounted on the shaft and connected to the telescope, and the pencil-bar mounted in the tubular arm, substantially as specified.

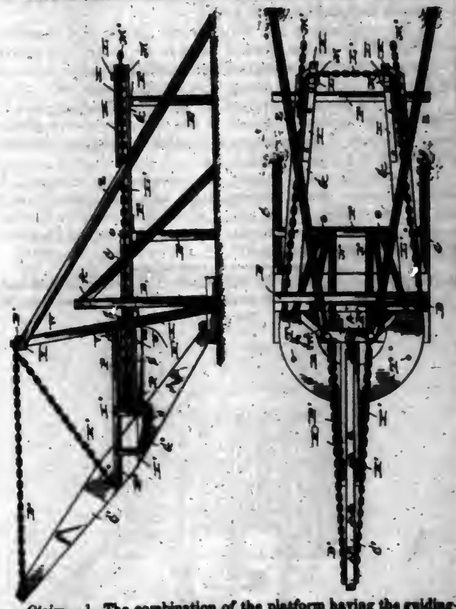
4. The combination, with the revoluble standard and the telescope swiveled at the upper end of the standard, of the vertical extensible shaft arranged adjacent to and in rear of the standard, the tubular arm pivoted to the upper end of the said shaft and provided with a hollow or slotted offset embracing the standard, and the pencil-bar mounted in the tubular arm, substantially as specified.



5. The combination, with the vertical revoluble standard C, of the telescope swiveled to the upper end of the standard and provided with suitable means, substantially as described, for operating the same, the swinging arm G, mounted on the standard and connected by a rod or wire, H, to the telescope, the tubular arm pivoted at one end to a vertical shaft arranged adjacent to the standard, and connected at the other end to the swinging arm by a suitable link, and the spring-actuated pencil-bar mounted in the tubular arm, substantially as specified.

398,866. WASHING-MACHINE. CHARLES R. WARNER, Meivern, Kans. Filed Mar. 22, 1888. Serial No. 268,113. (Model.)

Claim.—1. In a washing-machine, the combination of the suds-box and the beaters arranged within the tub, and consisting of main bars journaled between the sides of the suds-box near the lower edges of the same and fingers projecting upward from the shafts, as set forth.

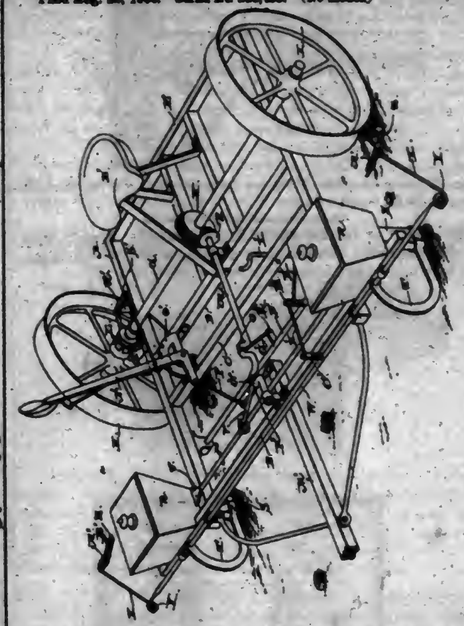


2. The combination of the suds-box having its lower corners cut away, the longitudinal V-shaped ribs secured to the upper faces of said cut-away portions, the beaters arranged within the suds-box and

398,866.

comprising transverse shafts and fingers projecting upward therefrom and adapted to rest upon the said cut-away portions and between the said ribs, and mechanism for oscillating said beaters, as set forth.

398,867. TURN-TABLE FOR CRANES. WILLIAM H. WHEELER, Scioto ville, Ohio. Filed Nov. 30, 1888. Serial No. 292,300. (No model.)



Claim.—1. The combination of the platform having the guiding-sheaves S, the boom, the pivoted arms on the platform on opposite sides of the boom, and the operating-chains attached to the said arms and engaging the guiding-sheaves, whereby the boom may be swung to any desired position, substantially as described.

2. The combination of the semicircular platform having the guiding-sheaves S arranged between its sides, the frame W, the yoke B', pivoted thereon, the pivoted boom, the guys connecting the upper end thereof to the ends of the yoke, the pivoted arms on the platform on opposite sides of the boom, the guys connecting the outer ends of said arms to the ends of the yoke, and the operating-chains engaging the guiding-sheaves and attached to the pivoted arms, whereby the latter may be swung to move the boom in either direction, substantially as described.

3. The combination of the frame having the semicircular platform at one end provided with the guiding-sheaves and the adjustable tightening-sheaves N at the opposite end, the pivoted arm on the platform, the endless chain engaging sheaves N, and the sheaves in the platform and attached to the pivoted arms, for the purpose set forth, and the boom arranged between the pivoted arms, substantially as described.

398,868. CORN-PLANTER. BERT H. WILLIAMS, Bonita, Kans. Filed Aug. 22, 1888. Serial No. 283,626. (No model.)

Claim.—1. The combination, in a check-row corn-planter, of the rock-shaft W, having the arms X, provided with the markers, and having the arm C, the rock-shaft D', having arm E' and arm F', the link H', connecting arms F' and C, the revolving crank-shaft M, and the pitman connecting the same to the arm F', substantially as described.

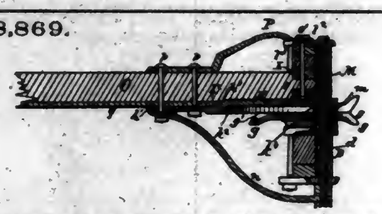
2. The combination, in a check-row corn-planter, of the rock-shaft W, having the arms X, provided with the markers, the rock-shaft D', having the arm F', connections, substantially as set forth, between the shafts D' and W, whereby the rocking motion of the former will be transmitted to the latter, the seed-slide, the revolving shaft M, having the cranks, and the pitmen connecting the cranks of said shaft to the seed-slide and to the arm F', substantially as described.

3. The rock-shaft having the spring-arms X, adapted for the attachment of the markers, substantially as described.

4. The rock-shaft W, having the spring-coils Y at its ends, and the arms X, extending from said coils and arranged at right angles to the said shaft, said arms being adapted for the attachment of the markers, substantially as described.

5. The combination, in a check-row corn-planter, of the rock-shaft W, having the arms X, provided with the markers, the rock-shaft D', having arm E', connected to a similar arm, C, on rock-shaft W, the foot-lever I', and the rod K', connecting the same to rod E', substantially as described.

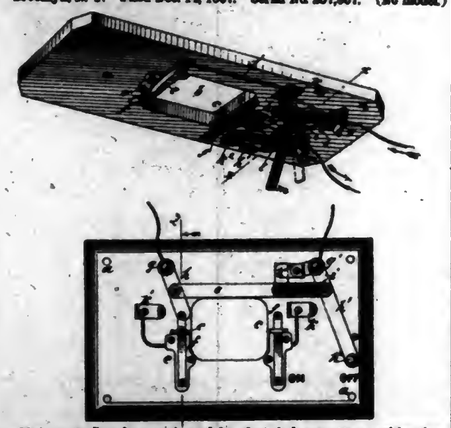
6. The combination, in a check-row corn-planter, of the frame, the tongue pivoted thereto and adapted to turn in a vertical direction, the lever N', connections between the same and the tongue, whereby the latter may be operated to raise or lower the front end of the frame, the shaft G, the driving-wheel H loose thereon, the clutch on the shaft to lock said wheel thereto, the bell-crank lever R', engaging the clutch, and connections between said lever and the lever N', whereby when the hand-lever is operated to cause the tongue to raise the frame the clutch is simultaneously disengaged from the drive-wheel, substantially as described.



7. The combination, in a check-row corn-planter, of the frame, the rock-shaft W, journaled thereon and having the spring-arms X, the markers Z, having the openings B', and the bolts A', to secure said markers at any desired adjustment to the spring-arms, substantially as described.

398,869. FIFTH-WHEEL. JAMES M. WILLIAMS, Rocket, Mo. Filed Apr. 12, 1888. Serial No. 270,425. (No model.)

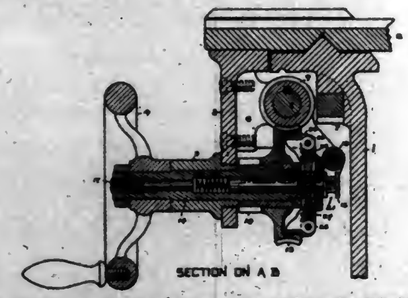
Claim.—1. The combination of the plate B, having the pairs of wings b^2 b^2, the enlargements E E, and the recesses b b, with the clips C C, the bolts F F, the axle A, and the tie-plate H, as set forth.



2. The combination of the perch G, the head-block I, the two portions of the fifth-wheel socketed together, the king-bolt M, the

398,869.

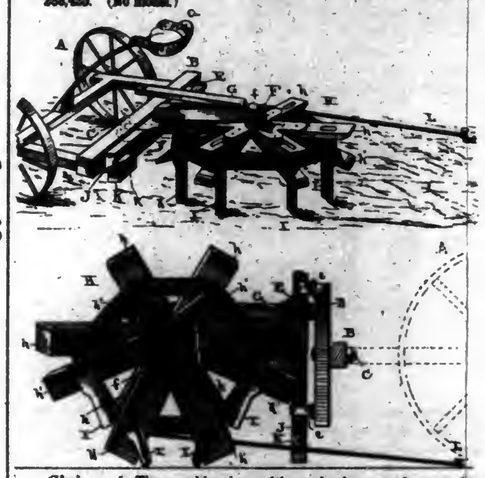
braces F and *n*, the plate N, having the prolongation *n'*, and the bolts *p* and *o'*, as set forth.



398,870. HANGER-BOARD FOR ARC LAMPS. JAMES J. WOOD, Brooklyn, N. Y. Filed Dec. 14, 1887. Serial No. 257,867. (No model.)

Claim.—1. In a hanger-board for electric lamps, the combination, with conducting suspension eyes or loops in connection with the terminals of the circuit, of conducting-springs, also in connection with the terminals of the circuit, adapted to press into the loops, with polar hooks or suspenders on the lamp adapted to engage between the loops and the springs, substantially as shown and described.

2. In a hanger-board, a suspension device formed of a base-plate, *c*, loop *e*, and spring *f*, both the loop and spring being in metallic contact with the base-plate, substantially as and for the purpose set forth.

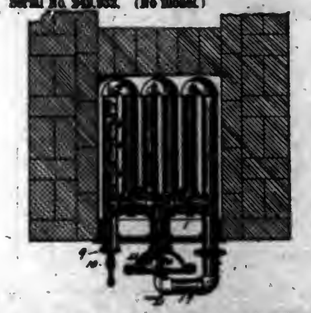


398,871. STOP-MOTION FOR LATHES. SAMUEL L. WORSLEY, Taunton, Mass., assignor to The Brown & Sharpe Manufacturing Company, Providence, R. I. Filed July 9, 1888. Serial No. 279,380. (No model.)

Claim.—1. The combination, substantially as hereinbefore set forth, of a worm driven by the power which drives the head-spindle of the lathe, a worm-wheel driven by said worm, a friction-clutch for connecting said worm-wheel with the train which communicates movement to the tool-carriage or for disconnecting it therefrom, a lever for working said friction-clutch, a holding-catch for locking the lever to close the clutch, a sliding tool-post carriage, and a stop for tripping the holding-catch, substantially as described.

2. The combination of a friction-clutch, connecting the train of gearing which gives movement to the tool-carriage with the prime mover, a lever for working said clutch to make or break such connection, a holding-catch for locking the lever to close the clutch, a sliding tool-post carriage, and a stop for tripping the holding-catch, substantially as described.

398,872. SELF-WINDING REEL FOR CHECK-ROW PLANTERS. WILLIAM H. ALDRICH, Red Oak, Iowa. Filed Oct. 12, 1888. Serial No. 288,425. (No model.)



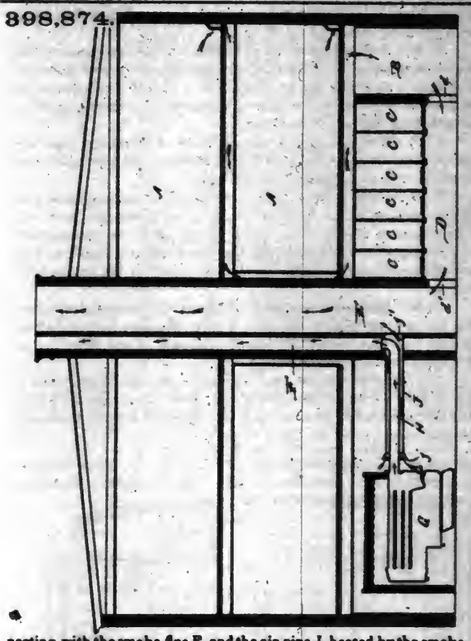
Claim.—1. The combination, with a check-row planter, of a check-line reel united thereto by a swivel-joint the axis of which lies horizontally, substantially as set forth.

2. The combination, with the check-row planter, of a check-line reel hinged to a cross-bar which is united to the planter by a swivel-joint, so as to be capable of vibration in a vertical plane transverse to the longitudinal axis of the planter, substantially as set forth.

3. A check-line reel composed of a cross-bar, D, a base-piece, E, hinged thereto, an arm, F, fastened to the base-piece and carrying a bolt, *f*, and a reel, H, mounted to revolve on the bolt and provided with projecting fingers I, as set forth.

4. A check-line reel composed of a cross-bar, D, a base-piece, E, hinged thereto, an arm, F, fastened to the base-piece and carrying a bolt, *f*, a bar, G, hinged to the arm F, a reel, H, mounted on the bolt *f*, and a block, K, attached to the base-piece and provided with an eye, *k*, substantially as described.

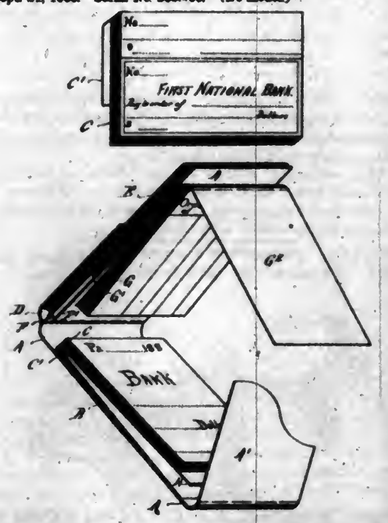
398,873. APPARATUS FOR GENERATING AND BURNING GASEOUS FUEL. RICHARD B. AVERY, New York, N. Y. Filed Sept. 17, 1887. Serial No. 249,932. (No model.)



Claim.—1. In devices for generating and burning gaseous fuel, the combination of a closed combustion-chamber, a generating pipe or retort arranged therein, an air or mixing chamber into which the generating-chamber delivers, said mixing-chamber arranged to deliver into the burner located in the closed fire-chamber, and a steam jet or exhaust arranged in the delivery end of the generator, substantially as and for the purposes specified.

2. In a device for generating and burning gaseous fuel, the combination of a closed fire-chamber, the series of generating-pipes 3 arranged therein, the nozzle 20 at the delivery end of the pipes 3, the central steam-jet exhaust, 21, the funnel-shaped air and mixing chamber provided with the register 26 26', and a perforated burner, 25, substantially as and for the purposes specified.

398,874. VENTILATION OF BUILDINGS. STERLING L. BAILEY, Hyde Park, Ill. Filed Jan. 7, 1888. Serial No. 295,603. (No model.)



Claim.—1. In a ventilating apparatus for buildings, the combination, with the dry-closets and their horizontal shaft D, of the ventilating-shaft E, the smoke-flue F, the furnace G, and the smoke-pipe H, connecting with the smoke-flue F, and the air-pipe J, heated by the smoke-pipe and communicating with the ventilating-shaft E, substantially as specified.

398,874.

2. In a building to be ventilated, the combination of the heating apparatus G, flues E and F, smoke-pipe H, connected to the flue F, and air-pipe J, heated by the smoke-pipe and connected to the ventilating-flue E, substantially as specified.

398,875. COMBINATION BANK-BOOK. WILLIAM H. BENSON, Reading, Pa., assignor of one-half to Charles F. Heller, same place. Filed Sept. 21, 1888. Serial No. 285,966. (No model.)

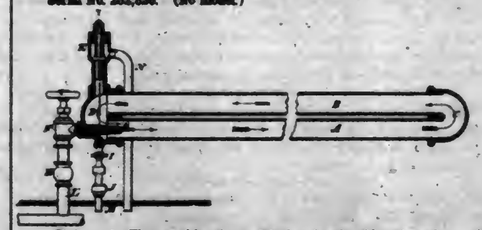
Claim.—1. A bank-book consisting of a case having a flap, A', and an inside pocket, B, on one side, and an outside pocket, D, on the other, in combination with a check-book having a back, C, removably held in said pocket B, and a bank-book placed in said pocket D, the flaps A' being adapted to cover the bank-book and be inserted in the pocket D, substantially as set forth.

2. A bank-book consisting of a case having a flap, A', and an inside pocket, B, on one side, and an outside pocket, D, and the inside pocket F on the other, in combination with a check-book having a back, C, removably held in said pocket B, a record-book similarly held in the pocket F and a bank-book placed in said pocket D, the flaps A' being adapted to cover the bank-book and be inserted in the pocket D, substantially as set forth.

3. A bank-book consisting of a case having a flap, A', and inside pockets, B and H, on one side, and an outside pocket, D, and inside pocket F on the other, in combination with a check-book, a bank-book, and a record-book, removably secured in said pockets B, D, and F, all arranged substantially as set forth.

4. A bank-book consisting of a case having inside pockets, B and H, on one side, and an inside pocket F on the other, in combination with a check-book and a record-book having backs C and G', removably held in said pockets B and F, substantially as set forth.

398,876. METHOD OF PREPARING FILLER MATERIAL FOR THE MANUFACTURE OF CIGARS. RICHARD A. BRIGHT, Providence, R. I., assignor to Walter A. Peck, trustee, same place. Filed June 2, 1888. Serial No. 275,947. (No specimens.)



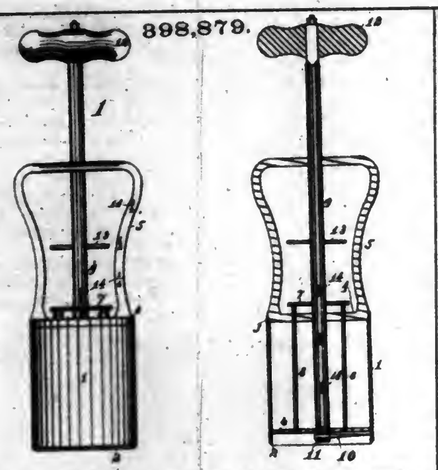
Claim.—The method of preparing a mass of cigar-fillers, which consists in first arranging a quantity of fillers in a substantially parallel position and then cutting out or removing a portion of the tobacco, so that the prepared mass will have the tobacco cut out or removed at its edge, and thus contain the proper proportion of tobacco in its different parts to form cigars of the required shape or taper.

398,877. FILLER MATERIAL FOR CIGARS. RICHARD A. BRIGHT, Providence, R. I., assignor to Walter A. Peck, trustee, same place. Filed Aug. 18, 1888. Serial No. 283,134. (No model.)

Claim.—A prepared mass of cigar-fillers having a portion of the tobacco cut out or removed at the edge of the mass, so that a quantity taken from any portion of said mass will contain the proper proportion of tobacco in its different parts to form cigars of the required shape or taper.

398,878. RAILWAY-CAR HEATER. WILLIAM BURNETT, New York, N. Y., assignor to John B. Gray, same place. Filed Mar. 20, 1887. Serial No. 232,236. (No model.)

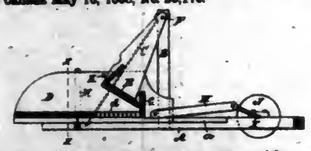
Claim.—1. The combination, with the circuit of heating-pipes, of a steam-jet pipe extending within the said pipes and an automatic relief-valve on the circuit-pipes, substantially as described.



2. A heater consisting of a continuous and unbroken circuit of pipes through which the circulating medium, consisting of air mingled with steam, is to be impelled, and a steam-jet pipe extending within the pipes of the circuit, the said circuit of pipes having an automatic steam-trap, substantially as described.

3. A heater consisting of a continuous and unbroken circuit of pipes through which the circulating medium is to be impelled, a steam-jet pipe extending within the pipes of the circuit and having a controlling-valve, the said circuit of pipes having a steam-trap and an automatic relief-valve, so as to be employed at will either for heating with the combined medium of air and steam or with the medium of water, substantially as and for the purpose described.

398,879. BUTTER-CUTTER. HARRY M. CAIN, Denver, Colo. Filed July 3, 1888. Serial No. 278,970. (No model.)

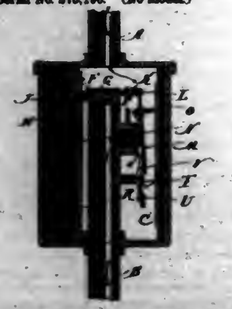


Claim.—The combination of the cylinder 1, cap 4, with attached handle 5, follower 6, ring 7, rods 8, connecting the follower and ring, knife-rod 9, having handle 12, and knife 10, pivoted by pivot 11 in the rod and at right angles thereto to automatically turn and present

398,879.

its edge in the direction of movement of the knife, substantially as set forth.

398,880. CURD-MILL. RICHARD H. CASWELL, Ingersoll, Ontario, Canada. Filed May 23, 1888. Serial No. 274,852. (No model.) Patented in Canada May 18, 1888, No. 29,176.



Claim.—1. In a curd-mill, the combination, with a supporting-frame, A, having posts B B', of a swinging presser, E, hung from said posts, and a trough, D, under the presser, said trough having an aperture in the bottom provided with intersecting knives *d*, and an end, *c*, and cross-bar K, to swing the presser when the trough is reciprocated to alternately expose and cover the knives, for the purpose set forth.

2. In a curd-mill, the combination, with a supporting-frame, A, of the reciprocating trough D, having an aperture in the bottom, provided with diagonally-intersecting knives *d*, a swinging presser, E hung from posts B B' of said frame and between an end, *c*, and cross-bar K of the trough, and a pitman, I, and crank-shaft H to reciprocate the trough, whereby the knives are exposed when the presser swings from the perpendicular, and the presser closes upon the knives when at the perpendicular, for the purpose set forth.

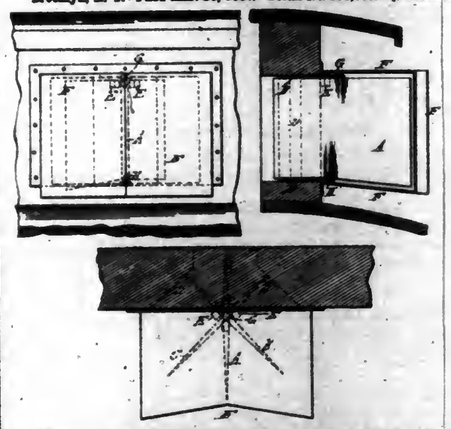
3. In combination with the reciprocating trough D and the supporting-frame A, the gate M, secured at top to a bent bar, L, straddling the trough and standing in holes in the frame, whereby the gate will remain stationary crosswise of the trough when the trough is reciprocated, for the purpose set forth.

398,881. GAS-REGULATOR. EDWARD J. COLBY, Chicago, Ill. Filed May 26, 1888. Serial No. 275,196. (No model.)

Claim.—1. In a fluid-regulator, the combination of a discharge-pipe having an aperture with a flap-valve and adjustable plate to which such flap-valve is pivoted, so as to vary the normal distance of the valve from the aperture.

2. In a fluid-regulator, the combination of a discharge-pipe having an aperture with a flap-valve pivoted above and supported below by a swinging stop.

3. In a fluid-regulator, the combination of a discharge-pipe having an aperture with a discharge-valve pivoted above and supported below by a swinging stop provided with a curved bearing-edge, so that as the flap-valve moves toward the aperture its bearing-point approaches the fulcrum of such stop.



4. In a fluid-regulator, the combination of a discharge-pipe having an aperture with a flap-valve pivoted above and a swinging stop provided with an adjustable counter-weight.

5. In a fluid-regulator, the combination of a discharge-pipe having an aperture with a flap-valve and a swinging stop provided with a bearing-edge of such shape that as the flap-valve nears the aperture the bearing-place approaches the fulcrum of the stop, and also with an adjustable counter-weight, so that the power of the stop may be varied.

6. In a fluid-regulator, the combination of a discharge-pipe having an aperture with a flap-valve, a fixed stop, and a screw-bolt to engage such stop, so that the limit of approach of the flap-valve to the aperture may be fixed at will.

7. In a fluid-regulator, the combination of a discharge-pipe having an aperture with a flap-valve pivoted above to an adjustable slide and supported below by a swinging stop provided with an adjustable counter-weight to fix the power of the stop at will.

398,882. AUTOMATIC CAR-VENTILATOR. WILLIAM G. CREAMER, Brooklyn, N. Y. Filed Mar. 26, 1887. Serial No. 232,605. (No model.)

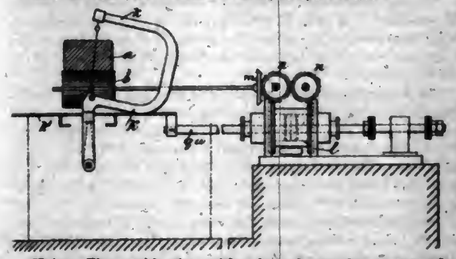
Claim.—1. In a car-ventilator, a deflector pivoted in the air-exit opening and having the upper pivot nearer than the lower to the outer edge of the deflector, whereby the deflector tends normally to assume a position at right angles to the side of the car.

2. The combination, with the pivoted deflector, of elastic strips located on each side of the pivot, and as close as possible thereto, and elastic strips located as described, so as to form a tight joint with the inner edge of the deflector in either position.

398,883. EDGE-SETTING MACHINE. JOHN E. DRAKE, Quincy, Mass. Filed June 23, 1888. Serial No. 278,061. (No model.)

Claim.—The edge-setting machine, as described, consisting of the stationary head or frame *a*, the reciprocating block *d*, mounted therein, and the tool-carrier *c*, secured to or forming a part of said block and projecting to one side of said head or frame, combined with the stationary guide a^4, and the arm or extension E, forming a part of or secured to the tool-carrier *c* or the block *d*, and suitable tools arranged on the said carrier *c*, substantially as and for the purpose set forth.

398,884. SASH-FASTENER. JACOB EBERHARDT, Chicago, Ill. Filed Jan. 7, 1889. Serial No. 295,658. (No model.)



398,884.

Claim.—1. A cam A, provided with a handle, *a*, in combination with the plate B, having a curved groove, *c*, and the spring-actuated pin *d*, substantially as and for the purpose specified.

2. The cam A, having a serrated edge, and plate B, having a curved groove, *c*, having its bottom oppositely inclined toward its ends, and a central depression, *f*, in combination with the spring-actuated pin *d*, substantially as and for the purpose specified.

398,885. TILE-CUTTING MACHINE. CARL A. RIEMER, Lugau, Saxony, Germany. Filed Feb. 20, 1888. Serial No. 264,610. (No model.) Patented in Germany Sept. 26, 1887, No. 44,518; in Belgium Jan. 31, 1888, No. 80,941, and in France Mar. 26, 1888, No. 183,107.

Claim.—The combination, with a bow, *k*, carrying cutters, of a cylinder, *l*, having inlet-valves *p p'* and outlet-valves *f f'*, a piston in said cylinder having rod *q u*, adapted to move said bow *k* back and forth, friction-drum *b*, and tumblers *o* o' o^2 o^3, revolved by gear from said drum, for the purpose set forth.

398,886. REST FOR DISPLAY-FRAMES. ROBERT PARISH, Decatur, Ill. Filed June 19, 1888. Serial No. 277,601. (No model.)

Claim.—1. A rest comprising the saddle recessed in its upper surface and the bars, the bars held centrally in the saddle and extended divergently on opposite sides thereof, as set forth.

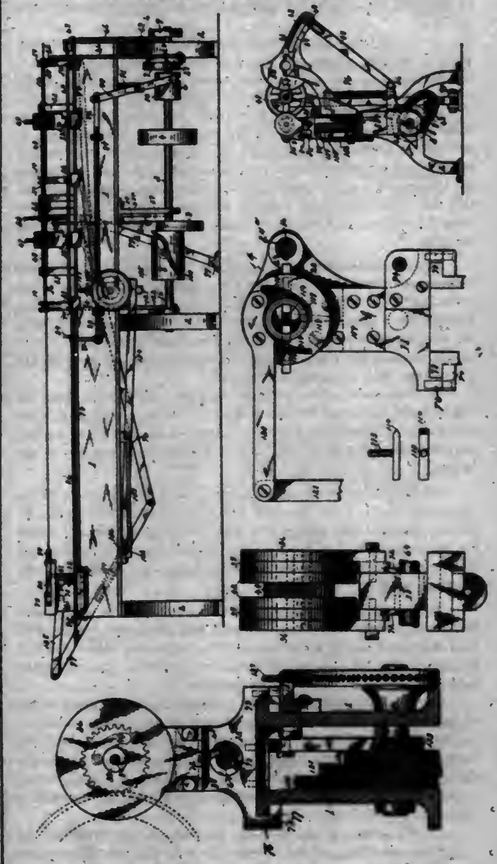
2. A rest comprising the saddle *h*, recessed in its upper surface, the bars *i i*, held centrally in the saddle and extended divergently on opposite sides thereof, and the supporting-surfaces *k'*, formed of the terminations of the bars, as set forth.

3. A rest comprising the saddle having the concave under surface, the bars in the saddle, and the attaching-screw adapted to retain the bars in the saddle and secure the saddle to a frame, as and for the purpose set forth.

4. A rest comprising the saddle *h*, recessed in its upper surface, the bars *i i*, held centrally in the saddle and extended divergently on opposite sides thereof, the supports *k'*, and the clamps *k*, both formed of terminations of the bars, as set forth.

5. A rest comprising the saddle and the wires, the saddle recessed in its upper surface and notched to receive the wires, as set forth.

398,887. SHOVEL. EDWARD I. PRESCOTT, Halifax, Nova Scotia, Canada. Filed Sept. 18, 1888. Serial No. 285,690. (No model.) Patented in Canada Sept. 24, 1888, No. 26,002.



Claim.—1. In a shovel, the combination of a body or pan, a curved socket riveted to said pan and having the inner edge of its mouth beveled, a handle, and a covering-plate riveted to said pan and the inner side of said socket, substantially as set forth.

2. In a shovel, a covering-plate, as D, secured to the pan and inner side of the socket of said shovel, substantially as and for the purpose set forth.

3. In a shovel, the combination of the pan A, the socket C, provided with the beveled mouth *t* and tang *f*, and secured to said pan by rivets *z*, the covering-plate D, secured to said pan and the inner side of said socket by rivets *v z*, and the handle B, all being arranged substantially as described.

398,888. WIRE-TWISTING MACHINE. FREDERICK D. FRY, Danbury, Conn., assignor of one-half to Theodore H. Benedict, same place. Filed Apr. 28, 1888. Serial No. 272,114. (No model.)

Claim.—1. The combination, with the frame-work, of stationary and movable standards, each of which is provided with a stationary and a movable jaw adapted to hold the wire, a rock-shaft, 16, and stationary and movable cams on said shaft adapted to force the movable jaws into operating position when it is desired to grasp the wire.

2. The combination, with standard 11 and adjustable standards 12, each carrying holding-jaws, of rock-shaft 16, having cams 24, for

operating the holding-jaws, the cams which operate the jaws carried by the movable standards being adapted to slide on said shaft.

3. The combination, with standards 12, the twisting-heads and operating mechanism therefor, stationary standard 11, and movable standards 12, of side plates 14, attached to the standards, stationary holding-jaws, movable holding-jaws pivoted between the side plates, and cams engaging the movable jaws to throw them to the closed position.

4. The combination, with rock-shaft 16, having cams 24, of standards 11 and 12, side plates secured thereto, in which the rock-shaft is journaled, stationary jaws having inclines 23, and movable jaws actuated by the cams and having inclines corresponding with inclines 23, so that the jaws register in the closed position.

5. The combination, with the standards and side plates, of stationary holding-jaws 17, jaws 19, carried by oscillating plates 20, and cams for oscillating said plates, said jaws having notches at their forward ends to engage the wire and inclines, whereby they are caused to register in the closed position.

6. The combination, with rock-shaft 16, having a groove, and cams 24, secured to said rock-shaft by splines engaging the groove, of stationary and movable standards each carrying a stationary and movable holding-jaw, and side plates on opposite sides of the cams, all arranged so that the movable standards may be adjusted without affecting the operation of the cams and jaws.

7. The combination, with stationary and movable standards 11 and 12 and holding-jaws carried thereby which grasp the wire, of movable standards 13, carrying twisting-heads midway between the holding-jaws, jaws in the twisting-heads, mechanism, substantially as described, for closing the jaws upon the wire, and mechanism, substantially as described, for rotating the twisting-heads while the jaws are holding the wire.

8. The twisting-heads consisting of side plates, 36, sleeve 33, journaled in the side plates, said sleeve having a longitudinal opening to receive the wire and a transverse opening, 35, pinion 44, disks 42, said pinion and disks having a transverse slot registering with the slot in the sleeve, a stationary and a movable jaw lying in said slots, the latter having rollers 41, disks 39, having eccentric slots engaged by said rollers, brakes acting on disks 39, and mechanism, substantially as described, to operate the brakes and to oscillate the pinion, whereby the brakes are caused to engage disks 39, the jaws to engage the wire, and the brakes to release disks 39, and the continued movement to twist the wire until the brakes act again and cause the jaws to release the wire.

9. The combination, with standards 13, side plates, 36, secured thereto, and a sleeve, 33, journaled in the side plates and having transverse slot 35, of pinion 44 and disks 42, having slots corresponding with slot 35, a stationary and a movable jaw lying in said slots, disks 39, also journaled on said sleeve, eccentric slots in said disks, rollers on the movable jaw engaging said slot, brakes engaging disks 39, and a segmental gear engaging the pinion.

10. The combination, with the standard, side plates, sleeve 33, disks 39 and 42, pinion 44, and the jaws, of brakes 38, recessed in the side plates, rock-shaft 64, having a groove, sleeve 69, having a spline engaging said groove, and links 72, connecting said sleeve with the brakes.

11. In a machine for twisting wire, the combination, with the stationary jaw and the movable jaw having rollers 41, of disks 39, having eccentric slots engaged by said rollers, pinion 44 and means for operating it, brakes 38, engaging said disks, and a rock-shaft and links whereby said brakes are caused to engage with disks at predetermined times.

12. In a machine for twisting wire, the combination, with sleeve 33, having a transverse slot, of disks 42 and pinion 44, turning with said sleeve and having transverse slots corresponding with the slot in the sleeve, jaws lying in said slots, and an oscillating gear engaging said pinion, whereby the jaws are operated.

13. The combination, with the holding-jaws and twisting-heads of an oscillating shaft having gears by which the twisting-heads are oscillated and a pinion, 49, a segmental gear having a slotted arm with a gage, a slide in the frame-work, and a rod, 55, pivoted to said slide and adjustably secured in said slot, whereby the oscillation of the twisting-heads may be regulated to impart more or less twist to the wire.

14. The combination, with the holding-jaw and twisting-head standards and racks pivoted thereto, of shaft 129, carrying gears of diminishing size engaged by said racks, whereby movement of said shaft and gears in either direction will adjust said standards to different sizes of hat-wires, the gears being so laid out that the twisting-heads are kept midway between the pairs of holding-jaws.

15. The combination, with the standards carrying the holding-jaws and twisting-heads and racks pivoted to said standards, of shaft 129, carrying diminishing gears engaged by said racks, and a disk, 136, having openings in its periphery, bracket 138, and a pin engaging said bracket and the openings in the disk, whereby the standards are locked at any desired adjustment.

16. The combination, with standard 11 and plates 109 and 116, of the cutters having pins 113 and an oscillating disk having curved slots engaged by said pins, whereby the oscillation of said disk operates the cutters to sever the wire at predetermined times.

17. Standard 11, plate 109, having slots 112, and plate 116, having grooves 115, in combination with the cutters lying in said grooves, and pins 113, which pass through slots 112 and engage curved slots in oscillating disk 117, as and for the purpose set forth.

18. The combination, with standard 11 and plate 109, having a threaded opening, of sleeve 111, engaging said opening, the cutters having pins 113, and oscillating disk 117, journaled on said sleeve and having slots engaged by said pins.

19. The combination, with standard 11, plate 116, having grooves 115, and the cutters having pins engaging said grooves, of disk 117, having slots engaged by said pins, arm 120, secured to said disk, lever 122, engaging cam 10, and a rod connecting said lever and arm.

20. The sliding feeding device consisting of upper and lower plates, a shaft journaled in said plates and carrying an operating-cam, and jaws pivoted to one of said plates, whose shanks are engaged, respectively, by springs 80 to open the jaws and by the cam to close them.

21. The combination, with the sliding feeding device having jaws 79, of shaft 81, carrying cam 82 to close the jaws, and a pin, 83, and a finger, 85, carried by a sliding shaft, 86, said fingers engaging pin 83 to open the jaws again at the proper time.

22. Sliding shaft 86, having fingers 84 and 85, in combination with the sliding feeding device carrying jaws 79, a shaft carrying a cam and having a pin, 83, which is engaged by finger 84 to close the jaws upon the wire when the feeding device is at its forward position and by finger 85 to open the jaws when the feeding device is at the opposite extreme of its movement.

23. The combination, with upper and lower plates, 73 and 74, and standard 75, of jaws 79, pivoted to the upper plate, springs 80, acting to throw said jaws to the open position, and shaft 81, journaled in said plates and carrying a cam which engages the shanks of the jaws to close them.

24. The jaws and shaft 81, having cam 82 and pin 83, in combination with sliding shaft 86, having fingers 84 and 85, which are engaged by pin 83 at predetermined times to open and close the jaws.

25. The combination, with jaws 79 and shaft 81, having cam 82 and pin 83, of sliding shaft 86, having fingers 84 and 85, sliding shaft 88, to which shaft 86 is connected, lever 90, carrying a roller engaging cam 6, and link 92, connecting said lever to shaft 88.

26. The combination, with the sliding feeding device, cam 5, and lever 98, having a roller engaging said cam, of rod 96, link 108, and lever 97, connected to said link and said rod.

27. The combination, with the sliding feeding device, cam 5, and lever 98, having a roller engaging said cam, of rod 96, link 108, and lever 97, pivoted to adjustable block 102 and connected to said link and said rod.

28. The combination, with the sliding feeding device, levers 97 and 98, rod 96, and link 108, of block 102, to which lever 97 is pivoted, and a rack pivoted to said block and engaging gear 130, whereby the throw of the sliding feeding device may be adjusted.

29. The combination, with block 102, rack 134, and gear 130, of the sliding feeding device, oscillating lever 98, rod 96, pivoted to said lever, link 108, pivoted to the sliding feeding device, and lever 97, pivoted to block 102 and to said rod and link, and provided with a gage, 105, whereby the parts may be set to feed the desired length of wire.

30. The combination, with block 102, rack 134, and gear 130, of the sliding feeding device, oscillating lever 98, rod 96, pivoted to said lever, link 108, pivoted to the sliding feeding device, lever 97, having slot 104 and gage 105, bolt 106, passing through said block and said slot, and a lock-nut engaging said bolt to lock the parts when adjusted.

31. In a wire-twisting machine, the combination, with sets of holding-jaws and intermediate twisting-heads, of a sliding feeding device carrying jaws 79 and operating mechanism arranged and timed, substantially as set forth, whereby each forward movement of the feeding device draws forward the wire last twisted and places new wire in the holding-jaws and twisting-heads ready to be acted upon.

32. The combination, with the holding-jaws, the twisting-heads, the sliding feeding device having jaws 79, cutters 114, and operating mechanism arranged and timed substantially as set forth, whereby a completed hat-wire is severed while the second is being formed.

33. The combination, with the cutters, the sliding feeding device, and operating and connecting mechanism, substantially as described and shown, of oscillating lever 98, rod 96, lever 97, having an adjustable fulcrum, and link 108, connecting said lever with the sliding feeding device.

34. The combination, with the cutters having pins 113, and oscillating disk 117, having slots 118 engaged by said pins, of arm 120, attached to said disk, lever 122, engaging cam 10, and rod 121, connecting said lever and said arm.

35. The combination, with standards 11 and 12 and a stationary and a movable holding-jaw in each standard, of rock-shaft 16, having a groove, cams 24, which actuate the movable jaws and are provided with splines engaging said groove, crank-arm 25 on said shaft, lever 27, having a roller engaging cam 7, and a rod connecting said lever and said crank-arm.

36. The combination, with stationary and movable twisting-jaws, the latter having rollers 41, and disks 39, having slots engaged by said rollers, of brakes 38, engaging said disks, rock-shaft 64, having a groove, sleeve 68, having a spline engaging said groove, links connecting said sleeve with the brakes, a crank-arm on said rock-shaft, a slide having a roller engaging a groove in cam 9, and a rod connecting the crank-arm with the slide.

37. The combination, with sleeve 33, having a transverse slot, disk 42, and pinion 44, having transverse slots registering with the slot in the sleeve, and a stationary and a movable jaw lying in said slots, the latter carrying rollers, of disks 39, having grooves engaged by said rollers, segmental gear 50, having arm 53, a slide having a roller engaging cam 8, and a rod connecting said arm and said slide.

38. The combination, with standards 12 and 13, the holding-jaws and twisting-heads carried by said standards, the feeding mechanism, and block 102, by which it is adjusted, of racks pivoted to said standards and said block, and a shaft carrying gears engaged by said racks, whereby the sliding feeding device and the holding-jaws and the twisting-heads may be so adjusted as to feed the desired length of wire and hold it at both ends and the center and to twist it midway between the points at which it is held.

39. The standards 12 and 13, having lugs 124, racks pivoted to said lugs so as to lie side by side, and block 102, also having a rack pivoted thereto, in combination with a shaft carrying diminishing gears engaged by said racks, the sliding feeding device, and holding-jaws and twisting-heads carried by the standards.

40. The combination, with standard 11, the cutters having pins, sleeve 111, and a disk journaled thereon and having slots engaged by said pins, of the sliding feeding device carrying jaws and operating mechanism arranged and timed substantially as set forth, whereby when the forward movement of the sliding feeding device takes place the jaws enter said sleeve and grasp the end of the wire after the cutters have severed the completed hat-wire.

41. The combination, with standard 11, the cutters having pins, sleeve 111, and a disk journaled thereon and having slots engaged by said pins, of the sliding feeding device, jaws 79, carried thereby, and mechanism, substantially as described, which causes the jaws to grasp the wire at one extreme of its movement and to release it at the other extreme.

42. The combination, with the sliding feeding device having jaws which grasp the wire at one extreme of its movement and release it at the other, of cutters which sever the completed hat-wire, holding-jaws which grasp the second wire at both ends and at the center, and oscillating heads which twist the wire midway between the points at which it is grasped, substantially as described.

43. The combination, with the twisting-heads having pinions 44, and oscillating shaft 48, having gears engaging said pinions, and a pinion, 49, of a segmental gear engaging pinion 49 and having a slotted arm, a slide, and a rod pivoted to said slide and adjustably secured in said slot, as and for the purpose set forth.

44. The combination, with the twisting-heads, oscillating shaft 48, and segmental gear 50, having an arm, 53, of a slide, 57, having a roller engaging a groove in cam 8, and a rod connecting said slide with said arm to cause the oscillation of the twisting-heads.

45. The combination, with the twisting-heads, shaft 48, segmental gear 50, having slotted arm 53, and gage 61, of slide 56 and arm 55, pivoted to said slide and adjustably secured to said arm, whereby the amount of rotation imparted to the twisting-heads may be accurately regulated.

46. The combination, with stationary standard 11 and movable standards 12 and 13, carrying the holding-jaws and twisting-heads, of the sliding feeding device carrying jaws, mechanism, substantially as described and shown, to cause said jaws to grasp and release the wire at proper times, and cutters whereby the wires are severed.

47. The holding-jaws, and twisting-heads located midway between the holding-jaws and the cutters, in combination with the sliding feeding device and mechanism, substantially as described, for adjusting the holding-jaws and the twisting-heads in proper relation to each other and adjusting the throw of the feeding device to correspond therewith.

48. The combination, with stationary and movable standards, the holding-jaws, mechanism, substantially as described and shown, for operating said jaws, and the twisting-heads, of a segmental gear having a slotted arm by which the twisting-heads are operated, and means, substantially as described, for regulating the oscillation of the segmental gear, whereby more or less twist may be imparted to the wire, as may be required.

49. The combination, with the holding-jaws, the twisting-heads, and the cutters, of the sliding feeding device carrying jaws 79, mechanism, substantially as described, for adjusting the throw of the feeding device, and adjustable fingers 84 and 85, carried by sliding shaft 86, whereby the opening and closing of the jaws may be regulated.

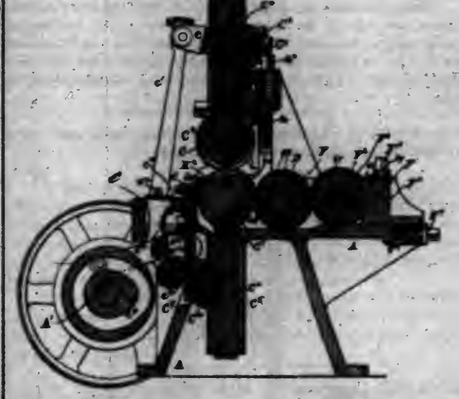
398,889. FASTENER FOR THE MEETING-RAILS OF SASHES.

GOTTLIEB GERBERS, Jamaica Plain, Mass. Filed Dec. 28, 1888. Serial No. 294,405. (No model.)

Claim.—1. The improved sash-fastener, as described, consisting of the shell or frame *c* and its pivoted spring-pressed pawl *d*, and the spring *f*, having projection *f'*, adapted to fit in a recess, *d''*, in said pawl, combined with the block *g*, having locking-surface *g'* and lip or projection *g''*, substantially as and for the purpose set forth.

2. The improved sash-fastener, as described, consisting of the frame or shell *c* and its pivoted spring-pressed pawl *d* and side projections, *c' c'*, in combination with the block *g*, having locking-surface *g'* and hooks *g³ g³*, substantially as and for the purpose set forth.

398,890. HAIR-TONIC.



HANS H. GARDE, Notting-Hill, County of Middlesex, England. Filed Jan. 2, 1889. Serial No. 295,156. (No specimens.) Patented in England Oct. 20, 1888, No. 15,889.

Claim.—1. The process of preparing a lotion for the hair and scalp by mixing apple-juice and alcohol, using juice expressed from rotten apples and alcohol, as above set forth.

2. The process of preparing a lotion for the hair and scalp by mixing apple-juice and alcohol, using juice expressed from rotten apples and grape-alcohol, as above set forth.

398,891. NAIL-MAKING MACHINE.

LOUIS GOSSE, Winchester, Mass., assignor to the Golden Improvement Company, Portland, Me. Filed July 12, 1888. Serial No. 279,766. (No model.)

Claim.—1. In a machine for forming nails from wire-like material, the combination of the following-described instrumentalities, viz: the feed mechanism to feed the wire, the combined cutting and forming mechanism to sever the wire to form a double blank and offset the same where the blank is to be separated to constitute the points for two nails, the carrying-wheels for the blank, and the cutting mechanism to separate the double blank at its offset portion and form points for the nails, substantially as described.

2. In a machine for forming nails from wire-like material, the combination of the following-described instrumentalities, viz: the feed mechanism to feed the wire, the combined cutting and forming mechanism to sever the wire to form a double blank and offset the same where the blank is to be separated to constitute the points for two nails, the carrying-wheels for the blank, the cutting mechanism to separate the double blank at its offset portion and form points for the nails, and the transferrer, to operate substantially as described.

3. In a machine for forming nails from wire-like material, the combination of the following-described instrumentalities, viz: the feed mechanism to feed the wire, the combined cutting and forming mech-

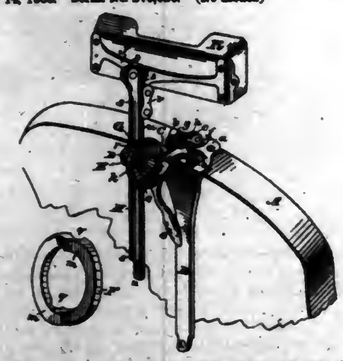
anism to sever the wire to form a double blank and to offset the same, the carrying-wheels for the double blank, the cutting mechanism to separate the double blank at its offset portion and form points for the nails, and the die-rolls having die-grooves, substantially as described.

4. The combination, in a nail-making machine, of a former-bar to bend the stock to form a double blank, and blank-carrying wheels having grooves out of line with each other, as described, and a transferrer to transfer the offset blanks into the said grooves, substantially as described.

5. In a machine for making nails, the former-bar, carrying-wheels having grooves out of line, as described, and a transferrer to transfer the offset double blank into the said grooves, combined with cutting mechanism to sever the offset blank and form points for the nails, substantially as described, without waste of stock.

6. In a nail-making machine, blank-carrying wheels having grooves out of line, as described, and the cutters to sever the offset blanks, combined with die-rolls having die-grooves, and with headers to head the nails held in the said die-grooves, substantially as described.

7. The former and anvil to offset the double blank, the transferrer, the carrier-wheels for the blank, and the cutting mechanism to sever the offset blank, combined with a shield having flanges to permit the escape from the grooves of the separate blanks, substantially as described.

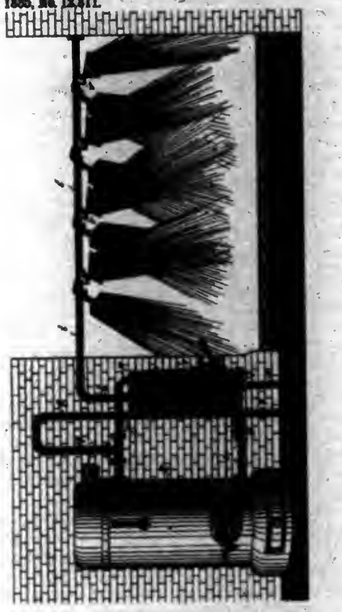


8. In a nail-making machine, the carrier-wheel and the compound shaft 40 42, to which it is attached, substantially as shown and described.

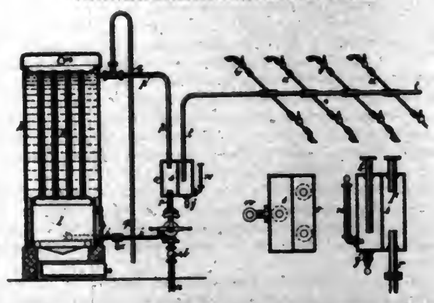
398,892. ANKLE-SUPPORTER. RICHARD H. GOLDEN, South Norwalk, Conn. Filed July 26, 1888. Serial No. 281,064. (No model.)

Claim.—An ankle-supporter the body of which consists of a single piece of material and the bottom of which has two full overlapping plies integral with the said body, and independent plies 4 and 5, secured to the inner and outer of the said overlapping plies, the said body being provided at its front side with lacing-holes, substantially as set forth.

398,893. HEAD-REST. AARON P. GOULD, Canton, Ohio. Filed Apr. 14, 1888. Serial No. 270,630. (No model.)



Claim.—1. The combination, in a head-rest, with a body portion, B, secured to the chair, of a supporting-stem formed of two parts, link A, cushion-support J, supporting-stem H, formed of two parts pivotally secured thereto, link *v*, pin D, having perforations *k p*, clamping-disks E F G, having inclined planes *m n* placed on said pin between the stems C and H, and a handle for turning said disk G, whereby the adjustable parts may be secured in desired adjustment, substantially as described, and for the purpose set forth.



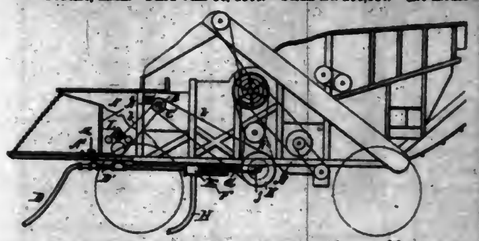
2. In a head-rest, the combination, with a suitable support and a head-rest cushion, of a two-part stem connecting the head-rest cushion with the support, one of the parts of the two-part stem being pivoted directly to the cushion-frame and the other connected therewith by a link, and a clamping device to lock the parts of the stem together and to the support, the said link forming a brace when the stem is locked, substantially as set forth.

3. In a head-rest, the combination, with a suitable support and a head-rest cushion, of a two-part stem pivoted to the support, one part of the two-part stem being pivoted directly to the support and the other connected with the support by a link, means for connecting the cushion with said two-part stem, and a clamping device to lock the parts of the stem together, substantially as set forth.

4. In a head-rest, the combination, with a suitable support, and a head-rest cushion, of two two-part stems, each element of one of the two-part stems being pivotally connected to the support, and each element of the other two-part stem being pivoted to the head-rest cushion, and an intermediate clamping device connecting said stems at points opposite their pivotal connection, substantially as set forth.

398,894. SHOWER-BATH. DAVID GROVE, Berlin, Germany. Filed Nov. 16, 1885. Serial No. 182,970. (No model.) Patented in England Oct. 26, 1885, No. 12,811.

Claim.—1. The combination of the heater *k* with the circulation-pipe or tube *p*, the exhaust pipe or tube *g*, the three-way cock *c*, pipes *i* and *r*, and the mixing vessel or chamber *o*, into which hot water will flow as soon as cold water is fed into the lower part of the heater, substantially as described and shown.



2. The combination of the mixing-vessel *o* with the delivery-pipe *t*, the roses, mouth-pieces, or nozzles *u*, the pipes *i*, *r*, and *p*, the heater *k*, and the cock *y*, substantially as described and shown.

3. The combination of the partition *s* and mixing-vessel *o* with the three-way cock *c*, pipe or tube *r*, *p*, and *t*, the thermometer *w*, roses, mouth-pieces, or nozzles *u*, and the regulating valves or cocks *v*, substantially as described and shown.

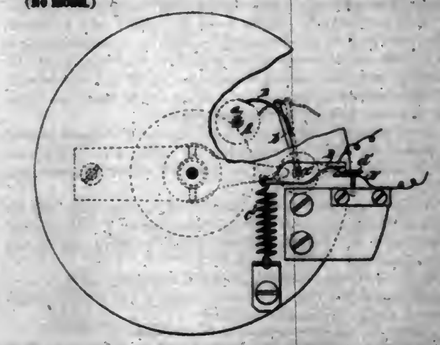
4. The combination of the three-way cock *c* with the water-supply pipe *a*, the pipe or tube *r*, the pipe or tube *i*, heater *k*, pipe *p*, mixing vessel or chamber *o*, pipe or tube *t*, and the roses, mouth-

pieces, or nozzles *u v*, so that the simultaneous supply of cold water to the heater *k* and mixing vessel or chamber *o* and hot water from the heater *k* to the mixing vessel or chamber *o* and the delivery-pipe *t*, and roses, mouth-pieces, or nozzles *u* can be regulated at will, substantially as described, and shown in the accompanying drawings.

398,895. STEAM-THRASHER REGULATOR. EPHRAIM HOWLAND, Pontiac, Mich. Filed Jan. 10, 1888. Serial No. 260,017. (No model.)

Claim.—1. The combination, with a thrashing-machine or separator, of a steam-engine located thereon and a governor adapted to regulate the steam-supply, said governor engaged directly with a moving part of the separator, whereby the motions are imparted immediately thereto, substantially as described.

2. The combination, with a thrashing-machine or separator, of a steam-engine located thereon and a governor adapted to regulate the steam-supply, said governor engaged directly with the cylinder of the thrasher or separator, whereby variations in the motion of the cylinder are imparted immediately to the governor, substantially as described.



3. The combination, with a thrashing-machine or separator, of a steam-engine located thereon beneath the body of the machine and between the sides, a steam-pipe leading thereto, and a governor adapted to regulate the supply of steam to the engine, said governor engaged directly with the cylinder of the thrasher or separator, substantially as described.

4. The combination, with a thrashing-machine or separator, of a steam-engine located thereon and engaged with a drive-shaft, and a steam-supply pipe with a governor to regulate the supply of steam to the engine, both said drive-shaft and said governor connected directly with the shaft of the thrashing or separating cylinder, substantially as described.

5. The combination, with a thrashing-machine or separator, of an operating steam-engine located thereon, an operating steam-supply pipe leading thereto beneath the platform, and a governor located in an apartment above the steam-pipe and between the feeder's position and the body of the machine, substantially as described.

6. The combination, with a thrashing-machine or separator, of a steam-engine located thereon, a steam-supply pipe whereby it may be connected with a separate boiler, a governor on the machine, whereby is regulated the supply of steam to the engine, and a throttle-valve, also on the machine and adjacent to the feeder, whereby steam may be admitted to or cut off from the engine.

398,896. ELECTRIC ALARM-CLOCK. SAMUEL KAHAN and ALBERT W. GRAVES, Melbourne, Victoria. Filed Oct. 13, 1888. Serial No. 287,969. (No model.)

Claim.—1. In an alarm-clock, the combination, with a make-and-break device interposed in an alarm-circuit and one of the quick-going arbors of the going train, of a shifting mechanism controlled by a slow-going arbor of the going train and connecting devices controlled by the shifting mechanism for connecting the make-and-break device with the quick-going arbor, substantially as and for the purpose specified.

2. In an alarm-clock, the combination, with a make-and-break device interposed in an alarm-circuit, one of the quick-going arbors of the going train, and a connection between one element of the make-and-break device and the quick-going arbor of the going train, consisting of a longitudinally-movable rock-shaft on which such element is mounted, a pawl secured to said rock-shaft, and a ratchet-wheel on the quick-moving arbor, of a shifting mechanism controlled by a slow-going arbor of the going train and adapted to operate on the rock-shaft to move the pawl into and out of engagement with the ratchet, substantially as and for the purpose specified.

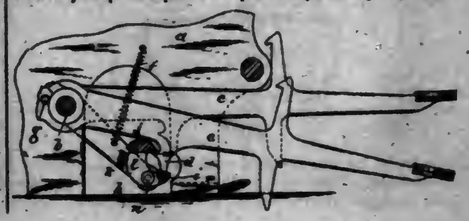
3. In an alarm-clock, the combination, with one of the quick-going arbors of the going train, a make-and-break device, and a ratchet-and-pawl connection between the two, of shifting mechanism adapted to move the pawl into and out of engagement with the ratchet and a controlling device operated by a slow-going arbor of the going train, consisting of a cam, and a connection between the cam and pawl-shifting mechanism, substantially as and for the purposes specified.

4. In an alarm-clock, the combination, with a quick-going arbor of a clock-going train, a ratchet-wheel, A, secured thereto, the hour-hand arbor of said train, and the cam E mounted thereon, of the contact D, a longitudinally-movable rock-shaft for said contact, a pawl carried on the rock-shaft and adapted to engage the ratchet on the quick-going arbor, and a shifting device connected with the rock-shaft and controlled by the cam on the hour-hand arbor to move the pawl into and out of engagement with the ratchet, substantially as and for the purpose specified.

5. In an alarm-clock, the combination, with a quick-going arbor of a clock-going train, a ratchet-wheel, A, secured thereto, a longitudinally-movable rock-shaft, C, the pawl B, and spring *c* mounted thereon, of the hour-hand arbor, the cam E loose thereon and provided with a head, *e*, the sliding pin *d*, and the spring F, said parts being arranged and operating substantially as and for the purpose specified.

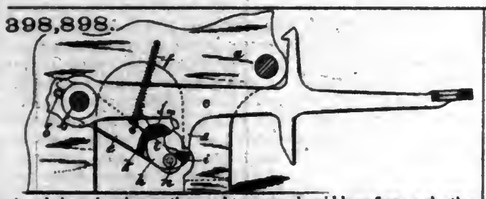
398,897. SHEAVE. WILLIAM S. KNEBOUR, Bellevue, Ky., assignor of two-thirds to A. G. Stiebel, St. Louis, Mo., and Henry G. Stiebel, Jr., Cincinnati, Ohio. Filed Dec. 6, 1886. Serial No. 202,812. (No model.)

Claim.—1. A composite sheave or carrying-pulley for cable railways and other uses, composed of two parts, to wit, a supporting frame or hub portion and a separable annulus containing the belt-groove or wearing portion entire, the parts being formed with corresponding interlocking lugs and recesses, whereby the same fit and are held together without bolts or other separate fastenings, substantially as set forth.



2. In a composite pulley having the wearing portion of its rim detachable, a permanent or hub portion provided with concentric lugs projecting at one side, and a detachable annulus containing the wearing portion of the face and completing the rim, provided interiorly with corresponding recesses, by which it may be slipped over and interlocked with the lugs, substantially as set forth.

3. In a composite pulley, the combination of the part *a'*, provided with the hub *b*, spoke *c*, and beveled lugs *d*, with the annulus *a²*, provided with recesses *e*, and beveled interlocking surfaces *e'*, substantially as set forth.



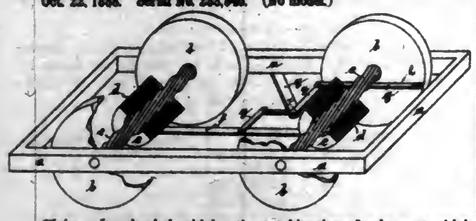
398,898. CASH INDICATOR AND REGISTER. CHARLES R. LOGE, Boston, Mass. Filed Oct. 11, 1888. Serial No. 287,802. (No model.)

Claim.—1. In a cash-register, the combination, with the registering-keys, of the key-coupler adapted to couple the displaced keys together during their registering motion, substantially as described, and for the purpose specified.

2. In a cash-register, the combination, with the registering-keys, of the key-coupler adapted to couple the displaced keys together dur-

398,898.

ing their registering motion, and to uncouple said keys from each other after the registration has been completed, substantially as described, and for the purposes specified.



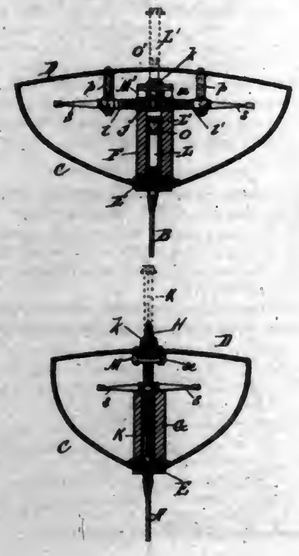
3. In a cash-register, the combination, with the registering-keys, each adapted to engage with a key-coupler, of the movable key-coupler support and the key-coupler mounted thereon and adapted to engage with displaced registering-keys during their registering motion, substantially as described, and for the purposes specified.

4. In a cash-register, the combination, with a set of registering-keys, of a key-coupler support pivoted to a suitable support, and the key-coupler pivoted upon said key-coupler support and engaging with displaced registering-keys during their registering motion, substantially as described, and for the purposes specified.

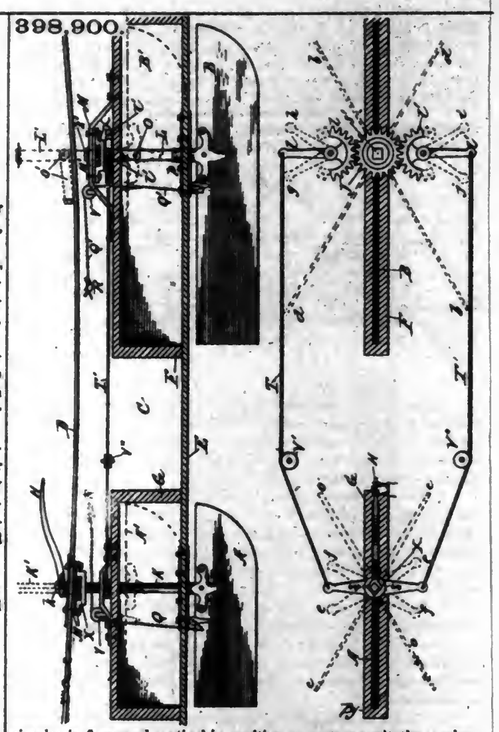
5. In a cash-register, the combination, with the pivoted registering-keys, each provided with the projection *d*, of the key-coupler support pivoted to a suitable support and held toward said keys by suitable means, and the key-coupler pivoted on said key-coupler support and engaging with the projections *d* on the displaced registering-keys during their registering motion, substantially as described, and for the purposes specified.

398,899. MECHANISM FOR DRIVING WHEELED VEHICLES.

JOHANNES MARTIENSSEN, Frankfort-on-the-Main, Prussia, Germany. Filed Oct. 22, 1888. Serial No. 288,946. (No model.)



Claim.—In wheeled vehicles, the combination of axles *c*, on which the wheels are fixed, nuts *d*, and frames *e*, with lever-connections *f g h*, for the purpose specified, substantially as described and shown.



398,900. STEERING APPARATUS FOR VESSELS.

FREDERICK W. MARTIN, Waukegan, Ill. Filed Apr. 23, 1887. Serial No. 235,930. (No model.)

Claim.—1. In machinery for steering boats, the box M, fastened to the under side of the deck of the boat, its interior surface being

398,900.

circular in form and vertical in position, so as to permit the washer X to revolve therein, and being also of such diameter as to afford the said washer the least practicable lateral motion, said washer being pierced with a hole of such size and shape that it fits loosely upon the rudder-stock K, which bears the rudder-blade A and revolves with said rudder-stock, steadying its motion, and allows it to pass upward and downward in the trunk G, substantially as shown, and for the purposes specified.

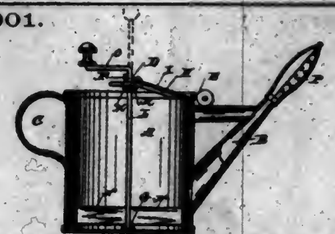
2. In machinery for steering boats, the yoke S, fastened tightly on the rudder-stock K and connected by means of the yoke-lines T and T' with the lever-gears I and I', which engage with the cogs of the gear-wheel J on its opposite sides, substantially as shown, and for the purpose specified.

3. The lever-gears I and I', fastened beneath the deck of the boat, in combination with the yoke S, by means of the connecting yoke-lines T and T', and engaging by their cogs with the cogs of the gear-wheel J, said gear-wheel being provided with an angular hole through its hub, of such diameter as to permit the rudder-stock L to easily pass through and also to cause it to revolve when the said gear-wheel J revolves, substantially as described, and for the purposes specified.

4. In machinery for steering boats, the rudder-stock L, angular in form except at its lower extremity, P, and of such diameter as to pass through and fit loosely in the hub of the gear-wheel J, and the washer X', said stock passing through the box M' and the trunk F, and being fastened at its lower end to the rudder-blade B, substantially as shown, and for the purposes specified.

5. In machinery for steering boats, the box M', fastened beneath the deck of the boat and containing the washer X', in combination with the rudder-stock L, passing through them, substantially as shown, and for the purposes specified.

6. The drop-joint O in the rudder-stock L, constructed near the middle of the same, and the cylinder-shaped section P of the rudder-stock L, made at its lower end, substantially as shown, and for the purposes specified.

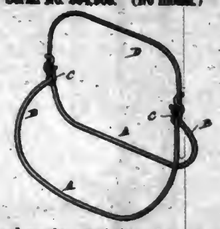


7. In machinery for steering boats, the chains Q and Q', in combination, respectively, with the rudder-blades A and B, substantially as shown, and for the purpose specified.

398,901. SPRINKLER.

JOSEPH HARER, Jr., Collins, N. Y. Filed Mar. 20, 1888. Serial No. 267,813. (No model.)

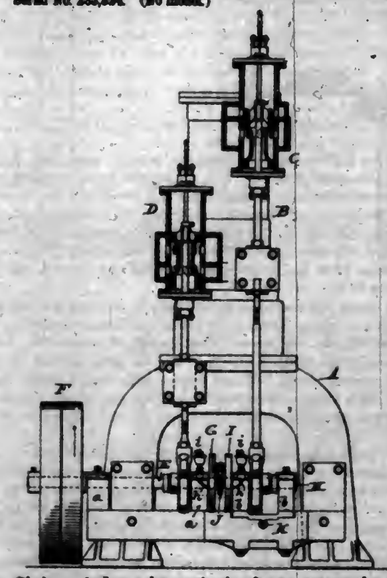
Claim.—1. In a sprinkler, the combination, with the can having a spout, of the socket in the bottom of the can, the spring-catch having a bearing, K, aligned with the socket, and the vertical shaft carrying a paddle and a crank and mounted in the socket and bearing, substantially as specified.



398,901.

2. In a sprinkler, the combination, with a can provided with a spout, and a hood, I, overhanging the front side of the can, of the spring-catch H, secured to the hood and extending beyond the rear edge thereof, and provided at its free end with the open-sided bearing K, which aligns with a socket, G, in the bottom of the can, and has its open side closed by the edge of the hood, and the vertical shaft provided with a paddle and a crank and mounted in the socket and bearing, as set forth.

398,902. WOOD-CARRIER.



EDWIN W. PAYNE, Morrison, Ill. Filed Feb. 23, 1888. Serial No. 264,908. (No model.)

Claim.—A wood-carrier consisting of two base-wires and a bail said base-wires having upwardly-extending and converging ends united to each other and to the ends of the bail in the manner described, whereby said base-wires are placed at a considerable distance apart at the base, and are thereby adapted to hold and support the wood laid crosswise thereon, and the bail is centrally and conveniently arranged for lifting and carrying.

398,903. VALVE MECHANISM FOR ORE-STAMPS.

EDWIN REYNOLDS and BRUNO V. NORDBERG, Milwaukee, Wis. Filed Aug. 21, 1888. Serial No. 283,234. (No model.)

Claim.—1. In a valve mechanism for ore-stamps, the combination, with the cylinder and its valves B C, of two revolving shafts each provided with a crank, a link connecting the cranks, and connections between the shafts and the valves.

2. In valve mechanism for ore-stamps, the combination, with a steam-cylinder and its valve, of a driving-shaft provided with a crank, a second shaft out of line with the driving-shaft and provided with a crank, a link connecting the cranks, and a connection between the driven shaft and the valve.

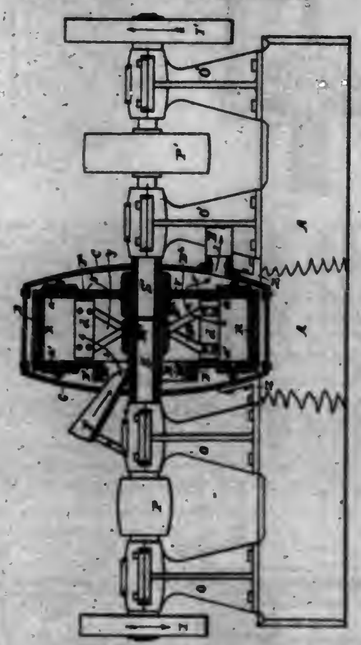
3. In a valve mechanism for ore-stamps, the combination, with a steam-cylinder and its valves, of a driving-shaft provided with a crank and connected with one of the valves, a second shaft out of line with the driving-shaft and provided with a crank, a link connecting the cranks, and a connection between the driven shaft and one of the valves.

4. In a valve mechanism for ore-stamps, the combination, with two revolving shafts, each provided with a crank, of a link connecting the cranks and means for changing or adjusting the relative positions of the shafts.

5. In combination with frame-work A, provided with cylinder B and bearings *a a*, shaft E, provided with band-wheel F, crank G, and crank-pin *d*, and mounted in the bearings *a a*, a second shaft, H, provided with crank I and crank-pin *e* and mounted in the bearings *b b*, a link, J, connecting the crank-pins *e* and *d*, a screw, K, adapted to adjust the bearings *b b* to bring the shaft H into or out of alignment with the shaft E, and a connection between the driven shaft H and the valve or valves of the cylinder.

398,904. URETHRAL POWDER-APPLIER.

CARLTON SAGE, Elkhart, Ind. Filed June 20, 1888. Serial No. 278,540. (No model.)



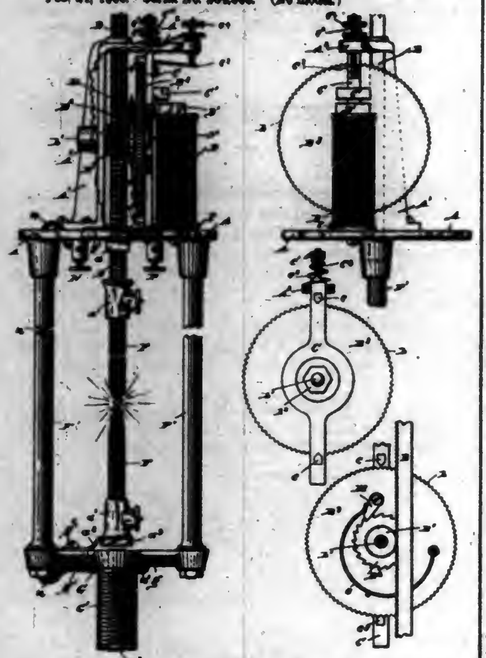
Claim.—1. In a urethral powder-applier, the combination, with shell A, having hollow head B, of the interchangeable devices D and E, and a retaining device for the latter.

2. In a urethral powder-applier, the combination, with shell A and head B, of a rod, D, provided with notch *a*, and a retaining device for the rod.

3. In a urethral powder-applier, the combination, with the shell A and head B, of a conveyer, E, provided with groove *b*, and a retaining device permitting rotary but not longitudinal motion of the conveyer.

398,905. PULVERIZING-MACHINE.

AUSTIN D. SEABIA, Sr., Seward, AUSTIN D. SEABIA, Jr., Channahon, and DEWITT C. SEABIA, Troy, Ill. Filed May 28, 1888. Serial No. 275,358. (No model.)

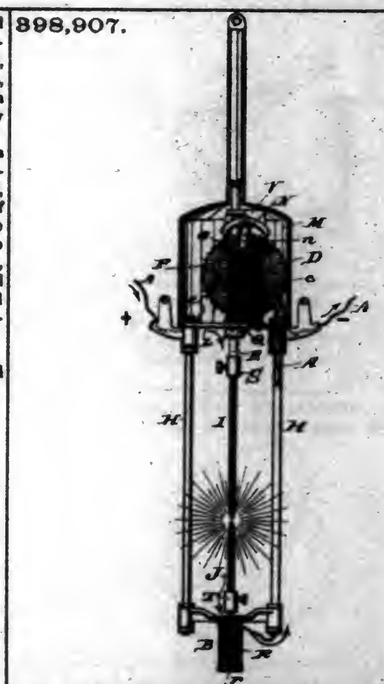


Claim.—1. In the pulverizing-machine shown and described, the combination of the drum D, having its inner head, D^2, provided with the perforations V, surrounding its hub and the removable lining-

plates *a*, the notched beater-plates R, arranged on its inner peripheral surface, the head D', having a central feed-opening and the removable lining-plates *a'*, the beater-head D^2, consisting of the hub H, radial arms *y*, and beaters *d*, secured to the outer ends of said arms, and the case C, the said beater-head D^2 arranged within said drum and adapted to rotate in an opposite direction therefrom, substantially as and for the purpose set forth.

2. The combination, with the case C, consisting of two parts hinged together and having the feed-pipe F, and the exit-pipe E, arranged on the side of said case opposite to said feed-pipe, shaft S, beater-head D^2, consisting of the hub H, secured on the inner end of said shaft and having radial arms *y*, and beater-plates *d*, secured on the outer ends of said arms, shaft S', rotatable drum D, consisting of hub D^3, secured on said shaft, head D^4, having the central perforations, V, and the removable lining-plates *a*, and head D', having the central feed-opening surrounded by the outwardly-projecting flange D^5, and having the removable lining-plates *a'*, all arranged to operate substantially as and for the purpose set forth.

398,906. ARC LAMP. WILLIAM L. SILVEY, Lima, Ohio. Filed Feb. 21, 1888. Serial No. 264,962. (No model.)



Claim.—In an arc lamp, the combination of the base-plate A, bracket A', and overhanging arm A^1, square rod B, having a rack cut in one side of it, pinion B', ratchet-wheel B^2, and escapement B^3, all mounted on the common center, *b'*, their motions being controlled by vertical escapement-bar C, having on one side two escapement-points, *c c'*, engaging at diametrically-opposite points of the escapement-wheel, all being operated by electro-magnet D, armature B^4, spring c^3, contact-screw c^4, and vibrating circuit-breaker c^5, as set forth and described.

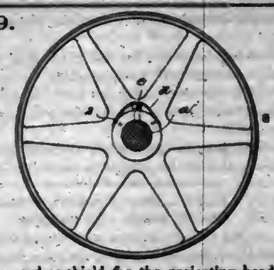
398,907. ELECTRIC-ARC LAMP. WILLIAM L. SILVEY, Lima, Ohio. Filed July 23, 1888. Serial No. 280,744. (No model.)

Claim.—In a monophotal arc lamp, the combination of base-plate L, stationary standard V, secured thereto, escapement-wheel D, ratchet-wheel G, and small pinion F, operating in one direction by racked

carbon-rod E, with pendulum and detent N O, solenoid-magnet C, of high resistance, whose coils are in derived circuit around the arc, the movable iron core P, actuated thereby, allowing the carbon-rod to descend, and the negative carbon drawn downward by solenoid-magnet B and iron core R in the main or arc circuit, as specified.

398,908. PAPER BAG. GEORGE J. STEVENS, Boston, Mass. Filed June 5, 1888. Serial No. 276,078. (No model.)

Claim.—1. The improved blank for forming paper bags herein described, the same consisting of a rectangular sheet provided with two transverse creases or folding-lines which set off side pieces and a longitudinal crease or folding-line which sets off bottom pieces, said blank being slit from the intersections of said crease-lines diagonally across the center bottom piece, thus leaving a triangular flap on each outer bottom piece, and adapted to be folded and secured, substantially as set forth.

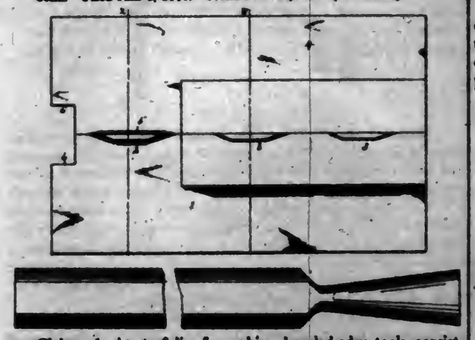


2. A paper bag consisting of the blank A, provided with the parallel creases or folding-lines *v x*, the longitudinal crease or folding-line *m*, and the diagonal slits *p*, cut from the points of intersection of said lines, whereby the blank is divided into the body portion B, side pieces, D, bottom pieces, G H, and flaps *f*, said bottom pieces, flaps, and side pieces being secured together, so that the bottom portion of the bag is of equal double thickness throughout, substantially as set forth.

3. A paper bag consisting of a blank comprising the body portion B, provided with the bottom piece H and side pieces, D, having the bottom pieces G, provided with triangular flaps *f*, the bottom piece H being pasted to the inner faces of said side pieces, the piece G pasted to the outer face of the body portion B, and the flaps *f* to the outer face of said side pieces, whereby the bag is provided with a bottom portion of equal double thickness throughout, substantially as described.

398,909. GUARD OR SHIELD FOR PROJECTING SURFACES. RANDOLPH L. STICKNEY, Peabody, assignor of one-half to King Upton, Salem, Mass. Filed Nov. 10, 1888. Serial No. 290,490. (No model.)

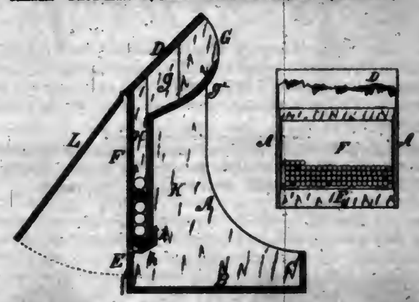
Claim.—1. The combination of a shaft, a hub or collar thereon, and a set-screw securing the same to the shaft and projecting from



398,909.

its face, with a guard or shield for the projecting head or end, said guard consisting of a metallic strip bent over upon said head or end and attached at its ends to the said hub or collar, substantially as and for the purpose described.

2. The combination of a shaft, a hub or collar thereon, and a set-screw securing the same to the shaft and projecting from its face, with a guard or shield for the projecting head or end, said guard consisting of a curved strip having an opening therein to receive the screw-head and attached at its ends to the said hub or collar, substantially as and for the purpose described.



398,910. DIE FOR MAKING CHISELS. JAMES SWAN, Seymour, Conn. Filed Jan. 3, 1889. Serial No. 295,794. (No model.)

Claim.—1. A set of dies for making beveled-edge tools, consisting of a relatively short breaking-down die of the required shape whose ends flare outward, substantially as shown and described, and a relatively long drawing and finishing die corresponding substantially therewith in cross-section, as shown and described.

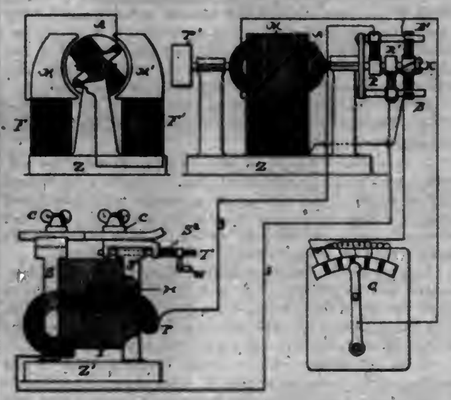
2. The combination, with a pair of short breaking-down dies grooved, as set forth, said groove flaring outward at both ends, and the corresponding upper member being slightly rounded from front to back, of a pair of relatively long drawing and finishing dies, the lower member of which is grooved to correspond with the breaking-down dies, the upper member being flat upon its under side.

398,911. BALLOT-BOX. CHARLES M. TAYLOR, Toronto, Ontario, Canada. Filed Mar. 24, 1888. Serial No. 268,632. (No model.)

Claim.—1. In a ballot-box, the combination, with a suitable case having an inlet for the balls, of a ball-chamber in communication with said inlet and having a transparent face, a removable covering for said face, and a hinged or removable bottom for said ball-chamber, substantially as and for the purpose specified.

2. In a ballot-box, the combination, with the case, of the glass front F, flap L, mouth or funnel G, ball-chamber H, hinged bottom A, and catch *k*, substantially as and for the purpose set forth.

398,912. METHOD OF MANUFACTURING SCREWS AND BOLTS BY ELECTRICITY. ELIHU THOMSON, Lynn, Mass. Filed May 17, 1888. Serial No. 274,195. (No model.)



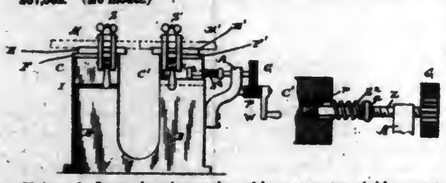
Claim.—1. The herein-described method of manufacturing screws, screw bolts and taps, consisting in forming the screw and plain or shank portions separately, bringing the same into contact, passing a current of large heating effect across the joint, and then uniting the pieces by end-pressure applied while they are heated by the electric current.

2. The herein-described method of manufacturing screws and screw bolts or taps, consisting in forming threaded stock in any desired lengths, subdividing the same as desired, and attaching the parts to shanks or plain portions by end-pressure applied while the joint is heated by an electric current passed across the joint, as and for the purpose described.

3. The herein-described improvement in manufacturing screws or screw-bolts, which consists in forming the head or nut separately, abutting the head and bolt proper, passing a heavy heating electric current across the joint to heat the head and bolt to welding temperature, and subjecting the two to endwise pressure in the direction of the end of the bolt, as and for the purpose described.

4. The herein-described method of manufacturing bolts and screws, consisting in forming the screw and shank portions separately, uniting the same by the electric welding process described, and then forming or adding the head or nut at any desired point, as and for the purpose described.

398,918. ELECTRICAL WELDING-MACHINE. ELIHU THOMSON, Lynn, Mass. Filed June 2, 1888. Serial No. 275,795. (No model.)



Claim.—1. In an apparatus for the electric working of metals, the combination of a transformer, a dynamo-machine having an armature-coil supplying the primary of said transformer, uncommuted currents, a field-coil connected with a commutator, by which the primary alternating currents are locally rectified in said coil, and a means for varying the current flowing to said coil, as and for the purpose described.

2. An apparatus for developing currents of large volume, comprising in combination a dynamo-machine, the armature of which develops alternating currents, a converter having a low-resistance secondary and a primary included in an alternating portion of the armature-circuit, a field-sustaining coil for the dynamo placed in series with the armature and primary of the transformer, and a commutator between the field and the alternating portion of the circuit for locally straightening the alternating currents which pass through the armature and primary of the converter and develop the large-volume currents in the secondary of the latter.

3. The combination, with a dynamo-machine delivering alternating currents direct to a working-circuit, of a commutator for locally commuting the working-currents, a field-magnet sustained by such locally-commuted currents, and a variable resistance around said commutator.

4. In an alternating-current dynamo, continuous-current field-coils traversed by the main or working current commuted, in combination with a variable resistance around the commuting device, as and for the purpose described.

398,914. ELECTRIC METAL WORKING AND WELDING MACHINE. ELIHU THOMSON, Lynn, Mass. Filed Oct. 8, 1888. Serial No. 287,562. (No model.)

Claim.—1. In an electric metal-working apparatus, rigid supports upon which the clamps or holders for the work are directly supported, in combination with independent conducting-pieces for supplying current to the work through a path independent of the rigid supports, as and for the purpose described.

2. In an electric metal-working apparatus, a supporting and guiding base carrying clamping devices by which the work is held, made of steel, iron, or such like rigid but comparatively poor conducting material, in combination with electric conductors of copper or other good conducting material in connection with the work and supplied with current through a path independent of the supporting and guiding base.

3. In an electric metal-working apparatus, mechanical holding and moving devices for the work, in combination with current-supplying devices electrically independent thereof, as and for the purpose described.

4. In an electric metal-working apparatus, the combination, with mechanical holding devices for the work, of plates or pieces of good conducting material interposed between the same and the metal to be operated upon and electrically connected with the source of heating-current by a direct conductor independently of the material of the holding devices.

5. In an electric metal-working apparatus, clamping or holding devices for the work, made of steel, iron, or such like material that is a comparatively poor conductor, in combination with electric conducting-pieces of good conducting material applied to the work near the part to be heated and connected with the source through a conductor independent of the body or material of the holding devices.

6. The combination, with the movable clamp body or support sliding in a suitable guide, of a current conveying-sliding connection independent of said guide.

7. In an electric welding or metal-working apparatus, the combination, with the movable clamp or holder carrying the work, through which an electric current passes, of an operating-screw and interposed spring for giving a forward movement to the clamp, and a connection between the screw and clamp for moving the latter in the opposite direction when the screw is reversed and the spring relieved.

8. In an electric welding or metal-working apparatus, the combination, with the movable clamp carrying the metal, heated by an electric current, of the operating-screw provided with a flange, a pin in the clamp for engaging with the flange, and a spring compressed between the clamp and screw, as and for the purpose described.

9. The combination, with an electric welding or metal-working apparatus, of the clamp bar or plate D', a link at one side pivoted to the clamp-body, and a locking-cam hung from a link connected with the opposite side.

10. The combination, with an electric metal-working apparatus, of a clamp bar or plate, D', a rod pivoted to the clamp-body and provided at its upper end with an adjustable nut, and a locking-cam hung from a link connected to said bar at the side of and opposite said rod.

11. The combination, with an electric metal-working apparatus, of the clamp bar or plate D', a pivoted locking-cam supported thereby, and an adjustable lug with which the locking-cam engages, said lug being supported by the clamp-body.

12. The combination, with an electric metal-working apparatus, of the clamping devices, the locking-cam, and an adjustable lug for engagement by said cam, said lug being provided with serrations, as described, and a fastening-screw for holding it in position against the clamp-body.

398,915. ACID GELATINE. CLEMENT B. TOWER, Hyde Park, Mass. Filed June 14, 1888. Serial No. 277,097. (No specimens.)

Claim.—1. Acidulated gelatine in a dry and frangible or brittle form, consisting of ordinary gelatine and an edible vegetable acid, as set forth.

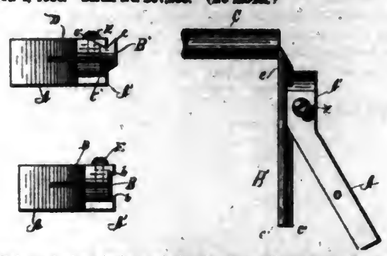
2. Acidulated gelatine in a dry and frangible or brittle form, consisting of ordinary gelatine and citric acid, as set forth.

398,916. ACID GELATINE. CLEMENT B. TOWER, Hyde Park, Mass. Filed July 14, 1888. Serial No. 279,905. (No specimens.)

Claim.—1. Acidulated gelatine in a dry and frangible or brittle form, consisting of ordinary gelatine combined with an innocuous acid, as set forth.

2. Acidulated gelatine in a dry and brittle form, consisting of ordinary gelatine combined with free phosphoric acid, as set forth.

3. Acidulated gelatine in a dry and brittle form, consisting of ordinary gelatine containing a mixture of phosphoric and other innocuous acids, as set forth.



4. Acidulated gelatine in a dry and brittle form, consisting of ordinary gelatine combined with phosphoric and citric acids, as set forth.

398,917. PAINT. ISRAEL TOWNSEND, Portsmouth, Va. Filed June 4, 1888. Serial No. 276,088. (No specimens.)

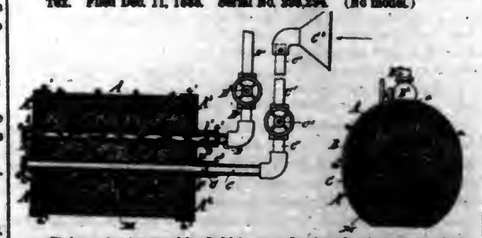
Claim.—1. The vehicle for paint, consisting of milk of lime, alum, linseed-oil, and litharge, substantially in the proportions specified.

2. The paint composed of the milk of lime, alum, linseed-oil, and litharge mixed with metallic brown, dry cement, and sand, substantially in the proportions described.

398,918. LATHE-TOOL. JOHN WHATLEY, Syracuse, N. Y. Filed Oct. 4, 1888. Serial No. 287,235. (No model.)

Claim.—1. In a lathe-tool, the shank A, offset A', slot D, binding-screw E, dovetail channel *b*, and blade B', provided with the shoulders *c' c'*, held in said channel *b b* by means of the binding-screw E, all constructed and operating substantially as and for the purpose set forth.

2. In a lathe-tool, the shank A, provided with the offset A', blade-holding channel *b b*, slot D, and binding-screw E, in combination with the blade B', held in said channel *b b* by means of the shoulders *c' c'* thereon and having the beveled cutting-edge *e* projecting laterally from the main portion thereof, all constructed and operating substantially as and for the purpose set forth and shown.



3. In a lathe-tool, a bent holding-shank provided, respectively, with a shank, A, and offset A', slot D, dovetail blade-holding channel *b b*, binding-screw E, and beveled edge G, in combination with a cutting-blade provided with dovetail shoulders corresponding to the channel *b b* and adapted to be adjustably held therein, all constructed and combined substantially as specified and shown.

398,919. FIRE-CLAY HEATER. GEORGE W. WHITE, Waco, assignor to the Texas Fire-Clay Manufacturing Company, Fort Worth, Tex. Filed June 26, 1888. Serial No. 278,295. (No model.)

Claim.—The fluid-burner fire-log formed of fire-clay in cylindrical or tubular form, and provided with an oil-supply passage, jet-burner passages in its periphery, a filling opening, and cap at one end, said tubular log filled with asbestus, substantially as and for the purpose described.

398,920. FLUID-BURNER FIRE-LOG. GEORGE W. WHITE, Waco, assignor to the Texas Fire-Clay Manufacturing Company, Fort Worth, Tex. Filed Dec. 11, 1888. Serial No. 293,294. (No model.)

Claim.—1. A portable fluid-burner fire-log having, in combination, a perforated tubular body, metallic removable heads, a fluid-supplying tube, a perforated air-induction distributing tie-tube provided with screw threads and nuts on its ends outside the heads, and a comminuted or disintegrated fire-proof filling surrounding the perforated portion of the air-tube and occupying the chamber of the body, substantially as and for the purpose described.

2. A portable fluid-burner fire-log having, in combination, a perforated tubular body, metallic removable heads, an air-supply tube, a perforated fluid conducting and distributing tube provided with screw threads and nuts at its ends outside of the heads, and a comminuted fire-proof filling surrounding the perforated portion of the oil-tube and occupying the chamber of the body, substantially as and for the purpose described.

3. In a portable fluid-burner fire-log, the combination of the perforated tubular body, metallic removable heads, a perforated air induction and distributing tie-tube, a perforated air induction and distributing tie-tube, both of said tubes provided with screw threads and nuts on their ends outside of the heads, and comminuted or disintegrated fire-proof filling surrounding the perforated portions of the tubes and occupying the chamber of the body, substantially as and for the purpose described.

4. In a portable fluid-burner fire-log, the combination of the perforated body, the removable heads, the perforated tie and oil induction and distributing tube, air supply and distributing tube provided with an inner perforated portion and an imperforated outer portion with funnel-shaped mouth, and a fire-proof filling, substantially as and for the purpose described.

398,921. GRAIN-BINDING HARVESTER. WILLIAM H. WHITELEY, WILLIAM BAYLEY, and OSCAR E. PERRIGO, Springfield, Ohio, assignors to said William H. Whiteley. Filed Apr. 1, 1886. Serial No. 197,436. (No model.)

Claim.—1. In a self-binding harvester, the combination of a continuously-moving grain-carrier, a bundle-forming mechanism, a needle-arm operated from beneath, and a knotter mechanism situated over said grain-carrier and binding the grain while resting thereon.

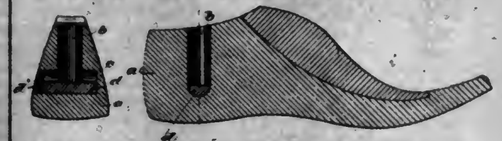
2. In a grain-binding harvester wherein the binding mechanism is situated between the grain-platform and the drive-wheel, the combination of the inclined continuously-moving elevating-belt, which carries the grain over the drive-wheel, and a knotter mechanism situated over said belt, which binds the grain while resting on said moving belt.

3. In a grain-binding harvester, the combination of a continuously-moving elevating-belt divided substantially centrally and a binding mechanism situated over said belt and adapted to bind the grain in bundles while resting on said belt, parts of said binding mechanism operating through the space between the parts of said divided belt.

4. In a grain-binding harvester, the combination of a continuously-moving lower elevating-belt divided substantially centrally, an upper elevating-belt moving in proximity to said lower belt, and also divided substantially centrally, and a binding mechanism which binds the grain into bundles while resting on said lower belt, parts of said binding mechanism operating in the space between the parts of said divided belts.

5. In a grain-binding harvester, the combination of a divided lower elevating-belt, a binding mechanism situated between the edges of the adjacent parts of the belt, and having parts thereof operating in the space between the parts of said divided belt, and an upper elevator-belt traveling in proximity to the lower belt and terminating near the knotting mechanism of the binder.

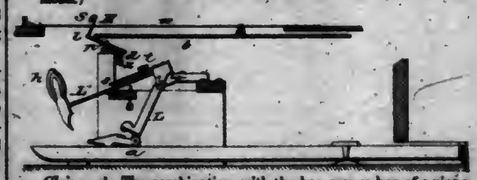
6. In a grain-binding harvester, the combination of a divided elevator-belt, rollers at the opposite ends of such belt, over which the belt travels, the axes of rollers of the parts of the divided belt being in the same line, and a binding mechanism situated between the adjacent edges of the parts of said belt, and having parts thereof operating in the space between the parts of the belt, substantially as set forth.



7. In a self-binding harvester, the combination of the needle-operating mechanism, a trip-arm, N, adapted to be depressed by the gavel, the dog L^2, a clutch-tripping lever, M, held normally in contact with said dog L^2, and a connecting-rod between the trip-arm and said clutch-tripping lever, said connecting-rod being also directly connected with and operated by the needle-operating mechanism, whereby when the needle is in operation the tripping-lever is free from dog L^2, regardless of the position of the trip-arm, as set forth.

398,922. THILL-COUPLING. GEORGE T. WILSON, Lowville, N. Y.; assignor of two-thirds to John D. Hough and Miles H. Bronson, both of same place. Filed Nov. 6, 1888. Serial No. 290,085. (No model.)

Claim.—The combination, with the axle and the clip B, of the plate H, having ears J J, the concave plate N, provided with vertical extension N^2, bearing against said clip, the set-screw M, the pivot pivotally connecting said plate N to said screw, the thill-iron pivotally secured between said ears, and the bearing-block in said plate N, extending behind the pivot of the thill-iron between the same and said extension, substantially as and for the purpose specified



398,923. LAST. EDWARD C. WOODWARD, Brockton, Mass., assignor of two-thirds to Ellery C. Wright and Horace F. Woodward, both of same place. Filed Nov. 23, 1888. Serial No. 291,699. (No model.)

Claim.—1. The last having the pin or tool receiving hole, and having a block-receiving hole in its body intersecting the said tool-receiving hole, combined with a metallic bar-like support inserted in the said block-receiving hole at the end of the tool-receiving hole, the said block constituting a rigid bottom within the body of the last for the tool to abut against, substantially as described.

2. The last having the pin or tool receiving hole, and having a block-receiving hole in its body intersecting the said tool-receiving hole, and a metallic tube placed in the said tool-receiving hole, combined with a metallic bar-like support inserted in the said block-receiving hole at the end of the tool-receiving hole, the said block constituting a rigid bottom within the body of the last for the tool to abut against, substantially as described.

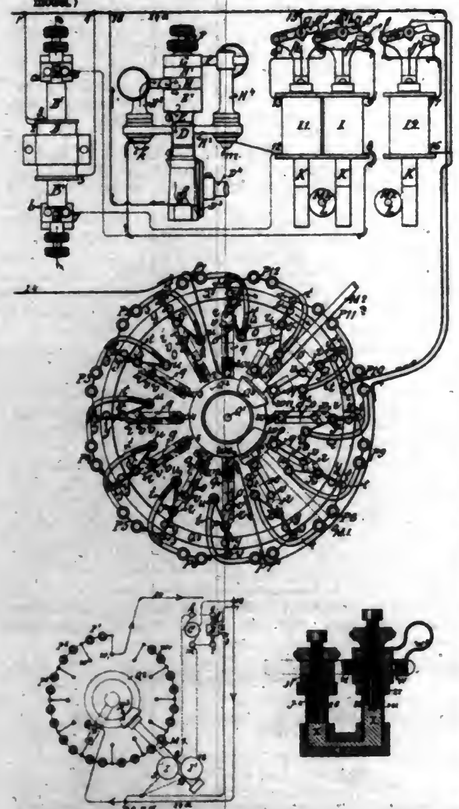
398,924. HARMONIC DAMPER FOR PIANOS. HARVEY WORRALL, Topeka, Kans. Filed June 14, 1886. Serial No. 205,130. (No model.)

Claim.—1. The combination, with the hammer or key of a piano, of a node-producing stop acting in connection with the key or hammer

and so arranged that by the action of the key or hammer the stop will press upon the piano-string when the string receives the blow from the hammer, thus causing the string to give out one of its harmonic tones, and be removed from contact with the string shortly after the blow from the hammer has been delivered, substantially as and for the purpose hereinbefore described.

2. The combination of the lever *l*, with its fingers *d* and *e*, node-producing stop S, buffer *x*, springs *c* and *s*, thumb-screw *t*, and buffer-button, with the piano-string *w* and its hammer A, key *a*, and complementary levers L L′, substantially as and for the purpose hereinbefore described.

398,925. MUSTACHE-TRAINER. LOUIS A. ALLARD, St. Louis, Mo. Filed Sept. 7, 1888. Serial No. 284,842. (No model.)



Claim.—1. A mustache trainer or cultivator consisting of a yielding strip adapted to be applied over a mustache upon the face, hooks pivoted to the said strip and adapted to straddle the upper edge thereof, depending plates or flanges, and pivoted hooks adapted to straddle the lower edges of the said plates, substantially as specified.

2. A mustache trainer or cultivator consisting of a yielding bowed strip, and hooks pivoted thereto and adapted to straddle the upper edge of the said strip, substantially as specified.

3. In a mustache trainer or cultivator, the combination, with the main flexible or yielding strip having pivoted hooks, of the loops, such as B, on the end of the said strip, substantially as specified.

398,926. ELECTRIC-CURRENT REGULATOR. JOSEPH W. RALEY, New York, N. Y., assignor of one-half to Robert Dunlap and Lake F. Cozans, same place. Filed Jan. 27, 1888. Serial No. 262,178. (No model.)

Claim.—1. In a regulator for dynamos and electric motors, the combination of the following elements, viz: a controller actuated by a current derived from the main circuit and adapted to complete another circuit when the main current is too weak or too strong, mechanism governed by the controller for operating the switches, and a series of storage-batteries arranged to receive the current of the main circuit through the switch-operating mechanism when the main current is too strong and to deliver a current from the storage-batteries to the main circuit when the main current is too weak, substantially as specified.

2. In a regulator for dynamos and electric motors, the combination of the following elements, viz: a centrifugal regulator connected with the motor driven by a current derived from the main circuit and adapted to complete another circuit when the main current is too weak or too strong, mechanism governed by the regulator for operating the switches, and a series of storage-batteries arranged to receive the current of the main circuit through the switch-operating mechanism when the main current is too strong and to deliver a current from the storage-batteries to the main circuit when the main current is too weak, substantially as specified.

3. In a regulator for dynamos and electric motors, the combination of the following elements, viz: a controller actuated by a current derived from the main circuit and a centrifugal governor connected with the motor driven by the main current, and both adapted to complete another circuit when the main current is too weak or too strong, mechanism governed by the controller for operating the switches, a second set of switches, mechanism governed by the centrifugal regulator for operating the second set of switches, and a series of storage-batteries arranged to receive the current of the main circuit through the switching mechanism when the main current is too strong and to deliver a current from the storage-batteries to the main circuit when the main current is too weak, substantially as specified.

4. In a regulator for dynamos and electric motors, the combination of the following elements, viz: a controller actuated by a current derived from the main circuit and adapted to complete another circuit when the main current is too weak or too strong, switch-actuating mechanism governed by the controller, switches operated by the switch-actuating mechanism, switches operated by gas, a sounder adapted to indicate that the storage-batteries are charged, and a series of storage-batteries arranged to receive the current of the main circuit through the switching mechanism when the main current is too strong and to deliver a current from the storage-batteries to the main circuit when the main current is too weak, substantially as specified.

5. In a regulator for dynamos and electric motors, the combination of the following elements, viz: a centrifugal regulator actuated by a motor driven by the main current and adapted to complete another circuit when the main current is too weak or too strong, switch-actuating mechanism governed by the regulator, switches operated by the switch-actuating mechanism, switches operated by gas, and a series of storage-batteries arranged to receive the current of the main circuit through the switching mechanism when the main current is too strong and to deliver a current from the storage-batteries to the main circuit when the main current is too weak, substantially as described.

6. In a regulator for dynamos and electric motors, the combination of a controller actuated by a current derived from the main circuit, a centrifugal regulator driven by a motor operated by the main current, the controller and regulator both being adapted to complete other circuits when the main current is too weak or too strong, switch-actuating mechanism governed by the controller and switch-actuating mechanism governed by the regulator, switches operated by the switch-actuating mechanism, switches operated by gas, a sounder arranged to be operated when the storage-batteries are charged, and a series of storage-batteries arranged to receive the current of the main circuit through the switching mechanism when the main current is too strong and to deliver a current from the storage-batteries to the main circuit when the main current is too weak, substantially as described.

7. In a current-regulator, the combination of the following elements, viz: a controller actuated by a current derived from the main circuit and adapted to complete another circuit when the main current is too weak or too strong, switch-actuating mechanism governed by the controller, switches operated by the switch-actuating mechanism, a series of storage-batteries arranged to receive the current of the main circuit through the switching mechanism, so as to make equilibrium between the main or charging current and the current of the storage-batteries, gas-actuated switches arranged to cut out of the main circuit the storage-batteries which have received their maximum charge, and a sounder for indicating that a storage-battery or set of storage-batteries has received its maximum charge, substantially as described.

8. In a current-regulating system, the combination of the following elements, viz: a series of storage-batteries arranged to receive a charging-current, a gas-actuated switch operated by the batteries, and a sounder operated from the said switch and indicating when the batteries have received their maximum charge, substantially as described.

9. In a current-regulator, the combination of a controller actuated by a current derived from the main circuit and adapted to complete another circuit when the main current is too weak or too strong, switch-actuating mechanism governed by the controller, a switch operated by the switch-actuating mechanism, and a series of cells arranged to send their current into the main circuit, the whole being constructed to switch into the main circuit the number of cells corresponding to the work to be done, substantially as described.

10. In a current-regulating system, the combination of a centrifugal regulator operated by a motor driven by the main circuit and adapted to complete another circuit when the main current is too weak or too strong, switch-actuating mechanism governed by the centrifugal regulator, a switch operated by the switch-actuating mechanism, and a series of cells arranged to send their current into the main circuit, the device being constructed to switch into the main circuit a number of cells corresponding to the work to be done, substantially as described.

11. In a current-regulating system, a controller formed of the solenoid B, provided with the tubular core B′, the armature A, placed in the tubular core and provided with contact-points *a b*, the spring B^2, arranged to oppose the action of the solenoid on the armature, and the contact-points *c d*, substantially as described.

12. In a current-regulating system, the combination, with circuit-controlling and switching mechanism, of one or more solenoids, I, each provided with a switching mechanism, a core, K, a roller, L, of magnetic material, adapted to be magnetized by induction from the core K and to be turned by the longitudinal movement of the said core, and means, substantially as herein described, for shifting the current passing through the solenoids, so as to cause the core K to vibrate longitudinally and turn the roller L, substantially as described.

13. In a current-regulating system, the combination of a series of contacts, *w*, arranged in a circle, and an automatically-operated switch-arm, Q, moving periodically in one direction over the said contacts, substantially as described.

14. In a current-regulating system, the combination of a series of contacts, *w*, arranged in a circle, and the switch-arms N Q, moving independently of each other over the contacts, the arm Q moving periodically in one direction and the arm N in both directions, substantially as described.

15. In a current-regulating system, the combination of a series of contacts, *w*, contact-springs engaging said contacts, and the sector R′, sliding over the said contact-springs to break the contact between the said springs and contacts *w*, substantially as described.

16. In a current-regulating system, the combination of a series of contacts, *w*, arranged in a circle, the contact-springs O^3, the automatically-operated switch-arm N, moving over said contacts, and the sector R′, carried by the said switch-arm and sliding over the springs to break the contact between the said springs and the contacts *w*, substantially as described.

17. In a current-regulating system, the combination, with a storage-battery and conductors carrying the charging-current, of a switch formed of the communicating tubes 25 26, of insulating material, the mercury, X, contained by the tubes, the contact-screws *u x*, entering the tubes, and the pipe *t*, communicating with the storage-battery and adapted to convey gas to the tube 25, the tube 26 being filled with air under pressure, substantially as and for the purpose specified.

18. The combination, with the communicating tubes 25 26, the contact-points *u x*, inserted therein, and the pipe *t*, communicating with the tube 25, of the valve W, supported on a spring-arm and adapted to shut the gas in the tube 25, and the arm Q, provided with the curved end U, adapted the hold the valve W closed, substantially as described.

19. The combination, with the communicating tubes 25 26, the contact-points *u x*, inserted therein, and the pipe *t*, communicating with the tube 25, of the valve W, closed by a spring-arm, W′, the said spring-arm being adapted to operate the valve W as a safety-valve for the relief of pressure within the tube 25, substantially as described.

20. The combination, in a current-regulating system, of a series of storage-batteries and mechanism, substantially as specified, for switching the storage-batteries into the main circuit for charging and switching the storage-batteries out of the main circuit after charging, and a sounder to indicate when and which set of storage-batteries are charged, substantially as described

21. In a current-regulating system for dynamos and electric motors, the combination of the distributing mechanism provided with the contacts *w*, the arms N Q, adapted to convey the current to different contacts, the sector R′, springs O^3, the storage-batteries P′ P^3, &c., the valves 30, the bevel-wheels Q^2 N^3, the bevel-pinions Q^2 N^3, engaging the said bevel-wheels, the shafts M′ M^3, provided with rollers L L′, the centrifugal regulator connected with the motor driven by the main current, and the electrical connections, substantially as described.

22. In a current-regulating system for dynamos and electric motors, the combination of the distributing mechanism provided with the contacts *w*, the arms N Q, adapted to convey the current to different contacts, the sector R′, springs O^3, the storage-batteries P′ P^3, &c., the valves 30, the bevel-wheels Q^2 N^3, the bevel-pinions Q^2 N^3, engaging the said bevel-wheels, the shafts M′ M^3, provided with the rollers L L′, the controller operated by a current derived from the main circuit, and the electrical connections, substantially as specified.

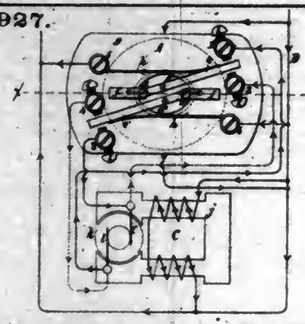
23. In a current-regulating system, the combination of a series of storage-batteries, switches actuated by a current derived from the main circuit, switches actuated by gas developed in the storage-batteries which have reached their maximum charge, and a sounder for indicating that the storage-batteries have received their maximum charging, substantially as described.

24. In a current-regulating system for dynamos and electric motors, the combination of the distributing mechanism provided with the contacts *w*, the arms N Q, adapted to convey the current to different contacts, the sector R′ and contact-springs O^3, the storage-batteries P′ P^3, &c., the valves 30, the bevel-wheels Q^2 N^3, the bevel-pinions Q^2 N^3, engaging the said bevel-wheels, the shafts M′ M^3, provided with the rollers L L′, the solenoid I^3, with switching mechanism and armature K, connected with the roller L, the solenoids I I′, with switching mechanism and armatures K, connected with the rollers L L′, the controller actuated by a current derived from the main circuit, the sounder, and the electrical connections, substantially as described.

25. In a current-regulating system for dynamos and electric motors, the combination of the distributing mechanism provided with the contacts *w*, the arms N Q, adapted to convey the current to different contacts, the sector R′ and contact-springs O^3, the storage-batteries P′ P^3, &c., the valve 30, the bevel-wheels Q^2 N^3, the bevel-pinion Q^2 N^3, engaging the said bevel-wheels, the shafts M′ M^3, provided with the rollers L L′, the solenoid I^3, with switching mechanism and armature K, connected with the roller L, the solenoids I I′, with switching mechanisms and armatures K, connected with the rollers L L′, the centrifugal regulator connected with the motor driven by the main current, and the electrical connections, substantially as described.

26. In a current-regulating system for dynamos and electric motors, the combination of distributing mechanism provided with the contacts *w*, the arms N Q, adapted to convey the current to different contacts, the sector R′ and contact-springs O^3, the storage-batteries P′ P^3, &c., the valve 30, the bevel-wheels Q^2 N^3, the bevel-pinions Q^2 N^3, engaging the said bevel-wheels, the shafts M′ M^3, provided with the rollers L L′, the solenoids I^3, with switching mechanisms and armatures K, connected with the rollers L, the solenoids I I′, with switching mechanisms and armatures K, connected with the rollers L L′, the centrifugal regulator connected with the motor driven by the main current, the controller actuated by a current derived from the main circuit, the sounder, and the electrical connections, substantially as described.

27. In a current-regulating system, the combination of the distributing mechanism provided with the contacts *w*, the arm Q, adapted to convey the current to different contacts, the cells P′ P^3, &c., the bevel-wheel Q^2, the bevel-pinion N^3, engaging the said bevel-wheel, the shaft M′, provided with the rollers L L′, the solenoids I I′, with switching mechanisms and armatures K, connected with the rollers L L′, the controller actuated by a current derived from the circuit of the cells, and the electrical connections, substantially as described.



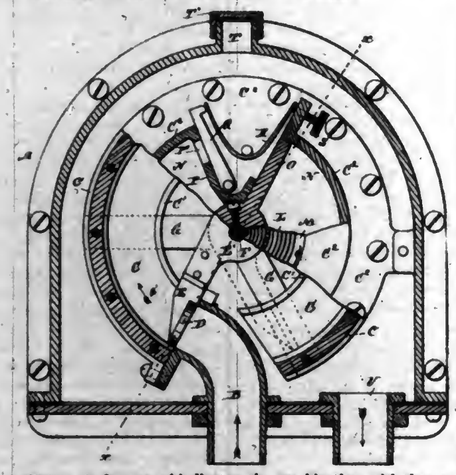
28. In a current-regulating system, the combination of the distributing mechanism provided with the contacts *w*, the arm Q, adapted to convey the current to different contacts, the cells P′ P^3, &c., the bevel-wheel Q^2, the bevel-pinion N^3, engaging the said bevel-wheel, the shaft M′, provided with the rollers L L′, the solenoids I I′, with switching mechanisms and armatures K, connected with the rollers L L′, the centrifugal regulator connected with the motor driven by the current of the said storage-batteries, and the electrical connections, substantially as described.

29. In a current-regulating system, a centrifugal regulator formed of the spindle D′, the head E, the ring E′, of insulating material, attached to the head, the ring H, of conducting material, carried by the ring E′, the ring H′, of insulating material, carried by the ring H, the cap G, of conducting material, the contact-screw F, inserted in the cap G, the body F′, of mercury, contained by the receptacle, and the contact-brushes *i l*, touching the ring H and cap G, substantially as specified.

30. In a current-regulator, the combination, with the contact-screw F and the body, F′, of mercury inclosed in the receptacle C, of a filling of mercurial vapor contained by the chamber C above the mercury for the prevention of sparking between the contact-screw F and the mercury, F′, substantially as specified.

398,927. ELECTRIC-CURRENT REGULATOR. JOSEPH W. RALEY, New York, N. Y., assignor of one-half to Robert Dunlap and Lake F. Cozans, same place. Filed May 14, 1888. Serial No. 273,841. (No model.)

398,927.



Claim.—1. In an electric-current regulator, the combination, with a helix, of two switch-operating bars of magnetic material, each movably supported within the helix, substantially as described.

2. In an electric-current regulator, the combination of a helix, two bars of magnetic material arranged within the helix parallel to its axis, two arms attached to and movable by the bars, springs pressing the movable arms in opposition to the magnetic action of the bars, and contact-points arranged to be touched by the movable arms, substantially as specified.

3. In an electric-current regulator, the combination of a helix, two bars of magnetic material arranged on pivotal supports and arranged to move independently of each other, two spring-pressed arms carried by the magnetic bars, contact-points arranged in the paths of the arms, an electric motor, and circuit-connections, the whole being arranged to cause the current to pass in one direction or in the other through the amature of the electric motor, according as the current is strong or weak, substantially as specified.

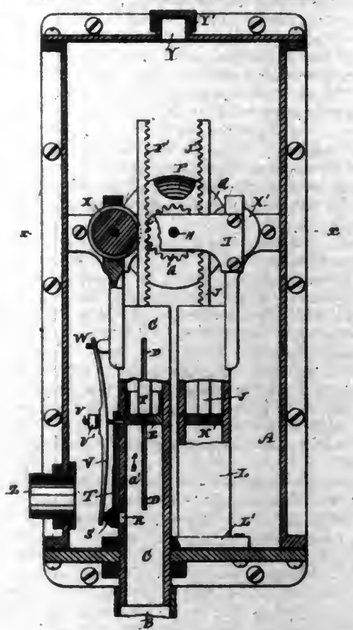
4. In a current-regulator, the combination of the helix B, magnetic bars a' a^2, arms c c', connected with the bars, two pairs of contact-points, one pair for each arm c c', the springs h h', the electric motor C, having its field-magnet permanently connected in a shunt to the main circuit, and the double connections of the commutator-brushes l l', substantially as specified.

398,928. SPEED-INDICATOR. ERNEST H. BARBER, Kent, Ohio. Filed Aug. 24, 1886. Serial No. 211,747. (No model.)

Claim.—1. In a speed-indicator, the combination, with the casing having a fluid inlet and discharge, as specified, and a curved compartment, C, one of whose sides or walls is slotted lengthwise, of an arm pivoted on a central spring-actuated shaft and working in the aforesaid slot, and a piston attached to the outer end of said arm and working in the compartment, substantially as specified, whereby the piston vibrates and opens or closes the slot more or less, according to the pressure of the fluid and the consequent increase or decrease of the volume passing through the slot.

2. In a speed-indicator, the combination, with an oscillating shaft, of two pistons, each connected to the said shaft and working in separate chambers, one of the said pistons automatically increasing or decreasing the available portion of the discharge-opening of its chamber as the volume of the actuating-fluid passing increases or decreases, and the other piston serving to prevent quick or vibratory motions of the said shaft, a pointer carried by the shaft, and a graduated scale over which the pointer works, substantially as herein shown and described.

3. In a speed-indicator, the combination, with a casing having two chambers, one of which communicates directly with the supply-pipe and is provided with a discharge-opening, of two pistons, one in each chamber, a shaft to which the said pistons are connected, a spring for actuating the shaft backward, a pointer, and graduated scale, substantially as and for the purpose set forth.



4. In a speed-indicator, the combination, with an outer casing and an inner casing having two chambers, one of which communicates with the supply-pipe and is provided with a discharge-opening, of a shaft provided with a pointer on its end, a spring secured to the shaft and casing, pistons secured to the said shaft and working in the said chambers, one of the pistons having its rod projecting through the discharge-opening of its chamber, and a graduated scale, substantially as described.

5. In a speed-indicator, the combination, with a casing provided with two chambers, of a piston in one chamber for automatically increasing or decreasing the available portion of its discharge-opening as the volume of the fluid passing increases or decreases, and a piston in the other chamber for overcoming the vibratory motion of the first-named piston, substantially as described.

6. In a speed-indicator, a casing having a chamber or compartment, a piston operating in the same, a shaft connected with the piston, a coil-spring on the said shaft, a pointer, and a dial, in combination with a chamber, a piston operating in the same, substantially as shown and described.

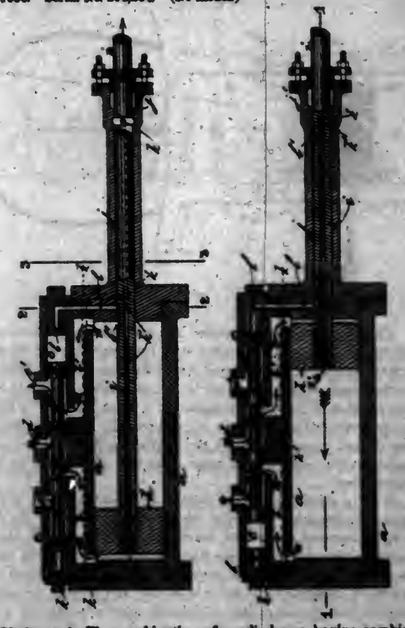
7. In a speed-indicator, a casing having a chamber or compartment, a piston operating in the same, a shaft connected with the piston, a coil-spring on the said shaft, a pointer, a dial, the chamber N, and the piston O, in combination with a valve covering an aperture in the wall of said chamber regulated by a spring and screw, substantially as shown and described.

398,929. SPEED-INDICATOR. ERNEST H. BARBER, Kent, Ohio. Filed Aug. 24, 1886. Serial No. 211,748. (No model.)

Claim.—1. In a speed-indicator, the combination, with a casing and a slotted tube connected to the supply-pipe, of a piston in said tube provided with a toothed piston-rod, a gear-wheel meshing with the said toothed piston-rod, and a spring to actuate the shaft of said gear-wheel backward, substantially as described.

2. In a speed-indicator, the combination, with a casing and a tube connected to the supply-pipe and provided with one or more longitudinal slots, of the piston in the said tube, the piston-rod F, having teeth F', the shaft H, the gear-wheel G on the shaft H, the spring P on said shaft, the pointer M, and the dial N, substantially as described.

3. The combination, with a chamber with which the supply-pipe communicates, provided with one or more discharge-openings, of an adjustable relief or safety valve covering another separate and distinct opening from the said chamber, substantially as described.



4. In a speed-indicator, the combination of a casing, a tube or pipe connected to the supply-pipe, projecting into the said casing and provided with an aperture within the said casing, and an adjustable valve for closing the said aperture, substantially as described.

5. In a speed-indicator, the tube C, having one or more slots, D, the piston E, the piston-rod F, having rack-teeth F', the gear-wheel G, and the shaft H and the spring P, in combination with the piston-rod J, having rack-teeth J', the piston K, and the cylinder L, substantially as shown and described.

6. In a speed-indicator, the tube C, having one or more slots, D, the piston E, the piston-rod F, having rack-teeth F', the guide-wheel the gear-wheel G, the shaft H, and the spring P, in combination with the piston-rod J, having rack-teeth J', the guide-wheel X', the piston K, and the cylinder L, substantially as shown and described.

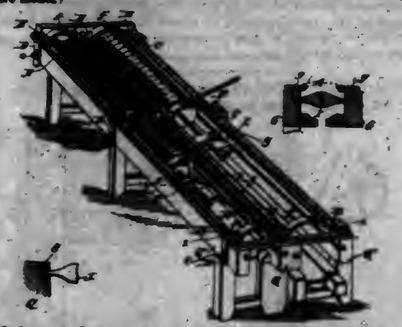
7. In a speed-indicator, the tube C, having one or more slots, D, and the aperture, in combination with the adjustable valves S, substantially as shown and described.

398,930. STEAM-ACTUATED VALVE. GUSTAV A. BARTH, St. Louis, Mo., assignor to Pierre Chouteau, same place. Filed Nov. 19, 1888. Serial No. 291,264. (No model.)

Claim.—1. The combination of a cylinder, *a*, having combined inlet and exhaust ports and passages *b b'*, a steam-chest, *c*, having inlet-port *d* and exhaust-ports *e e'*, a slide or distribution valve, *f*, located in steam-chest *c*, and formed with circumferential depressions or passages *g g' g²*, a piston, *h*, fitted within the cylinder *a*, and provided with a rod, *i*, passing through a tube, *j*, relief-passages *k* and *l*, opening from the tube *j* into the steam-chest *c* behind the respective ends of the distribution-valve *f*, with corresponding passage *k'* and groove *l'* formed in piston-rod *i*, substantially as shown, and for the purpose described.

2. In a direct-acting steam or other motive power engine, the combination of a cylinder, *a*, having combined inlet and exhaust ports and passages *b b'*, a steam-chest, *c*, having inlet-port *d* and exhaust-ports *e e'*, a slide or distribution valve, *f*, located within steam-chest *c*, and formed with circumferential depressions or passages *g g' g²*, a piston, *h*, fitted within the cylinder *a*, and provided with a rod, *i'*, passing through a tube, *j*, relief-passages *k* and *l*, opening from the tube *j* into the steam-chest *c* behind the respective ends of the distribution-valve *f*, said passages *l* having a cock or valve, *m*, with a corresponding passage, *k'*, and grooves *l' l²* formed in the piston-rod *i'*, substantially as shown, and for the purpose described.

398,931. PISTON-ROD-GUIDE PACKING. GUSTAV A. BARTH, St. Louis, Mo., assignor to Pierre Chouteau, same place. Filed Dec. 27, 1888. Serial No. 294,764. (No model.)



Claim.—1. In a piston-rod packing, the combination of a key or tongue inserted within a slotway formed through the wall of the casing containing the packing, with bolts passing through the said wall and tongue, and means for tightening said bolts, substantially as shown, and for the purpose described.

2. In a piston-rod packing, the combination of a key or tongue inserted within a slotway formed through the wall of the casing containing the packing and entering the circumference of the said packing, with bolts passing through the said wall and tongue, and means for tightening the bolts, substantially as shown, and for the purpose described.

3. The combination of packing-strips *b*, inserted within the cylindrical tube or casing *a a²* and fitted around the piston-rod *c* of a direct-acting engine, slotway *d*, formed longitudinally through the wall *a²* of the casing, key or tongue *e*, inserted flatwise within the slotway *d* and engaging between adjacent edges of the packing-strips *b*, lugs *f*, projecting from the wall *a²* of the casing, with bolts *g*, passing through the lugs *f* and interposed tongue *e* and provided with nuts *e'*, substantially as shown, and for the purpose described.

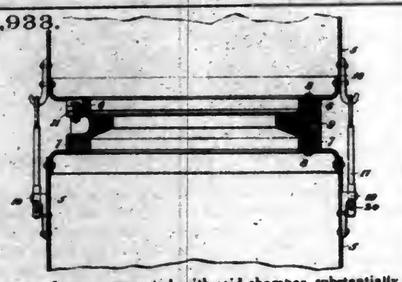
398,932. ATTACHMENT FOR GANG CHEESE-PRESSES. WILLIAM L. ERATON, Hallock, Minn. Filed Aug. 31, 1888. Serial No. 284,294. (No model.)

Claim.—1. In a gang-press of the herein-described type, the combination, with the frame having guides, of the guide attachment composed of longitudinal strips and cross-bars, the said strips being arranged to come over the said guides, substantially as described, for the purposes specified.

2. The combination, with the frame having guides, of the attachment composed of longitudinal strips and cross-bars, the strips being arranged in pairs and having the opposing edges of each pair of strips beveled, substantially as described, for the purposes specified.

3. The combination, with the frame having a guide, of the cross-bars, and the pair of longitudinal strips adjustably connected with the cross-bars, substantially as described, for the purposes specified.

4. The combination, with the frame having a guide, of the cross-bars arched opposite the said guide and having elongated openings, the longitudinal strips, and the bolts and the set-screws adjustably connecting the strips with the cross-bars, substantially as described, for the purposes specified.



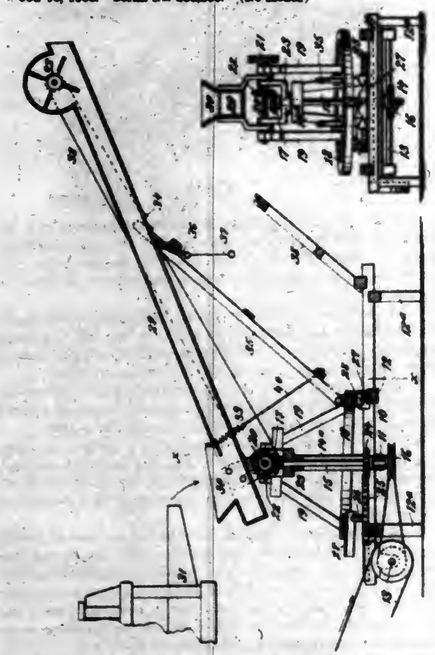
5. The combination, with the frame having a series of parallel guides, of the cross-bars arched opposite the guides and having elongated openings each side of the said guides, the short vertical bars hinged to the cross-bars at one end, the hasps hinged to the other ends of the cross-bars, the longitudinal strips arranged in pairs, and the bolts and thumb-screws for adjustably securing the strips to the said cross-bars, substantially as described.

398,933. VALVE-SEAT FOR HOT-BLAST STOVES. PER TORSTEN BUHS, Braddock, Pa. Filed Sept. 1, 1888. Serial No. 284,266. (No model.)

Claim.—1. The combination of the valve-chamber made in transversely-divided sections, a valve-seat ring interposed between the sections, fixed to one of them and bearing loosely on the other, so as to permit of independent transverse motion thereof, a valve connected with that section of the valve-chamber to which the valve-seat is fixed, and a pipe for the passage of gases connected with said chamber, substantially as and for the purposes described.

2. The combination of the upright valve-chamber composed of transversely-divided sections, a valve-seat secured to the upper section only, a vertically-moving valve arranged within the valve-chamber and having its stem connected with the upper section, and a pipe for

898,933.



the passage of gases connected with said chamber, substantially as and for the purposes described.

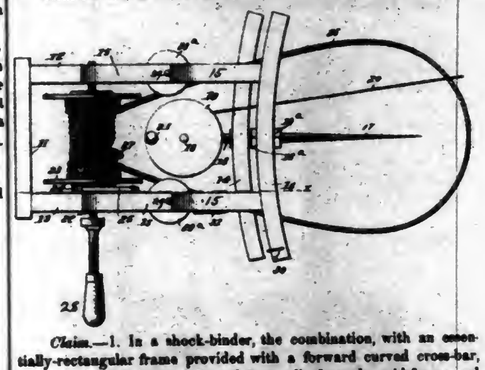
3. The combination of the valve-chamber made in transversely-divided sections, a valve-seat ring interposed between the sections, fixed to one of them and bearing loosely on the other, a valve which is connected with that section of the valve-chamber to which the valve-seat is fixed, links connecting the sections of the valve-chamber, and a pipe for the passage of gases connected with said chamber, substantially as and for the purposes described.

4. The combination of the valve-chamber made in transversely-divided sections, metal rings or facings fixed to the opposing faces thereof, a valve-seat ring interposed between the facings, fixed to one and bearing loosely on the other, a valve which is connected with that section of the valve-chamber to which the valve-seat is fixed, and a pipe for the passage of gases connected with said chamber, substantially as and for the purposes described.

898,934. STACKER. THOMAS BERRY, North Fort, Ky. Filed Oct. 16, 1888. Serial No. 288,208. (No model.)

Claim.—1. In a stacker, the combination, with a base-frame, of a vibratory and vertically-rocking table mounted on the base and a trunk mounted upon the said table, substantially as described.

2. In a straw-stacker, the combination, with a base-frame and a table mounted thereon capable of a simultaneous horizontal vibratory and a vertical movement, of a vertically-adjustable trunk mounted upon said table, and means, substantially as shown and described, for adjusting the trunk, as and for the purpose specified.



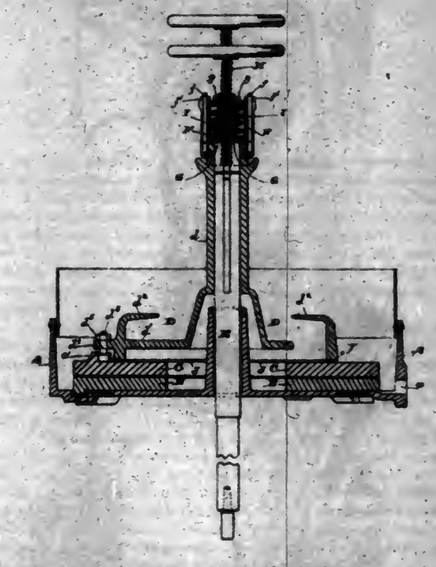
3. In a straw-stacker, the combination, with a base-frame and a table capable of a horizontal vibratory and a vertical movement, of a trunk pivoted upon the table, provided with teeth integral with the under side, a spring-actuated supporting-frame hinged to the table, and a spring-actuated latch located upon the supporting-frame engaging with the teeth of the trunk, substantially as shown and described.

4. The combination, with a base-frame, a vertical drive-shaft, a table mounted upon said base, and provided with a friction-roller at one side and a guide-plate upon the opposite side, of a spur-wheel rotated from the drive-shaft, a roller eccentrically located upon the said wheel, an undulating block secured to the base-frame adapted for contact with said roller, a trunk pivoted upon the table, and a spring-actuated supporting-frame hinged to the table and engaging with the trunk, substantially as shown and described.

5. In a straw-stacker, the combination of a vibratory and vertically-rocking trunk having an open outer end and provided with a hopper at its inner end, and an exhaust-fan arranged in said trunk, substantially as herein shown and described.

6. The combination, with a base-frame, a vertical shaft journaled in said base-frame, a wheel journaled upon the frame provided with an eccentric-pin, and a block having an undulating surface fixed on the frame, of a table suspended upon said shaft, a guide-plate and a friction-roller on said table, a horizontal shaft journaled in the frame of the table, a straw-elevator carried on the frame of the table, and operating-gearing, substantially as shown and described.

898,935. SHOCK-BINDER. CHRISTIAN RIE, Moline, Kans., assignor of one-half to John D. Dunlap, same place. Filed Aug. 3, 1888. Serial No. 281,846. (No model.)



Claim.—1. In a shock-binder, the combination, with an essentially-rectangular frame provided with a forward curved cross-bar, brackets projected upwardly and forwardly from the said frame, and a curved upper cross-bar secured to the extremities of the said brackets in advance of the lower cross-bar, of a drum carrying a tightening-rope journaled in the frame, a reel vertically supported from the lower curved cross-bar to carry the binding cord or wire, and a spear attached to the center of the upper cross-bar, substantially as shown and described.

2. In a shock-binder, the combination, with a frame provided with a front cross-bar of greater length than the width of the frame, having a concaved outer face, brackets projected upward and outward from the side bars of the frame in vertical plane with the side bars, an upper cross-bar, also having a concaved face, secured to the brackets in advance of the lower cross-bar, and a spear horizontally projected from the outer face of the said upper cross-bar, of a drum journaled transversely in the frame adapted to carry a compressing-rope, a ratchet-wheel secured to the said drum, a pawl pivoted to the frame engaging the ratchet-wheel, an angled spindle rearwardly projecting attached to the inner side of the lower cross-bar, and a reel journaled upon the said spindle to carry the binding rope or wire, all combined to operate substantially in the manner and for the purpose specified.

3. In a shock-binder, the combination, with a frame, a cross-bar secured to the forward end of the said frame having a curved outer face, brackets projected upwardly and outwardly from the side bars of the frame, a second cross-bar secured to the extremities of the said brackets in advance of and concentric with the lower cross-bar, and a spear horizontally attached to the center of the outer face of the upper cross-bar, of a drum transversely journaled in the frame, a compressing-rope secured to the said drum, a ratchet-wheel attached to the drum, and a pawl engaging the said ratchet, guide-pulleys journaled between the frame and brackets, an angled spindle projected centrally and rearwardly from the inner face of the lower cross-bar, a reel journaled on said spindle, a tying or binding rope secured to said reel, a clamp-hook attached to the upper cross-bar, and a knife secured to the outer face of one bracket adjacent to the said hook, all combined to operate substantially as shown and described.

4. In a shock-binder, the combination, with a frame, a cross-bar secured to the forward end of the frame provided with a concaved outer face, brackets projected upwardly and forwardly from the said side bars of the frame, an upper curved cross-bar attached to the extremities of the said brackets in advance of and concentric with the lower cross-bar, a clamp-hook secured to the upper cross-bar near one extremity, and a knife projecting upward from the bracket contiguous to the said clamp-hook, of a drum journaled in the frame adapted to carry a compressing-rope, an angled spindle projected rearwardly from the lower cross-bar, a reel journaled upon the said spindle carrying a binding-rope, a spear attached to the outer face of the upper cross-bar, and means, substantially as shown and described for locking the drum, as set forth.

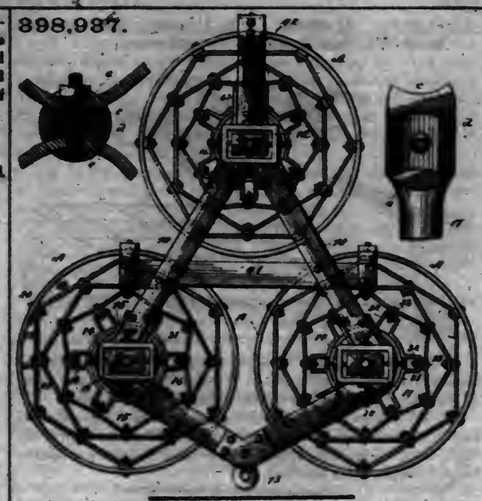
898,936. GRINDING-PAN. MARTIN P. BOSE, San Francisco, Cal. Filed May 4, 1888. Serial No. 272,882. (No model.)

Claim.—1. In a grinding-pan, a muller having the stem *d*, and the drive-shaft E, passing into said stem and adjustably connected therewith, whereby the muller is rotated and is adapted to move vertically, in combination with the driver-cap F, secured to the top of the muller-stem and having a flanged top, the adjusting-screw H, passing into the driver-cap and having its lower end bearing on the top of the drive-shaft, the nut G within the driver-cap and seated on the adjusting-screw, said nut having a flanged base, and the spring I within the driver-cap, around the nut, and bearing between the flanged base of said nut and the flanged top of said driver-cap, substantially as herein described.

2. In a grinding-pan, the combination of a pan, a drive-shaft and operative mechanism therefor, a die, a centrally-apertured shoe, and a muller having an apertured annular body and inwardly-curved flange d^3, for confining and directing the pulp between the shoe and die, substantially as herein described.

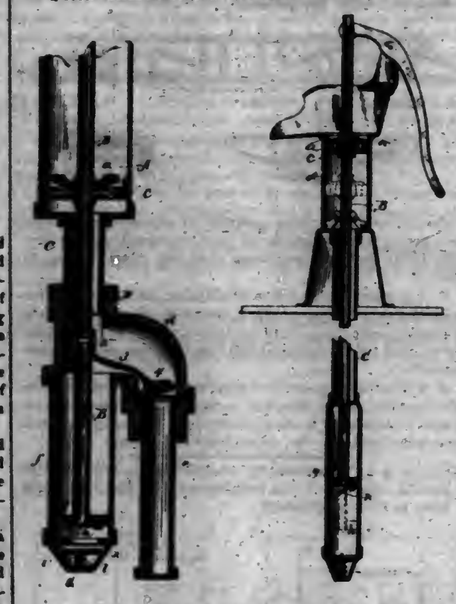
3. In a grinding-pan, and in combination with the pan having a die in its bottom and a discharge-opening in the base of its rim, the annular muller for confining the pulp, and having a centrally-apertured shoe on its foot operating over the die for directing the pulp outwardly between the shoe and die to the discharge-opening, said muller having an inwardly-curved flange, d^3, substantially as described.

898,937. ROTARY HARROW. ASA G. BROWN, Eugene City, Oreg. Filed Oct. 20, 1888. Serial No. 289,198. (No model.)



Claim.—1. In a rotary harrow, the combination, with a supporting-frame, of tilting blocks carried by the frame, and wheels carrying harrow-teeth and formed with gudgeons adapted to enter apertures in the tilting blocks, substantially as described.

2. The combination, with a main supporting-frame carrying anti-friction rollers, of trussed harrow-teeth carrying wheels A, gudgeons extending from the wheels A, blocks through which the gudgeons pass, and a pivotal connection between the blocks and the main supporting-frame, substantially as described.

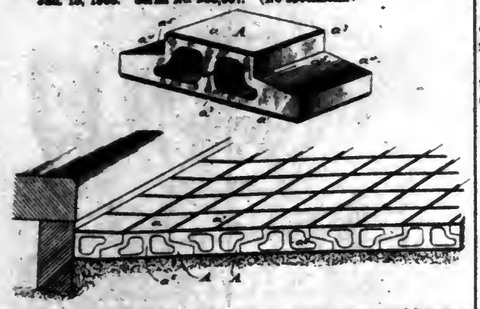


3. In a rotary harrow, the combination, with a box, 11, of a block formed with a central aperture, set-screws by which said block is supported within the box, limit-screws arranged in connection with the block, and a tooth-carrying wheel formed with a gudgeon which enters the aperture in the block, substantially as described.

4. A harrow-tooth formed with a head having concave faces, as *c* and *d*, and shoulders, as *e*, substantially as described.

898,987.

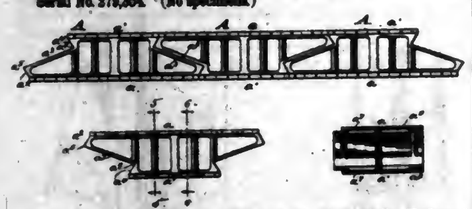
898,938. PUMP. WILLIAM L. BUTTS, Nashville, Tenn. Filed Sept. 4, 1888. Serial No. 284,564. (No model.)



Claim.—1. In a pump, the combination, with the pump-barrel, of a piston and hollow piston-rod, valves carried by said rod for lifting the water, an inlet-valve, an air-chamber connected to the pump-barrel with its lower end below the water-line, and provided with an opening covered by a suitable valve between the chamber and outside water, and an opening also covered by a valve from the piston-rod to the air-chamber, substantially as described.

2. In combination with the pump-barrel, the hollow piston-rod carrying the lifting-valves, an inlet-valve, an air-chamber connected to the pump-barrel openings from said chamber to the surrounding water, a valve normally closing said openings, a disk carried on the lower end of the piston-rod, forming the piston of the air-chamber, and a valve covering the lower open end of the rod, substantially as described.

3. In combination with the piston-rod of a pump, carrying the lifting-valves, an inlet-valve, and an air-cylinder connected to the pump-barrel, arranged below the water-line opening to the outside air through the hollow piston-rod, protected from the water above by a closely-fitting disk carried on the end of the piston-rod, and protected from the water below by a spring-supported valve, substantially as described.

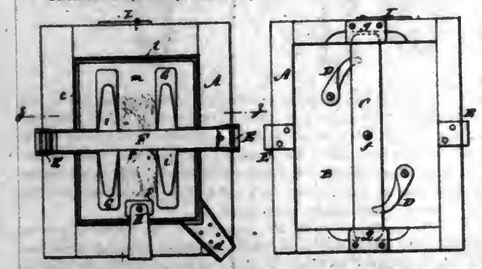


398,939. PAVEMENT. LYDIA J. CADWELL, Chicago, Ill. Filed Jan. 12, 1888. Serial No. 260,607. (No specimens.)

Claim.—1. A hollow T-shaped paving-block recessed between upper and lower bearing-walls and provided with one or more vertical studs through the hollow interior, substantially as described.

2. A T-shaped paving-block of metal or other hard material made hollow, having recesses between upper and lower bearing-walls of the block, and provided with a filling of other material suitable to deaden sound, substantially as described.

398,940. PAVEMENT. LYDIA J. CADWELL, Chicago, Ill., assignor to the Metal Block Pavement Company, of Illinois. Filed July 9, 1888. Serial No. 279,304. (No specimens.)



Claim.—1. A pavement composed of substantially T-shaped blocks having their contiguous end faces overlapped and also interlocked against vertical displacement when laid, substantially as described.

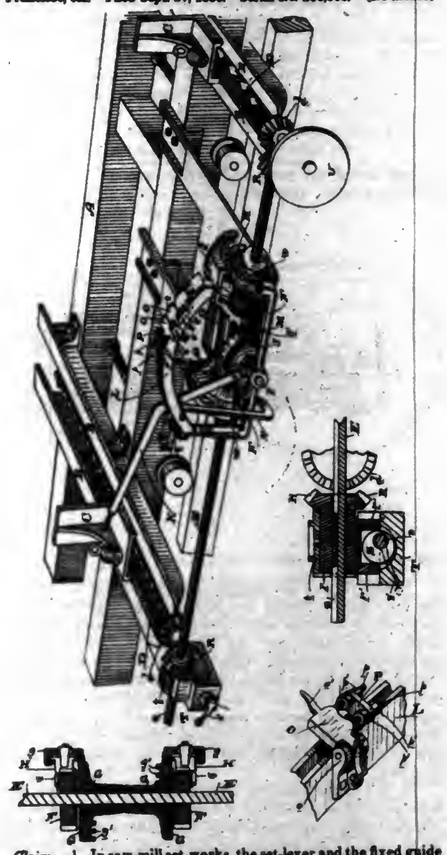
2. A pavement composed of overlapping blocks severally provided with a long face on one side, a short centrally-opposite parallel face on the opposite side, and end faces provided with mutually-engaging projections and recesses, substantially as described, and for the purposes set forth.

3. A pavement composed of overlapping blocks severally provided on their opposite parallel faces with transverse ribs terminating at one end short of the edge of the block and having a longitudinal rib which intersects the transverse ribs, substantially as described.

398,941. PHOTOGRAPH TRANSFERRING AND PRINTING FRAME. CORNELIUS T. CAIN, Owensborough, Ky. Filed June 15, 1888. Serial No. 277,231. (No model.)

Claim.—1. The frame A, having a groove or recess, *b*, in its rear on its inner side and provided with a lining-like strip or ledge, *c*, having its facial sides in direction of the thickness of the frame from front to back and arranged to project below the top wall of the recess in the frame, substantially as specified.

2. The frame A, grooved or recessed in its rear, and provided with a lining-like marginally-projecting ledge, *c*, and spout *d*, essentially as shown and described.



3. The frame A, grooved or recessed in its rear, and provided with a lining-like marginally-projecting ledge, *c*, and pivoted leg I at its one end or side, substantially as specified.

4. The combination, with the frame A, having a recess, *b*, in its rear, of the clamping-board B, the swiveling spring-bar C, clips *g*, and the pivoted wedge-like cams D D, essentially as described.

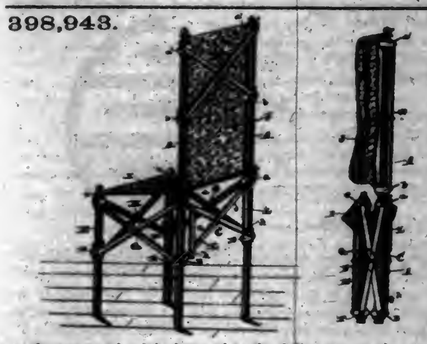
5. The combination, with the frame A, of the spring-pressure device H *k*, applied to the one or lower end portion of the frame in front, substantially as specified.

6. The combination, with the frame A, of the spring-racks E E, the cross-bar F, constructed to engage with said racks, and the springs G G, carried by said bar, essentially as described.

398,942. SAW-MILL SET-WORKS. FREDERICK W. COOK, San Francisco, Cal. Filed Sept. 27, 1888. Serial No. 286,563. (No model.)

Claim.—1. In saw-mill set-works, the set-lever and the fixed guide by which it is directed, in combination with the independent hinged limiting-plates O, secured to the guide, and the adjustable cross-stop on the foremost of said plates, substantially as herein described.

2. In saw-mill set-works, the set-lever and the fixed guide by which it is directed, in combination with a series of independent hinged limiting-plates, O, secured to the guide, the adjustable cross-stop P on the foremost of said plates, and the adjustable cross-stop Q at the other end of the guide behind the lever, substantially as herein described.



3. In a saw-mill set-works, the set-shaft and the set-screw having a gear, in combination with the adjustable gear R on the set-shaft, the sliding sleeve carrying said gear, the eccentric S, seated in the base of the sleeve, and the lever *a*, for operating the eccentric to slide the sleeve and throw its gear into or out of engagement with the gear of the set-screw, substantially as herein described.

4. In saw-mill set-works, the set-shaft and the set-screw having a gear, in combination with the sliding sleeve on the set-shaft, the gear on the sliding sleeve meshing with the gear on the set-screw, the eccentric and lever for moving the sleeve, and the box T, having the sliding top *t*, fitted over the sleeve, substantially as herein described.

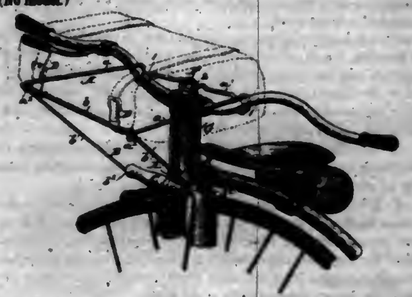
398,948. FOLDING CHAIR. JESSE A. CRANDALL, Brooklyn, N.Y., assignor of one-half to George A. Hurd, same place. Filed Oct. 3, 1888. Serial No. 287,072. (No model.)

Claim.—1. The combination of the front and rear pair of legs, the sliding pieces thereon, and the X-braces thereof connected to said pieces at their lower ends, with the pair of side X-braces connected to the upper ends of the legs and to the sliding pieces, whereby all the braces are opened or closed simultaneously, substantially as set forth.

398,943.

2. The combination of the rear legs extended to form the back-support, and the upper and lower X-braces connecting the same, having sliding connections with the legs at their lower ends, with the front pair of legs, the X-brace connecting the same, and the side pairs of X-braces connecting the front and rear legs, the lower ends of the braces being connected to sliding pieces on the legs, substantially as specified.

3. The combination of the front and rear pairs of legs and the sliding pieces thereon, the X-braces connecting the same, attached to said sliding pieces at their lower ends, with the side X-braces connecting the front and rear pairs of legs, and connected at their lower ends to said sliding pieces, and the locking device for the braces, substantially as described.



4. The combination, in a folding chair, of the pieces forming the rear legs and back-supports, and having knobs at center and top, and sliding pieces below each knob, and the X-braces connected to said knobs and sliding pieces, with the front pair of legs having knobs at top and sliding pieces below the knobs, the X-brace connected to said knob and sliding pieces, and the side pair of X-braces connected to the fixed knobs and sliding pieces of one front and one rear leg, and the flexible seat and back, all substantially as set forth.

398,944. BOTTLE-STOPPER. WILLIAM P. CRARY, New York, N.Y. Filed Aug. 20, 1888. Serial No. 284,092. (No model.)

Claim.—As an improved article of manufacture, a stopper comprising a cork, A, and a covering, B, of fabric, animal or rubber tissue, secured by cord C above the cork and extended to form the handle or grasp D for withdrawing the cork, substantially as described.

398,945. LUGGAGE-CARRIER FOR BICYCLES. HENRY S. CRUMBAUGH, New Carlisle, Ohio. Filed Sept. 1, 1888. Serial No. 284,377. (No model.)

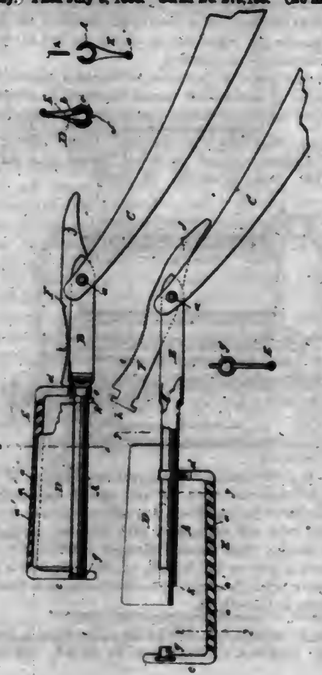
Claim.—1. A luggage-carrier for bicycles, consisting of a body portion, A, formed of spring-wire having one end constructed to fit upon and clamp the head or the handle-bars of the bicycle, and its opposite end provided with a depending portion adapted to be supported at its lower end upon the bicycle-head, substantially as and for the purposes specified.

2. A luggage-carrier for bicycles, consisting of a body portion, A, one end thereof constructed to fit upon and clamp the head or the handle-bars of the bicycle, and a depending portion or bracket, B, hinged at one end to the body portion, its opposite end adapted to be supported upon the bicycle-head when in place, said portion B forming a handle portion when the carrier is detached from the bicycle, substantially as shown and described.

3. In a luggage-carrier, the combination, with the body portion A, formed of spring-wire, having one end, *a'*, constructed to fit upon and clamp the head and handle-bars of the bicycle, of the bracket portion B, formed of spring-wire, its upper portion, *b*, hinged in the outer ends of the arms *a a*, its arms *b' b'* extended inward, forming supports for a handle-block, C, said block provided with a notch, *c*, substantially as and for the purposes described.

4. A luggage-carrier formed of spring-wire, consisting of the body portion A, said body portion formed of side arms, *a*, and cross-bar *a'*, said cross-bar bent to form downwardly-depending legs 1 and an inwardly-bent portion, 2, whereby said cross-bar may be clamped upon the head and handle-bars of the machine, and a swinging bracket portion, B, hinged in the outer end of the arms, said portion provided with extended arms *b b'*, and a handle-block, C, supported between said arms, substantially as and for the purpose described.

5. As a new article of manufacture, a luggage-carrier for bicycles, formed of spring-wire, consisting of a body portion, A, having side arms, *a*, and a cross-bar, *a'*, said cross-bar provided with clamping-legs 1 1 and 2, whereby said cross-bar may be clamped to the head and handle-bars of a bicycle, the forward ends of the arms *a* being provided with eyes a^4, a swinging portion, B, consisting of the cross-bar *b*, hinged in said eyes, said bar *b* bent to form arms *b' b'*, said arms bent toward each other, as at b^3, said bent portions b^3 supporting a handle-block, C, said handle-block having a transverse notch, substantially as and for the purpose described.



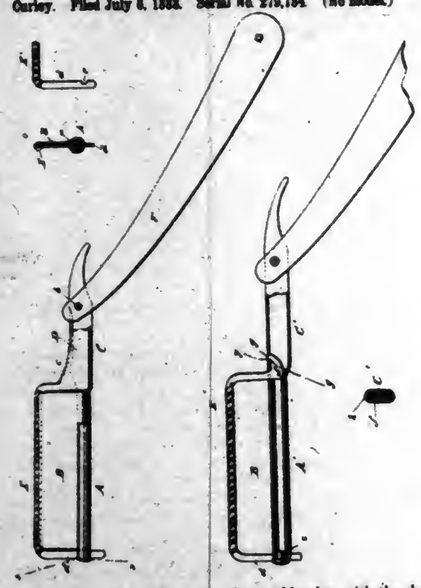
398,946. COMPOSITE PAVEMENT. MURRY CUNNINGHAM, Belle Vista, Pa. Filed Sept. 3, 1888. Serial No. 284,442. (No specimens.)

Claim.—1. In compositions for pavements, a binding mixture consisting of coal-tar, sulphur, tallow, and a coloring material, combined substantially in the proportions set forth.

2. A composition for pavements, consisting of broken stone screenings, coal-tar, sulphur, tallow, and a coloring material, combined substantially in the proportions set forth.

3. A composition for pavements, consisting of broken stone, coke-screenings, coal-tar, sulphur, tallow, and Prussian blue, substantially as described.

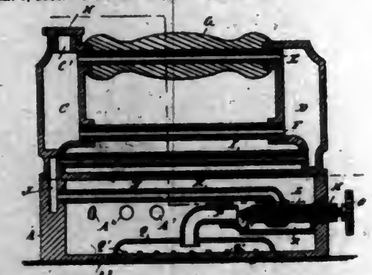
398,947. SAFETY-GUARD FOR RAZORS. THERON F. CURLEY and ALBERT S. GRANGER, Brooklyn, N.Y.; said Granger assignor to said Curley. Filed July 6, 1888. Serial No. 279,188. (No model.)



Claim.—1. The combination, with the slotted tubular back A, provided with the hollow shank B, of the razor-blade D, held by the tubular back, the swinging guard E, provided with the slotted eye *e*, and having the stud *g* and the swinging arm F, provided with the T-shaped head *h*, substantially as specified.

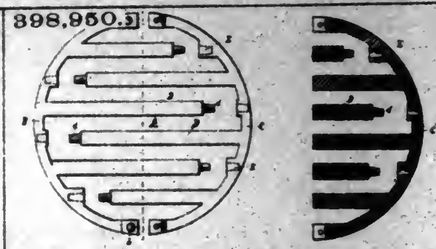
2. In a safety-razor, a reversible guard, E, provided with transverse ribs *a'* upon opposite sides, substantially as specified.

3. In a safety-razor, the combination, with the slotted tubular back A, and the razor-blade D, held by the said tubular back, of a swinging guard, E, provided with transverse ribs *a'*, and a fastener for holding the guard in the position of use, substantially as specified.



398,948. SAFETY-GUARD FOR RAZORS. TERENCE F. CURLEY and ALBERT S. GRANGER, Brooklyn, N. Y.; said Granger assignor to said Curley. Filed July 6, 1888. Serial No. 279,184. (No model.)

Claim.—1. In a safety-razor, the combination, with the slotted tubular back, and the blade loosely fitted to the said back, of a guard having one of its ends inserted in the tubular shank of the back and having the opposite end removably secured to the end of the tubular razor-back, substantially as specified.

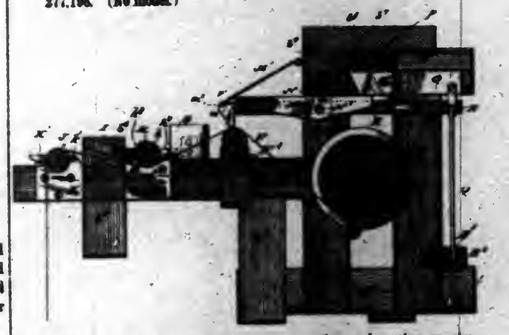


2. The combination, with the slotted tubular back A, provided with the tubular shank C, of the blade B, and the guard E, provided with the shank D, pivoted in the tubular shank C, substantially as specified.

398,949. SELF-HEATING SAD-IRON. JULIUS J. CHEPELL, Charleston, S. C., assignor to himself and Bernard Doscher, same place. Filed Mar. 9, 1888. Serial No. 266,673. (No model.)

Claim.—In a self-heating sad-iron, the combination of a hollow body, reservoirs supported upon the body at each end thereof, pipes connecting the reservoirs together, a chamber at one end of the body, a pipe leading from one reservoir to said chamber, a burner in the body, a pipe leading from the said chamber to the burner, an apertured distributing-pan on the bottom of the body, and a pipe into which the burner opens leading to the distributing-pan, substantially as herein shown and described.

398,950. GRATE FOR FURNACES. ARMELAND C. BAKER, Clinton, Mass. Filed Sept. 11, 1886. Serial No. 268,108. (No model.)



Claim.—1. A grate composed of two frame-sections connected substantially as described, and a series of grate-bars, each one of which is rigidly connected to or formed with one of the frame-sections at one end and has its free end loosely engaged in a corresponding socket in the opposite frame-section, whereby each bar can expand and contract independently of the other bars, substantially as described.

2. The herein-described grate, composed of the frame-sections B and C, connected at their ends, and each provided with alternate grate-bars and sockets, the ends of the bars of one section being arranged to enter loosely the sockets of the opposite section when the sections are united, substantially as set forth.

3. The combination, in a grate, of the section B, formed with alternate grate-bars and sockets, and a central grate-bar, F, with the section C, also formed with alternate grate-bars and sockets and connected at its ends to the ends of section B and centrally to the end of bar F, all constructed and arranged substantially as and for the purpose described.

398,951. HARMONIGRAPH OR MUSIC-RECORDING DEVICE. JOSEPH A. DROUIN, New Orleans, La. Filed June 15, 1888. Serial No. 277,196. (No model.)

Claim.—1. In a harmonigraph, a connecting-rod section consisting of the frame having guideways for the rods and formed in sections, whereby it may be folded, and the rods supported and movable in the guideways of such frame, substantially as set forth.

2. A harmonigraph, substantially as described, comprising a marker-section and a connecting-rod section, whereby to transmit the motion of the keys to the marker-section, such connecting-rod section having its rods arranged to converge upwardly, and being made in sections foldable, substantially as set forth.

3. In a harmonigraph, a connecting-rod section having its rods arranged to converge, as described, and formed in sections foldable, substantially as set forth.

4. In a harmonigraph, the combination, in the marker-section, of the framing, the paper-carrying roller journaled in said framing, the hammers, and the levers arranged to engage the hammers and pivoted in the framing above the paper-carrying roller, the bed roller or rollers journaled in said framing in rear of the paper-roller, and the feed-roller, substantially as set forth.

5. In a harmonigraph, the combination, with a marker by which to indicate tones or notes, of measure-indicating markers, substantially as set forth.

6. In a harmonigraph, the combination of the hammers pivoted between their ends and provided at one end with the markers, the levers pivoted between their ends and engaged at one end with the ends of the hammers opposite the markers, and connections whereby to transmit motion from the keys of the musical instrument to the ends of the levers, substantially as set forth.

7. In an apparatus substantially as described, the combination of the paper-support, the feeder, the mover for operating said feeder, the marker for indicating tones or notes, and the measure-indicating marker, substantially as set forth.

8. A harmonigraph having a bed along which the paper to be marked is passed, and provided with a marker bearing normally on the said bed or the paper thereon, whereby to normally mark the paper, and connections between the said marker and the keys of the musical instrument, whereby by the operation of said keys the marker may be lifted clear of the marked paper sheet, leaving a blank in the line drawn on such paper, substantially as set forth.

9. In a harmonigraph, the combination, with a supporting-frame and a series of bars, of hangers having top or end plates secured to the supporting-frame and depending plates fitting between the adjacent bars, the bars and plates being provided with coincident openings, and the pivot-shaft passed through said openings, substantially as set forth.

10. In a harmonigraph, the combination, with the bed over which the paper is directed, of the pivoted markers and springs engaging said markers, whereby to operate the same, substantially as set forth.

11. In a harmonigraph, a marker consisting of lever bar or support pivoted between its ends, a cup-like holder supported at one end of the bar, and an absorbent body in said holder, substantially as set forth.

12. In a harmonigraph, the combination, in the marker-section, of the framing provided with guideways for the depending rods Q, the markers or hammers, the levers pivoted between their ends, arranged at one end to engage the markers, and the rods Q, connected at their opposite end with the levers and extended through the guideways in the framing, substantially as set forth.

13. In a harmonigraph, the combination, with the supporting-frame and the markers, of the paper-supporting roller, a bearing for one end of said roller, and a bearing for the opposite end of said roller, the latter bearing consisting of a plate having a slot cut from its lower edge, and provided at its inner end with a seat-notch and a pivoted latch-plate, whereby to hold the trunnion of the roller in said seat-notch, substantially as set forth.

14. A harmonigraph comprising the supporting-frame, the markers adapted to mark with ink, the bed over which the paper is drawn below said markers, and fastenings for detachably securing said bed, whereby it may be replaced by the ink-well support, substantially as set forth.

15. In a harmonigraph, the combination of the markers for indicating tones or notes, connections by which said markers may be operated from the keys of the piano or similar instrument, the measure-marker, and a treadle, whereby said marker may be operated by the foot of the performer, substantially as set forth.

16. In a harmonigraph, a marker proper consisting of a funnel-shaped cup open at its large and small ends and the carrier or absorbent body fitted in said cup and drawn through the small end thereof, substantially as set forth.

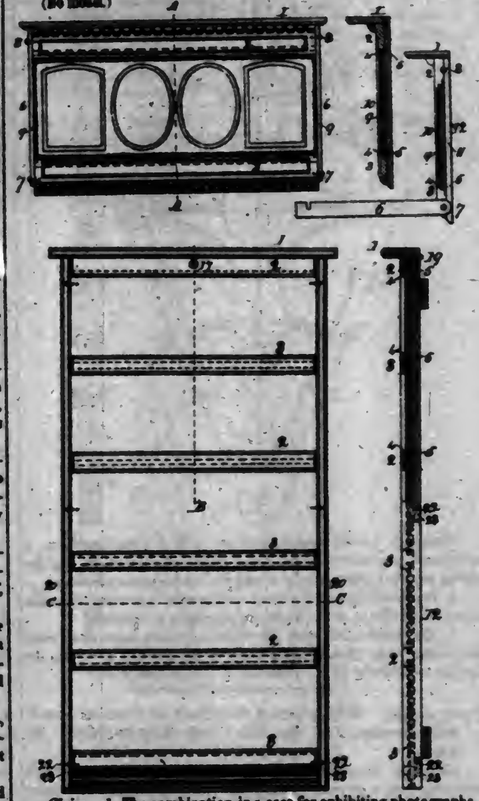
17. The combination, with the marker-section frame, of the measure-marker consisting of the lever arms or bars pivoted between their ends, having crayon-holders at their rear ends, a cross-bar extended between said arms and connected rigidly to both of same, and the spring engaging said bar, substantially as set forth.

18. In a harmonigraph, the combination of the paper-support, the markers, the bed-roller, the feed-roller, and the side guides arranged between the feed-roller and the bed-roller, substantially as set forth.

19. In a harmonigraph, the combination, with the markers and the paper-support, of the feeding-roller and the guide-strip which prevents the paper from being drawn or carried upward by the feed-roller, substantially as set forth.

20. A harmonigraph having markers by which to indicate tones or notes and provided with a measure-marker, and a treadle by which the same may be operated by the foot, substantially as set forth.

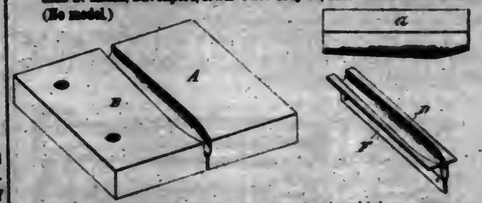
21. In a harmonigraph, the combination of a measure-marker having a bar pivoted between its ends and provided at its forward end with a depending rod, a connecting-rod arranged at its upper end to engage the lower end of said depending rod, the treadle, and the treadle-rod arranged to engage the lower end of the said connecting-rod, substantially as set forth.



398,952. RIBBED CONOIDAL WASHER. DAVID DODD, Orange, assignor to the National Lock Washer Company, Newark, N. J. Filed May 25, 1888. Serial No. 275,041. (No model.)

Claim.—1. The new article of manufacture herein shown and described, the same consisting of a conoidal or dished washer provided with a circular V-shaped rib adjacent to the concave edge of that one of the sides of the washer which is intended for impact against the face of the nut.

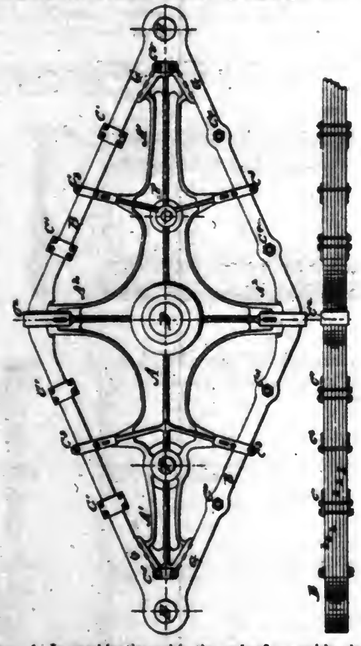
2. The combination, as herein set forth, of a bolt and nut of ordinary construction with a conoidal or dished washer provided upon that one of its sides which bears against the nut with a circular V-shaped rib, all parts of the apex of which after it has acquired contact with the nut are made by the screwing home of the nut to simultaneously embed themselves in the face of the nut, and to thereby effect the progressive movement of a portion of the nut toward the bolt while the central portion of the washer is being forced toward and against the surface of the object upon which the outer portion of the washer bears.



398,953. WALL-CASE FOR EXHIBITING PHOTOGRAPHS. FRANCIS KIRT, Dundee, Scotland. Filed Sept. 24, 1883. Serial No. 288,190. (No model.)

Claim.—1. The combination, in a case for exhibiting photographs, pictures, and similar articles having a glazed front slide, of moldings 2 and 3, each having a double groove, 4 and 5, for holding the glass and photograph-slide, respectively, and permitting their removal and replacement without displacing the wood-work containing said glazed slide, and the pivoted strips 6 6, for closing said double grooves, for the purpose set forth.

2. The combination, in a show-case having a glazed front slide and moldings formed with a double groove for holding the glass and photographic slide, of the hinged top 1 and side pieces, 20, having metal plates 23, provided with screw-pins 22, in the manner and for the purpose set forth.



398,954. DIE FOR STAMPING METALLIC CIGAR-MOLDS. GOTTLIEB D. HAHN, Davenport, Iowa. Filed May 17, 1888. Serial No. 274,311. (No model.)

Claim.—A female die having a depression in which to stamp metallic cigar-molds, composed of two halves, between which the lower

portion of the metallic blank is held and its form retained, notwithstanding the operation of stamping the upper part of said blank into the depression of the die and forming it into a mold, substantially as described.

398,955. WORKING-BEAM. CHARLES B. EMERY, Brooklyn, N. Y. Filed June 6, 1888. Serial No. 276,276. (No model.)

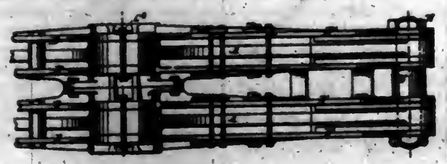
Claim.—1. In combination with the web of a working-beam, a beam-strap composed of a number of thicknesses connected and operating together, substantially as and for the purposes specified.

2. In a working-beam, a strap composed of a number of laminæ clamped together to act as a unit, substantially as described.

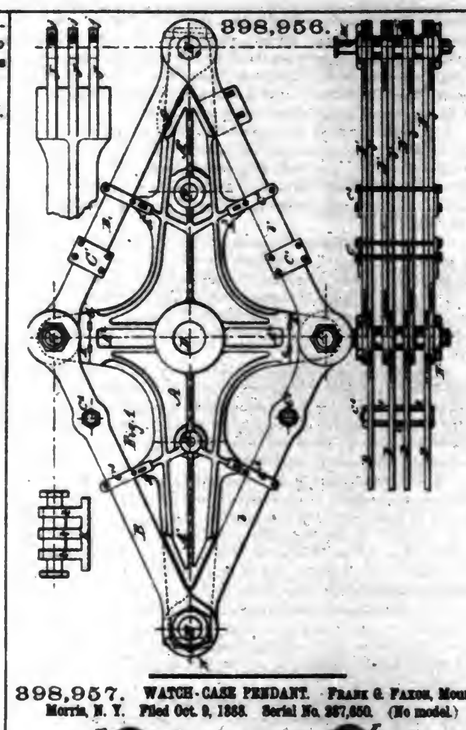
3. The combination, with the web of a working-beam and a compound beam-strap formed of a number of thicknesses, of clamps for insuring the stability of the strap under compressive strains.

398,956. WORKING-BEAM FOR STEAM-ENGINES. CHARLES B. EMERY, Brooklyn, N. Y. Filed June 7, 1888. Serial No. 276,387. (No model.)

Claim.—1. In combination, to form a working-beam, eye-bars, connecting-pins, a web, and devices for straining the eye-bars over the web.

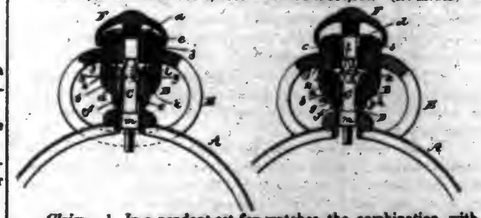


2. In combination with a beam-strap composed of eye-bars and a web over which the eye-bars are strained, pins connecting the eye-bars provided with journals for the main connections.



3. A working-beam provided with a strap composed of eye-bars, a web over which the eye-bars are strained, and clamps and necessary distance-pieces applied at various intermediate points along the eye-bars to hold the same rigidly together, so that they will act as a unit in compression, substantially as described.

4. In a working-beam provided with a strap composed of eye-bars and a suitable web, adjustable saddles transmitting the thrust of the eye-bars to the arms of the web.



5. In a working-beam, an eye-bar forming part of the strap and provided with a lateral lug, P, near the eye, adapted to transmit the strains arising from the tension of the bar when connected with other parts to an arm on the web, substantially as described.

6. The web of a working-beam and a strap for the same provided with a lateral projection at one of the angles, combined with a pin, R, substantially as described.

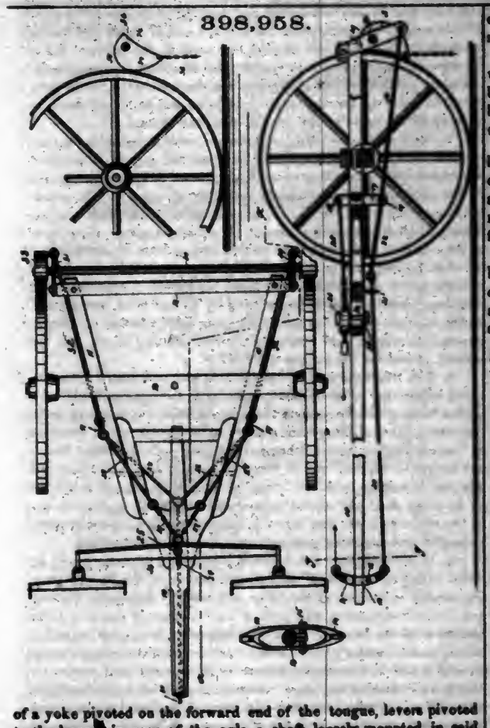
398,957. WATCH-CASE PENDANT. FRANK G. FAXON, Mount Morris, N. Y. Filed Oct. 9, 1888. Serial No. 287,650. (No model.)

Claim.—1. In a pendant-set for watches, the combination, with the winding and setting stem, of one or more springs arranged to hold the stem in position for setting or winding the watch and a lock for holding the said spring or springs in engagement with the winding and setting stem, substantially as specified.

2. In a pendant-set, the combination of the winding and setting stem C, provided with the collar *l*, the spring D, having the arms *g*, provided with heads *h*, and the bow E, having recesses *k* in the ends thereof, substantially as specified.

3. In a watch-pendant, the combination of the main part *a*, provided with the shoulder *e*, the ring *c*, the sleeve *b*, nut *d*, and the bow E, substantially as specified.

4. In a pendant-set, the combination of the part *a*, provided with the shoulder *e*, the slotted sleeve *b*, the ring *c*, nut *d*, the spring D, the bow E, having conical ends journaled in the part *a* and ring *c* and provided with recesses *k*, and the stem C, having the collar *l*, substantially as specified.

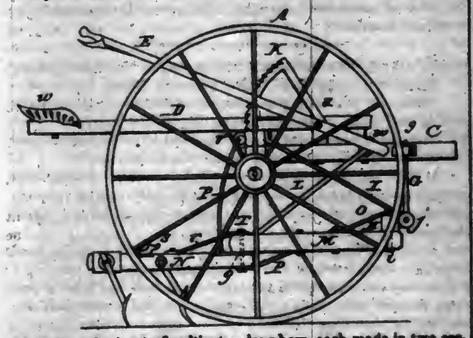


398,958. VEHICLE-BRAKE. JOHN FRASER, Simcoe, Ontario, Canada, assignor to himself and C. A. Upper, same place. Filed Oct. 30, 1888. Serial No. 289,494. (No model.) Patented in Canada Oct. 13, 1888, No. 29,964.

Claim.—1. The combination, with a vehicle having a yoke pivoted on the forward end of its tongue, of pivoted levers, reversible brake-shoes pivoted in said levers, and a connection between the said yoke and the lower ends of the levers, substantially as described.

2. The combination, with a vehicle having a yoke pivoted on the forward end of its tongue, of pivoted levers, a shaft loosely mounted in the arched said levers, brake-shoes having opposing concave and convex bearing-faces and secured to the ends of the said shaft, and a connection between the lower ends of the levers and yoke, substantially as herein shown and described.

3. In a vehicle-brake, the combination, with the forward hounds, the tongue, and a doubletree having a sliding movement on the tongue,



398,958.

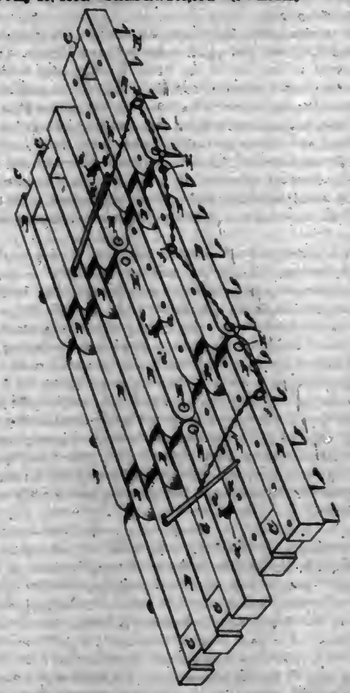
of a yoke pivoted on the forward end of the tongue, levers pivoted to the hounds in rear of the axle, a shaft loosely mounted in said levers, brake-shoes having opposing concave and convex bearing-faces, levers pivoted to the hounds in front of the axle and having their upper ends connected to the doubletree and their lower ends to the yoke and to the levers in rear of the axle, substantially as herein shown and described.

4. In a vehicle-brake, the combination, with the tongue, of the clevis 13, secured to the forward end of the tongue, and the yoke 14, through which the tongue projects, provided with eyes at its ends and pivoted to the clevis by the bolt 15 passing through the yoke and clevis below the tongue, substantially as herein shown and described.

398,959. CULTIVATOR. CHARLES H. GAGE, Richmond, Wis. Filed Sept. 1, 1888. Serial No. 284,351. (No model.)

Claim.—1. A set of cultivator drag-bars, each made in two sections jointed end to end for lateral vibration, in combination with couplings which connect the parallel sections in pairs, braces extending from each forward section to the rear section of the same drag-bar, a cultivator-frame, and a hanger which suspends said drag-bars from said frame, but allows vertical vibration, substantially as set forth.

2. The combination, with the main frame of the cultivator, of the arched bail or hanger G, the braces I, the coupling H, the jointed or sectional drag-bars, the perforated cross-plate *g*, and the arched brace *f*, sliding in guides upon the axle, substantially as set forth.



3. The combination, with the main frame and the arched hanger G, of the jointed drag-bar frames, the couplings H, the sliding brace or arch F in rear of the joint, the plate *g*, to adjustably connect the drag-bars and the lifting-lever, and the cross-bar *x* with foot-rests S, substantially as shown and described.

4. The cultivator-frame and the arched hanger, in combination with the jointed frames or drag-bars M N, the couplings H, the cross-bars *g* and *x* upon the rear section of the drag-bars, the sliding arched brace *f*, adjustable in plates *g*, and the lifting-lever, substantially as shown and described.

5. The combination, with the frame and the arched hanger G, having horizontal spindles, of the cross-barrel couplings H, the jointed drag-bars, the rear section, N, having the cross-bars *g x*, the adjustable connecting-bar F, and the foot-rests S, whereby said rear section may be swayed laterally, turning upon the pivot-bolts T of the jointed frame, as shown and described.

6. The frictional standard-holder consisting of flanged plate A', having the tapered opening *a*, the tapering pin B', having the recess *d* and a central perforation, and a bolt and nut, whereby all the parts are secured to the drag-bar and the shovel-standard held by friction so as to yield to obstructions.

398,960. DRAG AND HARROW. JOHN R. GOODMAN, Calumet, Mo. Filed July 13, 1888. Serial No. 279,534. (No model.)

Claim.—1. A drag or harrow consisting of two or more sections hinged together by loose spacing-blocks between the respective beams of the sections at the adjoining ends thereof, and bolts passing through the ends of the beams of the respective sections and through opposite ends of the said spacing-blocks, substantially as described.

2. A drag or harrow consisting of two or more sections hinged together by means of loose spacing-blocks between the respective beams of the sections at the adjoining ends thereof, and bolts passing through the ends of the respective sections and through the opposite ends of the said spacing-blocks, as set forth, the outer ends of the outer sections being spaced by fixed spacing-blocks, substantially as described.

3. A combined drag and harrow consisting of a drag composed of jointed sections and a harrow composed of jointed sections, the two being hinged together, substantially as described.

4. The combination, with a drag and harrow hinged together and each composed of jointed sections, of chains F, connecting the several sections of the harrow, the levers G, pivoted to the end sections of the drag, and the chains F', secured to the end sections of the harrow and to the said levers, substantially as described.

398,961. WHEEL-PLOW. ANDREW GOODYEAR, South Bend, Ind., assignor to the South Bend Chilled Plow Company, same place. Filed Aug. 20, 1888. Serial No. 283,223. (No model.)

Claim.—1. In a wheel-plow, the combination, with a frame and a plow supported thereon, of a guiding-wheel secured to the furrow

398,961.

side of the forward portion of said frame, a spring-latch holding said wheel substantially parallel with the landside of the plow, a lever pivotally secured to the frame, and means for connecting said lever with the guiding-wheel, whereby the spring-latch may be released and said wheel turned at any desired angle to guide the plow, substantially as shown and described.

2. In a wheel-plow, the combination, with a frame, a landside-wheel secured thereto, and a plow supported on said frame, of a caster-wheel secured to the rear of the frame, a spring-latch holding said caster-wheel parallel with the landside of the plow, a guiding caster-wheel secured to the furrow side of the forward portion of the frame, a spring-latch holding said forward caster-wheel parallel with the rear caster-wheel, and a lever pivotally secured to the frame, and means, substantially as described, for connecting said lever with the forward guiding caster-wheel, whereby the spring-latch may be released and said caster-wheel turned by said lever at any desired angle to guide the plow, all constructed, arranged, and operating substantially as set forth.

3. In a wheel-plow, the combination, with a frame and a plow supported thereon, of a guiding caster-wheel secured to the furrow side of the forward portion of the frame, a spring-latch holding said guiding-wheel substantially parallel with the landside of the plow, a segment-gear formed on the yoke of the guiding caster-wheel, a shaft mounted in a bearing on the frame, an upwardly-projecting toothed sector rigidly secured to said shaft and provided with a downwardly-projecting arm having a notched end, a spring-latch secured to the frame and engaging said notched end, and a lever pivotally secured to the shaft and provided with a spring-actuated dog adapted to engage with the toothed sector and having a segment-gear on its lower end adapted to be thrown in or out of gear with the gear on the yoke of the caster-wheel and to be held as adjusted by the spring-latch, all constructed, arranged, and operating substantially as shown and described.

4. In a wheel-plow, the combination, with a frame and a plow supported thereon, of a guiding caster-wheel, R', secured to the forward end of the furrow side of the frame, a spring-latch, *p*, adapted to hold said caster-wheel substantially parallel with the landside of the plow, a beveled segment-gear, R^4, secured to and projecting from the yoke of the caster-wheel, a bearing, S, formed on the frame, a shaft, S', mounted in said bearing and having rigidly secured to its rear end an upwardly-projecting toothed sector and a downwardly-projecting arm, T', having a hook end, *t*, provided with notches t' t^2, a spring-latch, T^3, secured to the frame and adapted to engage with said notches, and a lever, V, pivotally secured to the shaft S' and provided with a spring-actuated dog adapted to engage the toothed sector, and a beveled segment-gear, V', on its lower end, adapted to be thrown in or out of engagement with the gear R^4 and to be held as adjusted by the spring-latch T^3, all constructed, arranged, and operating substantially as shown and described.

5. In a wheel-plow, the combination, with a substantially U-shaped frame, a plow supported on said frame, a landside-wheel secured thereto, a casting, G, secured to the rear of the frame and laterally adjustable thereon and having a rearwardly-projecting arm, G', a vertical bearing, G^2, in said arm, a caster-wheel, H', having the pintle *h* of its yoke H mounted in the bearing G', and the segmental cross-bar H^2, having a notch, h^2, and a spring-latch adapted to engage with said notch, of a forward cross-bar, B, secured to the forward portion of the frame and projecting beyond its furrow side, a casting, P, secured to the extension of the cross-bar, a rearwardly-projecting arm, P', formed on said casting, a vertical bearing, P^2, formed in said arm, a caster-wheel, R', having the yoke R and pintle *r* mounted in said bearing P^2, and the segmental cross-bar R^2, provided with the notch r^2, and a spring-latch, *p*, adapted to engage with said notch, all constructed, arranged, and operating substantially as shown and described.

6. In a wheel-plow, the combination, with a frame supported upon suitable carrying-wheels, a crank-shaft mounted upon said frame, a lifting-lever secured to the crank-shaft, and a plow-beam pivotally secured to said crank-shaft and carrying on its rear end a plow, of a lever pivotally secured to the forward end of frame and having substantially S-shaped slot therein, and a pin on the forward end of the plow-beam engaging with said slot, all constructed, arranged, and operating substantially as shown and described, whereby, as the lever is moved back, the forward end of the beam will be forced down, so as to cause the point of the plow to enter the ground.

7. In a wheel-plow, the combination, with a frame having the vertical slot C' in its forward end and supported upon suitable carrying-wheels, a crank-shaft mounted on said frame, a lifting-lever secured to the shaft, and a plow-beam, L, pivotally secured to said crank-shaft, carrying on its rear end a plow and having its forward end projecting through the vertical slot C', of a toothed sector, O', secured to the frame at one side of the vertical slot, a lever, O, pivotally secured to the frame and provided with a spring-actuated dog, *o*, adapted to engage with the toothed sector and a hand-lever, *o'*, connected with said dog, a substantially S-shaped slot, O', in said lever, and a pin, *l*, on the forward part of the beam, engaging with said slot O', all constructed, arranged, and operating substantially as shown and described, as and for the purpose set forth.

8. In a wheel-plow, the combination, with a frame, a wheel secured to the rear of the frame, a crank-shaft mounted on said frame, a plow-beam pivotally secured to the crank-shaft and carrying on its rear end a plow, a lifting-lever secured to said crank, and a cross-bar or brace extending across the rear of the plow, of a depending brake-bar hinged to the rear of the frame in front of the rear wheel and adapted to engage with the cross-bar or brace as the plow is lifted by its crank-shaft and moved back so as to be forced against the tire of the rear wheel, and thus form a brake for the plow, all constructed, arranged, and operating substantially as shown and described.

9. In a wheel-plow, the combination, with a frame, a wheel secured to the furrow side of the forward portion of the frame, a casting secured to the rear of the frame and laterally adjustable thereon, and a wheel secured to said casting and adapted to travel in a line parallel with the forward wheel, of a depending brake-bar hinged to the adjustable casting in front of the rear wheel, a plow-beam mounted on said frame and carrying a plow on its rear end, and means for raising and lowering the beam, whereby as said beam is raised the plow will engage the brake-bar and force it against the rear wheel, substantially as shown and described, as and for the purpose set forth.

10. In a wheel-plow, the combination, with the frame, a landside-wheel secured thereto, a caster-wheel secured to the furrow side of the forward portion of the frame, a casting, G, secured to the rear of the frame and laterally adjustable thereon, a caster-wheel, H, secured to said casting, a crank-shaft mounted on the frame, a plow-beam, L, pivotally secured to the crank-shaft and carrying on its rear end a plow, L', a lifting-lever secured to said crank-shaft, and a cross-bar or brace, *w*, extending across the rear of the plow, of a depending brake-bar hinged to the casting G in front of the caster-wheel H and adapted to be engaged by the cross-bar or brace on the plow and be forced against the tire of the rear caster-wheel when said plow is lifted by its crank-shaft and moved back, thus forming a brake for the same, all constructed, arranged, and operated substantially as shown and described.

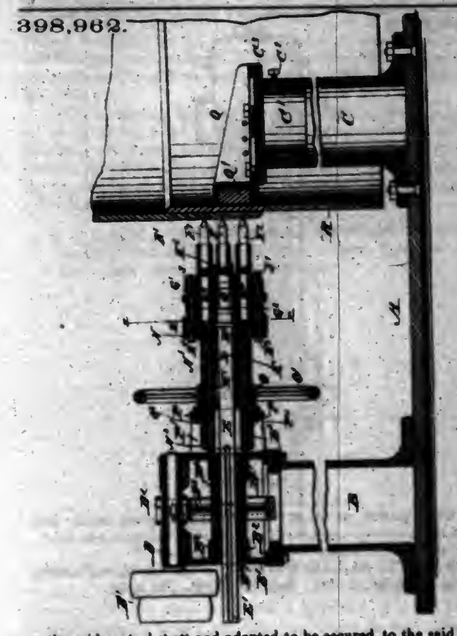
398,962. MULTIPLE DRILLING-MACHINE. RICHARD HAMMOND, Buffalo, N. Y. Filed May 29, 1888. Serial No. 275,423. (No model.)

Claim.—1. In a drilling-machine, the combination, with a central drilling-tool, of two outer drilling-tools held parallel with the said central drilling-tool and mounted in bearings held to swing from the said central drilling-tool, substantially as shown and described.

2. In a drilling-machine, the combination, with a central shaft carrying a drilling-tool, of two outer parallel shafts rotated from the said central shaft and mounted in bearings pivoted on the said central shaft, substantially as shown and described.

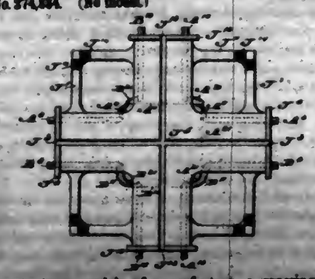
3. In a drilling-machine, the combination, with a central shaft carrying a drilling-tool, of two outer parallel shafts, each carrying a drilling-tool and rotated from the said central shaft, and bearings carrying the said outer shafts and pivoted on the said central shaft, substantially as shown and described.

4. In a drilling-machine, the combination, with a face-plate, of a central shaft held to rotate in the said face-plate and carrying a drilling-tool, two outer parallel shafts, each carrying a drilling-tool and rotated from the said central shaft, and bearings carrying the said outer shafts pivoted on the said central shaft, said bearings being adapted to be secured to the said face-plate, substantially as shown and described.



5. In a drilling-machine, the combination, with a face-plate mounted to slide forward and backward, of a central shaft passing through the said face-plate and carrying a drilling-tool, two outer parallel shafts, each carrying a drilling-tool and rotated from the said central shaft, and bearings carrying the said outer shafts and pivoted on the said central shaft and adapted to be secured to the said face-plate, substantially as shown and described.

6. In a drilling-machine, the combination, with a face-plate and means, substantially as described, for imparting a forward and backward sliding motion to the said face-plate, of a central shaft passing through the said face-plate and carrying a drilling-tool, two outer parallel shafts, each carrying a drilling-tool and rotated from the said central shaft, and bearings carrying the said outer shafts and pivoted on the said central shaft and adapted to be secured to the said face-plate, substantially as shown and described.



7. In a drilling-machine, a face-plate mounted to slide forward and backward and provided with an annular slot, in combination with a central shaft mounted to rotate in the said face-plate and sliding forward and backward with the same, two outer parallel shafts rotated from the said central shaft, bearings carrying the said outer shafts and pivoted on the said central shaft, and bolts passing into the said annular slots and through the said bearings to secure the latter to the face-plate, substantially as shown and described.

8. In a drilling-machine, a face-plate mounted to slide longitudinally, a central shaft mounted to rotate in and sliding with the said face-plate, two outer parallel shafts rotated from the said central shaft, and bearings carrying the said outer shafts and pivoted on the said central shaft and connected with the said face-plate, and drilling-tools secured to the said central and outer shafts, in combination with a wooden block held in front of the said drilling-tools, a frame carrying the said block and mounted to slide horizontally, a table in which the said frame is held to slide, a sleeve carrying the said table, and a column in which the said sleeve is held vertically adjustable and mounted to turn, substantially as shown and described.

398,962.

398,963. CROSSING-CONDUIT FOR ELECTRIC RAILWAYS. ISAAC W. HEYBERGER, Philadelphia, Pa. Original application filed Apr. 21, 1887, Serial No. 236,034. Divided and application filed Nov. 29, 1887, Serial No. 256,260. Again divided and this application filed May 24, 1888. Serial No. 274,634. (No model.)

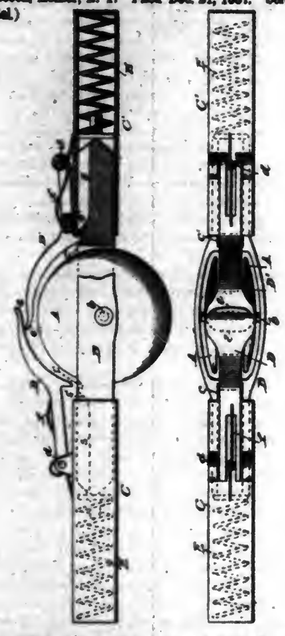
Claim.—1. As an article of manufacture, a crossing-conduit for electric railways for use at intersections thereof, formed in a single construction, practically complete before being put into place, said conduit having two transverse passages crossing at an angle and opening into each other, provided with longitudinal slots along their upper surfaces, intersecting and opening into each other, said passages having secured to their inner and opposite sides parallel conducting leads for each intersecting line A^4 B^5 A^{16} B^{16}, interrupted by the distance between the internal corners of said transverse passages, and having the free ends of the conductors of said leads joined to their continuations beyond said interrupted space by deflected and insulated metallic conductors carried across said intersection out of the line of travel of the current-gathering devices of a motor-car upon either line of railway, said leads attached to the inner sides of said conduit by insulated supports, the free ends of said leads at the extremities of the passages and the outer ends of said passages adapted to be attached to the free ends of the leads and the free ends of the passages of the conduits of said railways, so as to complete the said intersecting railways and the electric connections thereof when the said conduit is in place, substantially as described.

2. The railway-crossing conduit having transverse passages open through the same and intersecting each other, longitudinal open slots along its upper surfaces intersecting each other, and a supporting frame-work, J^9 J^{11}, for the rails of an intersecting railway, the whole formed in one construction before being put into place for use, substantially as described.

3. In a crossing-conduit for electric railways, the transverse intersecting passages L L', having walls J J^{10}, said passages crossing each other at an angle, in combination with supporting-arms J^7 J^{11} J^7 J^{11} springing from the outer walls of said passages and having their free ends united at J^{20} J^{20}, the whole forming a rigid square frame-work adapted to support the trackway of two intersecting railways and prevent displacement of the said conduit by the thrust of said railways in either direction, together with a line of electric leads extended along said passages, insulated from said walls, and interrupted at said intersection, and laterally-deflected conductors bridging said interrupted spaces out of line of travel of the current-gathering devices of a motor-car upon said railways, substantially as described.

4. In combination with a crossing-conduit for electric railways, the intersecting passages L L', having intersection L^3, the leads A^4 B^5 along the sides of the passage L, and the leads A^{16} B^{16} along the sides of the transverse passage L', said leads insulated from the conduit-walls J J^{10} and interrupted at said intersection L^3, each of said leads substantially continuous and carried out laterally through the wall of said conduit and across said intersection beneath the same, and thence back through said wall into said passage beyond said intersection and continuously onward along the line, together with flexible insulating tubes or ducts K K^6, surrounding said leads and preserving the insulation thereof in their passage from the deflected end of each of said leads to the continuation of the same beyond said intersection, substantially as described.

5. In an electric-railway-crossing conduit, the transverse passages L L', intersecting each other, in combination with the leads A^4 B^5 A^{16} B^{16}, extended along said passages and interrupted at the intersection L^3 thereof, said leads deflected, so as to cross the said intersection out of the line of passage of the current-gathering devices of a motor-car, and the insulating-tubes K K^4 K^6 K^8, surrounding said deflected leads, substantially as and for the purposes described.

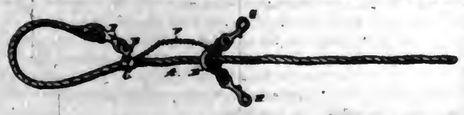


6. In combination with the cross-shaped conduit having walls J J J^{10} J^{10} and intersecting passages L L', the electric leads A^4 B^5 A^{16} B^{16}, adapted to be connected with the corresponding leads of one or more electric railways, and the flanged expansions J^9 J^9 J^{10} J^{10} upon the free ends of the walls of said cross-shaped conduit, and bolt-holes J^7 J^{17} in said flanged expansions, the said flanges adapted to face against corresponding flanges of the conduits of transverse lines of electric railway, and, bolted thereto through said bolt-holes, maintain the said leads and said cross-shaped conduit in place against thrust from either direction, substantially as described.

7. In an electric-railway crossing, in combination with the leads A^4 B^5 A^{16} B^{16}, insulated from their supports and adapted to supply electricity to the current-gathering devices of a motor-car traveling in contact therewith, the deflected wires A^{11} A^{16} B^{11} B^{16}, covered with an insulating substance and contained within ducts K K' K^6 K^8, carried across the intersection L^3 out of line of travel of said current-gathering devices, the space between said wires and said ducts filled with melted paraffine or the like after the said wires are in place in said ducts, substantially as described.

8. In an electric-railway-crossing conduit, conducting-leads extended along within the same, insulated from said conduit by insulators I^5, and interrupted at the intersection L^3, said leads deflected at said interruption to bridge the said intersection, or the free ends thereof connected by laterally-deflected wires, in combination with leaden tubes K^6, or the like, surrounding and insulating said deflected wires, said tubes extended through perforations in said insulating-blocks I^6 I^5,

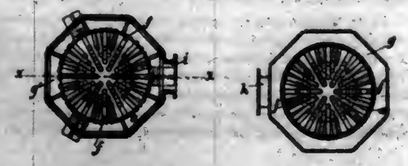
opposite the free ends of said leads, and secured in said insulators I^5 by joints or expansions K^5 K^5, substantially as described.



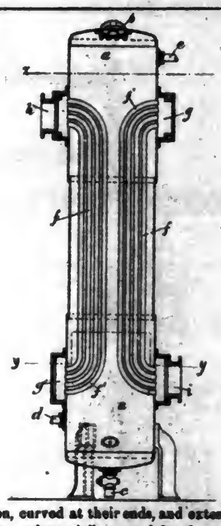
398,964. POSITIVE SHUTTLE-MOTION FOR LOOMS. WILLIAM F. HITCHCOCK, Homer, N. Y. Filed Dec. 21, 1887. Serial No. 258,567. (No model.)

Claim.—1. The combination, with a shuttle, B, consisting of a yoke having vertically-aligned bobbin-bearings, diametrically-opposite projecting ends, and notches *c c'* on one side of the shuttle and where the said projecting ends join the yoke, of the tubular shuttle-carriers having arch-shaped hooks D D' pivoted at their outer ends to the same side of the carriers, with their axes parallel with the said bobbin-bearings and constructed to travel along the projecting shuttle ends and engage the notches therein, and the springs throwing the hooks toward the open side of the yoke, substantially as set forth.

2. The combination of the shuttle B, having a central yoke, side notches, *c c'*, at opposite ends of the yoke, and opposite end side grooves, *s s*, terminating in inclined inner ends, *s' s'*, the tubular shuttle-carriers C C', and the horizontally-operating arch-shaped hooks D D', pivoted to said carriers and constructed to travel within the grooves *s s* up the inclines *s' s'* and to engage with the notches in the shuttle also having inclined outer ends adapted to lift or release the one hook by the other, and springs operating to latch or close the hooks into engagement with the shuttle, essentially as set forth.

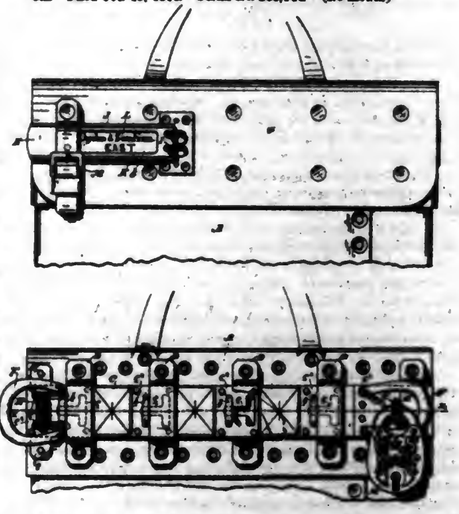


398,965. DEVICE FOR HITCHING ANIMALS. CHARLES A. HUNT Fall River, Mass. Filed Nov. 30, 1888. Serial No. 292,212. (No model.)



Claim.—A hitching-strap comprising the neck-loop, a loose ring connected by a chain to said loop, and snap-hooks attached to said ring, substantially as described.

398,966. FEED-WATER HEATER. JOSEPH L. HUNTER, Pittsburg Pa. Filed Sept. 11, 1888. Serial No. 285,145. (No model.)



Claim.—As an improvement in feed-water heaters, a water-tank, *a*, annular steam-chambers *g g'*, arranged outside of and encircling the water-tank, and steam-heating pipes straight and vertical through

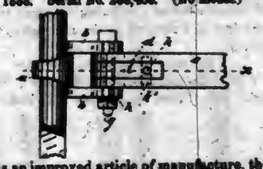
their major portion, curved at their ends, and extending radially into the steam-chambers, substantially as and for the purpose described.

398,967. MAIL-BAG FASTENING. JOSEPH JACOBS, San Francisco, Cal. Filed Oct. 15, 1888. Serial No. 288,144. (No model.)

Claim.—1. In a mail-bag fastening, the combination of T-shaped tongues on the flap of the bag adapted to pass through openings or slits in its sides or folds, the sliding strap on the back of the bag having the T-shaped grooves or slots for receiving and holding the T-shaped tongues of the flap, and the limiting-stop for defining the movement of the sliding strap, consisting of a loop or band, E, secured to the bag and passing through elongated slots *e'* in the strap, substantially as described.

2. In a mail-bag fastening, tongues upon the flap of the bag adapted to pass through its sides or folds, a sliding strap upon the back of the bag and having grooves or slots for receiving and holding the tongues, and a locking-staple passing through the bag and the sliding strap and receiving a lock at the back of the bag, whereby the sliding strap is held, in combination with the frame for receiving the tag or destination-card, consisting of the open-faced plate K, hinged to the flap of the bag and carrying the locking-staple, and the flanged plate J, secured to the flap and receiving the plate K and its staple, substantially as herein described.

3. In a mail-bag fastening, tongues upon the flap of the bag adapted to pass through its sides or folds, a sliding strap upon the back of the bag and having grooves or slots for receiving and holding the tongues, and a locking-staple passing through the bag and sliding strap and receiving a lock on the back of the bag, whereby the sliding strap is held, in combination with the frame for receiving the tag or destination-card, consisting of the open-faced plate K, hinged to the flap of the bag and carrying the locking-staple, and the flanged plate J, secured to the flap and receiving the plate K and its staple, and the cross-strap and buckle for holding the plates together when the staple is released from the back of the bag, substantially as herein described.



4. In a mail-bag fastening, and in combination with the staple by which the bag is locked, the frame for the tag or destination-card, consisting of the outer open-faced plate, K, hinged to the flap of the bag and carrying the staple, and the flanged base-plate J, hinged to the flap and having a slotted end through which the staple passes, substantially as herein described.

398,968. VENTILATING ATTACHMENT FOR STOVE-PIPES. GEORGE L. JONES and BENJAMIN M. MILES, Chippewa Falls, Wis. Filed Mar. 7, 1888. Serial No. 266,366. (No model.)

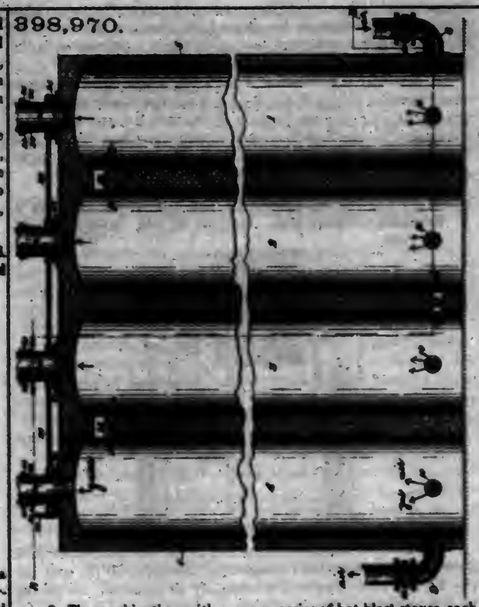
Claim.—The combination, with a vertical draft-pipe having a series of lateral openings at different heights, of a sleeve, as E, surrounding said pipe, having an opening, as J', registering with said openings when the sleeve is adjusted, a projection, as C, and pin, as D, rigidly secured on said pipe below and above the sleeve, respectively, a shoulder, as F, produced on the upper edge of said sleeve, and a hood, as G, secured to said sleeve; having a brace, as P, substantially as described.

398,969. THILL-COUPLING. DANIEL KAVANAGH, Orange, N. J. Filed Sept. 26, 1888. Serial No. 286,408. (No model.)

Claim.—1. As an improved article of manufacture, the thill-coupling herein described and shown, consisting of a clip with ears and bolt, a thill-iron having a slotted hooked end, and a locking-key pivotally secured at one end to the clip-bolt and the other end fitting in said slot, said thill-iron and key turning freely on said bolt, said key being held in position thereon by a set-screw with elongated head, for the purpose set forth.

2. The combination, in a thill-coupling, of a clip, *a*, with ears *b b* thereon, a thill-iron, *c*, having hooked ends *c*, and a locking-key pivotally connected to the clip-bolt at one end and securing the thill-iron to the said clip, substantially as and for the purposes set forth.

3. The combination, in a thill-coupling, with a clip, *a*, with ears *b b* thereon, and a bolt secured in said ears, of a loose ring, *i*, on said bolt and having a tangential portion, i^3, with beveled end i^3, a thill-iron, *c*, slot *d*, hooked end *e*, thumb-screw *k*, and oblong head *k'*, substantially as and for the purposes set forth.

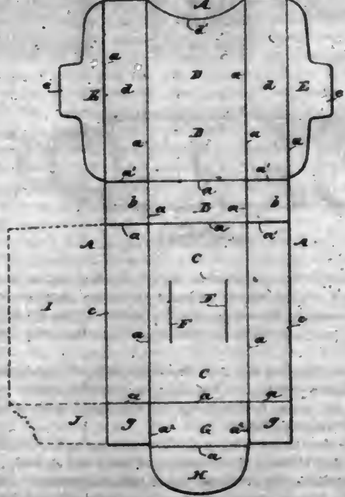


4. A locking-key for a thill-coupling, pivotally secured to the clip-bolt at one end and at the other end adapted to fit in a slot in a thill-iron, as and for the purposes set forth.

398,970. HOT-BLAST STOVE. HUGH KENNEDY, Sharpsburg, Pa. Filed Aug. 15, 1887. Serial No. 246,263. (No model.)

Claim.—1. The combination of a series of hot-blast stoves, connected by alternate high and low openings, forming a continuous air-passage therethrough, with separate gas-inlets at the base and separate gas-outlets at the top of each stove, substantially as and for the purposes described.

2. The combination, in a hot-blast stove, of a gas-outlet at the top, with a sliding valve for closing the same, and a pipe pivotally connected by rods to the sliding valve, and also pivotally connected by rods to a stationary point on the opposite side from the valve, so that when the valve is opened the pipe shall occupy a vertical position over the gas-outlet, and when the valve is being advanced to close the outlet the pipe shall be raised out of the path of the valve, substantially as and for the purposes described.



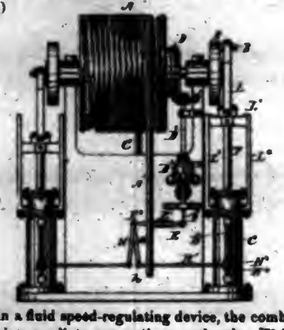
398,970.

3. The combination, with a row or series of hot-blast stoves, each having a gas-outlet at the top controlled by a sliding valve provided with a rack, of a power-shaft extending transversely to the valves and provided with pinions engaging the racks, a pulley on said shaft, and a chain or belt extending to near the ground for actuating the shaft, substantially as and for the purposes described.

4. A series of hot-blast stoves having air-ports opening from one to the other, each stove of the series being provided with a gas inlet and outlet port, so that the gas shall pass through each stove independently of the other, and the air shall pass from one stove to the other, substantially as and for the purpose specified.

398,971. PAPER BOX. EMIL L. MEYER, Brooklyn, N. Y. Filed Sept. 19, 1888. Serial No. 285,782. (No model.)

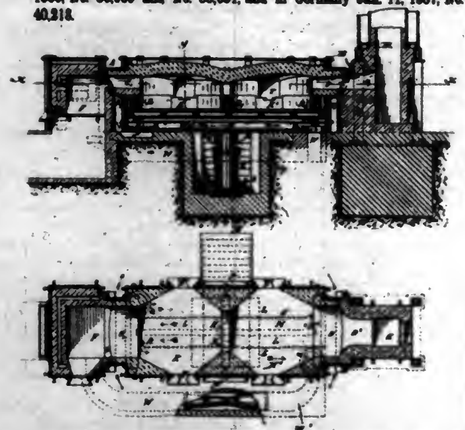
Claim.—1. A folding box-blank made with transverse slits *a' a' a' a'* and longitudinal slits a^5 a^5 and locking slits F F, providing parts B *b b*, C *c c*, D *d d*, E *e* E *e*, G *g g*, and H, all substantially as herein set forth.



2. A folding box-blank made with transverse slits *a' a' a' a'* and longitudinal slits a^5 a^5 and locking-slits F F, providing parts B *b b*, C *c c*, D *d d*, E *e* E *e*, G *g g*, and H, and scored at *a* between said parts, substantially as herein set forth.

3. A folding box formed of a blank made with slits *a'* a^5 F, providing parts B *b b*, C *c c*, D *d d*, E *e* E *e*, G *g g*, and H, said parts folded

with the flaps *b b* between the pairs of side flaps, *c d*, and the parts E overlapping the part C and having their tabs *e* interlocked in the slits F of said part C, substantially as herein set forth.



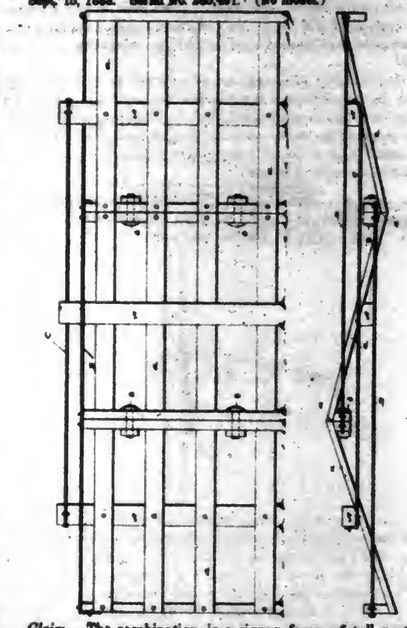
4. A folding box formed of a blank made with slits d' d^2 F, providing parts B *b b*, C *c c*, D *d d*, E *e* E *e*, G *g g*, and H, said parts folded with the flaps *b b* between the pairs of side flaps, *c d*, and the parts E overlapping the part C and having their tabs *e* interlocked in the slits F of said part C, and said parts E C, across the slits F, secured by an adhesive stamp, strip, or label, substantially as herein set forth.

398,972. SPEED-REGULATOR FOR ELEVATORS. WILLIAM E HENDERSON, Cambridge, Mass. Filed Nov. 30, 1888. Serial No. 292,234. (No model.)

Claim.—In a fluid speed-regulating device, the combination of a governor, D^3, intermediate connections, and valve H^3 H^4, with the pipe H^2, and fluid-cylinder C, substantially as described, and for the purpose set forth.

398,973. ROTARY DOUBLE-FLAME FURNACE. GOTTFRIED PIETZKA, Witkowitz, Moravia, Austria-Hungary. Filed Mar. 16, 1888. Serial No. 267,411. (No model.) Patented in Austria-Hungary Nov. 1, 1886, No. 30,909 and No. 55,631, and in Germany Jan. 11, 1887, No. 40,218.

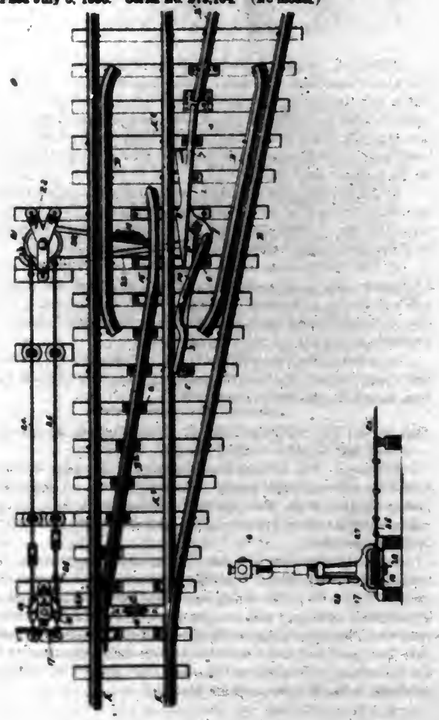
Claim.—1. The combination, with a fire-box and a stack or chimney, of a double hearth or heating-chamber constructed and arranged to connect alternately with the exit-flue of the fire-box and with the chimney, and means for rotating said hearth, substantially as described.



2. The combination, with a fire-box and a stack, of a double hearth arranged between the fire-box and stack, a turn-table supporting the said hearth, and means for operating said turn-table, substantially as herein shown and described.

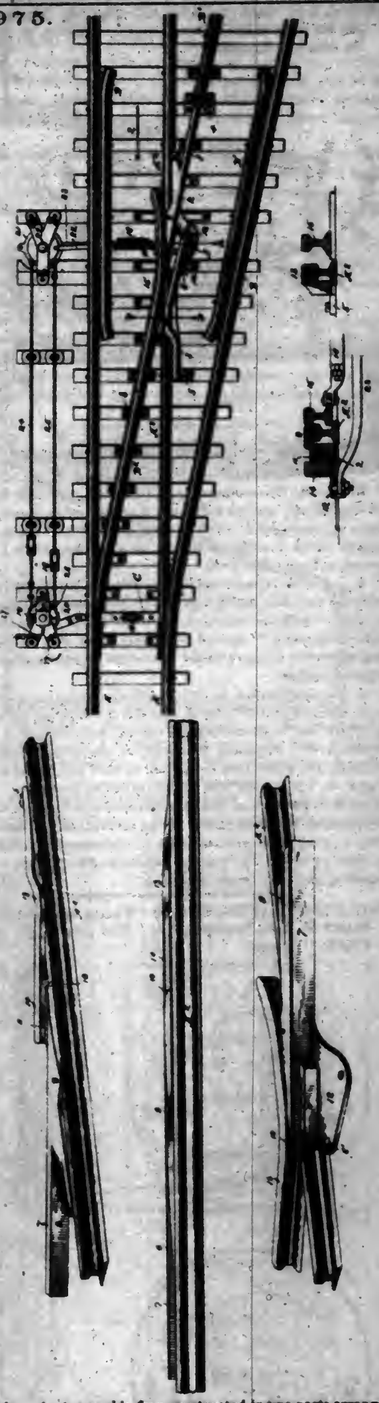
3. The combination, with a fire-box and a stack, of a double hearth arranged between the fire-box and stack and provided with opposite channels leading therefrom, a turn-table supporting the hearth, and means for raising, lowering, and turning the said turn-table, substantially as herein shown and described.

4. In a furnace, the combination, with a fire-box and a chimney opposite the fire-box, of a double hearth between the fire-box and chimney and provided with an air-channel below the bottom thereof, and a blast-engine connected with the said air-chamber and with the fire-box, substantially as herein shown and described.



5. In a furnace, the combination, with a hearth, of a partitioned channel, l, below the bottom of the hearth, and connected at one end with the open air and at the other end with the suction-pipe of a blast-engine, substantially as described.

398,974. FENCE. EPHRAIM POTTER, Bowling Green, Ky. Filed Sept. 15, 1888. Serial No. 285,491. (No model.)



Claim.—The combination, in a zigzag fence, of tall posts alternating with the main fence-posts and arranged in line with each other, outer wires arranged, as shown, parallel to each other and to the middle wire and secured to the main fence-posts, so as to cross the bends or zigzags, the intermediate wire being arranged at a greater altitude than the outer ones and secured to the alternating tall posts, substantially as specified.

398,975. RAILROAD-FROG. CHARLES B. PRICE, Pittsburg, Pa. Filed July 5, 1888. Serial No. 279,104. (No model.)

398,975.

Claim.—1. A movable frog constructed in two parts arranged to be thrown on and off the main rail at one side thereof, substantially as described.

2. A movable frog constructed in two parts hinged together and arranged at one side of the main rail to be operated by a single connection to throw them upon the said main rail, substantially as described.

3. A movable frog constructed in two parts connected to move together at their inner ends and arranged to be moved simultaneously to and from the main rail, the outer ends of the two parts being pivotally attached to the track and arranged at one side of the main rail, substantially as described.

4. A movable frog constructed in two sections pivoted at their outer ends at one side of the main rail, in combination with an actuating device connected to the sections at their inner ends, substantially as described.

5. A movable frog constructed in two parts hinged together and arranged to be operated simultaneously, one part acting to form a continuation of the side-track rail and the other operating as a guide-rail therefor, substantially as described.

6. A movable frog constructed in two parts and connected to move together, one part forming a continuation of the side-track rail and an inclined way for the main track, and the other part forming a guard for the side-track rail and an inclined way for the main track, substantially as described.

7. A movable frog consisting of two sections connected together, one section being pivoted at one end adjacent to the side-track rail and arranged to form a continuation of said rail, and having a flange arranged to overlap the main rail and furnishing a bearing for the wheels, and the other section being pivotally mounted adjacent to the main rail, substantially as described.

8. A movable frog consisting of two sections connected together, one section being pivoted at one end adjacent to the side-track rail and arranged to form a continuation of said rail, and having a flange arranged to overlap the main rail and furnishing a bearing for the wheels, and having a recess, as 11, for the passage of the wheel-flanges, substantially as described.

9. A movable frog consisting of two sections connected together, one section being pivoted at one end adjacent to the main track and having an inclined flange, as 13, adapted to overlap the main rail, the free end being bent to act as a guard-rail, substantially as described.

10. A movable frog consisting of two sections, one having an extended base to which the other is pivoted, and a connecting-rod secured to said base for operating the sections simultaneously, substantially as described.

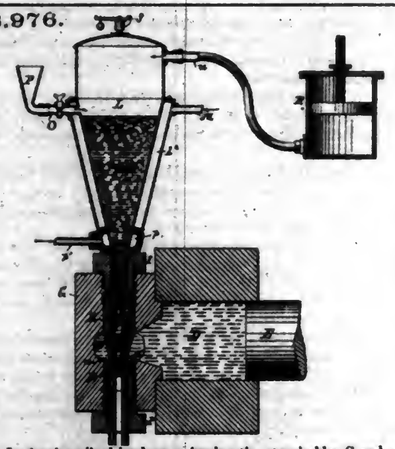
11. The combination, with a main rail, of a movable frog on one side of said main rail, and a spring-rail on the opposite side of the main rail movable independently of the frog, substantially as described.

12. The combination, with the main rail, of a movable frog consisting of two sections pivotally connected together and arranged to form a continuation of the side-track rail, and a spring-rail movable independently of the frog and arranged to form a continuation of the leading-in rail, substantially as described.

13. The combination, with the main rail, of a movable frog consisting of two sections pivoted together and arranged at one side of the main rail, and a spring-rail movable independently of the frog arranged at the other side of the main rail, and connecting-rods for the frog and spring-rail, the said rods being secured to the opposite sides of the operating-wheel, substantially as described.

14. The combination, with the movable frog consisting of two sections, one forming a continuation of the side-track rail and having a flange overlapping the main rail, the other section forming a guard-rail for the frog and having a flange overlapping the main rail, of a spring-rail forming a continuation of the leading-in rail, and connections with the frog-rail and spring-rail for moving them simultaneously, substantially as described.

15. The combination, with a continuous main-line rail, of a movable frog forming a continuation of the side-track rail and having a portion overlapping the main rail, and a spring-rail movable independently of the frog constructed to meet the overlapping portion of the frog and constituting therewith a practically continuous side-track rail over the main rail, substantially as described.



16. The combination, with the movable frog-section having a pointed flange overlapping the main-track rail, of a spring-rail arranged to complete the leading-in rail and protect said flange-point, substantially as described.

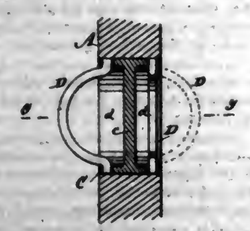
17. The combination, with a switch-stand connected to operate the switch-points upon a quarter-turn, of a movable frog and guard-rail pivoted at two points upon the same side of the main rail, and operating-wheel connected to operate both upon a quarter-turn, and connecting-rods between the operating-wheel and switch-stand, whereby the wheel is operated by a direct pull in either direction, substantially as described.

398,976. APPARATUS FOR MANUFACTURING SOLDER-RODS. JOHN ROSENBERG, Brooklyn, N. Y., assignor of one-half to James Hartle, same place. Filed Sept. 26, 1888. Renewed Oct. 8, 1888. Serial No. 287,556. (No model.)

Claim.—1. The combination, with the combined lead-press and flux containing and heating vessel, of the described separate heating devices located at and so as to heat the lower end of the said vessel, as and for the purpose specified.

398,976.

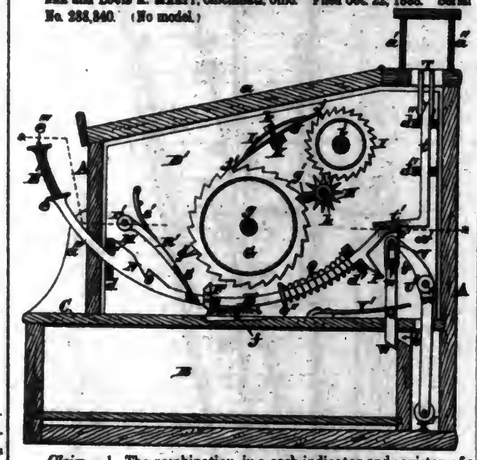
2. In the described lead-press, having the core-holder G and contained core H, the combination, with said holder and core, of highly-heated blocks of iron, V V, one or more, constructed and applied as and for the purpose described.



398,977. HORSE-DETACHER. STEPHEN H. ROBLIN, Bay City, Mich., assignor to the American Whiffletree Company, same place. Filed Sept. 4, 1888. Serial No. 284,523. (No model.)

Claim.—1. The combination, in a horse-detaching device, of the whiffletree having end ferrules, *d*, provided with the horizontal slots *e*, the tag-holders *h*, pivoted in said slots *e* and provided with the arms *j*, extending inwardly over the rear side of the whiffletree and having the depressions *k* and cap-pieces *l*, secured to the whiffletree and provided with the central slots, *n*, and the end slots, *o*, with the lock-pieces *r* beneath the said cap-pieces, and with their outer ends passed over the free ends of the arms *j*, the screws *s*, passed through the slots *n* and into the lock-pieces, and the operating-cords *v*, secured to the inner ends of the lock-pieces, substantially as and for the purpose set forth.

2. In a horse-detaching device, the combination, with the thills and whiffletree provided with devices, as described, for securing the tugs thereto and for releasing the same, with holdback securing devices consisting of a base-plate secured to each thill and provided with hooks *b'*, projecting inwardly from their rear ends and extending forward, the rings *c'*, engaging with the hooks, and retaining-bolts *h'* between the hooks and base-plates, and with one end bearing against the rings, and the springs *g'*, for holding the said retaining-bolts in position against the rings, substantially as and for the purpose set forth.

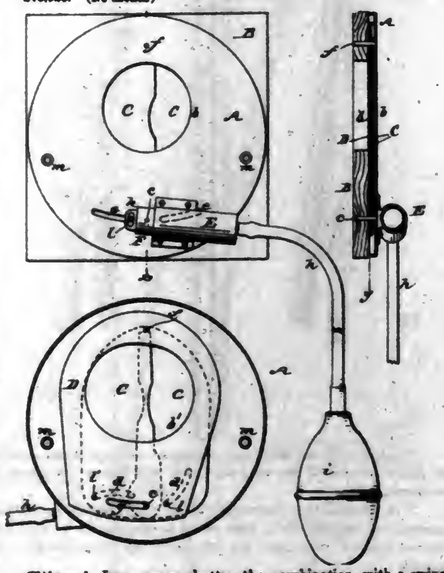


398,978. HANDLE FOR SLIDING DOORS. PETER SCHEER and JOHN G. STATES, Minn., Nebr. Filed July 27, 1888. Serial No. 281,183. (No model.)

Claim.—1. A handle attachment for sliding doors and for other analogous uses, consisting of a circular band open at its opposite ends and handles pivoted to said band and arranged to close into the opposite end portions thereof, substantially as specified.

2. The within-described handle attachment for sliding doors and for other analogous uses, consisting of the circular band C, open at its opposite ends, but closed by a partition, *c*, in its center, and the handles D, pivoted to said band on opposite sides of said partition and adapted to close within the band, as set forth.

398,979. CASH INDICATOR AND REGISTER. WILLIAM G. SCHENKER and LOUIS K. MARTY, Cincinnati, Ohio. Filed Oct. 22, 1888. Serial No. 288,340. (No model.)



Claim.—1. The combination, in a cash indicator and register, of a bent key suitably guided within the case and having means for operating a registering-disk, said key being provided with a trip and rigid shoulder, which shoulder is caught by a rest-bar when a tablet is exposed, as herein described.

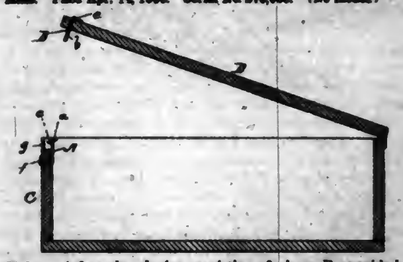
2. In a cash indicator and register, the bent key E, suitably guided within the case and having a pawl, F, trip N, and rigid shoulder O, in combination with the rest-bar S and tablet T, said rest-bar being provided with levers R R', pivoted to the side plates, *r r'*, and the pawl F being adapted to engage with the teeth of the registering-disk G, for the purpose described.

3. The combination, in a cash indicator and register, of the bent key E, having a pawl, F, trip N, shoulder O, retracting-spring Q, and spur P, the bar V, connecting the pivoted bell-cranks U *u* U' *u'*, the drop-catch W *w*, suspended from said bar, the spring V', that retracts said catch, the tablet-stem *t*, operated by said key E, and a registering-disk, G, actuated by said pawl F, as herein described.

4. The combination, in a cash indicator and register, of primary and secondary registering-disks having ratchet-teeth, a double-ended spring, J *j j'*, engaged with said teeth, a supplementary spring, L, bearing upon the spring J *j j'*, and an adjusting-screw, *k*, tapped into the supporting-bar K, as herein described.

398,980. CAMERA-SHUTTER. WILLIAM SHAKESPEARE, Jr., and GARRET W. LOW, Kalamazoo, Mich. Filed July 3, 1888. Serial No. 278,925. (No model.)

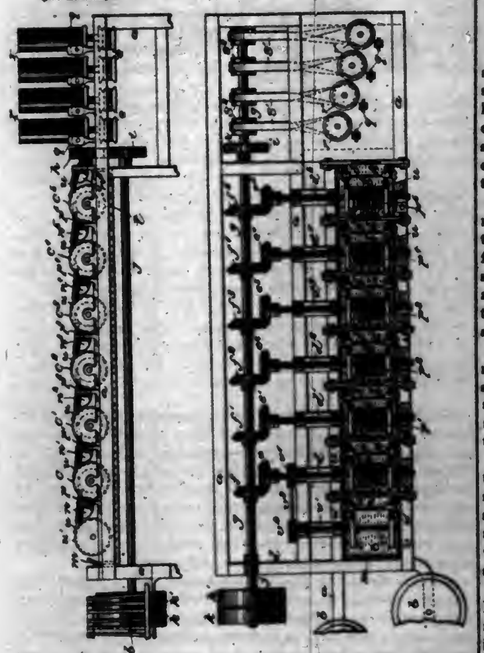
Claim.—1. In a camera-shutter, the combination, with a swinging or rocking slotted shutter, of a pivoted arm, lever, or plate provided with a pin arranged to engage with the slot in the shutter for operating the latter, substantially as specified.



2. The combination, with the apertured shutter case or frame and its pivoted shutter-slides C C, having reverse slots *d d*, of the pivoted lever-like operating-plate D, having studs or pins *l l*, arranged to engage with said slots, essentially as and for the purpose herein set forth.

3. The combination, with the apertured shutter case or frame having slots *e*, of the swinging or rocking shutter-slides C C, having a common pivot, *c*, and reverse slots *d d*, and the pivoted arm, lever, or operating-plate D, having a slot, *g*, and pins *l l*, substantially as specified.

4. The combination of the piston F of the air-cylinder E with the pivoted lever-like shutter-operating plate D, having attached pins *l l*, and the pivoted swinging or rocking shutter-slides C C, having reverse slots *d d*, essentially as described.

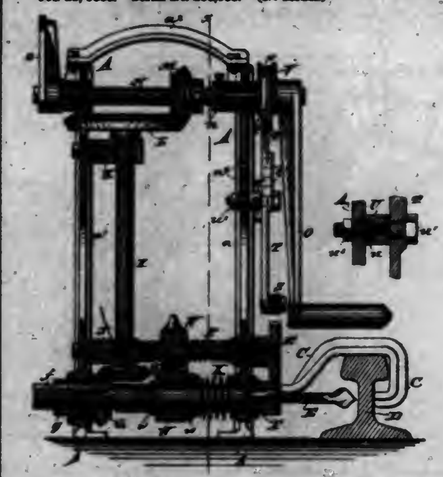


5. The combination, with a shutter case or frame having duplicate exposing-apertures *b b*^{3} out of line with each other, of a pivoted swinging or rocking slotted shutter or shutter-slides having extension-wings *s*, and the pivoted arm, lever, or shutter-operating plate with attached pin or pins for operating the shutter, substantially as specified.

398,981. BOX-FASTENER. JOSEPH W. SHAW, Shelburne Falls, Mass. Filed Apr. 14, 1888. Serial No. 270,605. (No model.)

Claim.—A fastening device consisting of a hasp, B, provided with the slot *b*, and the catch A, formed with a projecting hook, *c*, and the guard *a*, all combined substantially as and for the purposes set forth.

398,982. WIRE-DRAWING MACHINE. FREDERIC SMITH, Halifax, County of York, England. Filed July 18, 1888. Serial No. 280,310. (No model.)



Claim.—1. In a machine for drawing two or more wires and reducing them simultaneously any required number of sizes, the combination of the swifts *b*, the series of revolving drawing-through pulleys *c*, each pulley being broad enough to accommodate on its periphery all the wires to be drawn, all the pulleys being driven by bevel-gearing at gradually-increasing surface speeds from the swifts to the winding-on drums *b*, which are driven at a still quicker speed by pulleys and belts, the several series of dies or draw-holes *o*, each series of holes being smaller than the preceding one, the lubrication of the wires being effected by immersing the revolving drawing-through pulleys in lubricant contained in a reservoir, and also by immersing the series of dies *o* in lubricant supplied to a series of troughs, *n*, all substantially as herein set forth, for the purposes specified.

2. The combination, with the series of flanged drawing-through pulleys *c*, driven at varying surface speeds by bevel-gearing, as described, and immersing in a reservoir containing lubricant, of the tubes or channels *u*, and the series of troughs *n*, substantially as and for the purposes herein described, and as shown.

3. The combination, with the series of lubricating-troughs *n* and the series of dies *o*, of the series of guides or forks *p*, and the drawing-through pulleys *c*, substantially as herein set forth, for the purposes specified.

398,983. RAIL-DRILL. MERITT W. SMITH, Waverly, N.Y. Filed Oct. 22, 1888. Serial No. 288,363. (No model.)

Claim.—1. In a drilling-machine, the combination, with a frame, a rotating and endwise-movable spindle thereon, and gearing, substantially as specified, for rotating the spindle, of an open-sided or half nut hung to the spindle, a feed-screw held parallel with the spindle and which the nut is adapted to engage, a ratchet on the feed-screw, a cam on the driving-shaft, a lever fulcrumed to the frame and engaged by the cam to oscillate it, and a pawl on the lever engaging the feed-screw ratchet, substantially as herein set forth.

2. In a drilling-machine, the combination, with the frame, a rotatable and endwise-movable drill-spindle thereon, gearing, substantially as specified, for rotating the spindle, of a feed-screw, P, on the frame, an open-sided nut, W, on the spindle adapted to engage the feed-screw, a ratchet, R, on the feed-screw, a cam, V, on the driving-shaft, a lever, T, fulcrumed on the frame and having a forked end engaging the cam, and a pawl on the lever engaging the ratchet, substantially as herein set forth.

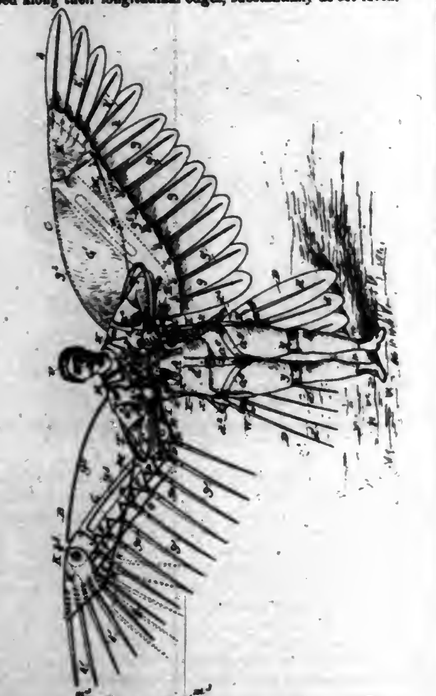
3. In a drilling-machine, the combination, with the frame, a rotating and endwise-movable spindle, and gearing, substantially as specified, for rotating the spindle, of an open-sided nut hung to the spindle, and a feed-screw held parallel with the spindle, and which the nut is adapted to engage for feeding the spindle and drill, substantially as herein set forth.

4. In a drilling-machine, the combination, with the frame, a rotating and endwise-movable spindle, and gearing, substantially as described, for rotating the spindle, of an open-sided nut hung to the spindle, a feed-screw held parallel with the spindle and with which the nut is adapted to engage, and a spring forcing the spindle backward when its nut is disengaged from the feed-screw, substantially as herein set forth.

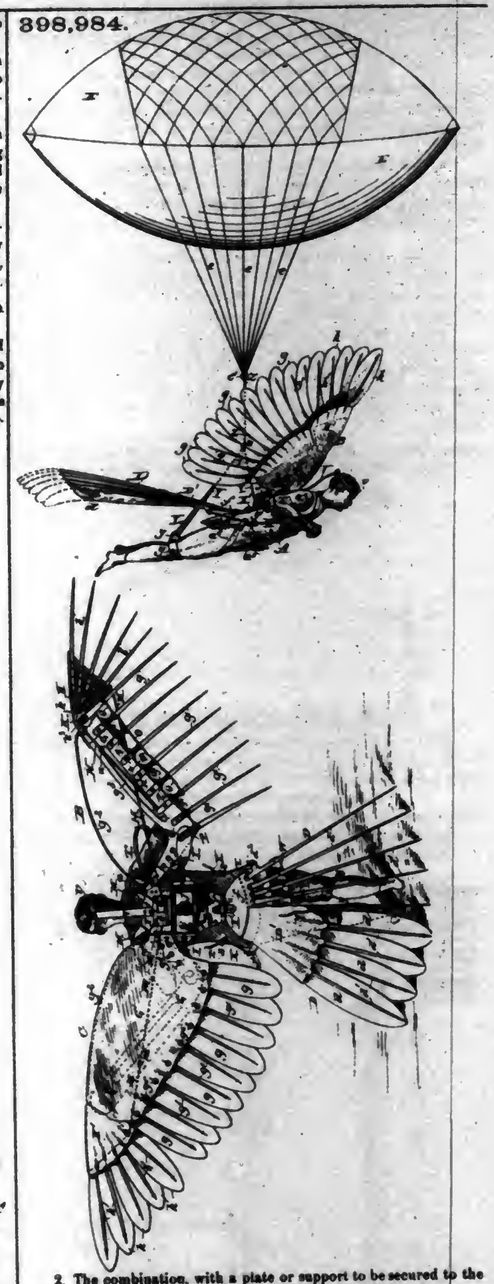
5. In a drilling-machine, the combination, with the frame, of shafts I N, gearing H L M thereon, a pinion, G, journaled to the frame and meshing with the pinion H, a spindle, F, splined at one end to the pinion G and journaled at its other end in the frame, a half-nut, W, hung to the spindle, but immovable endwise of it, a feed-screw, P, on the frame, adapted to be engaged by the nut, and a spring, X, normally

withdrawing the spindle or drill when the nut is disengaged from the feed-screw, substantially as herein set forth.

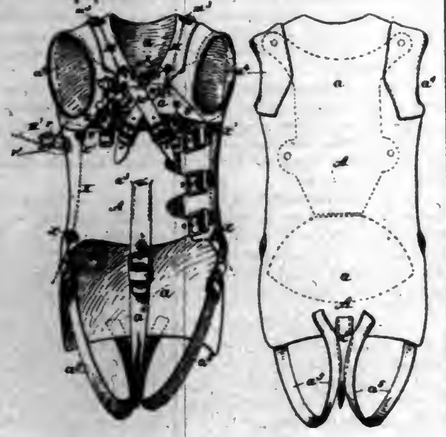
6. In a rail-drill, the combination, with the frame provided with a rotatable and endwise-movable drill-spindle, of hooks adapted to clamp the rail to be drilled and having a quickly-detachable hook-and-eye connection with the frame, substantially as herein set forth.



7. In a rail-drill, the combination, with the frame provided with a rotatable and endwise-movable drill-spindle, of clamp-hooks having a quickly-detachable hook-and-eye connection with the frame and provided with bent outer ends bearing on the farther side of the web of the rail, substantially as herein set forth.



8. The combination, with the drill-frame and the feed-lever actuated from the driving-shaft and operating the feed-screw, substantially as specified, of a detachable fulcrum, U, made of two bolt-studs, *u u'*, held to the frame and to each other, substantially as herein set forth.



398,984. FLYING-MACHINE. REUBEN J. SPALDING, Rosita, Colo. Filed Sept. 1, 1888. Serial No. 284,340. (Model.)

Claim.—1. The combination, with a plate or support to be secured to the back of an aeronaut, of spring-elevated wing-levers hinged to said plate to swing vertically and inclined outwardly and forwardly therefrom, and separate flexible feathers secured at their front ends to and projecting rearwardly from said levers and alternately overlapped along their longitudinal edges, substantially as set forth.

398,984.

2. The combination, with a plate or support to be secured to the back of an aeronaut, of vertically-swinging elbow-levers hinged at their angles to the said plate or support behind the shoulder portions thereof, with their short arms inclined inwardly and provided with bearings on the shoulder portions of the plate or support, the long arms of said levers projecting forwardly and outwardly, and separate and independent feathers secured at their front ends to said long arms extending rearwardly therefrom and overlapping alternately along their longitudinal edges, substantially as set forth.

3. In a flying-machine, the combination, with a support to be secured to the back of an aeronaut, of vertically-swinging wings having bearings on said support, springs acting on the wings at their pivots or axes to raise them, and operating-connections, substantially as described, leading from the wings to points within reach of the aeronaut, substantially as set forth.

4. In a flying-machine, the combination, with a jacket or support for the aeronaut, of a pair of wings fulcrumed on the jacket, a spring, J, held to the jacket and having opposite end coils, *j j*, and arms I I, connected to the wings and fulcrumed to the spring-bearings, and connected to the spring-coils which raise the wing, and operating-connections, substantially as described, connected to the wings and in reach of the aeronaut for lowering the wings, substantially as herein set forth.

5. In a flying-machine, the combination, with a jacket or support for the aeronaut, of a pair of wings fulcrumed on the jacket, a spring connected to the jacket, and also to the wings, and operating normally to raise the wings, and auxiliary springs connected to the wings and operating to assist the aeronaut in lowering the wings, substantially as herein set forth.

6. In a flying-machine, the combination, with a jacket or support for the aeronaut, of a pair of wings fulcrumed thereto, a spring connected to the jacket, and also to the wings, and operating normally to raise the wings, operating-connections, substantially as described, connected to the wings and to hand-grasps for the aeronaut, and plate-springs T, connected to the jacket and to the hand-grasps, and assisting the aeronaut to lower the wings, substantially as herein set forth.

7. In a flying-machine, the combination, with a jacket or support for the aeronaut, of wings fulcrumed thereto and made in inner and outer sections hinged together, and cords leading from the outer wing-sections in reach of the aeronaut, who by pulling the cords will contract or fold the wings edgewise to reduce their area, substantially as herein set forth.

8. In a flying-machine, the combination, with a jacket or support for the aeronaut, of wings fulcrumed thereto and each made with a hinged sectional frame and a spring which normally expands the wing edgewise, and cords leading from the outer wing-section in reach of the aeronaut for contracting or folding the wing-sections to reduce the area of the wings, substantially as herein set forth.

9. In a flying-machine, the combination, with a jacket or support for the aeronaut, of wings fulcrumed to the jacket and made with sectional frames having spring-actuated joints which normally expand the wings, cords leading from the outer wing-sections in reach of the aeronaut and provided with knots for holding the cords, and detents on the jacket with which the cords may be interlocked to hold the wings in contracted condition, substantially as herein set forth.

10. In a flying-machine, the combination, with a jacket or support for the aeronaut, of wings fulcrumed thereto and made in two hinged sections adapted to fold or contract edgewise to reduce the area of the wings, and the feathers of the inner or main wing-section pivoted to their frame, and pull-rod and cord connections from the outer wing-sections to the feathers of the inner wing-sections, substantially as described, whereby as the outer wing-sections are folded edgewise the feathers of the inner wing-sections will also be contracted or folded edgewise, and as the outer wing-section is expanded the feathers of the inner wing-sections will also be expanded, as herein set forth.

11. In a flying-machine, the combination of a jacket or support for the aeronaut and a pair of wings fulcrumed thereto, said wings made with a main lever, G, and feathers or aerial planes *g*, pivoted thereto, and cords P, interlaced between the lever and feathers, substantially as herein set forth.

12. In a flying-machine, the combination of a jacket or support for the aeronaut and a pair of wings fulcrumed thereto, said wings made with a main lever, G, provided with feathers or aerial planes, as *g*, an upper rod, g^2, on the lever, and webbing G', stretched on said rod and on the frame, substantially as herein set forth.

13. In a flying-machine, the combination of a jacket or support for the aeronaut and a pair of wings fulcrumed thereto, said wings each made with a main lever, G, having feathers *g*, and an outer plate, H, hinged to the lever G by a spring-joint normally expanding the wing, and having feathers *h*, a rod, g^2, on the lever G, and webbing G' H' on the wing-frame sections G H, substantially as herein set forth.

14. In a flying-machine, the combination, with a jacket or support for the aeronaut, of a tail or aerial plane hinged thereto and comprising a plate, a series of feathers pivoted thereto, an elastic connection between the feathers holding them normally in contracted condition, and pull-cords connected to the outer feathers and leading to the aeronaut, substantially as described, whereby on pulling the cords the tail or aerial plane may be expanded laterally, substantially as and for the purposes set forth.

15. In a flying-machine, the combination, with a jacket or support for the aeronaut, of a tail or rudder hinged thereto and comprising a plate and a series of feathers held thereto, pull-cords X, connected to the tail, and guides *x x'* and detents, as x^2, on the jacket for the pull-cords, substantially as herein set forth.

16. In a flying-machine, the combination, with a jacket or support for the aeronaut and wings connected therewith and operative by the aeronaut, of a tail or rudder hinged to the jacket and comprising a plate, as *f*, a series of feathers, as *d*, held thereto, and a webbing, D', held to the plate and feathers, substantially as herein set forth.

17. In a flying-machine, the combination, with a jacket or support for the aeronaut and wings connected therewith and operative by the aeronaut, of a head-rest for the aeronaut connected to the jacket, substantially as herein set forth.

18. In a flying-machine, the combination, with a jacket or support for the aeronaut and wings connected therewith and operative by the aeronaut, of an elastic plate, V, connected to the jacket, and a band, *v*, attached to the plate and adapted to receive the aeronaut's head, substantially as herein set forth.

19. In a flying-machine, the combination, with a jacket or support for the aeronaut, of a tail or rudder hinged thereto, and a stay-plate, X', held at the tail-joint and limiting vertical movement of the tail, substantially as herein set forth.

20. In a flying-machine, the combination, with a jacket for the aeronaut, of a metal plate, F, held thereto, a pair of wings, B C, fulcrumed to the plate at *f f'* and connected by arms I I to a spring, J, held to a bearing-plate, I', also fixed to the plate F, springs T, fulcrumed at *t'* to the plate F and connected to the aeronaut's hand-grasps, pull-rods R, connected to the hand-grasps and wings, a head-rest, V *v*, also held to the plate F, and an auxiliary plate, *f*, hinged to the main plate F and carrying the tail D, all arranged for operation substantially as herein set forth.

398,985. BRICK-TRUCK. JAMES C. STEELE, Statesville, N. C. Filed Oct. 22, 1888. Serial No. 288,979. (No model.)

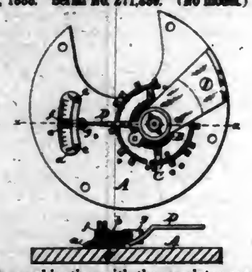
Claim.—1. The combination, with a wheeled truck, of a pair of rests or lifting-arms, G G, arranged between the wheels and near the ground, and lifting mechanism for both the front and rear ends of said arms to raise and lower the same in level position, as described.

2. The combination, with a wheeled truck, of a pair of rests or lifting-arms, G G, arranged between the wheels and near the ground, link-bars H, connecting with the front ends of the arms, elbow-levers I, jointed to the links, rods J J, connected to the elbow-levers, and bail-shaped handle K, connected to the rods J, substantially as and for the purpose described.

3. The combination, with the wheeled truck, of the rests or arms G G, formed at the front end of a bent bar, lift-rod L, connected to the middle portion of the bent arms, and the links H, elbow-levers I, rods J, and bail K, connected to and operating the front ends of the rests or arms, as described.

4. The combination, in a truck, with the longitudinal side bars and the cross-bar connecting the same, of the axle-arms extended inside the longitudinal bars and across the angle to the cross-bar to form a brace, as described.

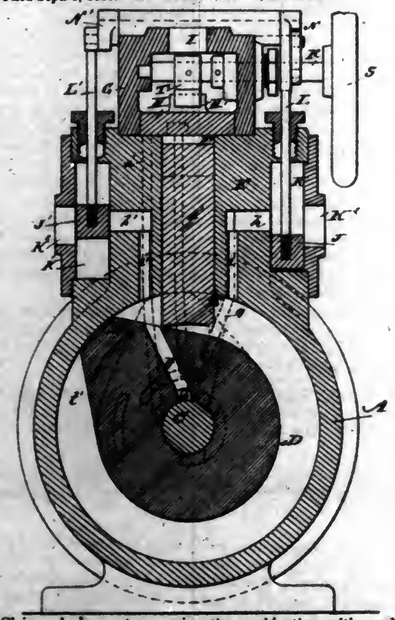
398,986. SCREW-DRIVER. CARL A. STRASSER, Baltimore, Md., assignor, by mesne assignments, of one-half to Christian Schroeder, same place. Filed Aug. 30, 1888. Serial No. 284,214. (No model.)



Claim.—1. The improvement in screw-drivers, consisting of the ratchet-head having a slot formed in the direction of its axis, the screw-driving blade fitted in said slot, the handle having bearings for the ratchet-head, the pawl engaged at one end with the ratchet-ring and having on its outer side, near such end, a rearwardly-facing shoulder, and the spring bearing at one end against the pawl back of such shoulder and having its opposite end held in the handle, substantially as and for the purposes set forth.

2. An improved screw-driver consisting of the handle having a portion, A', recessed at I and having the rear wall of such recess provided with a nick or slot, S, the pawl fitted in said recess and having at its rear end a projecting portion, *d*, fitting a corresponding recess in the portion A', whereby to prevent longitudinal movement of the

pawl, such pawl having a rearwardly-facing shoulder, *d'*, on its outer side near its rear end, the spring held at one end in slot 3 and bearing at its opposite end against the pawl in rear of the shoulder *d'*, the ratchet-head, and the plate A', all substantially as and for the purposes specified.



398,987. WATCH-REGULATOR. CHARLES TIMES, Hartford, Conn. Filed Apr. 26, 1888. Serial No. 271,889. (No model.)

Claim.—1. In combination with the regulator-arm of a watch, a fixed bar having on its body portion a downwardly-projecting longitudinal rib, the traveler-block, the body portion of which is slotted transversely and fitted to slide on the ribbed portion of said fixed bar, the inner end of said block being fitted to receive the end of the regulator-arm, and the outer end being perforated, and a disk journaled in the perforation at the outer end of said block and with its perimeter in engagement with the outer edge of said fixed bar, substantially as described, and for the purpose specified.

2. In combination with the regulator-arm of a watch, a fixed bar adjacent thereto, a traveler-block fitted to slide longitudinally on said bar, having its inner end connected to said regulator-arm and its outer end pointed to form an index, a disk journaled in the index end of said traveler-block with its perimeter in engagement with said bar, and the graduated scale on the outer side of said bar, over which scale the pointed outer end of the traveler-block traverses, substantially as described, and for the purpose specified.

398,988. ROTARY ENGINE. ARTHUR TICKLE, Brooklyn, N. Y. Filed Sept. 5, 1888. Serial No. 284,615. (No model.)

Claim.—1. In a rotary engine, the combination, with a cylinder and a piston mounted to rotate therein, of a gate held to slide in the said cylinder and forced against the said piston by live steam, a steam-chest held on top of the said cylinder, a slide-valve held in the said steam-chest to reverse the motion of the engine, and exhaust-valves moving simultaneously with the said slide-valve to open and close the exhaust-ports, substantially as shown and described.

2. In a rotary steam-engine, a cylinder provided with inlet and outlet ports and also with gate-ports, a steam-chest held on top of the said cylinder, and a valve held to slide in the said steam-chest to open and close alternately said inlet-ports and said gate-ports, in combination with a piston mounted to rotate in the said cylinder and provided on its face with recesses which connect said inlet-ports with the interior of the cylinder, and also connect said inlet-ports with the said gate-ports, substantially as shown and described.

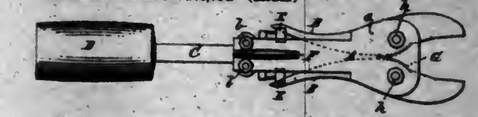
3. In a rotary steam-engine, a cylinder provided with inlet and outlet ports and also with gate-ports, a steam-chest held on top of the said cylinder, and a valve held to slide in the said steam-chest to open and close alternately said inlet-ports and said gate-ports, in combination with a piston mounted to rotate in the said cylinder and provided on its face with recesses which connect said inlet-ports with the interior of the cylinder, and also connect the said inlet-ports with the said gate-ports, and a gate held to slide in the said cylinder against the said piston, being pressed against the latter by the live steam passing through the said gate-ports on top of the said gate, substantially as shown and described.

4. In a rotary steam-engine, a cylinder provided with inlet and outlet ports and also with gate-ports, a steam-chest held on top of the said cylinder, and a valve held to slide in the said steam-chest to open alternately said inlet-ports and said gate-ports, in combination with a piston mounted to rotate in the said cylinder and provided on its faces with recesses to connect the live-steam ports with the interior of the cylinder, and also provided with recesses for connecting the live-steam ports with the gate-ports and for connecting the latter with the exhaust-ports, substantially as shown and described.

5. In a rotary steam-engine, a cylinder provided with inlet and outlet ports and also with gate-ports, a steam-chest held on top of the said cylinder, and a valve held to slide in the said steam-chest to open alternately said inlet-ports and said gate-ports, in combination with a piston mounted to rotate in the said cylinder and provided on its faces with recesses to connect the live-steam ports with the interior of the cylinder, and also provided with recesses for connecting the live-steam ports with the gate-ports and for connecting the latter with the exhaust-ports, and a gate held to slide in the said cylinder and forced against the said piston by live steam entering through the said ports, substantially as shown and described.

6. In a rotary steam-engine, a cylinder provided with inlet and outlet ports and also with gate-ports, a steam-chest held on top of the said cylinder, and a valve held to slide in the said steam-chest to open and close alternately said inlet-ports and said gate-ports, in combination with a piston mounted to rotate in the said cylinder and provided on its faces with recesses which connect the live-steam ports with the interior of the cylinder, and also provided with recesses for connecting the live-steam ports with gate-ports and for connecting the latter with exhaust-ports, a gate held to slide in the said cylinder and forced against the said piston by live steam entering through the said gate-ports, and exhaust-valves operating simultaneously with the said slide-valve to open and close the said exhaust-openings alternately, substantially as shown and described.

7. In a steam-engine, the combination, with a cylinder having an inlet-port and a gate-port, of a piston mounted to rotate in the said cylinder and provided on its face with recesses for connecting the said inlet-port with the said gate-port, substantially as shown and described.



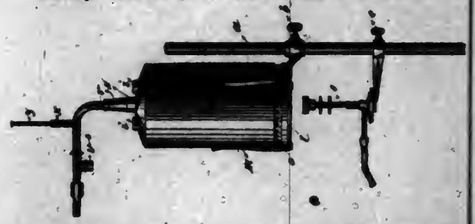
8. In a steam-engine, the combination, with a cylinder having an inlet-port, a gate-port, and an exhaust-port, of a piston mounted to rotate in the said cylinder and provided on its face with recesses for connecting said inlet-port with the said gate-port and the said gate-port with the exhaust-port, substantially as shown and described.

9. In a steam-engine, the combination, with a cylinder having an inlet-port, a gate-port, and an exhaust-port, of a piston mounted to rotate in the said cylinder and provided on its face with recesses for connecting said inlet-port with the said gate-port and the said gate-port with the exhaust-port, and a gate held to slide in the said cylinder and forced against the said piston by steam entering through the gate-port, substantially as shown and described.

10. In a steam-engine, the combination, with a cylinder having an inlet-port, a gate-port, and an exhaust-port, of a piston mounted to rotate in the said cylinder and provided on its face with recesses for connecting said inlet-port with the said gate-port and the said gate-port with the exhaust-port, a gate held to slide in the said cylinder and forced against the said piston by steam entering through the gate-port, a steam-chest held on top of the said cylinder, and a slide-valve held in the said steam-chest above the said gate and provided with a recess for taking the steam from the gate-port into the said gate, substantially as shown and described.

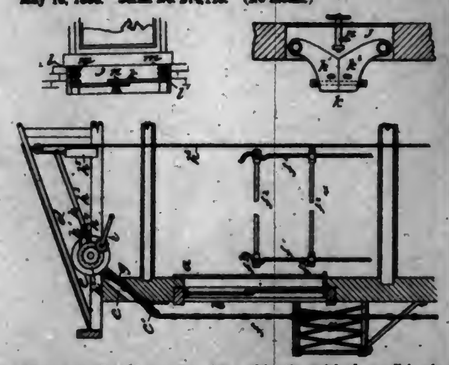
11. In a steam-engine, the combination, with a cylinder having an inlet-port, a gate-port, and an exhaust-port, of a piston mounted to rotate in the said cylinder and provided on its face with recesses for connecting said inlet-port with the said gate-port and the said gate-port with the exhaust-port, a gate held to slide in the said cylinder and forced against the said piston by steam entering through the gate-port, a steam-chest held on top of the said cylinder, a slide-valve held in the said steam-chest above the said gate and provided with a recess for conducting the steam from the gate-port on top of the said gate, and an exhaust-valve operating simultaneously with the said slide-valve to open and close the said exhaust-opening, substantially as shown and described.

398,989. WRENCH. JOSEPH TOBLINSON, Folsom, Cal. Filed June 30, 1888. Serial No. 278,704. (Model.)



Claim.—In a wrench, the combination, with the body portion A, of the lever-jaws B, pivoted in and at the forward end of the body and having outwardly-curved rear ends, the spring C, interposed between the lever-jaws for holding them open, the bar C, sliding within the body and provided with the head *c*, and the blocks E, secured to the head *c* and recessed to receive the rear ends of the lever-jaws, substantially as described.

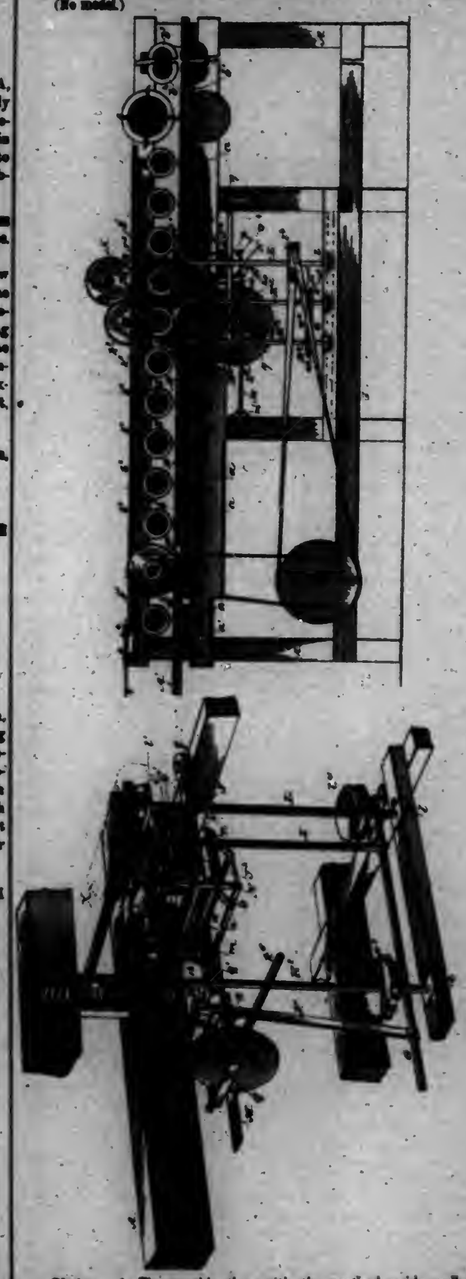
398,990. PROCESS OF MAKING A YELLOW DYE. JOHANNES WALTER, Basle, Switzerland, assignor to John R. Geigy & Co., same place. Filed Dec. 13, 1888. Serial No. 293,995. (Specimens.)



Claim.—The herein-described process for producing a new yellow coloring-matter by first dissolving sodium salt of thioparatoluidine sulphonic acid in water, mixing it with sulphuric acid, and to the precipitate of the acid compound thus obtained and cooled with ice adding gradually nitrite of sodium dissolved in water, the solution of the diazo compound poured into an alkaline solution of salicylic acid containing enough caustic soda to saturate the acids employed, the mixture being then boiled, and after that the color precipitated with salt, substantially as described.

398,991. INHALER FOR WARM AIR. LOUIS WEISSER, Berlin, Germany. Filed Dec. 7, 1888. Serial No. 292,907. (No model.)

Claim.—An apparatus for producing warm air for inhalation, comprising a chamber, *f*, heated by a burner, *c*, or equivalent heating device, fitted with outlets *i i* for the escape of the products of combustion and surrounded by a casing, *n*, the space *u*, intervening between the chamber and the casing, serving as a passage for air which enters through openings below, becomes heated through contact with the central chamber, *f*, and ultimately escapes from the upper part of the space *u* by way of a conduit furnished with valves *z z'* for inhalation and exhalation, respectively, substantially as described.



398,992. FIRE-ESCAPE. JOHN WHITE, Hartford, Conn. Filed May 16, 1888. Serial No. 274,113. (No model.)

Claim.—1. In a fire-escape, in combination with the wall having the ladder-slot, the ladder-reel provided with a brake normally holding the reel against rotation, the sectional bracket located in a socket below the window and through the wall and adapted to be swung outward on a horizontal plane and engage the ladder, and the pull-rope connected to the roll-brake, all substantially as described.

2. In a fire-escape, in combination with a flexible ladder secured at its upper end to a wall, a folding bracket formed in two sections, each swinging on a pivot and pressed outward by a spring, and the bolt whereby the folding parts of the bracket are temporarily held within the bracket-socket, all substantially as described.

398,993. STAVE JOINTING AND PLANING MACHINE. WILLIAM J. WERNET, Cooperstown, Pa. Filed Sept. 26, 1888. Serial No. 286,269. (No model.)

Claim.—1. The combination, with the vertical guide-rollers mounted upon shafts having a pivotal bearing at their lower ends, and rock-shafts connected with said guide-rollers, of the head-blocks J, con-

nected to said shafts and the cutter-heads, the shafts of said heads having a pivotal bearing at their lower ends in the frame, and their upper ends journaled to the head-blocks, whereby the movement of the guide-rollers will automatically set the cutters to the point of the beginning of the cut of the stave-bevel, substantially as and for the purpose specified.

2. In a stave-jointing machine, the combination, with the guide-rollers E E, mounted upon rotatable shafts having a pivotal bearing at their lower ends, rock-shafts G, mounted in the frame, arms F, connecting said shafts to the roller-shafts, and an arm, I, connected to the rock-shaft, of the head-blocks J, adapted to lateral movement in the frame, said head-blocks connected to the arm I, and the cutter-heads L, journaled at their upper ends in the head-blocks, their lower ends having a pivotal bearing in the frame, all arranged substantially as and for the purpose set forth.

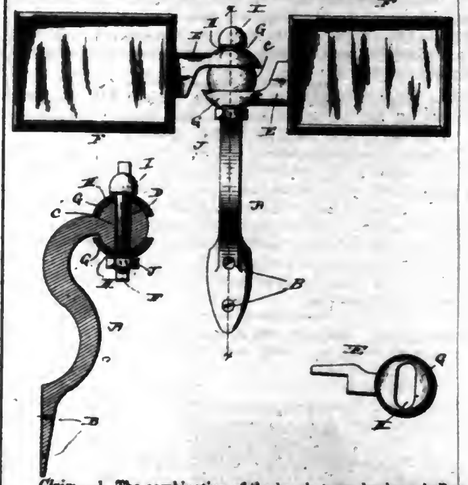
3. In a stave-jointing machine, the combination of the vertical guide-rollers mounted on a shaft having a rotatable and swinging movement, rock-shafts journaled in the frame and operated by the movement of the guide-roller shafts, the divided head-blocks, the upper sections, J', connected with the rock-shafts, the cutter-heads mounted in said sections, the yielding shaft and roller X, journaled in the frame above the bed, said shaft connected to the lower section, J², said shaft X adapted to raise said lower section in operative contact with the upper section when raised, and the automatic devices, substantially as shown and described, for vibrating said head-blocks, the movement of said vibrating devices, the yielding shafts, and the head-blocks being timed and regulated by the moving billet, substantially as described.

4. In a stave-jointing machine, the combination, with the yielding guide-roller shafts, said shafts journaled at their lower ends in pivotal bearings, lateral arms E², connected to said shafts, said arms projected at their inner ends in the frame, and rebounding springs mounted on said arms between the frame and the roller-shafts, of the rock-shafts G, mounted in the frame-shaft, provided with arms F F, connected at their upper ends to the arms E², and an arm, I, connected to the upper head-block, said head-block supporting the upper end of the cutter-disk shaft, the lower end of said shaft having a pivotal bearing at its lower end, all arranged substantially as and for the purpose specified.

5. In a stave-jointing machine, essentially as described, the combination, with the automatic feed devices, substantially as shown and described, and pivotal bearings *l*, mounted thereon, of the cutter-shafts L, journaled at their upper ends in said pivotal bearings *l*, and their lower ends provided with pivotal bearings *e*, journaled in the main frame, whereby the upper ends of said cutter-shafts will be moved differentially to determine the cut of the bevel and the bilge, substantially as shown and described.

6. In a stave-jointing machine, the combination, with the yielding roller-shafts, the rock-shafts G, operated thereby, the head-blocks J, and the cutting devices, substantially as shown, connected to and operated by the head-blocks, of the adjustable connections between said head-blocks and rock-shafts, said connections consisting of arms I, secured at their lower ends to the said shafts, vertically-adjustable centrally-apertured plates guided at their ends on vertical screw-posts secured at the inner ends of the head-blocks, and adjusting-nuts engaging said posts, the upper ends of said arms I passed through the apertured plates, substantially as set forth.

7. In a stave-jointing machine, the combination, with the upper head-block sections, said sections connected with the cutter-disks, and the yielding guide-rollers, whereby said head-blocks and cutter-disks are forced outward when the staves enter between said roller, of the yielding roller-shaft X, supported above the bed of the machine, the lower section, J², supported on the frame O, connected with and operated by the vertical movement of said shaft X, and the vibrating levers arranged to be automatically operated by said shaft X and the upper head-block, whereby said head-blocks are moved to and from each other to determine the curvature of the edges of the staves, as set forth.



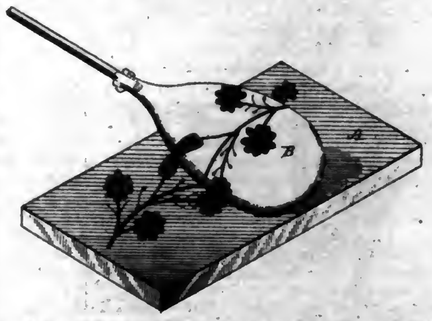
8. In a stave-jointing machine, the combination, with the table B, having an opening, *d*, and the trimmer-saws C C, adjustably mounted on the shaft *c*, supported above said bed and opening *d*, of the stop-plate D, pivoted in said opening, said stop adapted to automatically close the feed-passage between said saws by pressure of the billet being treated, substantially as shown and described.

9. In a stave-jointing machine, the combination, with the head-blocks J, the rock-shafts G, connected therewith, spring-arms F, connected with the rock-shaft, and the yielding roller-shafts connected with the arms F, and the swinging frame M, of the bell-crank levers 13, provided with diagonally-slotted arms 12, adapted to receive pintles 10 on the upper sections, J', of the head-blocks, said levers pivoted at 14 to the frame of the machine and having arms 16, and arms *m m*, secured at their lower ends to the swinging frame M and pivotally connected with the arms 16 at their upper ends, all arranged substantially as and for the purpose described.

10. The combination of the swinging frame M, connected at its free end to the upper section, J', of the head-block, the shaft L², journaled in said frame and provided with diagonally-arranged cam-disks P P, said shaft provided with a drive-gear, L², the vibrating arms Q' Q', having yokes Q at their forward ends, their rear ends pivoted to the frame at *g*, said yokes formed with contact-points against which the disks P operate, the yielding shaft and roller X, journaled above the bed of the machine, said shaft provided with a gear, K', which is automatically geared with the gear L² on shaft L², all arranged substantially as and for the purpose described.

11. In a stave-jointing machine, the combination, with the shaft L², having a ratchet-wheel, 19, and the shaft X, of the retaining-pawl 20, engaging the wheel 19, and a connection between said pawl and the shaft X, whereby the pawl is automatically lifted from engagement with the wheel 19, substantially as and for the purpose specified.

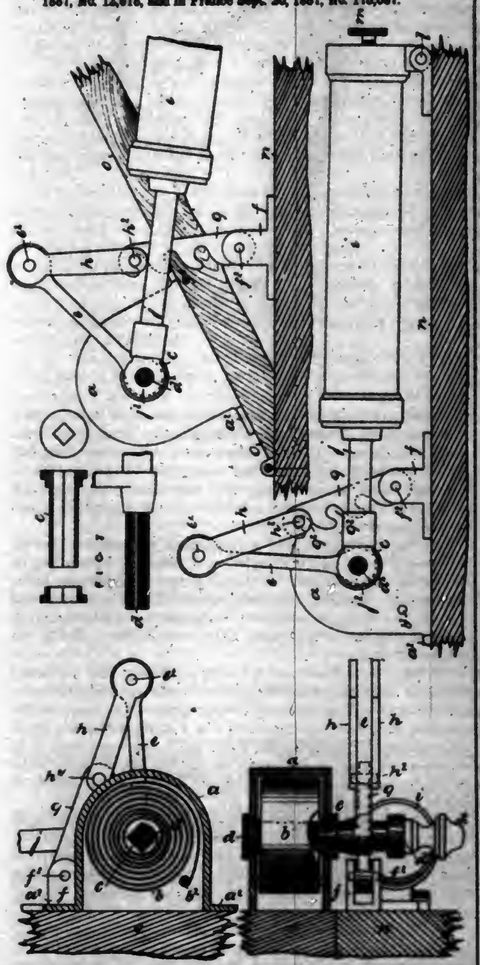
398,994. WINDOW-MIRROR. NIELS ANDERSEN, Decorah, Iowa. Filed Nov. 16, 1888. Serial No. 291,040. (No model.)



Claim.—1. The combination of the bracket-arm having a ball at its upper end, the mirror-supporting arm having a cup resting on said ball and having a diametrical slot, and the pivotal securing-bolt inserted vertically through said ball and the slot in the cup, as set forth.

2. The combination of the bracket-arm having a ball at its upper end, the mirror-supporting arm having a cup resting on said ball and provided with diametrical slot, and the pivotal securing-bolt inserted through the ball and the slot in the cup, as set forth.

3. As an improvement in window-mirrors, the combination of the bracket-arm having a ball at its upper end provided with the vertical opening, the mirror-supporting arm having its inner end provided with the cup resting on the ball and having the diametrical slot, and the pivotal bolt inserted vertically through the slot in the cup and the opening in the ball and provided with a securing-nut on its lower end, as specified.



398,995. METHOD OF MANUFACTURING ORNAMENTAL GLASS. THOMAS R. ATTERBURY, Pittsburg, Pa. Filed Sept. 20, 1888. Serial No. 285,906. (No model.)

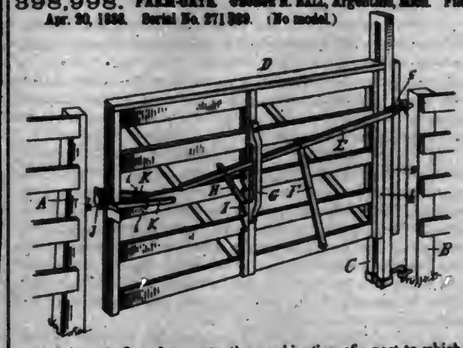
Claim.—1. The herein-described improvement in the art of manufacturing ornamental glass, which consists in rolling the glass bulb or ball, while in a hot condition, on a plate or marver having the design formed thereon, on which is placed a vitrifiable coloring material, and finally shaping the bulb into the article desired.

2. The herein-described improvement in the art of manufacturing ornamental glassware, which consists in rolling the hot bulb or ball of glass over a marver having a design formed thereon of vitrifiable coloring material such as described, thus depositing the colors on the bulb, reheating the bulb to fuse the colors, and finally blowing or pressing the bulb in a mold to form the article, as set forth.

398,996. DOOR SPRING AND CHECK. PERSIFER R. AYTON and SAMUEL HILL, Birmingham, England; said Hill assignor to Thomas Pemberton & Sons, same place. Filed Dec. 21, 1887. Serial No. 258,609. (No model.) Patented in England Mar. 8, 1887, No. 3,493, and Sept. 17, 1887, No. 12,618, and in France Sept. 20, 1887, No. 178,087.

Claim.—1. In a door spring and check, the combination, with the reversible drum *a*, the spring *b*, and the angular hollow bush *c*, open at both ends and turning in said drum, of the angular spindle *d*, adapted to fit into said bush from either end and connected by suitable levers to a bracket, *f*, on the door-jamb, substantially as described.

2. In a door spring and check the combination of air-cylinder *i* and piston *j*, drum *a*, spring *b*, bush *c*, secured to the end of said spring, spindle *d*, fitting in said bush, lever *e*, rigidly secured to said spindle, link *h*, jointed to said lever and having pin h^3, with link *g*, formed with open-ended slots or notches g^3, and pivoted to bracket *f*, said bracket being located between the air-cylinder and the spring, substantially as described.



398,997. DUST-PAN. ROYAL F. BAILEY, Galva, Ill. Filed Dec. 23, 1887. Serial No. 258,332. (No model.)

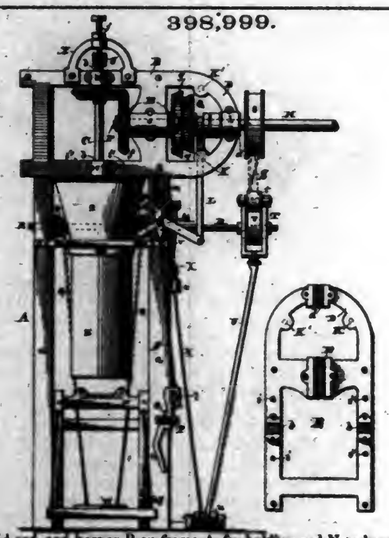
Claim.—1. As an article of manufacture, the dust-pan herein described, having the rearwardly-inclined bottom C, provided at its front and with the inclined flange D, the sides having their upper edges tapering or inclining downwardly both to the rear and to the front, the flattened top E extending from the rear lower edge of the sides to the point where said sides incline forwardly, and having the forwardly and downwardly inclined lip G projecting from along the front edge of the top E, substantially as and for the purposes set forth.

2. As an article of manufacture, the dust-pan herein described, having the bottom inclined from front to rear and provided at its front with the forwardly-inclined flange D, the upright sides A, having their upper edges tapering or inclining downwardly both to the front and the rear, the incline of the front edge being shorter and at a greater angle than the incline of the rear edge, as shown, and the flattened top E, extending from the rear edge of the pan to the top of the rear incline, substantially as and for the purposes set forth.

398,998. FARM-GATE. GEORGE H. BALL, Argentine, Mich. Filed Apr. 20, 1888. Serial No. 271,339. (No model.)

Claim.—1. In a farm-gate, the combination of a post to which is hinged a slotted standard, a gate sliding vertically in said slotted standard, and a lever pivotally connected to the gate and standard, said lever being provided with a pivoted dog engaging a racked bar on the gate, substantially as and for the purposes described.

2. In a farm-gate, the combination, with the posts A B, of slotted standard C, hinged to the post B, gate D, sliding vertically in said slotted standard, lever E, pivoted at one end to the standard, bar F, connecting said lever with the gate, dog H, pivoted to said lever and arranged to engage with a notched bar, I, secured to the gate, latch J, pivoted to the free end of the gate, and latch-bars K, the parts being constructed, arranged, and operating substantially in the manner and for the purposes specified.



398,999. FLOUR-PACKER. HERMAN A. BARNARD, Moline, Ill., assignor to the Barnard & Leas Manufacturing Company, same place. Filed Mar. 3, 1888. Serial No. 266,018. (No model.)

Claim.—1. In a packer, a metal frame having bearings cast integral with it for the support of the auger and driving shafts, and a detachable arch, constructed substantially as described, attached to said frame and adapted to keep the auger-shaft from rising out of place, said frame being provided with bolt-holes at the upper and lower side and made reversible, whereby the driving-shaft may be made to extend to either side and the arch attached in proper position when reversed, substantially as described.

2. The combination of the sectional counter-shaft with the shaft R, carrying cone-drums, a friction-wheel, and a pulley, with the belt S, tightener T, friction-band *v*, lever X, rods U and Y, and treadle *u*, whereby the belt S can be tightened simultaneously with the loosening of the friction-band, and vice versa, substantially as described.

3. The combination of frame A, the metal frame B thereon, the auger-shaft and sectional counter-shaft supported thereon, and the friction-clutch G on said counter-shaft, with the bifurcated lever for operating said clutch pivoted on a leg projecting from frame B, the toggle-lever M and rod N, for actuating said clutch, and the dog O

398,999.

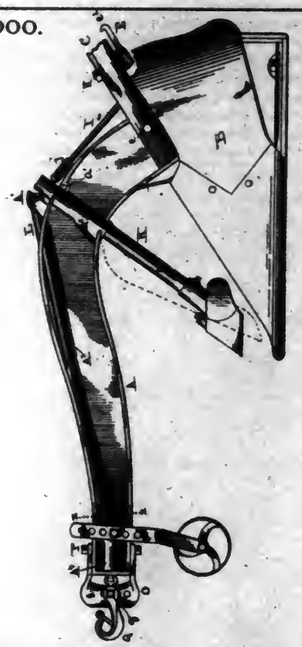
on said rod, and keeper P on frame A, for holding rod N to keep the clutch engaged, substantially as described.

4. The combination of the auger-shaft, the sectional counter-shaft provided with a friction-clutch, and a vertically-reciprocating platform, with the shaft R and chains for lifting said platform, the belt S and pulleys for transmitting motion from the counter-shaft to shaft R, and mechanism, substantially as described, for simultaneously tightening belt S, to cause the raising of the platform and to operate the friction-clutch to start the shaft, substantially as described.

5. The combination of the auger-shaft, the sectional counter-shaft for driving the same, the friction-clutch on said counter-shaft for connecting its parts, and the vertically-reciprocating platform, substantially as described, with the lever for operating said friction-clutch, the toggle-lever, and spring-controlled rod for operating said lever, and the dog O on said rod engaging a keeper, P, on the main frame when the rod is depressed, to keep the clutch engaged and adapted to be struck by a lug on the movable platform as the latter descends, and to be released, thereby permitting the disengagement of said clutch, substantially as set forth.

6. The combination of the auger-shaft, the sectional counter-shaft connected by a friction-clutch, and a vertically-reciprocating platform to carry the receptacle to be filled, with the bifurcated lever engaging said clutch, toggle-lever M, and spring-controlled rod N, for operating said clutch, the dog O on said rod for engaging a keeper on the main frame, and the devices, substantially as described, for depressing said rod to keep the clutch engaged, substantially as set forth.

7. The combination of the sectional counter-shaft and its clutch G, the shaft R, receiving motion from said counter-shaft by a belt, S, and operating the movable platform, with the lever L, toggle M, and rod N, for actuating the clutch, the tightener T for belt S, and the connections of rod N and tightener with a treadle, whereby the platform can be elevated and the packer started simultaneously, substantially as specified.



8. The combination of the sectional counter-shaft having a friction-clutch, G, for connecting its parts and driving the auger-shaft, the movable platform W, shaft R, having friction-wheel V and receiving motion from the counter-shaft by a slack belt, S, when the latter is tightened, with the mechanism for simultaneously closing clutch G, tightening belt S, and loosening the friction-band around pulley V, substantially as specified.

9. The herein-described frame B, having an offset arch, D, and cast with bearings *b b* for the auger-shaft and bearings E and *d* for the counter-shaft, and having lugs K K′ on arch D, and openings *i i′ i′*, and the arch I, bolted to said frame, substantially as set forth.

10. The combination of frame A and reversible frame B thereon, having bearings formed in it for the auger-shaft and counter-shaft, and having opposite lugs, K K′, with the auger-shaft C, shaft F, supported in frame B and imparting motion to shaft C, and the shaft H, having one journal in frame B, and engaging shaft F by a friction-clutch, G, and the lever pivoted on one of the legs of frame B, for operating said clutch, substantially as and for the purpose specified.

399,000. HILLSIDE-PLOW. MILO D. BEACH, Litchfield, Conn. Filed Nov. 16, 1888. Serial No. 291,085. (No model.)

399,000.

Claim.—1. The combination, with a reversible plow provided with a duplex hook and having a shifting jointer or colter and a laterally-movable clevis, of suitable crank-like devices for operating said jointer or colter and the clevis and connections between said cranks and duplex hook, substantially as described, whereby when the hook is turned the jointer or colter and the clevis will be shifted, as and for the purpose set forth.

2. The combination, with a reversible plow provided with a duplex hook and having a shifting jointer or colter and a laterally-movable clevis, of an eccentric for operating the jointer or colter and a crank-pin for operating the clevis, connected shafts carrying said eccentric and crank-pin, and means, substantially as described, for imparting the motion of the duplex hook to the shafts, as and for the purpose set forth.

3. The combination, with a reversible plow provided with a duplex hook and having a shifting jointer or colter and a laterally-movable clevis, of a shaft carrying a sector-gear and an eccentric for operating the jointer, and connected with a shaft carrying an adjustable crank-pin for operating the clevis, and a sector-gear secured to the duplex hook and meshing with the aforesaid gear, whereby when the duplex hook is reversed the shafts will be rotated, substantially as and for the purpose set forth.

4. The combination, with a reversible plow, of a duplex hook loosely pivoted on an axially-yielding bolt and having its hooks turned upwardly on its upper side, so that when locking with the lugs on the mold-board its arms move downward in a plane at right angles to their plane of revolution without any backward movement, substantially as described.

5. The combination, with a reversible plow, of a cross-bar, D, attached thereto and provided with the lugs *d′*, and a duplex hook, E, having upwardly-turned hooks e^3, pivotally supported on the bar between the lugs by means of an axially-yielding bolt, and having ribs e^2 for engaging the lugs *d′*, substantially as described.

6. The combination, with a reversible plow having catches *b* made with inclined edges, of a duplex hook, E, having upwardly-turned hooks e^3 provided with similarly-inclined edges, substantially as described.

7. The combination, with a reversible plow having a shifting jointer or colter, of the cross-bar D, the sleeve F, mounted thereon and carrying the sector-gear G, the duplex hook attached to the sleeve, and the shaft I, carrying the sector-gear F, meshing with the gear G, and provided with a crank-like device for operating the jointer or colter, substantially as described.

8. The combination, with a rotatable jointer or colter stem having a diametrical slot, of an eccentric shaft passing through the slot and means for rotating the shaft, substantially as described.

9. The combination, with a jointer or colter stem capable of rotation and lateral vibration and having a diametrical slot, of an eccentric shaft passing through the slot and means for rotating the shaft, substantially as described.

10. The combination, with a reversible plow, of a colter having a stem capable of rotation and lateral vibration and a blade having its point lying in the axial line of the stem and its cutting-edge diverging from said line in front or rear of the same, and means for simultaneously rotating and vibrating the colter-stem, substantially as described.

11. The combination, with the shaft I, of the eccentric provided with a semi-cylindrical socket, *j*, and a hub, *j′*, substantially as described.

12. The combination, with the shaft I, of the rotatable jointer or colter stem and the eccentric shown and described, consisting of a socket, *j*, a hub, *j′*, and a short straight cylindrical shaft uniting the socket and hub and having its axial line at an angle to the axial line of the socket and hub, substantially as described.

13. The combination, with a clevis, O, having a groove, *o*, of a crank-pin engaging with said groove and means, substantially as described, for actuating the crank-pin, as and for the purpose set forth.

14. The combination, with a plow-beam, of the shaft M, carrying the curved head M′, the dog N, adjustable on the head, the clevis O, engaged by the dog, and means for rotating the shaft, substantially as described.

15. The combination, with the shaft M, carrying the curved head M′, having the grooves *m′*, of the dog N, adjustable along the grooves *m′* and having a nose, N′, the clevis O, having a groove, *o*, and means for rotating the shaft M, substantially as described.

16. The combination, with the laterally-adjustable clevis O, having chamfered sides, and vertical teeth o^3, extending the entire length of its front edge, of the clevis-hook Q, having the vertical teeth *q′*, intermeshing with the teeth o^3 when the hook is attached to the clevis, substantially as described.

17. The combination, with the laterally-adjustable clevis O, of the clevis-hook Q, pivoted thereto by a horizontally-arranged bolt, the front edge of the clevis and the rear end of the clevis-hook having vertical teeth which intermesh when the hook is bolted to the clevis, whereby the hook is capable of lateral adjustment with reference to the clevis, substantially as set forth.

18. An iron plow-beam provided with the tubular bearing A^2 for a jointer or colter stem and tubular bearings A^2 A^5 for shafting, said bearings being cored out in the beam, substantially as described.

19. The combination, with a reversible plow having a shifting jointer or colter, of a crank-like device for operating the same, adapted to make a half-revolution when shifting the jointer or colter and to stand on a dead-center when the jointer or colter is in either of its working positions, whereby the crank-shaft is relieved of all torsional strain, substantially as described.

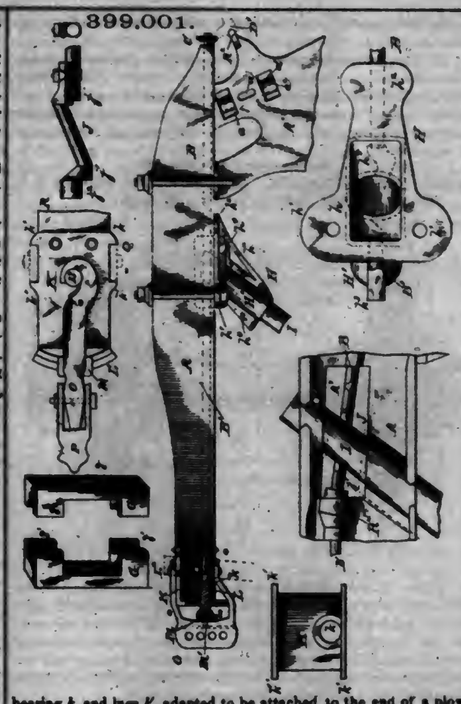
20. The combination, with a reversible plow having a laterally-adjustable clevis, of a crank-like device for shifting said clevis, adapted to make a half-revolution in so doing and to stand on a dead-center when the clevis is in either of its working positions, whereby the crank-like device is best enabled to resist the strain upon the clevis, substantially as described.

399,001. HILLSIDE-PLOW. MILO D. BEACH, Litchfield, Conn. Filed Nov. 16, 1888. Serial No. 291,086. (No model.)

Claim.—1. The combination, with a plow-standard, A′, having a rounded flange, A^3, of the vertically-adjustable handles E, secured to the bar D′, which has a groove, *d*, fitting the flange A^3, substantially as described

2. The combination, with a plow-standard having the slot *a* and the journals a^3, of the handles E, the blocks G, having the slots *g*, and bearings for the journals a^3, and the bolt *e*, passing through the slots *a* and *g* and adjustably securing the handles to the blocks, substantially as described.

3. The combination, with a plow having a reversible jointer or colter, of a shaft provided with crank-like devices for actuating the jointer or colter, a gear-wheel on said shaft, a pair of laterally-shifting handles, and a rack fastened to the handles and meshing with the gear-wheel, substantially as described.



4. The combination, with a plow having a laterally-swinging clevis, of a shaft provided with a crank-pin for actuating the clevis, a gear-wheel on said shaft, a pair of laterally-shifting handles, and a rack fastened to the handles and meshing with the wear-wheel, substantially as described.

5. The casting H, having a tubular bearing, H′, a base-plate, *h*, ears *h′*, rear extension, h^2, hollow rib h^3, and brace h^4, adapted to be attached to a plow-beam and receive the stem of a jointer or colter, substantially as described.

6. The casting K, having a top, bottom, and end, and a tubular bearing, *k*, adapted to be attached to the end of a plow-beam and afford a bearing for the shaft, substantially as described.

7. The casting K, having a top, bottom, and front end, tubular bearing *k*, and lugs *k′*, adapted to be attached to the end of a plow-beam and receive the wheel-standards, substantially as described.

399,001.

399,002. PERMUTATION-LOCK. LOUIS A. BAUER, Paris, France, assignor to Edouard Vieillot, same place. Filed Aug. 24, 1888. Serial No. 283,043. (No model.) Patented in France Aug. 16, 1882, No. 150,054, and in Belgium Aug. 19, 1882, No. 58,806.

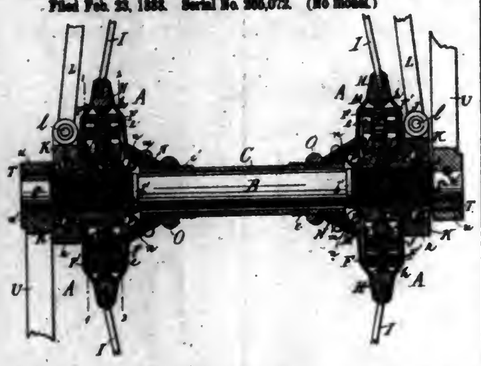
Claim.—1. In a lock, the combination, with the bolt-controller, of the carriages and the blocks, one set movable with said bolt-controller, the other being stationary, and the screws which adjust said carriages, so that motion of said controller is or is not dogged by contact between them and the said blocks, substantially as described.

2. The combination, with the bolt-controller, of the carriages and the blocks, one set movable with said bolt-controller, the other stationary, the screws which adjust said carriages, so that the said controller is or is not dogged, and the adjustable mounting for the said blocks, so that their position can be altered to change the secret combination, substantially as described.

3. The combination, with the bolt-controller, of the carriages and blocks, one set movable with said bolt-controller, the other stationary, the screws which adjust said carriages, and the adjustable mounting for said blocks, composed of a friction-clamp and a slotted support, said blocks interlocking with said carriages when in registering position, and said friction-clamps permitting them when interlocked to be moved with said carriages by said screws, substantially as described.

4. The combination, with the bolt-controller, the carriages, and the blocks, of the screws which adjust the carriages, provided with flat places, and the springs which press upon said flat places, substantially as described.

5. The combination, with the bolt-controller, the carriages, and the blocks, of the screws which adjust the carriages, provided with flanges, and the washer held with yielding pressure against said flanges, substantially as described.



6. The combination, with the bolt-controller, the carriages, and blocks, one set movable with the bolt-controller, the other set stationary, the carrier for said movable set and the screws which adjust said carriages, of the spindle having a friction-connection with said carrier, substantially as described.

7. The combination, with the bolt-controller, having an operating handle or device on each side of the lock, the carriages, and the blocks, of the screws which adjust said carriages, having both ends

accessible for operation on each side of the lock, substantially as described.

8. The combination, with the bolt-controller, of the carriages and blocks, the one set stationary and the other movable with said bolt-controller, the cylinder or its specified equivalent for carrying said movable set, the case which supports the stationary set, and the screws journaled in bearings and adjusting the said carriages, substantially as described.

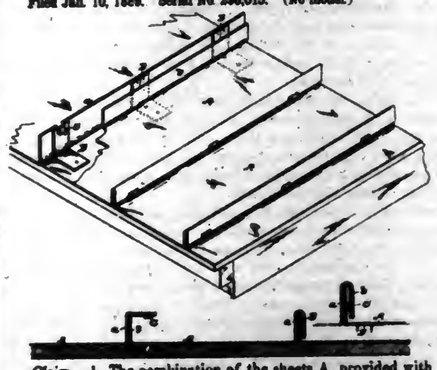
399,008. VELOCIPEDE. CHARLES E. BENTLEY, New York, N. Y. Filed Feb. 23, 1888. Serial No. 265,072. (No model.)

Claim.—1. The combination, in a velocipede, and with its drive-wheel axle, of a spur-gear rotating with the axle, an internal gear fast to the drive-wheel, a frame or support placed between said spur-gear and internal gear and carrying planet-gears meshing with said spur-gear and said internal gear, and a clutch device acting between the planet-gear frame and a relatively-stationary surface or support, substantially as described, for the purposes set forth.

2. The combination, in a velocipede, and with its drive-wheel axle, of a spur-gear rotating with the axle, an internal gear fast on the drive-wheel, a frame or support placed between said spur-gear and internal gear and carrying planet-gears meshing with said spur and internal gears, and two clutch devices or series of clutch devices, one clutch or series of clutches operating between the planet-gear frame and the spur-gear or a collar on the axle, and the other clutch or series of clutches acting between the planet-gear frame and a relatively-stationary surface or support, substantially as described, for the purposes set forth.

3. The combination, in a velocipede, and with its drive-wheel axle, of a spur-gear fixed to each end of the axle, two internal gears forming opposite side hubs or supports to the drive-wheel spokes, a planet-gear frame, and gears placed between the spur-gear and internal gear of each side hub, and two clutch devices at each side, one clutch device operating between the planet-gear frame and the spur-gear or a collar on the axle, and the other clutch device acting between the planet-gear frame and a relatively-stationary surface or support, substantially as described, for the purposes set forth.

4. The combination, in a velocipede, and with its drive-wheel axle, of a spur-gear, D, rotating with the axle, a collar or shoulder, d^3, also rotating with the axle, an internal gear, H, held to the driving-wheel spokes or body, a ring-frame, F F', carrying planet-gears E, meshing with the gears D H, a relatively-fixed collar or flange, as k, connected to the machine-frame, a clutch device operating between the frame-ring F and the shoulder d^3, and a clutch device operating between the frame-ring F' and the collar or flange k, substantially as described, for the purposes set forth.

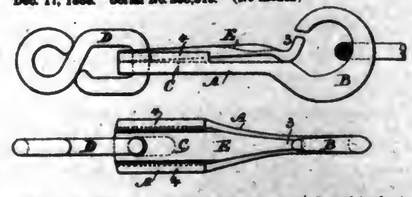


5. The combination, in a velocipede, and with its drive-axle, of a spur-gear, D, rotating with the axle, a collar or shoulder, d^3, also rotating with the axle, an internal gear, H, held to the drive-wheel spokes or to the body of the wheel, a ring-frame, F F', carrying planet-gears E, meshing with the gears D H, a collar, K, connected to the fork-frame and supported on a ball-bearing from the axle, and provided with a flange, k, a clutch device operating between the ring F and shoulder d^3, and a clutch device acting between the ring F' and the flange k, substantially as described, for the purposes set forth.

6. The combination, in a velocipede, and with its drive-wheel axle, of a spur-gear, D, rotating with the axle, a collar or shoulder, d^3, also rotating with the axle, an internal gear, H, held to the drive-wheel spokes or to the body of the wheel, a ring-frame, F F', carrying planet-gears E, meshing with the gears D H, a relatively-fixed collar or flange, as k, connected with the machine-frame, a clutch device operating between the ring F and the shoulder d^3, a clutch device operating between the ring F' and the collar k, and dust-guard plates fitted to the drive-wheel at opposite faces of the planet-gear frame and covering the gearing and clutches, substantially as herein set forth.

7. The combination, in a velocipede, and with its drive-wheel axle, of a tube or sleeve, C, next the axle, and mechanism fitted at each end of the axle, as follows: a spur-gear, D, rotating with the axle, a collar or shoulder, d^3, also rotating with the axle, an internal gear, H, forming a hub or half-hub to the drive-wheel spokes, a ring-frame, F F', carrying planet-gears E, meshing with the gears D H, a collar, K, supported on a ball-bearing from the axle and connected to the fork-frame, and provided with a flange, k, a clutch device operating between the ring F and the shoulder d^3, and a clutch device operating between the ring F' and the flange k, an outer dust-guard plate, J, held to the gear H and surrounding the flange k, an inner dust-guard, M, held to the gear H, a hardened metal collar fixed to and with the plate M, and a circle of balls placed between said collar and an opposing surface on the axle for an inner ball-bearing, all arranged for operation substantially as described, for the purposes set forth.

8. The combination, in a velocipede, of an axle having near its ends hardened metal collars fast to said axle, a tube loosely surrounding said axle and having at its ends hardened metal collars fitted to said tube at one end by a right-handed and at the other by a left-handed thread, and the collars on the tube forming the inner and the collars on the axle the outer surfaces of ball-bearings, the adjustment of which is made by the revolution of said tube.

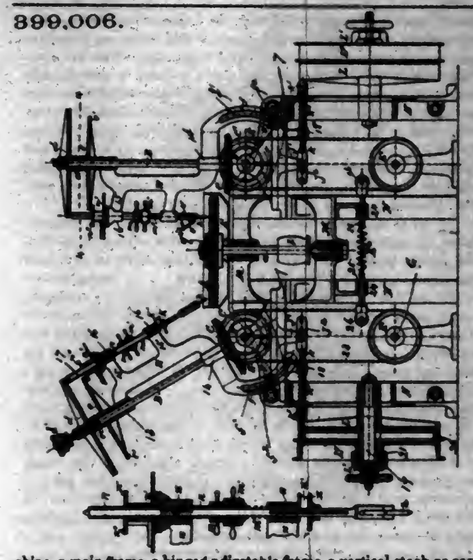


399,004. METAL ROOFING. WILSON C. BERGER, Canton, Ohio. Filed Jan. 10, 1889. Serial No. 296,015. (No model.)

Claim.—1. The combination of the sheets A, provided with the tongued-up portions a and b, the lips C, formed in the tongued-up portion a and the anchors B and said lips folded over each other, and the tongued-up portion a extending above the tongued-up portion b, bent or folded over the tongued-up portion b, together with the anchors B and lips C, substantially as and for the purpose set forth.

2. The sheets A, provided with the tongued-up portions a and b, the anchor B, and the lips C, formed in the anchors B and the tongued-up portion a, said lips cut opposite to each other and both of said lips bent down, substantially as and for the purpose set forth.

399,005. SNAP-HOOK. OSCAR V. BLAKER, Gillette, N. J. Filed Dec. 17, 1888. Serial No. 293,819. (No model.)



Claim.—1. The combination, with the hook B and body A, having a longitudinal slot, C, of the sliding hook-closer E, having a head, 3, to close the mouth of the hook, and a hole through which the connection D to the trace or chain passes, substantially as set forth.

2. The combination, with the hook B and slotted body A, of the sliding hook-closer E, having a head, 3, and a connection to the chain or trace, whereby the tension upon the chain or trace draws the head 3 into the mouth of the hook, substantially as set forth.

399,006. MACHINE FOR CUTTING AND POLISHING PRECIOUS STONES, &c. THEODOR BLAUSCHILL, Schaffhausen, Switzerland. Filed Dec. 20, 1886. Serial No. 222,031. (No model.) Patented in France July 1, 1886, No. 177,126, and in Germany July 4, 1886, No. 39,311.

Claim.—1. The combination, in a gem polishing and grinding machine, a main frame, a hinged adjustable frame, a vertical stock or carrier in said hinged frame, connections, substantially as described, for intermittently depressing said stock and carrier, and a polishing-disk and its shaft mounted in the main frame, substantially as set forth.

399,006.

2. In a gem polishing or grinding machine, the combination of a horizontal grinding-disk, devices for rotating it, a block, J, a spring-pressed shank connected to said block J and having a roller, a cam-wheel, L, and a frame, H, mounted on said block J and carrying a tool-stock, substantially as described.

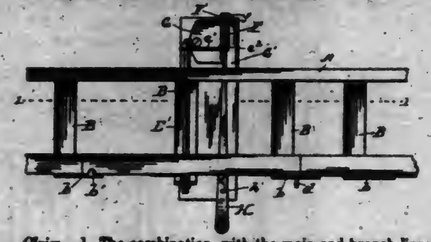
3. In a tool grinding or polishing machine, the combination, with a horizontal rotating grinding or polishing disk, of the frames H, having the stocks and tools and cam-disks for intermittently depressing said stocks, pulleys E E', and chain belts 23, for driving said depressing-disks and tension devices connecting said chain belts, substantially as set forth.

4. In a tool grinding or polishing machine, the combination, with the horizontal rotating grinding or polishing disk, of the frame H, carrying the tool-stock and the tool and shaft B, having disks d e, the disk d being provided with shoulders d'' and the disk e with projections e', and a disk, n', provided with shoulders n'', substantially as described.

5. In a machine for grinding or polishing gems, the combination, with a horizontal rotating grinding or polishing disk, of a frame or carrier, a stock and tool mounted therein, and devices for actuating said stock and tool, a disk, K, mounted on said stock, and a fixed index or needle, k', substantially as set forth.

6. The combination, in a gem grinding or polishing machine, of a tool-stock having an independent tool and a spring-pressed cam-lever, i', substantially as set forth.

399,007. SWITCH FOR OVERHEAD TRACKS. JOHN BOUCHARD, Chicago, Ill., assignor of one-half to George H. Webster, same place. Filed Oct. 21, 1887. Serial No. 253,094. (No model.)



Claim.—1. The combination, with the main and branch rails, of the switch-rail arranged between the same and having one of its ends flexibly connected to the end of the main rail, the rock-shaft provided with a crank-arm attached to the switch-rail by a sliding connection, the operating-lever, and a second crank-arm on the rock-shaft connected to said operating-lever, substantially as and for the purposes specified.

2. The combination, with the main and branch rails, of the switch-rail arranged between the same and having one of its ends flexibly connected to the end of the main rail, the slide mounted on said switch-rail, the rock-shaft provided with a crank-arm pivoted to said slide, the depending operating-lever, and a second arm on the rock-shaft engaging said operating-lever, substantially as and for the purposes specified.

3. The combination, with the main and branch rails, of the switch-rail arranged between the same and having one of its ends flexibly connected to the end of the main rail, said switch-rail being slotted as described, the slide connected to said switch-rail by bolts passing through the said slots, the rock-shaft provided with a crank-arm pivoted to the slide, the depending operating-lever provided with a slot, a notched rack for said lever, and a second arm on the rock-shaft extending through the slot in the said lever, substantially as and for the purposes specified.

399,008. SWITCH FOR OVERHEAD TRACKS. JOHN BOUCHARD, Chicago, Ill., assignor of one-half to Michael Cudady, same place. Filed Mar. 31, 1888. Serial No. 269,186. (No model.)

Claim.—1. The combination, with the main and branch lines, of the horizontally-swinging switch-rail, a vertical rock-shaft having one arm connected to said switch-rail, and a second arm by which it is operated, a pair of toggle-levers connected to said second arm and to a fixed support, and an operating-lever connected to said toggle-levers, substantially as and for the purposes specified.

2. The combination, with the main and branch lines, of the horizontally-swinging pivoted switch-rail, the rock-shaft E, having arm E connected thereto, and arm e', the toggle-levers F and F', the former connected to the arm e' by means of links e^2, and the latter pivoted to a fixed support, the operating-lever H, pivoted to the toggle-levers, and means for locking said operating-lever, substantially as and for the purposes specified.

3. The combination, with the swinging switch-rail and the rock-shaft E, for operating the same, of the toggle-levers F and F', the former connected to said rock-shaft and the latter pivoted to a suitable fixed support and provided with a toe, f'', to limit its downward motion, substantially as and for the purposes specified.

4. The combination, with the swinging switch-rail, its rock-shaft, and the toggle-levers for operating the same, of the support G, having keeper g and pin g', and the operating-lever H, pivoted to the toggle-levers, passing through the keeper, and apertured at h to receive the pin g', substantially as and for the purposes specified.

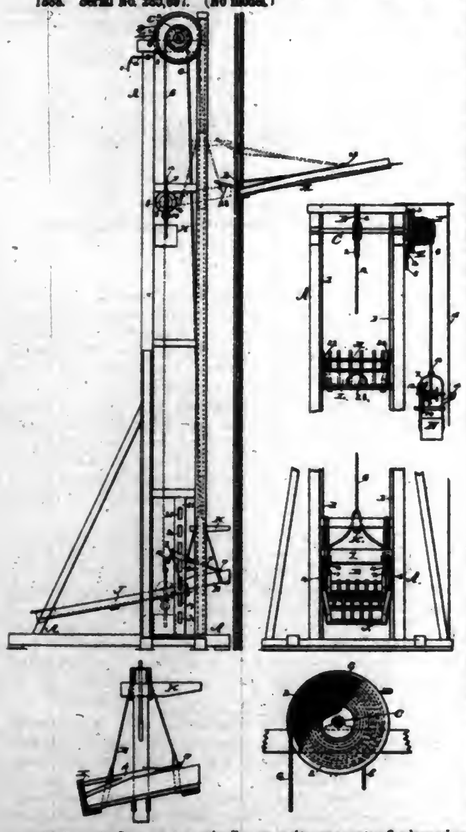
399,009. PROCESS OF PRODUCING COBALT MATTE FROM COBALT ORES. WILLIAM BRADENBURG, Sing Sing, assignor to the Mineral Reduction Company, New York, N. Y. Filed Feb. 2, 1887. Serial No. 226,327. (No specimens.)

Claim.—1. The process of producing cobalt matte from cobalt ores, consisting of breaking up the ore, then mixing it with graphitic carbon and adding a suitable flux, then melting the mass and drawing off the metal, substantially as described.

2. The process of producing cobalt matte from cobalt ores, consisting of breaking up the ore, breaking up a quantity of graphitic carbon equal to about twenty-five per cent., by weight, of the ore, mixing the ore and graphitic carbon, adding a suitable flux, then melting the mass, and then drawing off the metal, substantially as described.

3. The process of producing cobalt matte from cobalt ores, consisting of breaking up the ore, breaking up a quantity of graphitic carbon equal to about twenty-five per cent., by weight, of the ore, mixing the ore and graphitic carbon, adding a suitable flux, melting the mass in a furnace having a hearth made of graphitic carbon, and then drawing off the metal, substantially as described.

399,010. PRODUCING NICKEL MATTE FROM NICKEL ORES. WILLIAM BRADENBURG, Sing Sing, assignor to the Mineral Reduction Company, New York, N. Y. Filed Feb. 2, 1887. Serial No. 226,329. (No specimens.)



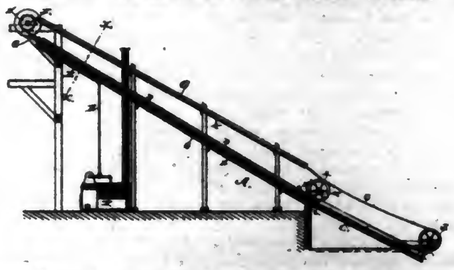
Claim.—1. The process of producing nickel matte from nickel ores, consisting of breaking up the ore, then mixing it with graphitic carbon and adding a suitable flux, then melting the mass and drawing off the metal, substantially as described.

2. The process of producing nickel matte from nickel ores, consisting of breaking up the ore, breaking up a quantity of graphitic

carbon equal to about twenty-five per cent., by weight, of the ore, mixing the ore and graphitic carbon, adding a suitable flux, then melting the mass, and then drawing off the metal, substantially as described.

3. The process of producing nickel matte from nickel ores, consisting of breaking up the ore, breaking up a quantity of graphitic carbon equal to about twenty-five per cent., by weight, of the ore, mixing the ore and graphitic carbon, adding a suitable flux, melting the mass in a furnace having a hearth made of graphitic carbon, and then drawing off the metal, substantially as described.

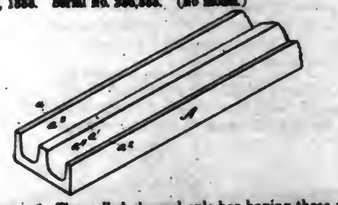
399,011. AUTOMATIC APPARATUS FOR LOWERING ICE FROM STORE-HOUSES. JOHN H. BRIGGS, Coeymans, N. Y. Filed Sept. 18, 1888. Serial No. 285,607. (No model.)



Claim.—1. In an automatically-operating apparatus for lowering ice, the combination of a rope-drum having only sufficient space between its heads or flanges to receive a single diameter of the rope used thereon, and upon which the rope is wound so that each successive convolution of said rope will be wound upon and be of greater diameter than the precedent convolution, and a spirally-grooved cylindrical rope-drum having a gradual decrease in its diameter near the end where the terminal turns of said rope are wound thereon, the rope of one of said rope-drums being wound thereon in a contrary direction to that of the other drum, a gig for carrying the ice being secured to the lower end of the rope attached to the first drum, and a weight, which overbalances said gig when the latter is empty, being attached to the lower end of the rope of the other drum, as and for the purpose herein specified.

2. The combination of a vertically-reciprocating gig, a rope-drum to which said gig is connected and whose heads are spaced at such distance apart as to admit between them only a single diameter of the rope which connects said drum with the gig, a spirally-grooved rope-drum having a gradual decrease of diameter toward the end where the terminal turns of the rope are wound, and a counteracting-weight connected by a rope to said spirally-grooved drum, said weight having a preponderance over said gig when the latter is in an unloaded condition, and being adapted to move always in a reciprocally-different direction to that in which said gig moves in, as and for the purpose herein specified.

3. In an apparatus for automatically lowering ice, the combination of upper feeding-chute, whereon the cakes of ice slide by their own gravity toward the discharge end of said chute, an automatic gate located at the discharge end of said chute, a gig which has a vertically-reciprocating movement, and which is fitted to automatically raise said gate when said gig is near the upper termination of its movement, a drum-shaft provided with rope-drums, as herein described, one of said drums having said gig connected thereto by a rope, and the other drum having a weight connected thereto by a rope which winds in a contrary direction to the gig-rope, said weight being adapted to normally retain said gig when unloaded at the highest point of its movement, as and for the purpose herein specified.



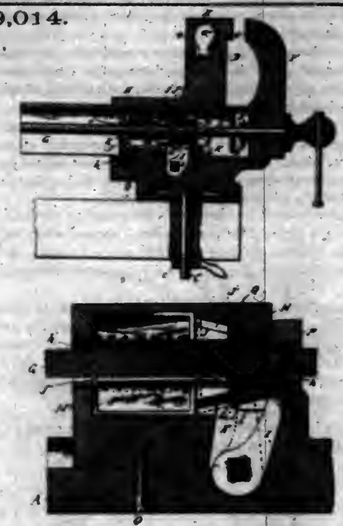
4. In an apparatus for automatically lowering ice, the combination of an upper feeding-chute, whereon the cakes of ice slide by their own gravity toward the discharge end of said chute, an automatic gate located at the discharge end of said chute, a gig having an outwardly and downwardly inclined bottom, said gig having a vertically-reciprocating movement and provided with means for automatically raising said gate of the feeding-chute, and a drum-shaft provided with rope-drums, as herein described, one of said drums having said gig connected thereto by means of a rope, and the other drum having a weight connected thereto by means of a rope which winds in a contrary direction to the gig-rope, and said weight being adapted to retain said gig when the latter is unloaded at the highest point of its movement, and said gig being provided at its discharging side with an automatic gate, which is fitted to engage with a fixture by which said gate will be opened near the termination of its lowest point of movement, said apparatus being so arranged that its operation will be entirely automatic so long as cakes of ice remain on the feeding-chute, as and for the purpose herein specified.

399,012. HEATER FOR ICE-ELEVATORS. JOHN H. BRIGGS, Coeymans, N. Y. Filed Oct. 19, 1888. Serial No. 288,532. (No model.)

Claim.—In an ice-elevator, the combination of the endless chains of the elevator, guideways for said endless chains provided with longitudinal channels in proximity to the path of said endless chains, and steam-pipes arranged in said channels, whereby ice is prevented from forming on said chains and guideways, as and for the purpose herein specified.

399,013. VEHICLE-AXLE. CHARLES B. BROWN, Chicago, Ill. Filed Oct. 1, 1888. Serial No. 286,883. (No model.)

Claim.—1. The rolled channel axle-bar having three webs extending from one end of the axle to the other, said webs being squeezed together at the ends of the bar to form tapering ends, said tapering ends uniting with the middle part of the axle on gradual curves without forming abrupt bends or shoulders, substantially as specified.



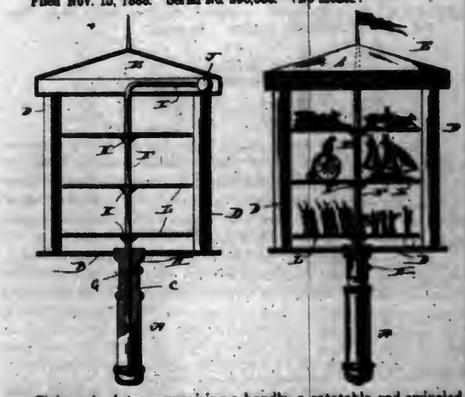
2. The combination, with an axle-bar having three parallel vertical webs squeezed together at the ends of the axle, of axle-skeins fitting upon the tapering ends of said axle-bar, said tapering ends uniting with the middle part of the axle on gradual curves without forming abrupt bends or shoulders, substantially as specified.

399,014. VISE. PERRY BROWN, Louisville, Ky., assignor to Daniel R. Doherty, same place. Filed June 12, 1888. Serial No. 276,736. (No model.)

Claim.—1. In a vise, and in combination with the screw thereof, a divided nut constructed, as described, so as to move in the direction of the length of the screw as the nut opens, substantially as described.

2. In a vise, and in combination with the screw thereof, a divided nut and means, as the thumb-lever i', rocking shaft i, finger I, and the inclined guides j', for opening said nut, substantially as described.

399,014.



3. In a vise, and in combination with the screw thereof, the box J, having guides j', a tube working in the box, a spring operating on said tube, a divided nut working on said guides, a yoke embracing said nut, and vibrating finger operating said nut, substantially as described.

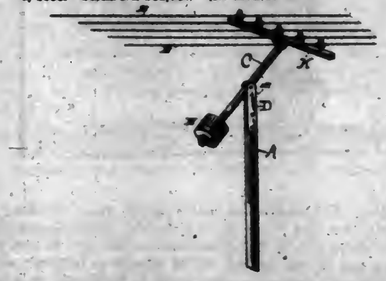
4. In a vise, and in combination with the screw and the movable and fixed sections of the vise, a box, H, secured in said fixed section, a second box inclosed in said box H and having guides j'', a divided nut whose sections travel on said guides, a yoke embracing said nut-sections, a tube acting on said yoke and nut-sections, a spring acting on said tube, and a vibrating finger operating on said yoke in opposition to the spring and tube, substantially as described.

5. The combination, with one of the sections of a vise having a ball-stud, of a movable jaw with a ball-socket formed therein and having its bottom curved, and a washer surrounding said ball-stud and provided with a curved face, substantially as described.

6. In a vise, and in combination with the screw thereof, a divided nut constructed, as described, so as to move on inclined guides set between the ends of the sections of the nut and a pair of inclines above and below the nut to hold them firmly against the action of the screw, substantially as described.

399,015. MECHANICAL TOY. JOSEPH P. BURFOOT, Mobile, Ala. Filed Nov. 15, 1888. Serial No. 290,888. (No model.)

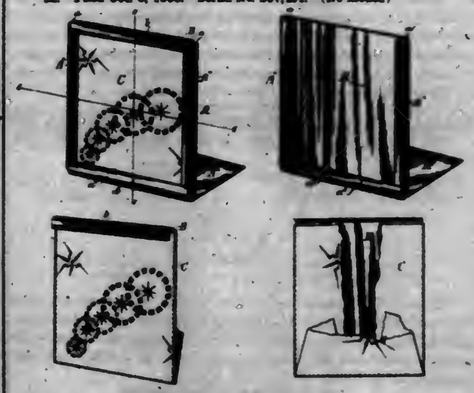
Claim.—1. A toy comprising a handle, a rotatable rod swiveled in the handle, a series of disks secured to said rod and rotated thereby and having images secured upon their upper sides, and a weight secured to the rod independently of the disks, whereby when the handle is tilted the weight will fall and the rod be rotated, as set forth.



2. A toy comprising a handle, a rotatable rod swiveled in said handle, an arm extending laterally from the said rod, a weight secured to the end of said arm, and a series of disks secured to and rotated by the rod and having images secured on their upper sides, as set forth.

3. A toy comprising a handle, a roof supported by the handle, a rod mounted in the handle and having a ball connected to its upper end and adapted to move over the bottom plate of the roof, and the disks secured to the said rod and carrying figures, as set forth.

4. A toy comprising a handle, a rod mounted in said handle and having laterally-projecting tongues or offsets, disks secured to the handle and carrying figures, and a ball connected to the said rod to rotate the same, as set forth.

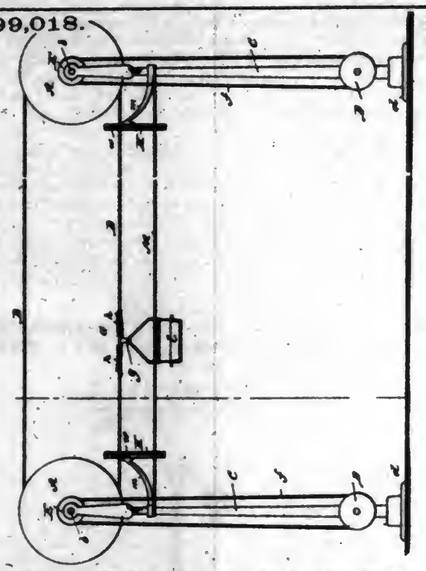


5. The improved toy herein described and shown, comprising the handle having a socket in its upper portion, the platform secured to the upper end of the handle, the columns erected on the platform, the roof supported by the columns, the rod having its lower end journaled in the socket in the handle and provided with an annular groove, and having its upper end bent to one side, the pin inserted transversely through the handle and engaging the annular groove of the said rod, the ball secured to the upper end of the said rod, and the disks secured to the said rod and carrying figures, as set forth.

399,016. STRETCHER FOR MECHANICAL-TELEPHONE-LINE WIRES. ALEXANDER W. BUTTERWORTH, New York, N. Y. Filed Aug 6, 1888. Serial No. 282,047. (No model.)

Claim.—A tension device for overhead wires, consisting of a main support, as a pole, a lever pivoted upon the pole, a bridge-piece for carrying the wire attached to one end of the lever, and an adjustable counter-weight on the opposite end of the lever, substantially as set forth.

399,017. SAMPLE-HOLDER. WILLIAM A. CAMPBELL, Hyde Park, Ill. Filed Oct. 6, 1888. Serial No. 287,431. (No model.)



Claim.—1. A holder for samples, comprising a frame provided with a horizontal plate or wing for supporting the frame in the vertical position and with guide-grooves, and a sample-holding plate adapted for insertion in said guide-grooves, substantially as described.

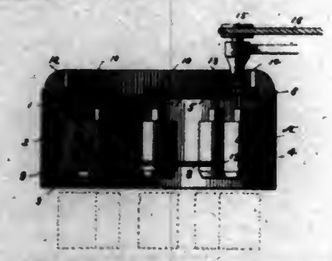
2. A holder for samples, comprising a frame provided with a horizontal plate or wing for supporting the same in a vertical position and with guide-grooves upon three of its sides, and a sample-holding plate adapted for insertion in said grooves and provided with a flange on one of its margins, substantially as described.

3. A holder for samples, consisting of a vertical frame provided with a horizontal part or wing, said frame consisting of a piece of sheet metal bent inwardly at its opposite edges to form two guide-grooves, and the wing consisting of a second piece of metal bent upwardly at its front edge and secured to the piece of sheet metal forming the frame, and a metal plate adapted for insertion into the guide-grooves of the frame, substantially as described.

399,018. CASH AND PARCEL CARRIER. EDSON P. CLARK and ADDO T. CROMLEY, Northampton, Mass. Filed June 6, 1888. Serial No. 276,341. (No model.)

399,018.

Claim.—1. The combination, with a pair of wheels or rollers, A A, and the endless cord B thereon, of a frictional saddle consisting of a length of spring-wire by its intermediate portion bent to form an eye or loop and its end portions wound spirally to form the coils A A, said coils being disposed at slight angles to each other, whereby four points of yielding contact upon the cord are insured, and a carrying device suspended from the said eye-loop, substantially as and for the purpose described.



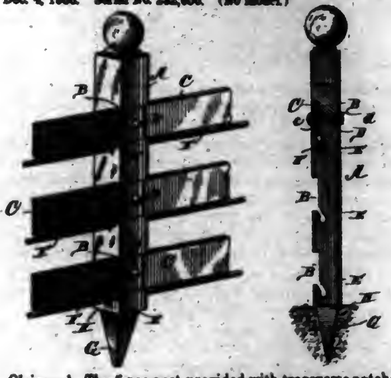
2. In combination, the standards C C, provided with the wheels and sheaves A E at one end and the sheaves D at the other, the hand-belts *f f* around said sheaves, the endless cord B on said wheels A, the brackets *m m*, supported on said standards, and the abutment-guards H H on said brackets, standing in planes across the travel of said endless cord and provided with apertures to permit the travel of said cord therethrough, and a frictional saddle mounted on said endless cord, and an article-carrying appliance supported from said saddle, all substantially as and for the purpose described.

399,019. PROCESS OF ELECTRIC WELDING. CHARLES L. COFFIN, Detroit, Mich. Filed Sept. 18, 1888. Serial No. 285,740. (No specimens.)

Claim.—The process herein described of welding two articles together, which consists in placing the two articles against each other and welding the joint by simultaneously traversing such joint by an electric current and subjecting it to the action of a voltaic arc, substantially as set forth.

399,020. CAN-SOLDERING MACHINE. JOHN M. COLBERT, Manton assignor to James H. Ferguson and Frank Ferguson, Bridgeton, N. J. Filed Jan. 22, 1889. Serial No. 297,191. (No model.)

Claim.—1. A head for a can-soldering machine, consisting of a case or frame, a series of spindles supported therein and provided with soldering-irons and pinions, and a driving-wheel gearing with all the said pinions, substantially as set forth.



2. The combination, in a head of a can-soldering machine, of a support for a series of vertical spindles arranged in a circle and each provided with a pinion and a soldering-iron, and a driving-wheel gearing with all of said pinions, substantially as set forth.

3. The combination of a frame or case having bearings for a series of spindles arranged in a circle and each capable of moving vertically in its bearings, a pinion, and a soldering-iron carried by each spindle, and a driving-wheel gearing with all of the pinions and greater in depth than the latter, substantially as set forth.

4. The combination, in a head of a can-soldering machine, of a case supporting a series of vertical spindles, a series of soldering-irons carried by the spindles, the case extending below the irons, and pinions upon the spindles gearing with the driving-wheel, substantially as set forth.

5. The combination of a case provided with a perforated top and bottom, a series of vertical spindles extending through the perforations in the top and each provided with a pinion at its upper end gearing with a driving-wheel, and a series of soldering-irons carried by the spindles and each extending through one of the perforations in the bottom of the case, substantially as set forth.

399,021. FENCE-POST. THOMAS DAILEY, Jackson, Mich. Filed Dec. 4, 1888. Serial No. 292,656. (No model.)

Claim.—1. The fence-post provided with transverse notches B B, and grooves E E at the lower inner angles of the said notches, in combination with the wires fitting in the said grooves, and the rails or boards fitting in the notches and held in place by bolts passing through the posts, substantially as specified.

2. A fence-post provided in one side with shallow rail-notches B B, and having grooves *g g* inclining downwardly and inwardly from the inner lower angles of the said notches, substantially as specified.

399,022. GAS-STOVE. ALFRED S. DUNMORE, Boston, Mass. Filed Feb. 16, 1888. Serial No. 264,265. (No model.)

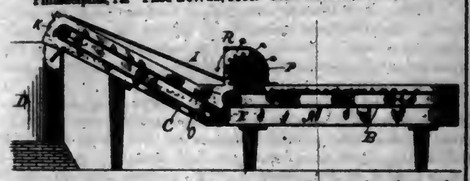
Claim.—1. The combination of a heating-drum of a gas-stove with a two-part top, one part of which is seated upon and closes the end of the drum, and is provided with an opening and movable cover therefor, the other part of which top is supported a short distance above the first-mentioned part, with a space between said parts open to the outside air, substantially as and for the purpose described.

2. The combination of the heating-drum of the gas-stove with a two-part top, one part being fastened upon and closing the end of the drum and being provided with a central opening, and the other part being provided with feet that rest upon the first-mentioned part, a bolt fastening the said parts together, with a space open to the outside air between them, and a cover for the opening of the under part movable on and guided by the said bolt, substantially as described.

399,023. PROCESS OF MAKING ALLOYS OF CHROME, IRON, AND MANGANESE. HENRICH EICKARDT, Dortmund, Prussia, Germany. Filed Jan. 8, 1889. Serial No. 296,756. (No specimens.) Patented in Germany Jan. 31, 1888, No. 44,896; in England Sept. 24, 1888, No. 13,742, and in Belgium Sept. 29, 1888, No. 82,166.

Claim.—1. The herein-described process of producing alloys of chrome, iron, and manganese, which consists in mixing chrome ore with the slag of the acid Bessemer process and subjecting the mixture to the reduction process, substantially as set forth.

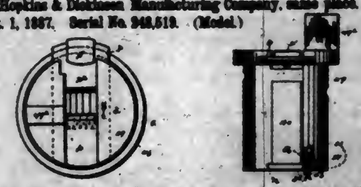
2. The process herein described of producing alloys of chrome, iron, and manganese, which consists in mixing ores of chrome and manganese with the slag of the acid Bessemer process, and subjecting the mixture to a reduction process, substantially as set forth.



3. The herein-described process of producing alloys of chrome, iron, and manganese, which consists in mixing the chromium ore, manganese ore, and the slag of the acid Bessemer process in finely-ground state with tar freed of water, and reducing the pasty mass in the form of briquettes in a blast or reverberatory furnace, substantially as set forth.

399,024. PLATE-HOLDER. WILLIAM C. RUSH, Ashland, Pa. Filed Mar. 15, 1888. Serial No. 267,280. (No model.)

Claim.—In a plate-holder, the combination of the vertical post A, stationarily secured to a base, a block, *b*, adjustably mounted on the post A, having an integral stationary jaw formed with an upward and downward bend, a movable jaw pivoted to the elbow of the said stationary jaw, and a clamping-screw passing through the ends of the two jaws, substantially as described.



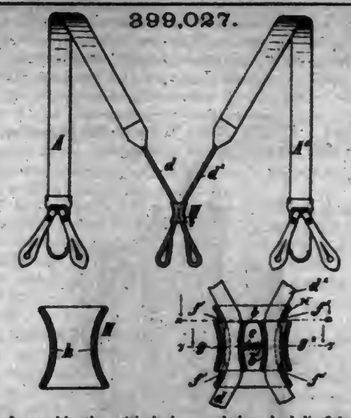
399,025. CLAY PULVERIZER AND CONVEYER. JAMES EVANS, Philadelphia, Pa. Filed Nov. 22, 1888. Serial No. 291,583. (No model.)

Claim.—1. A device for disintegrating and conveying clay to the machine, an endless belt or carrier, and a spiked drum located over said carrier to disintegrate the clay on said carrier as it passes to the machine.

2. A device for disintegrating and conveying clay from the pit to the machine, a horizontal traveling belt or carrier, a disintegrating device located over and adapted to pulverize the clay on said carrier, and an inclined carrier for conveying the clay upward into the machine, as set forth.

399,026. LOCK. WILLIAM S. PIKE, Brooklyn, N. Y., assignor to the Hopkins & Dickinson Manufacturing Company, same place. Filed Sept. 1, 1887. Serial No. 248,513. (Model.)

Claim.—1. In a cylinder-lock, the combination, with the cylinder-case, having the opening 47, and the revolving plug, of the slotted sliding plate, the lug thereon, and the tumblers engaging a slot in said plate, the said plate adapted to operate against the eccentric flange of a mortise-lock, substantially as specified.



2. In a cylinder-lock, the combination, with the case and the revolving plug, of the slotted plate seated in bevel grooves in the plug and having the key-slot, and the tumblers having the actuating-springs, substantially as specified.

3. The combination, with the cylinder-case having the central opening provided with a radially-disposed slot, of the revolving plug provided with the shouldered spring-pressed locking-pin supported in a seat therein and normally engaging said slot, the shouldered tumblers K, K', K², K³, and K⁴ and their actuating-springs, the removable piece 150, the slotted plate having its slot registering with the radially-disposed slot in the cylinder-case, the projecting slotted sliding plate, and the projecting arm 49², substantially as specified.

399,027. BRACES OR SUSPENDERS. SIGISMUND FRANK, Hamburg, Germany. Filed Nov. 10, 1888. Serial No. 290,408. (No model.)

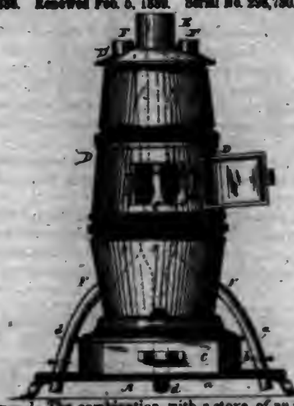
Claim.—1. As an improvement in suspenders having end cords, the collar or slide and the laterally-movable dies for clamping said end cords, substantially as set forth.

399,027.

2. In combination with the loop-ended cords *d d'* of the shoulder-straps A A', a collar or slide, H, provided with a pair of laterally-movable dies, *b g* and *b' g'*, and spring *c*, substantially as and for the purpose set forth.

399,028. PROCESS OF RECOVERING GLYCERINE FROM SPENT SOAP-LYES. ARTHUR W. TRENOR, Brooklyn, N. Y., assignor to Joseph Bates, same place. Filed Dec. 12, 1888. Serial No. 293,373. (No specimens.)

Claim.—1. In the process of extracting glycerine from spent soap-lye, the improvement which consists in adding to the lye rennet solution for coagulating and precipitating albuminous matter and fatty acids contained in said lye, substantially as described.

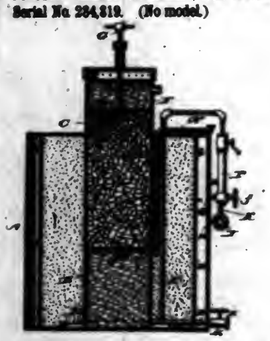


2. In the process of extracting glycerine from spent soap-lye, the improvement which consists in adding to the lye a rennet solution in acid, and afterward adding an acid to complete the precipitation of the albuminous matter and of the fatty and resinous acids contained in the lye, as specified.

399,029. ART OF DECORATING POTTERY-WARE. LAURA A. FRY, Camp Dennison, Ohio. Filed Mar. 16, 1888. Serial No. 186,404. (Specimens.)

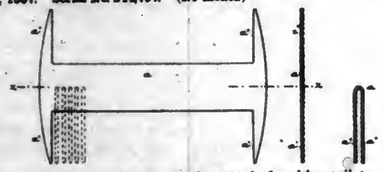
Claim.—1. The improvement in the art of decorating articles of clay-ware, which consists in blowing an atomized spray or cloud of coloring-matter upon the surface thereof, and thereafter fixing the same by firing, substantially in manner as described.

2. The improvement in the art of decorating clay-ware, which consists in heating the surface and blowing upon the heated surface an atomized spray or cloud of coloring-matter, and thereafter fixing the same by firing, substantially in manner as described.



399,030. STOVE. NANCY J. GRAHAM, Jackson, Ohio. Filed Feb. 26, 1888. Renewed Feb. 5, 1889. Serial No. 298,730. (No model.)

Claim.—1. The combination, with a stove, of an annular series of air-heating tubes having contracted upper and lower ends, and bulging intermediate portions arranged in the combustion-chamber to form a centrally contracted space for the ascent of the products of combustion, the pipes *d*, leading through the stove-hearth and through the wall of the stove and communicating with the lower ends of said tubes, and a series of upwardly-flaring pipes connected to the upper ends of said tubes and leading out of the stove through its top, substantially as described.

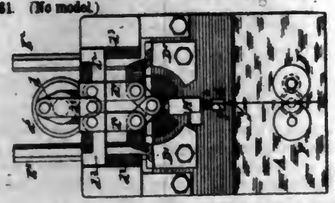


2. The combination of a stove, a concentric series of air-heating tubes having bulging portions in the combustion-chamber thereof, each tube having an air-supply pipe provided with a damper, and a concentric series of upwardly-flaring pipes leading out of the top of the stove around the outlet E, substantially as described.

399,031. FILTER. HENRY W. GRELLE, New Orleans, La. Filed Sept. 7, 1888. Serial No. 284,819. (No model.)

Claim.—The combination, with the outer casing, A, of the sand-chamber B, arranged therein and having perforations near its upper end, as shown, to communicate with the chamber *a*, the gravel-chamber C, arranged centrally in the sand-chamber and having at its lower end the water-chamber E and at its opposite or upper end a pure-water chamber, F, the said gravel-chamber having a perforated bottom, D, and a removable perforated top carrying a pressure-screw, F, which has a bearing in the top of the pure-water chamber, the perforated pipe L, arranged in the sand-chamber and concentric to the water-chamber E, valved pipes leading from said chamber, the pipe N, leading from the upper portion of the water-chamber E and provided with cocks, the pipe H, provided with the valve and communicating with the chamber *a*, the pipe K, leading from the pipe H and communicating with the perforated pipe in the said chamber, the pipe Q, provided with valves and connecting a pipe, K, with the chamber *a*, and the air-pipe P, also connected with the chamber *a*, substantially as specified.

399,032. COMB. HENRY G. GUILD, New York, N. Y. Filed July 20, 1887. Serial No. 244,797. (No model.)



Claim.—1. The herein-described method of making toilet-combs, which consists in first forming the blank for the head of the comb of sheet metal with integral prongs $a^{\times}$ $a^{\times}$, then applying a film of solder to the one face of each of said prongs, then placing the metal teeth of the comb between the plies of the head and subjecting the whole to pressure, as described, then heating the comb until the solder melts, and then cooling it, substantially as set forth.

2. A comb having its head and guard-teeth formed of two thicknesses or plies of sheet metal of like form, placed face to face and soldered together, substantially as set forth.

3. A comb having its head and guard-teeth formed of a sheet-metal blank comprising the body *a* and four prongs, $a^{\times}$ $a^{\times}$, said blank being folded along the line *x*, and the prongs $a^{\times}$ $a^{\times}$ thus brought face to face in pairs united by solder to form the guard-teeth $b^{\times}$, substantially as set forth.

399,033. MACHINE FOR MAKING SHEET-METAL HINGES. WILLIAM HAAS, Brooklyn, N. Y. Filed Aug. 23, 1888. Serial No. 283,561. (No model.)

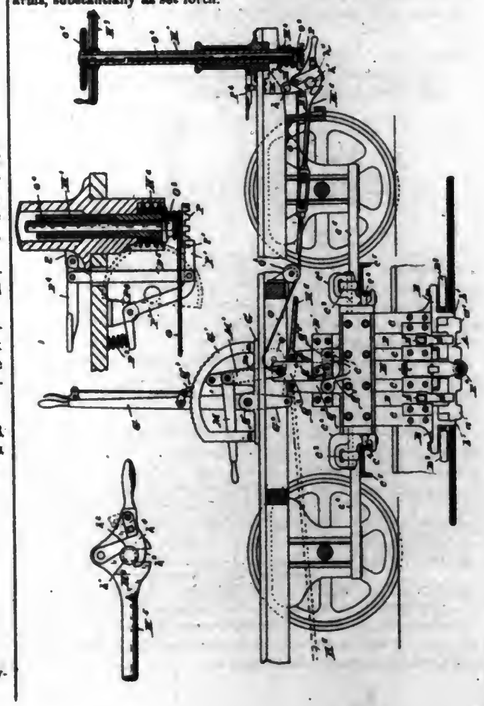
Claim.—1. The combination of upright feed-boxes, horizontally-reciprocating pushers at the lower end of said feed-boxes, oscillating jaws, feed-rollers for the pintle-wire, a reciprocating pintle-cutter, an eye for guiding the pintle from the cutter into the partly-closed pintle-sleeves, and a reciprocating sleeve-closing jaw, substantially as set forth.

2. The combination of upright feed-boxes, reciprocating pushers guided in ways below the feed-boxes, fixed stops in front of said feed-boxes, and oscillating bending-jaws moving at right angles to the pushers and jaws, substantially as set forth.

3. The combination, with oscillating jaws, of arc-shaped guide-cheeks for said jaws, wire-feeding rollers, a reciprocating pintle-cutter, a fixed eye above the same for guiding the cut-off pintle, and a reciprocating sleeve-closing jaw, substantially as set forth.

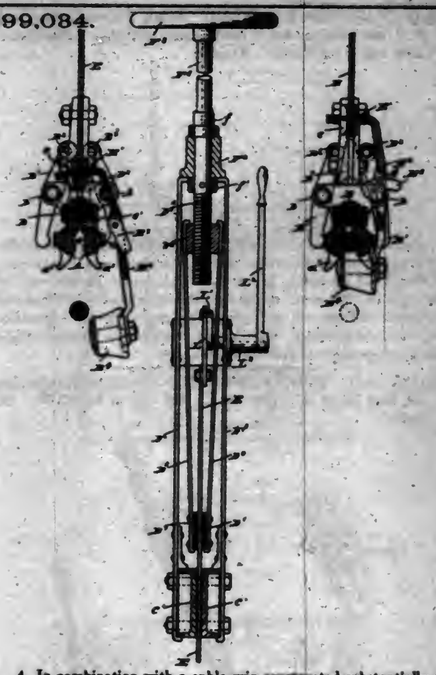
4. The combination of oscillating bending-jaws, arc-shaped guide-cheeks for said jaws, a shoulder intermediately between said cheeks, intermittently-rotating wire-feed rollers, a reciprocating pintle-cutter having an opening for the wire, a guide-eye above the cutter, and a reciprocating sleeve-closing jaw, substantially as set forth.

5. The combination of a rotary crank-shaft, a connecting pivot-link, a vertically-guided cross-piece, angular oscillating sleeve-bending jaws applied to a fixed pivot, and parallel pivot-links connecting said cross-piece and jaws, so as to impart oscillating motion to the jaw, substantially as set forth.



6. The combination of intermittently-rotating grooved wire-feed rolls, a fixed cheek for guiding the wire, a horizontally-reciprocating cutter having an opening for the wire, a fixed eye above the cutter, and a horizontally-reciprocating sleeve-closing jaw, substantially as set forth.

399,034. CABLE-GRIP. WORCESTER HADDOCK, Cincinnati, Ohio. Filed June 9, 1888. Serial No. 276,599. (No model.)

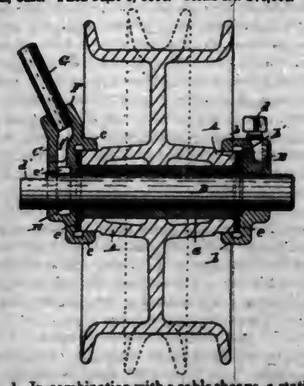


Claim.—1. A cable-grip consisting of two hinged or pivoted jaws having outwardly-flared extensions for guiding the cable into said jaws, in combination with the pawl-arm mechanism for closing the jaws and suitable mechanism for operating said pawl-arms, for the purposes set forth.

2. In combination with a cable-grip, a cable-lifting device consisting of a suitable arm having a sheave pivoted at its lower end portion, said arm being provided with a suitable cam for throwing the lifting-sheave from beneath the cable, and mechanism, substantially as set forth, for raising and lowering said arm independent of the grip.

3. A cable-grip consisting of two hinged or pivoted jaws attached to a suitable hanger-bar, as B, said bar being attached to and suspended from the cross-bars C by means of bars C, in combination with the grip-bars D, having wedge-shaped lugs D^3, pawl-arms B', pivoted to said hanger-bar B, the jaws of the grip being closed by raising said bars D through the medium of said wedge-shaped lugs and pawl-arms, substantially as set forth.

399,034.



4. In combination with a cable-grip constructed substantially as set forth, a cable-lifting device consisting of a suitable sheave, E^4, attached to an arm, as E^3, said arm being attached to the bar E in an opening, E', therein, and having a suitable cam, E^5, pivoted near the center thereof, and suitable mechanism for raising and lowering said bar.

5. In combination with a cable-grip constructed substantially as set forth, the connection between the car and grip, consisting of the yokes C^2, attached to cross-bars C', and having the rollers C^3 and C^4 pivoted therein in a vertical and horizontal position, respectively, said rollers bearing upon and against the top and sides of the channel-bars C^5, made fast to the frame of the car, substantially as set forth.

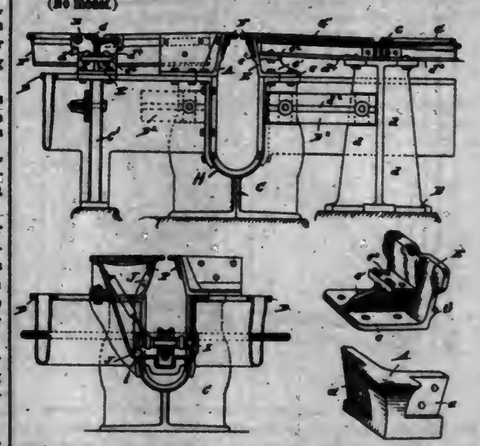
6. The jaws A, having projections *a'*, said jaws being pivoted or hinged to the hanger-bar B, bars C, cross-bars C', grip-bars D D, having the wedge-shaped lugs D^3, and pawl-arms B', having the rollers B^2 pivoted in one end thereof, in combination with lifting-bar E, arm E^3, having the cam pivoted therein, and the sheave E^4 and suitable mechanism for raising and lowering the grip-bars D D and lifting-bar E, substantially as set forth.

7. In combination with a cable-lifting device constructed substantially as set forth, the bar E, pivoted to link L, said link being pivoted at its other end to the crank-arm L', the latter having a suitable lever attached thereto, substantially as set forth.

399,035. CABLE-RAILROAD SHEAVE. WORCESTER HADDOCK, Cincinnati, Ohio. Filed June 9, 1888. Serial No. 276,600. (No model.)

Claim.—1. In combination with a cable sheave, a stationary shaft having a longitudinal oil-reservoir in its under or lower face, the collars B and C, attached to said shaft, the collar B, having an air-vent therein, and the collar C, constructed, substantially as described, for admitting oil to said reservoir in the shaft, and suitable means for supporting said shaft to the conduit.

2. In combination with a cable sheave, the shaft D, having the oil-reservoir E therein, collars B and C, set-screws *d d*, for attaching said collars to the shaft, washers *c c*, interposed between said collars and the ends of the hub, and suitable means for attaching said shaft to the conduit, substantially as set forth.



3. In combination with a cable sheave, the shaft D, having a longitudinal oil-reservoir therein, collars B and C, having overlapping flanges *b* and *c*, respectively encircling the end portions of the hub A, the collar B, having an air-vent therein, and the collar C, having an annular recess, *c'*, on its inner portion, and lug F, cast with said collar C, and having an opening, *f'*, leading to said recess *c'*, substantially as set forth.

4. In combination with a cable sheave, the shaft D, having a longitudinal recess therein, collar B, having an air-vent, *b'*, and suitable means for connecting said collar to the shaft, collar C, having the annular recess *c'* therein, lug F, having opening *f'*, said lug being cast with said collar C, pipe G, inserted or attached to said lug, and having a suitable cover, *g*, and suitable means for connecting the shaft to the conduit, as and for the purposes set forth.

5. In combination with a cable sheave, shaft D, having an oil-reservoir, E, collar B, having an air-vent, *b'*, collar C, having annular recess *c'*, and lug F, cast thereto, set-screws *d*, washers *c c*, pipe G, and suitable means for securing said shaft in the conduit in a non-rotatable position, substantially as set forth.

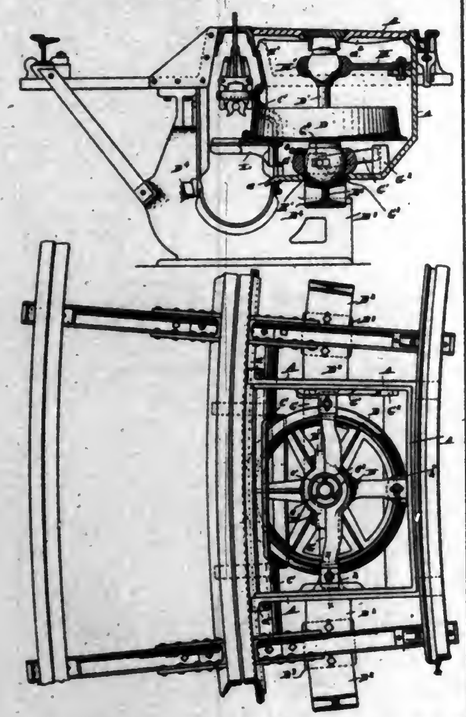
6. In combination with a cable sheave, a shaft, and oiling attachments constructed, substantially as set forth, the journal-boxes H and I, formed with the walls of the conduit, and key *i*, inserted into the journal-box I over the flat portion *d'* of the shaft, substantially as set forth.

399,036. CROSSING FOR CABLE RAILWAYS. WORCESTER HADDOCK, Cincinnati, Ohio. Filed July 2, 1888. Serial No. 278,050. (No model.)

Claim.—1. In a crossing for cable railways, the corner pieces or castings, A, bolted or suitably secured to the top intersecting flanges of the conduits, said castings having the rabbeted portions *a* in their inner faces corresponding in configuration to the slot-rails to be secured therein, substantially as set forth.

2. In a crossing for cable railways, the corner castings, A, secured to the top intersecting flanges of the conduits, said castings having their inner faces rabbeted to receive varying configurations of slot-rails, in combination with said slot-rails, and suitable brackets, as E, secured to the top flanges, B, of the conduits, said brackets being adapted to retain the slot and tram-rails in their relative positions on the conduits, substantially as set forth.

3. In a crossing for cable railways, suitable pedestals constructed, substantially as described, for supporting the intersection of the tram-rails, said pedestals being located at right angles to the two lines of cables, substantially as set forth.



4. In combination with a cable-crossing constructed substantially as set forth, the pedestals having an octagonal base, D, supporting-ribs *d*, top extensions, D', and lugs d^3, the intersecting tram-rails resting on said extensions between said lugs, said pedestals being connected to the yokes of the conduits by suitable stay-bars, D^2, substantially as set forth.

5. In a cable-railway crossing, the brackets E, having a base, *e*, supporting-rib *e'*, platform *e²*, and hooked lug *e³*, the ends of the tram-rails resting upon said platform, and the slot-rails resting in said lug, substantially as set forth.

6. In combination with a crossing for cable railways constructed substantially as set forth, the two depression-sheaves P P, for lowering one cable below the cable traveling at an angle thereto, substantially as set forth.

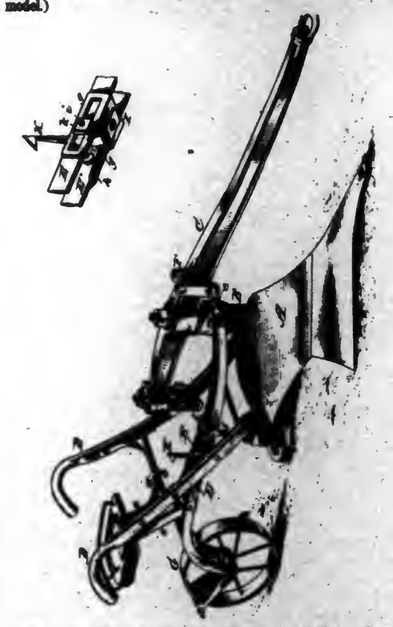
7. In combination with a cable-crossing, the two depression-sheaves P P, adapted to rotate upon suitable shafts, one end of said shafts resting in a journal, I, in one side of the conduit-wall, the other end of said shafts being pivoted in a lever-arm, J, said arm resting in a shoulder, *i*, at bottom and detachably connected at top to the slot-rail or other suitable portion of the conduit, substantially as set forth.

399,037. CABLE-CONDUIT CURVE. WORCESTER HADDOCK, Cincinnati, Ohio. Filed July 23, 1888. Serial No. 280,837. (No model.)

Claim.—1. In a cable-railway-curve construction, a series of sheave-boxes detachly connected to the slot-rails on the inner side of the curve, a space intervening between said boxes, said boxes being supported by a suitable connecting-bar resting upon extensions of the conduit-yokes, and a sheave suitably supported in said boxes in a horizontal position, the periphery of said sheaves projecting into the conduit through an opening in the side plate thereof, substantially as set forth.

2. In the construction of a cable-conduit curve, the sheave-box A, sheave D, shaft D', and ball journal-bearings E and E', in which the shaft rotates, the lower journal-bearing resting in a circular recess in the bar G, the top journal-bearing being secured to place in the box by means of the brace H and clamp H', substantially as set forth.

3. The construction herein shown and described for supporting and adjusting the sheave, consisting of the ball journal-bearings E and E', the journal-bearing E being secured in place on the shaft by a spider-shaped brace, H, and cap H', the journal-bearing E' resting in the circular recess G^3 in lever-bar G, said bar being pivoted at one end to suitable lugs in the box, the other end of said bar having the hand-lever G' pivoted thereto, substantially as set forth.

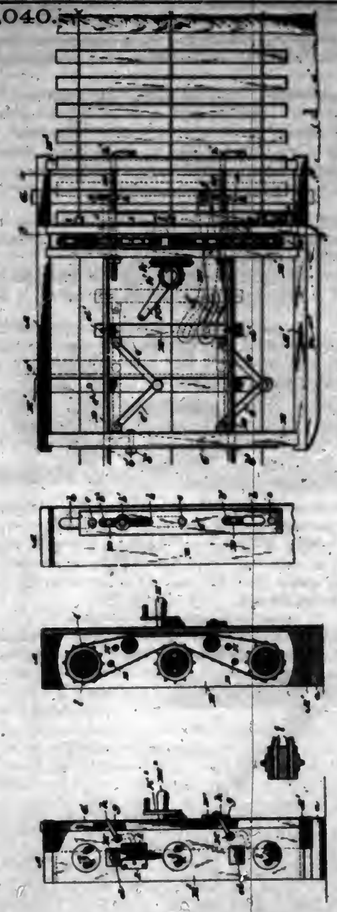


4. In combination with one or more sheaves mounted in boxes secured at one side of a cable-curve, the side plate, C, having the sheave-opening C^2 and drain-opening C^4, said plate being suitably connected to the yokes of the conduit, substantially as set forth.

399,038. CARPET-FASTENER. THOMAS D. HAMMOND, Syracuse, N. Y., assignor of one-half to Ellen J. Keller, same place. Filed June 7, 1888. Serial No. 276,342. (No model.)

Claim.—The within-described carpet-fastener, composed of the base *a*, post *b* at one end of said base and terminating in the rearward and downward projecting jaw *c*, the spring-plate *d*, placed over the base *a*, parallel therewith, and having its heel secured to said base and its opposite and free end under the jaw *c*, and the lever *f*, pivoted to the post *b*, and provided with the cam *e* under the free end of the plate *d*, substantially as described and shown.

399,039. RIDING ATTACHMENT FOR PLOWS. CHARLES HARSON, Rock Island, Ill. Filed Aug. 15, 1888. Serial No. 282,796. (No model.)



Claim.—1. The combination, with the hand-plow, of an adjustable clip on the beam of said plow, a lateral jointed bolt projecting from said clip, and the riding attachment consisting of the beams E, secured together at their forward ends and having a hole to receive one portion of said bolt, substantially as shown and described.

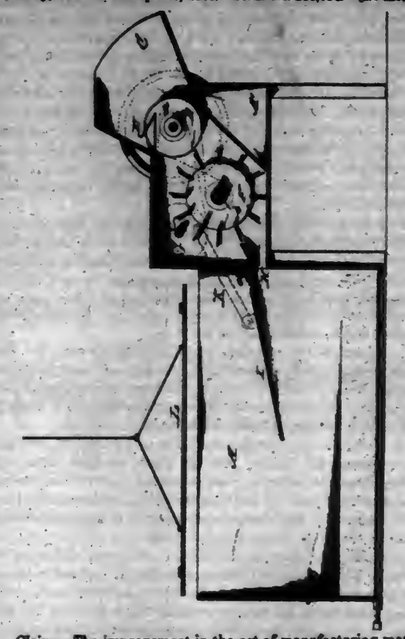
2. The combination, with the plow, of the riding attachment consisting of two beams, E, secured together at their forward ends and connected to the plow-beam by a pivotal connection and gradually separated toward their rear ends, the wheel G between the rear ends of the beams, and the guard *d*, connected to the beams and extending over the rim of said wheel, substantially as shown and described.

3. The combination, with the plow, of the beams E, secured together at their forward ends and to the plow-beam, the bracket I secured to the beams and having slotted sides *g* and tongues *h*, the bolt *i*, passed through holes in the beams and through the slots in said sides *g*, and the nut *k* on the threaded end of said bolt, substantially as described.

4. The combination, with the plow, of the beams E, secured together at their forward ends and to the plow-beam, the bracket I, secured to the beams and having slotted sides *g* and tongues *h*, the bolt *i*, passed through holes in the beams and through slots in said sides *g*, the nut *k* on the end of said bolt, and the spring-catch K, attached to said bracket and extending between the beams, substantially as and for the purpose specified.

399,040. FENCE-MAKING MACHINE. WALLACE A. HAWLEY, Napoleon, Mich. Filed Jan. 2, 1889. Serial No. 295,163. (No model.)

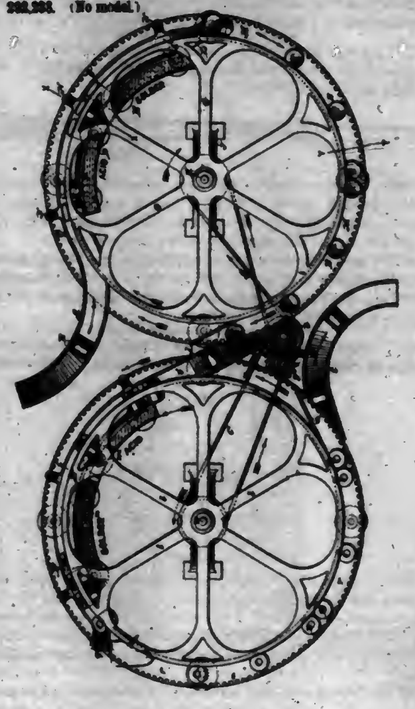
Claim.—1. In a fence-machine, the combination of the horizontally-supported rods D D, connected to each other to move in unison by a connecting-bar, a lever engaging with said connecting-bar so as to operate a vertically-moving bar to which rock-shafts are connected, the outer ends of said rock-shafts being provided with hooks, substantially as shown, and for the purpose set forth.



2. The combination, in a fence-machine constructed substantially as shown, of the parallel rods D D, connected to each other by a bar, E, which is adjustable thereon, a vertically-moving bar, E', provided with links *c* and *d*, and a pivoted lever having one end slotted for engagement with the bar E, said lever being secured to a vertically-moving bar, G, with which projecting members of the rock-shafts H H engage, the ends of said rock-shafts being bent to form hooks or locks, substantially as shown, and for the purpose set forth.

3. The combination, substantially as described, of the supporting-frame, the horizontal bars D D, the coupling-bar rigidly secured thereto, the toggle-arms connected at their ends to the frame and coupling-bar, and centrally to a bar, E', adapted to slide in vertical guides on the frame, and an adjustable stop, e^4, secured to said bar E' to limit the forward movement of bars D D.

4. The combination, substantially as described, of the twister-frame, the hooked rock-shafts journaled in said frame and threaded at their inner ends, arms secured to said rock-shafts, a vertically-moving bar provided with openings to engage said arms, and nuts engaging the threaded ends of the rock-shafts to regulate the distance of the hooks from the face of the frame.



5. In a fence-machine constructed substantially as shown, the combination, with the horizontally-moving bars D D, having heads, of a connecting-bar adjustably secured to said rods and provided with an outwardly-projecting pin which passes through a curved slot in a pivoted lever, F, the opposite end of said lever engaging with a vertically-moving bar for operating the rock-shafts H, so as to throw, when the bars D D are projected, the bent ends of the rock-shafts beyond the frame to engage with a picket, substantially as set forth.

399,041. METHOD OF MAKING MATTRESSES. DANIEL HAYES, Sealy, Tex. Filed Sept. 20, 1888. Serial No. 286,784. (No model.)

Claim.—The improvement in the art of manufacturing mattresses, which consists in first disintegrating the material and simultaneously forcing the same into a suitable receptacle, fanning said material as it passes into the receptacle, and finally compressing the same, substantially as described, thereby dispensing with tacking of the bat, as set forth.

399,042. CAN-SOLDERING MACHINE. WILLIAM HIPPERLING, New York, N. Y., assignor to Stephen A. Glass, Plainfield, N. J., and Richard A. Donaldson, Brooklyn, N. Y. Filed Nov. 30, 1888. Serial No. 292,262. (No model.)

Claim.—1. In a machine for soldering the heads upon tin cans, the inclined table upon which the cans are moved through the acid and solder baths and the rotating frame or wheel for moving said cans, combined with the acid and solder receptacles and the rotating frame for receiving the cans from said receptacles and conveying them to a point of delivery, substantially as and for the purposes set forth.

2. In a machine for soldering the heads upon tin cans, the inclined table upon which the cans are moved through the acid and solder baths and the rotating frame or wheel for moving said cans, combined with the acid and solder receptacles mounted upon vertically-adjustable standards and the rotating frame for receiving the cans from said receptacles, also mounted upon vertically-adjustable standards, substantially as set forth.

3. In a machine for soldering the heads upon tin cans, the acid and solder receptacles arranged in the arc of a circle, the inclined table on which the cans move, and the rotating frame or wheel for moving said cans, combined with the rotating frame for receiving the cans from said receptacles and having a toothed periphery, gearing for engaging said periphery, and a stationary frame for supporting said toothed frame, substantially as set forth.

4. In a machine for soldering the heads upon tin cans, the acid and solder receptacles, the inclined table on which said cans move, and the rotating frame or wheel for moving the cans, combined with the rotating toothed frame M, having groove *d*, the stationary frame *f*, having groove *e*, and the rollers *g*, substantially as set forth.

5. In a machine for soldering the heads on tin cans, the acid and solder receptacles, the inclined table on which the cans move, and the rotating frame or wheel G, having pivoted fingers F for moving the cans, combined with the rotating frame for receiving the cans from said receptacles and transmitting them to a point of delivery, substantially as and for the purposes set forth.

6. A machine for soldering the heads on tin cans, embracing in duplicate the acid and solder bath receptacles, the inclined table on which the cans move, the rotating frame or wheel for moving the cans along said receptacles, and the rotating frame for receiving the cans after leaving said receptacles, combined with means, substantially as described, for reversing the position of the cans between the times of their treatment by the duplicate parts of the machine, so as to present one head of the can to one part and the other head to the other part, substantially as set forth.

7. A machine for soldering the heads on tin cans, having duplicate parts, each embracing the following elements: the acid and solder receptacles, the rotating frame for carrying the cans through said receptacles, and the rotating frame for receiving the cans from said receptacles, combined with feed and delivery chutes for the cans and a table for receiving the cans from one of said duplicate parts and delivering them to the other of said parts, substantially as set forth.

399,043. PEN-HOLDER. LOUIS HOLSWORTH, New York, N. Y., assignor to the Eagle Pencil Company, same place. Filed Dec. 3, 1888. Serial No. 292,467. (No model.)

Claim.—1. A pen-holder consisting, essentially, of the external or main barrel, B, and a plurality of curved sheet-metal strips or tongues, C, nested and secured within said barrel concentrically with one another, as and for the purpose shown and described.

2. The pen holder and handle consisting of the external barrel, B, and the tongues C, provided with tubular inner ends, C', nested within the barrel and around the tenon of the handle A, as and for the purpose set forth.

399,044. DEVICE FOR CLEANING WELLS. JAMES F. HUDSON, Cheyenne Wells, Colo. Filed Sept. 10, 1888. Serial No. 285,089. (Model.)

Claim.—1. In a well-cleaner, the combination of a central bottom piece with the folding sides, which are loosely connected thereto, rods connected to these sides, a rod connected to the central bottom piece, and a sliding sleeve placed upon the central rod, and to which the connecting-rods are attached at their inner ends, substantially as shown.

2. The combination, in a well-cleaner, of a central bottom piece having an elevating-rod connected thereto, with the side and corner pieces, rods for closing or raising the side and end pieces, and a sliding sleeve which is placed upon the elevating-rod, substantially as described.

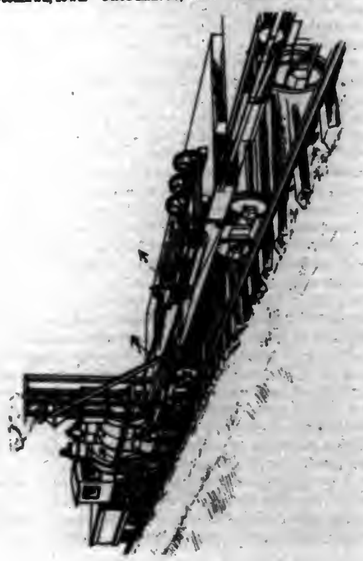
3. In a well-cleaner, the combination of the bottom piece, A, having an elevating-rod connected thereto, the folding side pieces connected to the edges of the pieces A, the folding corner-pieces, which unite the ends of the sides together, the sliding sleeve placed upon the elevating-rod, and the rods which connect the folding sides to the lower end of the sleeve, substantially as set forth.

399,045. PAVEMENT. BEN W. HUNTER, Washington, D. C., assignor of four-fifths to Clement W. Howard, same place. Filed Mar. 23, 1888. Serial No. 268,281. (No specimens.)

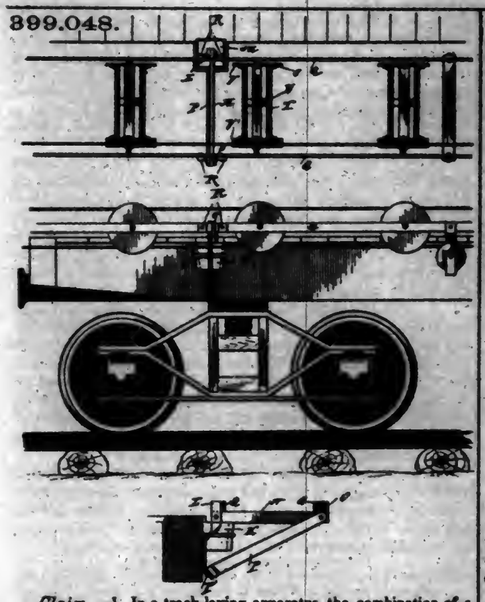
Claim.—A paving composition consisting of sand and grits, fibrous rock, a fixed oil, rosin, coal-tar, and asphalt, substantially in the proportions specified.

399,046. SPINDLE FOR SPINNING-MACHINES. DAVID JACKSON, Pawtucket, R. I. Filed Apr. 2, 1888. Serial No. 269,373. (No model.)

Claim.—The combination, with the bolster of a roving-machine, of a spindle therefor provided with annular packed grooves for absorbing and holding the lubricant, said grooves having no communication with each other and being formed within the limits of that portion of the spindle which traverses the bolster, as and for the purposes hereinbefore set forth.



399,047. POCKET-KNIFE. EDMUND JAMES, Solingen, Prussia, Germany. Filed Sept. 12, 1888. Serial No. 285,780. (No model.)



Claim.—1. In pocket-knives, the combination of a hasp, *d*, blade *a*, and sliding clasp *b*, the said clasp *b* being loosely fastened to the blade *a* and sliding over the end of the clasp *d*, so as to keep the blade from accidentally opening or shutting, substantially as described.

2. In pocket-knives, the combination of a hasp, *d*, blade *a*, having a hook, *v*, and sliding clasp *b*, the said clasp *b* being loosely fastened to the back of the blade *a* by the guide-piece *f*, so as to slide over the end of the clasp *d*, substantially as and for the purpose described.

399,048. TRACK-LAYING APPARATUS. DELBERT E. JOHNSON, Ottumwa, Iowa. Filed Mar. 16, 1887. Serial No. 231,183. (No model.)

399,048.

Claim.—1. In a track-laying apparatus, the combination of a locomotive-engine, a conveyer, an engine for propelling the conveyer supported by one of the cars of the train, and a pipe-connection between the locomotive-boiler and the engine aforesaid for propelling the conveyer, substantially as set forth.

2. In a track-laying apparatus, the combination of a locomotive, a conveyer, a separate engine for propelling the same, and a pipe-connection between said separate engine and the locomotive-boiler, said pipe-connection being provided with a yielding coupling for permitting the pipe to accommodate itself to relative movements of the locomotive and the car, substantially as set forth.

3. In a track-laying apparatus, the combination of a locomotive-engine, a conveyer, a separate engine for propelling the same, a pipe-connection between said separate engine and the boiler of the locomotive, and a flexible hose-connection between the parts of said pipe attached, respectively, to the locomotive and the separate engine, substantially as set forth.

4. In a supporting-bracket for conveyers in a track-laying apparatus, the combination of an upright to pass through and extend below the stake-socket and approximately fitting the opening of said socket, a cross-piece pivoted at one end to the top of said upright above the socket, and a diagonal brace pivoted at one end to the outer end of said cross-piece, and its lower end having a bearing in the lower end of the upright, substantially as described.

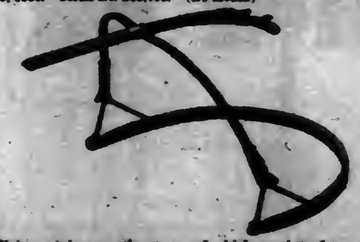
5. In a track-laying conveyor, the combination of a frame-work for supporting rollers, a bracket, and lugs attached to said frame-work for preventing lengthwise motion thereof in the brackets, substantially as set forth.

399,049. FOLDING CHAIR. LEWIS KELLER, Five Creek, W. Va. Filed Aug. 15, 1888. Serial No. 282,776. (No model.)

Claim.—1. In a folding chair, the combination, with the seat provided near its rear edge with horizontal slots L L, of the back having side bars, K, which extend below its lower edge and are provided with pins which slide in the said slots, whereby when the back is in a horizontal position its edge fits close to the rear edge of the seat, and the swinging arms attached to the back and engaged by suitable clutches, substantially as specified.

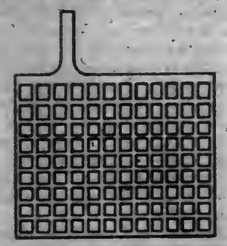
2. In a chair, the combination, with the seat provided with the side bars, B B, having slots L L near their rear ends and slots Q Q near their front ends, of the back having side bars provided with pins mounted in the slots L L, the swinging arms on the back engaged by clutches on the seat, the side arms pivoted at their rear ends to the back, and the links connected to the front ends of the arms and having pins on their lower ends operating in the slots Q Q, substantially as specified.

399,050. TOBACCO-BOX. ARDEN D. KENDALL, Miles, Iowa. Filed Dec. 3, 1888. Serial No. 292,464. (No model.)



Claim.—1. The combination, with the box, the cover pivoted at one end to one end of the box and having a notch at its other end, which is engaged by a pin on the other end of the box, the opening through which the pivot passes being extended and curved in its length, of the gravity locking-bolt adapted to enter the said longitudinally-curved opening, substantially as and for the purpose described.

2. The combination, with the box and the horizontally-moving cover, of the lever pivoted midway of its ends, the weight at one end of the lever and the locking-bolt at the other end of the lever, substantially as and for the purpose described.



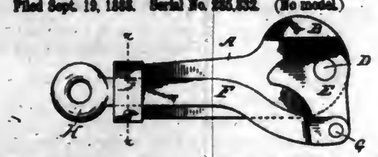
3. The combination of the box and the covers B and J, the cover B having a notch, *b*, in its front end and an opening or slot, *b'*, near its rear end, curved in its length, of the pin E for limiting the movement of the covers, the pivot D, connecting the covers with the box and passing through the said longitudinally-curved opening *b'*, and the gravity locking-bolt normally projecting into the said curved opening, substantially as described.

399,051. HARNESS. PAUL KIRK, Washington, D. C. Filed Aug. 25, 1888. Serial No. 283,708. (No model.)

Claim.—A harness the straps of which consist of two layers of animal hide tanned with the hair on, said layers stitched together at their edges with their flesh sides in contact, substantially as specified.

399,052. SECONDARY BATTERY. EDWARD P. KNOWLES, Brooklyn, assignor, by mesne assignments, to the Mutual Electric Manufacturing Company, New York, N. Y. Filed Dec. 1, 1888. Serial No. 292,419. (No model.)

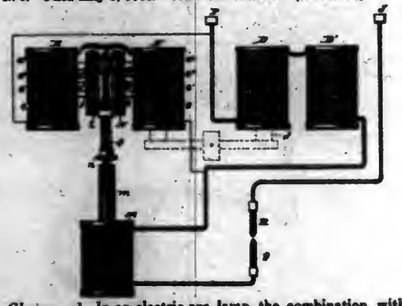
Claim.—1. The method herein described of making secondary-battery plates, which consists in first sulphating the oxides, then pasting the same onto the grids, then pickling the grids in different solutions of acidulated water, the solutions being of gradually-increasing strength, and finally forming and mounting them for use.



2. The method herein described of making secondary-battery

plates, which consists in first sulphating the oxides, then pasting the same onto the grids, allowing them to dry, then pickling the grids in different solutions of acid and water, the solutions being of gradually-increasing strength, and finally forming and mounting them for use.

3. The method herein described of making secondary-battery plates, which consists in first sulphating the oxides, then pasting the same onto the grids, then pickling the grids first in pure water and then in different solutions of acid and water, the solutions being of gradually-increasing strength, and finally forming and mounting them for use.



4. The method herein described of making secondary-battery plates, which consists in first treating the finely-divided oxides with sulphuric acid or a solution of the same until all of the oxides which it is possible to be acted upon by the acid are sulphated, then pasting the same on the grids, then pickling the grids thus prepared in different solutions of acid and water successively, the solutions being of gradually-increasing strength, and finally forming and mounting them for use.

399,053. WIRE-STRETCHER. FRANK A. LANDER, Moline, Ill. Filed Sept. 19, 1888. Serial No. 285,532. (No model.)

Claim.—A wire-stretcher composed of the straight frame or body A, arranged longitudinally in the line of draft and provided at one end with the guiding-loop C and at the other end with the lateral projection D, the cam E, pivoted on said frame or body opposite said projection, and the bar F, having one end curved or deflected laterally and pivoted to the cam, and its remaining portion arranged in the line of draft and passing through and embraced by the loop which serves to support and guide said bar, substantially as and for the purposes specified.

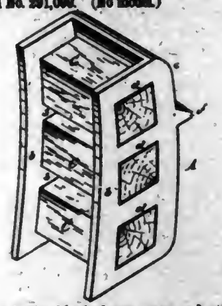
399,054. ELECTRIC-ARC LAMP. GEORGE M. LANE, Asbury Park, N. J. Filed May 3, 1888. Serial No. 272,633. (No model.)

Claim.—1. In an electric-arc lamp, the combination, with the feed-controlling magnets, the one in the main circuit and the other of high resistance in a derived circuit and composed of a series of sections, of a circuit-closer and an auxiliary magnet in the main circuit to control the circuit-closer to bring more or less of the resistance-magnet in the derived circuit, substantially as and for the purpose specified.

2. In an electric-arc lamp, the combination, with the magnet of high resistance placed in a derived circuit and composed of a series of sections, of the circuit-closer and an auxiliary magnet in direct circuit and controlling the circuit-closer to bring more or less of the resistance-magnet in the derived circuit, substantially as set forth.

3. In an electric-arc lamp, the combination, with the feed-controlling magnets, the magnet of high resistance being in the derived circuit and composed of a series of sections, and the series of contacts having the top and bottom terminals of each two sections connected with each contact, respectively, of the circuit-closer and the auxiliary magnet in the direct circuit to control the position of the circuit-closer to bring more or less of the resistance-magnet in the derived circuit, substantially as described.

4. In an electric-arc lamp, the combination, with the resistance-magnet composed of a series of sections and a series of contacts having each contact in electrical connection with the top and bottom terminals of each two of the said sections, respectively, of the circuit-closer and the auxiliary magnet in the main circuit and controlling the circuit-closer to bring more or less of the resistance-magnet in circuit, substantially as and for the purposes specified.



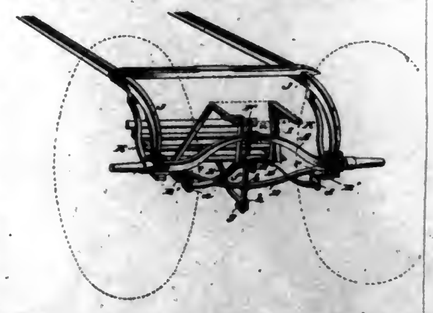
5. In an electric-arc lamp, the combination, with the magnet of high resistance, arranged in a derived circuit and composed of a series of sections, and the series of contact-points having the top and bottom terminals of each two of the said sections connected therewith, of the circuit-closer, the rod supporting the circuit-closer and threaded, the spring arranged on the rod and adjustable by a nut mounted on the rod, the core, and the solenoid placed in direct circuit, substantially as specified.

6. In an electric-arc lamp, the combination, with a twin magnet having each branch thereof composed of a series of sections, and the two series of contacts having the top and the bottom terminals of each two sections connected therewith, substantially as shown, and arranged opposite each other, of the circuit-closer and the magnet in the main circuit for controlling the circuit-closer for bringing a greater or less number of the sections of the said resistance-magnet in circuit, substantially as described.

7. In an electric-arc lamp, the combination, with the two magnets D and E, the magnet E, of high resistance, being in a derived circuit and composed of a number of sections, and means, substantially as described, controlled by the variation of the current in the main line, to bring more or less of the resistance-magnet in the derived circuit, of the rocking lever controlled by the variation in strength between the two magnets D and E, the movable frame I, connected with the rocking lever and carrying the feed-controlling devices, and the brake, substantially as and for the purpose described.

8. In an electric-arc lamp, the combination, with the magnets D and E, the rocking lever controlled by the magnets D and E, the frame I, and the adjustable connection between the rocking lever and the said frame, of the feed-controlling devices supported by the frame I and the brake, substantially as and for the purpose described.

399,055. BRAKE-BLOCK. ROBERT H. LANYON, Carterville, Mo., assignor of one-half to William R. Poundstone, same place. Filed Nov. 17, 1888. Serial No. 291,060. (No model.)



Claim.—1. In a brake-block for wagons and other vehicles, the metal frame A, having a back, *c*, and constructed with sides *b b*, adapted to receive the tire of the vehicle-wheel within them, and provided with openings *d d*, essentially as and for the purpose herein set forth.

2. In a brake-block for wagons and other vehicles, the metal frame A, having apertured sides *b b* and a back, *c*, provided with a bolt-hole and an exterior lug, *f*, essentially as described.

3. In a brake-block for wagons and other vehicles, the combination of the frame A, having a back, *c*, and constructed with sides *b b*, having a series of openings, *d*, in them, and the separated wooden blocks C C, arranged to enter within said openings and leaving spaces *e* in between them, substantially as shown and described.

399,056. ROAD-CART. BOSWIE B. LAWRENCE, Napoleon, Mich. Filed Dec. 20, 1888. Serial No. 294,318. (No model.)

Claim.—1. The combination, in a sulky or road-cart, of an upwardly-curved axle, a brace-bar located beneath the same, said axle and brace-bar having guides or perforations, and springs secured rear of the axle and provided with a seat-support, the rod F, passing through the guides in the axle and brace-bar and provided with a rearwardly-extending member connected to the spring, substantially as shown, and for the purpose set forth.

2. The combination, in a road-cart or sulky, of an axle and brace beneath the same having perforations through which passes a rod, F, having a rearwardly-extending member, a spring located rear of the axle, to which said rearwardly-extending member is secured, means for connecting the seat to the spring, and a forwardly-extending bar connected to the lower part of the bar F and to the foot-rest or front portion of the body, substantially as shown, and for the purpose set forth.

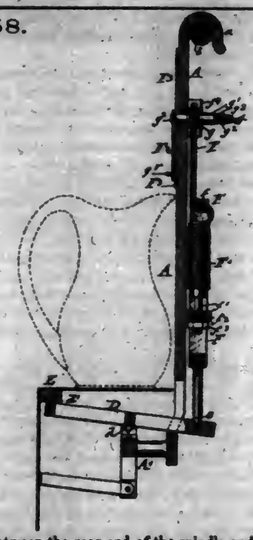
3. The combination, in a road cart or vehicle, of an upwardly-curved axle having a central perforation, a brace-bar having a corresponding perforation located beneath the axle and provided with rearwardly-extending lugs, a semi-elliptical spring connected to said lugs by links or swinging connections, a rod, F, passing through the perforations in the axle and brace-bar, said rod having a rearwardly-projecting member connected to the under side of the semi-elliptical spring, means for connecting the seat to the spring, and a forwardly-extending bar having a perforated rear end, through which the rod F passes, the front end of said bar being connected to the foot-rest of the body of the vehicle, substantially as shown, and for the purpose set forth.

4. The combination, in a road-cart or sulky, of a seat supported upon semi-elliptical springs, a movable guide having a rearwardly-extending member connected to the center of said spring, the spring being connected to the axle by links, and a forwardly-extending brace connected to the foot portion of the body and to the lower end of the brace-rod, the parts being organized so that the body of the vehicle can have a vertical and a lateral swinging movement, for the purpose set forth.

5. The combination, in a road-cart, of a seat supported upon a spring, said spring being connected to a vertical bar, F, which passes through the axle and brace-bar, so as to insure a vertical movement thereof, and the thills secured to the axle and provided with springs K K, the parts being constructed and combined substantially as shown, and for the purpose set forth.

399,057. INTERRUPTER FOR ELECTRIC CIRCUITS. ISAAC R. LECOULTRE, Lausanne, Switzerland. Filed Sept. 21, 1887. Serial No. 250,387. (No model.) Patented in Belgium Mar. 15, 1887, No. 78,612.

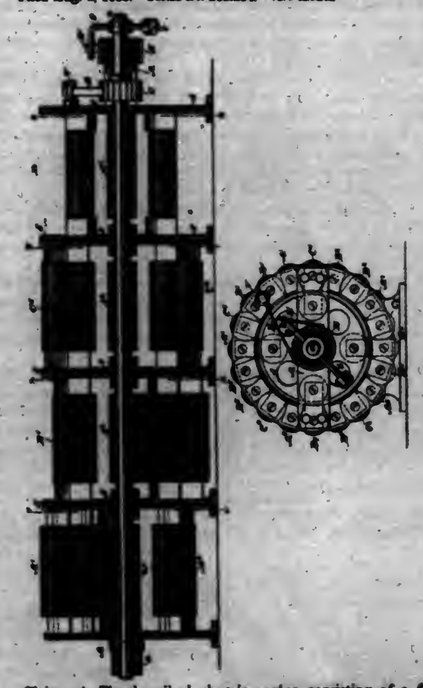
Claim.—1. The combination, with the base and cover of insulating material, the metallic segments upon the base, and a movable piston, of a flat, bent, or loop-shaped friction-spring secured at its central portion to the cover, and having its free opposing ends curved to frictionally grasp and hold the piston, substantially as specified.



2. The combination, with the base and cover of insulating material, of the metallic segments D E upon the base, and the electric connections to the said segments, a movable piston for making and breaking the electric circuit, and a stem to the same passing through the insulated cover, and a button-head, c^2, a bent or loop friction-spring connected to the cover and having curved or concave opposing free ends engaging the piston widthwise at opposite sides and acting to maintain the same in its various positions, and a ring, *c'*, connected to and acting to prevent the displacement of the piston, substantially as set forth.

399,058. SPRING-SCALE FOR WEIGHING LIQUIDS. THEODORE LEE, New York, N. Y. Filed Aug. 31, 1888. Serial No. 284,205. (No model.)

Claim.—1. The combination, with a supporting-frame, of a fulcrumed scale-beam, a platform on said scale-beam, a rack-bar guided on the frame and resting on the scale-beam, a spiral spring connected to the rack-bar and frame, a hollow arbor provided with a pinion meshing with said rack-bar, a headed and spring-actuated spindle passing through the hollow arbor, a hand or index placed loosely on said spindle, a graduated scale in the supporting-frame, and a lever connected to the spindle and adapted to release the hand from the pressure of the spindle, so that it can drop back to the starting-point, substantially as set forth.



2. In a spring-scale, the combination, with a guided and spring-actuated rack-bar, of a hollow arbor having a pinion meshing with said rack-bar, a headed spindle passing through said hollow arbor, a loose hand at the front end of the spindle, a graduated scale, a spiral spring

399,058.

interposed between the rear end of the spindle and the hollow arbor, and a pivoted lever for pressing the spindle forward and releasing the hand, so that it drops back to the starting-point on the scale after having indicated the weight of the vessel and the contents of the same, substantially as set forth.

399,059. ELECTRIC MOTOR. ORAMEL LAGO, New York, N. Y. Filed Aug. 8, 1888. Serial No. 282,234. (No model.)

Claim.—1. The described electric motor, consisting of a field-magnet composed of a number of concentrically-arranged bobbins or electro-magnets, two or more of which are connected in series, in combination with an armature composed of similar bobbins or electro-magnets, two or more of which are also connected in series, and commutator-connections for throwing said field and armature bobbins into and out of action as the armature rotates, substantially as described.

2. In an electric motor, a series of stationary field magnets or bobbins surrounding a series of armature magnets or bobbins having in-

termediate and commutator connections, as described, for connecting the armature and the field bobbins in multiplex-series circuits successively, substantially as described.

3. In an electric motor, the combination of field-magnet bobbins arranged in sets in two or more branches from the same electric source, with corresponding sets of armature-bobbins and commutator and intermediate connections for throwing two or more of said field-magnet bobbins and two or more of said armature-bobbins into independent series connection, substantially as described.

4. In an electric motor, the combination of two or more sets of field-magnet bobbins having a common multiple-arc connection at one end of one set, corresponding sets of armature-bobbins located on a single shaft, with a single multiple-arc connection at the end of one set and independent and intermediate connections from the free ends of the other sets of both the field-magnet and armature bobbins for throwing two or more bobbins in the armature and the field-magnet in series with a fixed and a rotating brush for successively commutating the circuit through the field-magnet and armature bobbins, substantially as described.

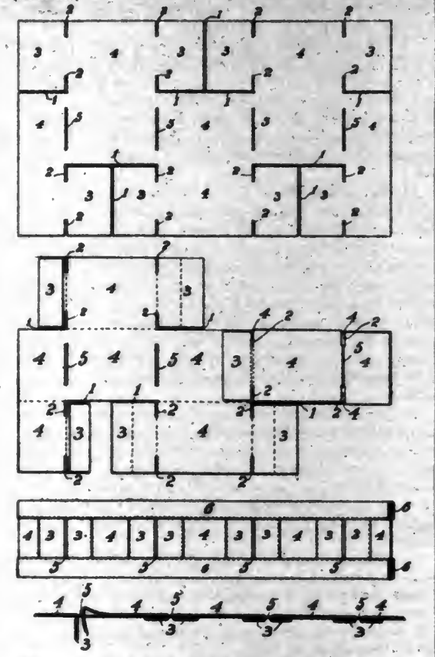
5. In an electric motor, the combination of a series of field-magnet bobbins arranged in sets with a series of armature-bobbins, arranged also in sets on a common shaft, two commutators, one stationary and the other rotary, two brushes, one stationary and the other rotary, multiple-arc connections from one set of field-magnet bobbins to the propelling-battery and stationary brush resting on the rotating commutator, independent connections from the free ends of one set of the field-magnet bobbins to the stationary commutator, intermediate connections between the several sets of field-magnet bobbins, multiple-arc connections from one set of the armature-bobbins to the rotary brush resting on the stationary commutator, independent connections from the free ends of one set of armature-bobbins to the commutator-strips of the rotary commutator, and intermediate connections between the several sets of armature-bobbins, whereby two or more field-magnet bobbins and two or more armature-bobbins are caused to act simultaneously at different tangential points of the armature's circumference, substantially as described.

6. An electric motor or dynamo-electric machine having a fixed and a rotary commutator, in combination with a fixed and a rotary brush, all of said parts being located at one end or side of the machine, substantially as described.

7. An electric motor or dynamo-electric machine having a fixed or stationary commutator attached to the frame of the machine and a rotary commutator attached to the armature-shaft, in combination with a fixed or stationary brush bearing on the rotary commutator and a rotary brush attached also to the armature-shaft and bearing on the fixed commutator, said parts being all located at one end or side of the machine, substantially as described.

8. An armature for an electric motor or dynamo-electric machine, consisting of two or more sets or groups of electro-magnets bolted together end to end and fixed upon a common shaft, substantially as described.

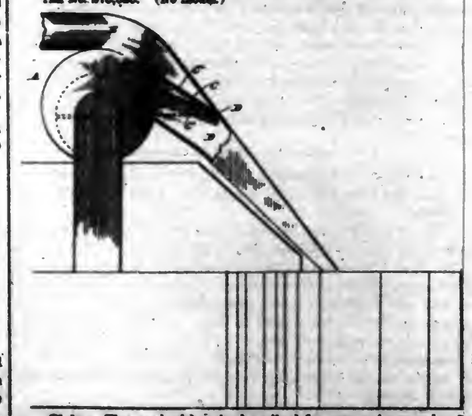
9. An electric motor or dynamo-electric machine having a field-magnet composed of two or more sets or groups of electro-magnets or bobbins joined together end to end, electro-magnets or bobbins of the different sets lying in different radial planes, substantially as described.



10. An electric motor or dynamo-electric machine having a field-magnet composed of two or more sets or groups of electro-magnets or bobbins joined together end to end, the individual bobbins of the different sets or groups lying in different radial planes, in combination with an armature composed of similar sets or groups of electro-magnets or bobbins, the individual electro-magnets or bobbins of the respective sets being located in the same plane, substantially as described.

399,060. RECEIPT AND RECORD BOOK. HUGO LOEWENBACH, Milwaukee, Wis. Filed July 16, 1886. Serial No. 208,170. (No model.)

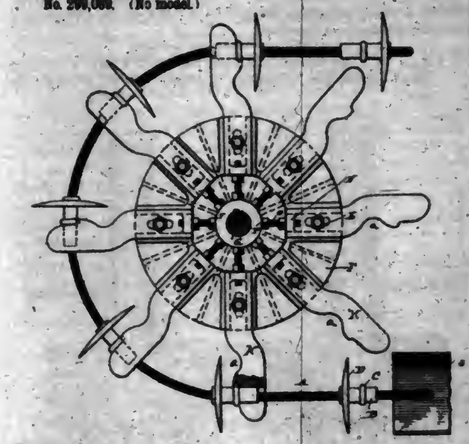
Claim.—A record and receipt book consisting of stiff covers and alternate permanent and detachable leaves bound together between said covers, the detachable leaves being of greater width than the permanent leaves, and each of the former being provided with a vertical line of perforations in close proximity to the back of the book and another vertical line of perforations between the just-named line and the outer edge of said leaf, substantially as set forth.



399,061. METHOD OF MAKING BUTTON-HOLE STRIPS. HENRY W. LYON, Bridgeport, Conn. Filed Dec. 3, 1888. Serial No. 292,446. (No model.)

Claim.—1. The method of making button-holes in a strip, the same consisting in cutting button-hole slits at suitable distances throughout the central section of the strip, forming T-headed flaps at the sides of the strip, folding said flaps upon themselves, folding the sides of the strip inward, inserting said flaps in pairs through the slits, and folding the flaps backward in opposite directions against the strip, substantially as set forth.

2. The method of making button-holes, which consists in forming a single blank having button-hole slits at proper intervals within the central section of said blank and T-headed flaps within the opposite sides of said blank, doubling said flaps upon themselves and folding the sides of the blank inward, inserting the flaps through said slits and folding said flaps backward in opposite directions against the blank, stitching the flaps to the blank, and finally barring the opposite ends of the button-holes, substantially as shown and set forth.

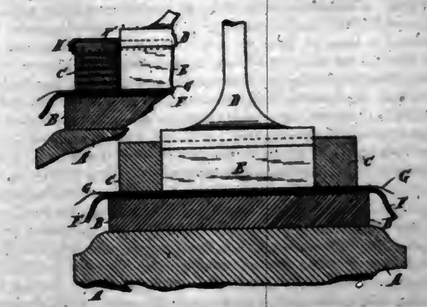


399,062. METHOD OF CONSUMING SMOKE. RICHARD H. MICHELL, Redruth, County of Cornwall, England. Filed May 25, 1888. Serial No. 275,023. (No model.)

Claim.—The method herein described for consuming smoke for its utilization as fuel, which consists in mechanically separating the combustible from the incombustible gases, and varying the feeding of the lighter combustible gases to the fire, such separation being effected

by the centrifugal force developed by a rotary fan or exhauster, and such variation of the feeding of the combustible gases being effected by the adjustment or manipulation of the damper, substantially as set forth.

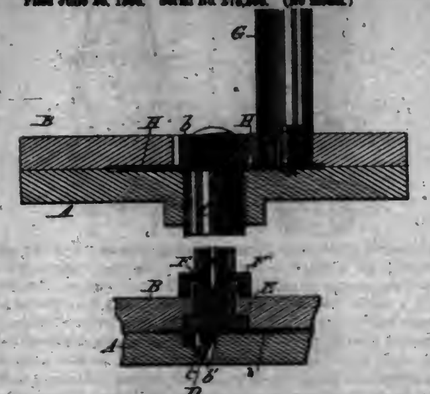
399,063. DEVICE FOR CONVEYING GRAIN, ICE, COAL, &c. THOMAS MCBRIDE, Philadelphia, Pa., and REUBEN FISHER, Kincardine, Ontario, Canada. Filed Mar. 5, 1888. Renewed Feb. 7, 1889. Serial No. 299,669. (No model.)



Claim.—1. In a device for conveying coal, ice, grain, &c., an endless wire cable having carrying disks or plates, the sleeves of which disks are provided with projections or ribs near the middle at a distance from the disks, said ribs adapted to be engaged by bifurcated arms on the driving-wheel, as set forth.

2. A conveyer for coal, ice, grain, &c., comprising a conveying trough or tube, an endless cable provided at intervals with disks or plates the sleeves of which have circumferential ribs or projections near the middle at a distance from the disks, and an expansible driving-wheel with bifurcated arms, around which said cable passes, said arms engaging said ribs or projections, substantially as shown and described.

3. In a device for conveying coal, grain, &c., a sleeve to engage a wire cable, having near one end a flange or annular projection to which a carrying disk or plate is attached, and an enlarged annular portion or rib adjacent the point of connection of the disk, the latter adapted to be engaged by the bifurcated arms of the driving-wheel, as set forth.

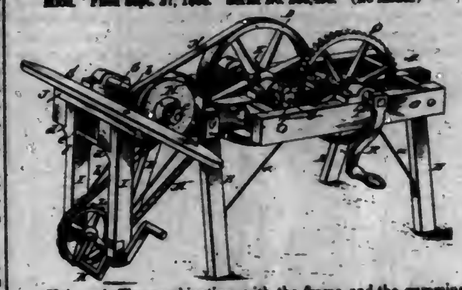


4. The conveying-trough provided with a discharge-aperture and a spring-hook arranged at the aperture, in combination with the conveyer having mounted thereon carrying-disks to be engaged by the spring-hook to tip the disks and discharge the load, as set forth.

399,064. BRICK-MOLD. ALEXANDER MCLEAN, Reservoir Road, Brockley, County of Surrey, assignee of one-half to Robert Cunyns Ames, London, England. Filed Feb. 17, 1887. Serial No. 227,960. (No model.) Patented in England June 2, 1886, Nos. 8,747 and 8,748.

Claim.—In a mold for bricks and similarly-shaped articles, the combination of a base-plate forming the bottom of the mold, a receptacle forming the sides of the mold and supported by said base-plate, a layer of felt or similar absorbent material placed on the said base-plate between it and the said receptacle, and a layer of coarse fabric upon the top of the said absorbent material, both said absorbent material and the layer of coarse fabric extending beyond the side edges of the receptacle, and a plunger, substantially as specified.

399,065. COIN-ADJUSTER. SAMUEL MCLOUGHLIN, Corunna, Mich. Filed June 20, 1888. Serial No. 278,008. (No model.)



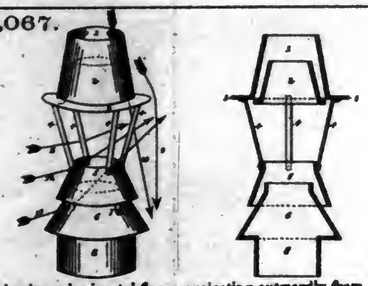
Claim.—1. In a machine for adjusting planchets, the combination of the plates A and B, relatively adjustable, the feed-tube G, and the knife D, attached to said plates, and the plate provided with fingers revolving between said plates A and B to carry forward the planchets, substantially as specified.

2. In a planchet-adjusting mechanism, the combination, with the recessed plates, of fingers revolving in the recess between said plates, an adjustable shaving-knife, the feeding-tube, and an opening through the lower plate for the escape of the planchets, as and for the purpose specified.

3. In adjusting mechanism for coining, the combination of the supporting-frame, recessed plates A B, knife D, and plate E, with the revolving shaft C, carrying the plate H, said plate being provided with curved fingers adapted to carry the planchet between the knife and plate E, substantially as and for the purpose set forth.

399,066. SAW-GUMMER. CALVIN S. MCMILLAN, East Saginaw, Mich. Filed Sept. 27, 1888. Serial No. 286,496. (No model.)

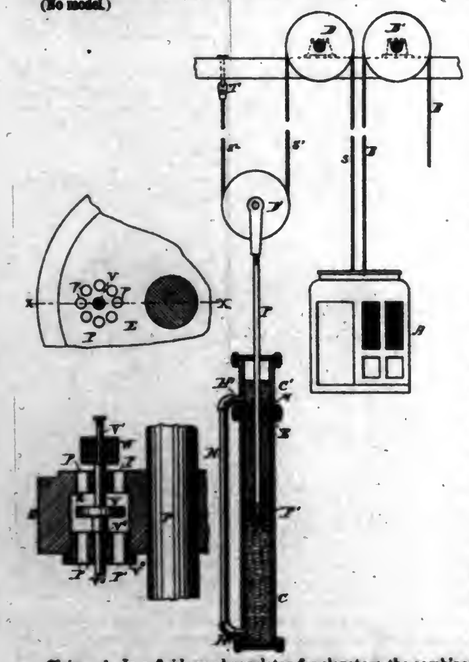
Claim.—1. The combination, with the frame and the gumming-wheel, of the shaft C, journaled in said frame, the wheel D on said shaft, the pulley *b* on the shaft of the gumming-wheel, the belt connecting said pulley and wheel D, the crank-shaft K, a sprocket chain and wheel connection between said shafts K and C, and the pinion Q, provided with a crank-handle and constructed to impart motion to said shaft C, substantially as described.



2. The combination, with the frame, the shafts C and G, journaled therein, parallel with each other, the pinion F on the shaft C, the pulley *b* and the emery-wheel H on the shaft G, the pulley D and sprocket-wheel E on the shaft C, and the endless belt N, of the arms I, the crank-shaft K, journaled in the lower ends thereof, the sprocket-wheel L on said shaft K, and the endless sprocket-chain M, connecting said sprocket-wheels, the shaft P, and the pinion Q thereon, meshing with the pinion F, substantially as and for the purpose specified.

399,067. VENTILATING TOP FOR CHIMNEYS. THOMAS J. WHEELOCK, Louisville, Ky. Filed Nov. 26, 1887. Serial No. 256,302. (No model.)

Claim.—1. In a ventilator-top for chimneys, a caplike top part consisting of a hollow conical frustum with a horizontal flange projecting outward from the rim of its lower base, surrounding a small similar frustum rising to about two-thirds of its height and projecting below it, having a horizontal flange, the walls of the two frustums being inclined obliquely toward each other, the diameter of the lower base of the smaller being greater than the diameter of the flue-pipe below, and both being open at the top.

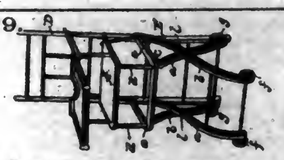


2. In a ventilator-top for chimneys, the combination, with a flue-

399,067.

pipe, 8, having a horizontal flange projecting outwardly from the rim of its orifice, of a hollow conical frustum, 6, having a vertical cylindrical flange around its upper base, which is less in diameter than the pipe 8, a similar frustum, 5, similarly flanged, having the diameter of its upper base the same as that of 8 and its walls inclined obliquely to those of 6, so as to have a wind-channel narrowing downward between them, and a capless top part raised over 5, so as to leave an open interval consisting of a hollow conical frustum, 1, having a horizontal flange, 3, surrounding a smaller flanged frustum, 2, having the diameter of its lower base greater than that of 8, all the frustums being open at the ends and braced together and arranged substantially as set forth, and for the purpose specified.

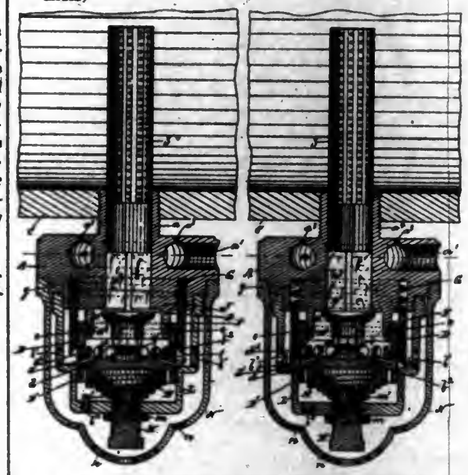
399,068. SPEED-REGULATOR FOR ELEVATORS. WILLIAM R. NICKERSON, Cambridge, Mass. Filed Nov. 30, 1888. Serial No. 292,236. (No model.)



Claim.—1. In a fluid speed-regulator for elevators, the combination of the safety-rope S S' S^2, the piston-rod P, and piston P', with the cylinder C, cap-plate E, valves V, auxiliary cylinder C', and pipe H' H H^2, leading from the auxiliary cylinder C to the lower part of the cylinder C, all operating together substantially as described, and for the purpose set forth.

2. In a safety-fluid speed-regulator for elevators, the combination of the piston-rod P, piston P', main cylinder C, cap-plate E, and valve V, having adjusting-weights W, with the auxiliary cylinder C' and pipe H' H H^2, substantially as described, and for the purpose set forth.

399,069. CONVERTIBLE CHAIR. BENJAMIN C. ODELL, Kingston, N. Y., assignor to Thompson, Perley & Wells, Baldwinsville, Mass. Filed Jan. 11, 1888. Serial No. 260,690. (No model.)



Claim.—A convertible chair consisting of the seat, a supplemental frame beneath the same, serving to support the seat and form a base therefor, pivoted crossed legs connected with the lower sills of the frame to support the same, the wheels connected to the legs, and the

399,069.

pivoted arms E, and the locking-links connecting the arms to the chair, substantially as described.

399,070. WATER-DRAINER AND POP SAFETY-VALVE. CHARLES PARENT, Boston, Mass. Filed Oct. 17, 1888. Serial No. 288,400. (No model.)

Claim.—1. An automatic water-drainer and pop safety-valve, consisting of a head, A, adapted to be attached to a reservoir or boiler, an orifice through the head opening on one side into the reservoir, a valve, B, controlling the outlet, a spring-seated thimble shutting over the outlet and forming a seat for the valve-stem, the thimble being provided with ports which are closed by a sliding sleeve outside the thimble, the sleeve being seated upon a spring, a cap, L, enveloping the thimble and sleeve and secured to the head and provided with ports, the thimble being also provided with a small vent leading into a passage between the sleeve and the thimble, a small vent leading from this passage into cap L, the small vents being so proportioned to the pressure of the spring on which the thimble is seated that when the pressure reaches a certain degree beyond the capacity of the vent the valve will open further, forcing the thimble back on its spring-seat and partially opening the larger ports, d^3, when the increased pressure thereby brought against the beveled rim of the sleeve will force the sleeve back upon its spring-seat, opening wide the ports, substantially as described.

2. An automatic water-drainer and pop safety-valve, consisting of a head, A, adapted to be attached to a reservoir or boiler, a chamber, a, within the head, and a port, a', through which steam may be admitted to heat the head, an orifice through the head opening on one side into the reservoir, a valve, B, controlling the outlet, a spring-seated thimble shutting over the outlet and forming a seat for the valve-stem, the thimble being provided with ports which are closed by a sliding sleeve outside the thimble, the sleeve being seated upon a spring, a cap, L, covering the thimble and sleeve and secured to the head and provided with ports, the thimble being also provided with a small vent, d', leading into a grooved passage formed by the thimble, the beveled edge of the sleeve and the shoulder on which the edge of the sleeve is seated, the beveled edge of the sleeve having a small vent leading from the grooved passage into the cap L, the small vents being so proportioned to the pressure of the spring on which the thimble is seated that when the pressure reaches a certain degree beyond the capacity of the small vent the valve will open further, forcing the thimble back on its spring-seat and partially opening the larger ports, d^3, when the increased pressure thereby brought against the beveled edge of the sleeve will force the sleeve back upon its spring-seat, opening wide the ports d^3, substantially as described.

3. An automatic water-drainer and safety-valve, consisting of a head, A, adapted to be attached to a reservoir or boiler, an orifice through the head opening on one side into the reservoir, a valve, B, controlling the outlet, a spring-seated thimble, D, shutting over the outlet and forming a seat for the valve-stem, the thimble being provided with ports which are closed by a sliding sleeve, F, outside the thimble, the sleeve being seated upon a spring, G, a cap covering the thimble and sleeve and secured to the head and provided with ports, the cap L, having in its end a set-screw, M, to regulate the tension of the spring H and to hold the thimble on its seat in case the spring is broken, the thimble being also provided with a small vent, d', leading into a grooved passage formed by the thimble, the beveled edge of the sleeve, and the shoulder on which the sleeve is seated, the beveled edge of the sleeve having a small vent leading from the grooved passage into the cap L, the small vents being so proportioned to the pressure of the spring on which the thimble is seated that when the pressure exceeds the capacity of the small vent the valve will open further, forcing the thimble back on its spring-seat and partially opening the larger ports, d^3, when the increased pressure thereby brought against the beveled rim of the sleeve will force the sleeve back upon its spring-seat, opening wide the ports, substantially as described.

4. A water-drainer having within its head a chamber, a, independent of the valve-chamber, with ingress-port a', connected with a pipe, a^2, through which steam may be admitted to heat the head, and egress-ports a^3, through which the steam may escape, substantially as described.

399,071. COMBINATION DENTAL TOOL. JOHN J. B. PATRICK, Belleville, Ill. Filed Aug. 31, 1888. Serial No. 284,375. (No model.)

Claim.—1. In a dental tool, the pliers having tapered screw-dies D between the jaws, and the regulating set-screw C, substantially as specified.

2. In a dental tool, the combination of the pliers, the screw-dies, and the taper-cutter on one of the jaws, substantially as specified.

3. In a combination dental tool, the adjustable barb-cutter, substantially as specified.

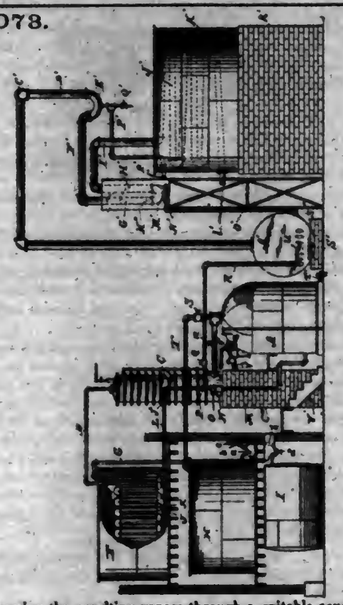
4. In a combination dental tool, the pliers, the barb-cutter having a chisel point, and the set-screw, substantially as specified.

5. In a combination dental tool, the combination of the pliers, the set-screw, the cutter-blades, the screw-threaded dies, the taper-cutter, and the barb-cutter, substantially as specified.

399,072. COMB OR FORMER FOR FELT-HARDENING MACHINES. JOHN PENDERGAST, Boston, and DANIEL PENDERGAST, Merrimac, Mass. Filed Nov. 17, 1888. Serial No. 291,094. (No model.)

Claim.—1. As an improved article of manufacture, a former for felt goods, comprising a foraminous body provided with ribs or corrugations on one or both of its faces, substantially as set forth.

2. The former A, provided with perforations x and corrugations z, substantially as and for the purpose described.



399,073. PROCESS OF DISTILLING PETROLEUM. GEORGE H. PERKINS, Philadelphia, Pa. Filed May 14, 1886. Serial No. 202,143. (No model.)

Claim.—1. The process of distilling a petroleum product and separating its distillates, which consists in treating said product with heat in a still, in passing the resulting vapors through a suitable condenser, in conveying, by suitable conduits, the lighter distillates to a proper receiving-vessel, and in conveying the heavier distillates, which have not been trapped back into the original still, to a supplementary vessel or still, in which they may, without other heat than that originally derived from the original still, further separate into heavier and lighter products, as specified.

2. The process of distilling a petroleum product and separating its distillates, which consists in treating said product with heat in a still, in passing the resulting vapors through a suitable condenser, in conveying, by suitable conduits, the lighter distillates to a proper receiving-vessel, in conveying the heavier distillates, which have not been trapped back into the original still, to a supplementary vessel or still, in which they may, without other heat than that originally derived from the original still, further separate into heavier and lighter distillates, and, finally, in distilling and separating the residual products remaining in said supplementary still by the application of heat thereto, as specified.

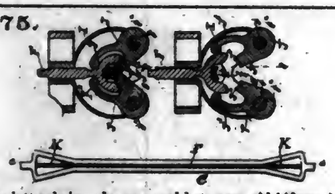
3. The process of distilling a petroleum product and separating its distillates, which consists in treating said product with heat in a

399,073.

still, in passing the resulting vapors through a suitable condenser, in conveying, by suitable conduits, the lighter distillates to a proper receiving-vessel, in conveying the heavier distillates, which have not been trapped back into the original still, to a supplementary vessel or still, in which they may, without other heat than that originally derived from the original still, further separate into heavier and lighter distillates, and, finally, in distilling and separating the residual products remaining in said supplementary still by the application of heat thereto, in conveying the resulting vapors from said supplementary still to and through a proper condenser, in conveying, by suitable conduits, the resulting lighter distillates to a proper receiving-vessel, and in conveying the resulting heavier distillates back to the supplementary still, as specified.

399,074. HARNESS-PAD. ERNEST F. PFLUEGER, Akron, Ohio. Filed Oct. 31, 1888. Serial No. 289,600. (No model.)

Claim.—The medicated sack-pad for harness, consisting of the medicated cloth sides and an intermediate flattened layer of ground cork and astringent chemicals with starch and carbolic acid, said sides being held together by edge stitches and by quilting-seams through said intermediate layer, substantially as specified.



399,075. GRIP FOR CABLE RAILWAYS. ELWOOD C. PHILLIPS, St. Louis, Mo., assignor to the Phillips Economical Cable Grip Construction Company, Chicago, Ill. Filed Sept. 24, 1888. Serial No. 286,260. (No model.)

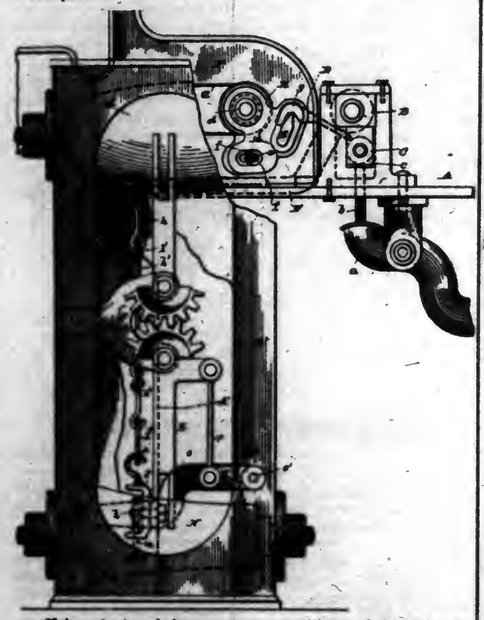
Claim.—1. In a cable-gripping device, the combination of a pair of pivoted jaws with a vertically-reciprocating plunger, the said jaws being actuated by said plunger, and these three devices combining to grip the cable, substantially as set forth.

2. In combination with a pair of pivoted jaws, a reciprocating plunger bifurcated at its lower end and operating between them, each jaw being provided with a shoulder arranged to be struck by one of said bifurcations as the plunger descends, and with a curved plate or raised part arranged to be struck on the reverse motion for opening said jaws, substantially as set forth.

3. In combination with a pair of pivoted jaws, each provided with an inwardly-inclined shoulder and raised plate, as described, a plunger having rounded bifurcations arranged to strike against said plates or said shoulders, according to the upward or downward motion of said

399,075.

plunger, the latter being also recessed between said bifurcations to fit said cable, substantially as set forth.



4. A vertically-movable plunger and jaws operated thereby for gripping a cable, in combination with a lever, pawl, and rack for moving said plunger into either the gripping or releasing position and locking it there, a frame to which said lever is pivoted, and plates in contact with the outer edges of said frame and movable angularly to brace the latter, substantially as set forth.

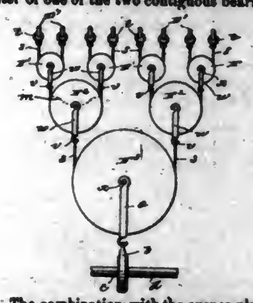
5. In combination with a fixed guide-frame and a lever pivoted thereto, angularly-movable bracing-wings fitted against the edges of said frame, metallic straps which inclose said frame and wings, and are provided with flaring recesses having end walls arranged to fit said wings in any position of the latter, substantially as set forth.

6. In combination with a fixed guide-frame and a lever pivoted thereto, a plunger working up and down in said frame, a connection between said lever and said plunger, pivoted gripping-jaws opened and closed by said plunger, and a casing which provides bearings for the jaws and incloses them and the lower end of said plunger, substantially as set forth.

399,076. EVENING MECHANISM FOR COTTON-OPENERS, &c. JAMES C. POTTER, Pawtucket, R. I. Filed July 9, 1888. Serial No. 279,266. (No model.)

Brief.—The invention consists in improvements in the scale-lever system and in the means for supporting the knife-edge bar for the evener-plates.

Claim.—1. A scale-lever system comprising scale-levers having connecting-links, whereby the levers below are suspended from those next above, in combination with evener-arms and links whereby the topmost scale-levers are connected to and suspended from said arms, substantially as and for the purposes hereinbefore set forth.

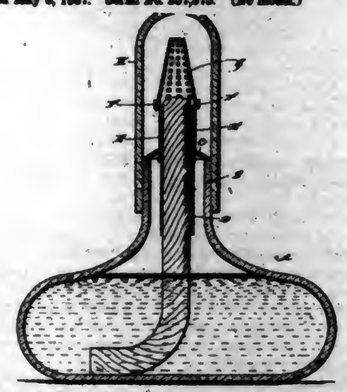


2. In combination with the evener-arms, the scale-lever system comprising scale-levers and connecting-links, whereby the levers below are suspended from those next above and the topmost scale-levers are connected to and suspended from said arms, said scale-lever system being located outside of the front wall of the machine and under the feed-trough, substantially as set forth.

3. The combination of the evener-plates, the knife-edge bar, its swiveled adjustable supporting-brackets, and means for securing said brackets in adjusted position, substantially as and for the purposes hereinbefore set forth.

4. The combination of the evener plates and arms, the suspended scale-lever system connected to said arms and having the scale-levers below suspended from those next above, the cone-drums, cone-drum belt, and belt-shipper, and belt-shipper-actuating mechanism connected to and operated by the main-scale lever, all substantially as and for the purposes hereinbefore set forth.

399,077. EVENING MECHANISM FOR COTTON-OPENERS, &c. JAMES C. POTTER, Pawtucket, R. I. Filed Jan. 23, 1889. Serial No. 297,907. (No model.)

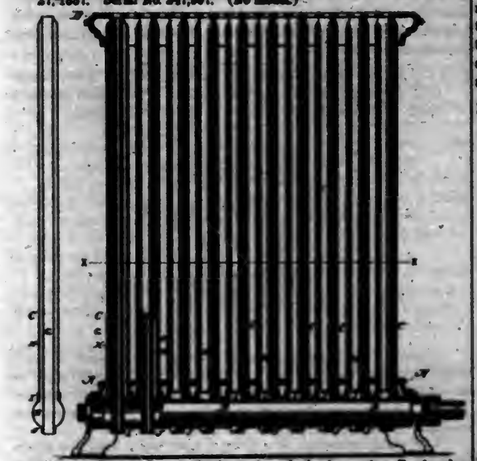


Brief.—The scale-lever system of the evening mechanism is replaced by a system of curved bearing-pieces, in combination with supporting-straps, each of which passes peripherally around the under face of its curved bearing-piece below and has its two ends connected each to the center of one of the two contiguous bearing-pieces above.

Claim.—1. The combination, with the evener plates and arms, of the described system of curved bearing-pieces and supporting-straps, each strap passing peripherally below and around its appropriate bearing-piece, the topmost series of straps being suspended by their ends from the evener-arms, and the straps of the other series being suspended from the centers of the curved bearing-pieces next above, substantially as and for the purposes hereinbefore set forth.

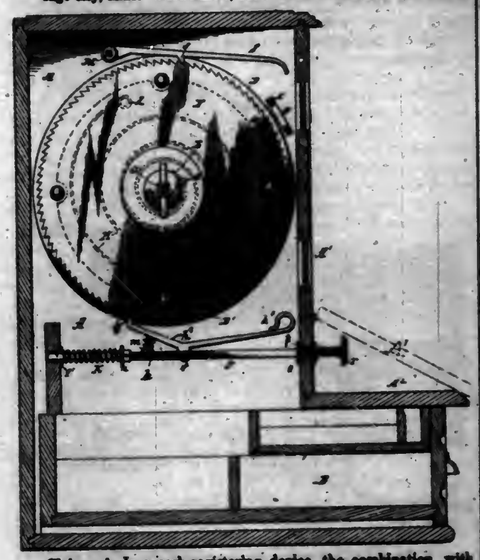
2. The combination, with the evener plates and arms, the cone-drums, cone-drum belt and shipper therefor, and shipper-actuating mechanism, of the described system of curved bearing-plates and supporting-straps therefor, each strap passing peripherally below and around its appropriate bearing-piece, the topmost series of straps being suspended by their ends from the evener-arms, the straps of the other series being suspended from the centers of the bearing-pieces next above, and the lowermost or main bearing-piece being connected to the shipper-actuating mechanism, substantially as and for the purposes hereinbefore set forth.

399,078. ALCOHOL DISINFECTING-LAMP. MARKWELL S. PURDY and HERMANN ALBER, Corning, N. Y.; said Purdy assignor to said Alber. Filed May 6, 1887. Serial No. 237,373. (No model.)



Claim.—1. The herein-described alcohol disinfecting-lamp, comprising the bowl A, having its central portion extended up and reduced to form the integral neck B, the disk C, resting on the upper edge of the neck, the wick-tube D, extending down through an opening of the disk and secured at an intermediate point of its length thereto, and the vertical supports E, secured to the disk C and extended upward beyond the wick-tube, so as to hold the cap out of contact with the wick, and having hooks at their upper ends, the perforated platinum cap G, supported detachably by the hooks above the wick-tube, and the extinguisher H, as set forth.

2. The bowl A, the cap G, of perforated sheet metal or platinum, and the extinguisher H, to extinguish the flame, whereby when the extinguisher is removed after the flame is extinguished the vapor from the alcohol, rising up, comes in contact with the cap and becomes decomposed, and the heat generated by the decomposition of the alcohol-vapor keeps the platinum cap in an incandescent condition, as set forth.

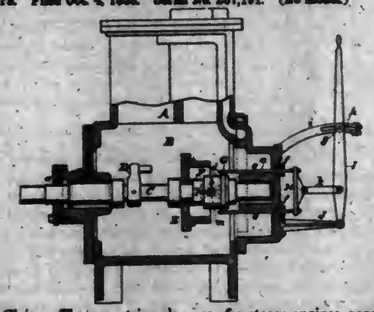


3. The bowl A, disk C, and wick-tube D, combined with the supports E, extending up from the disk above the wick-tube and having the hooks F, and the removable platinum or sheet-metal cap G, having its base or open end resting on the top of the supports within the hooks, whereby the cap will be held above the wick, so that the latter cannot come in contact with the cap, as set forth.

399,079. RADIATOR. JAMES REILLY, Brooklyn, N.Y. Filed Aug. 27, 1887. Serial No. 247,997. (No model.)

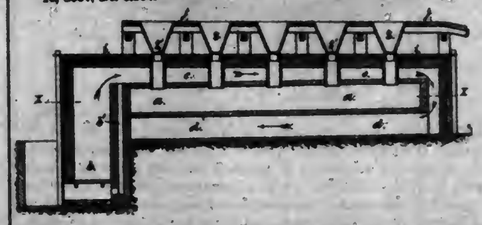
Claim.—In a radiator, the base A and the base-pipe B, circular in cross-section and having the flanges I J, combined with the pipes G H, brazed to the flanges I J, respectively, the upper edge of the outer pipe, H, being closed against and brazed to the upper edge of the inner pipe, G, and all of said pipes being constructed from thin sheet-copper, substantially as and for the purposes set forth.

399,080. CASH-REGISTERING DEVICE. OTTO C. REMLOFF, Winnebago City, Minn. Filed June 6, 1888. Serial No. 276,199. (No model.)



Claim.—1. In a cash-registering device, the combination, with the disk and ratchet-wheel, of a push-bar provided with a retractile spring, a pawl pivoted to the push-bar and provided with a rearwardly-projecting arm, and a spring, substantially as set forth.

2. In a cash-register, the combination, with suitable frame-work and a shaft journaled therein, of two distinct sets of disks mounted on said shaft, each disk being adapted to rotate independently of the others, a ratchet-wheel secured to each disk, a spring to rotate it in one direction, a dog to prevent said ratchet-wheel from rotating in one direction, a push-bar provided with a retractile spring, a pawl pivoted to the push-bar and provided with a projecting arm, and a spring interposed between the push-bar and pawl, substantially as set forth.



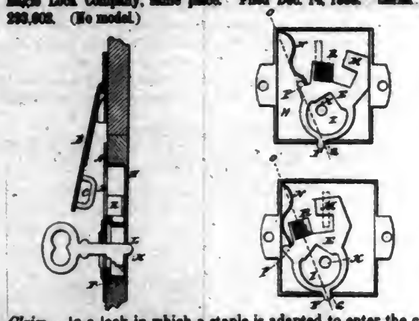
3. In a cash-registering device, the combination, with suitable frame-work and a shaft journaled therein, of two distinct sets of disks mounted on said shaft, each disk being adapted to rotate independently of the others, figures or characters denoting different denominations of money on the disks, a bar in front of the disks having sight-holes, pins on said bar to engage pins projecting from the disks, a ratchet-wheel on each disk, springs to rotate the disks in one direction, a push-bar for each disk having a retractile spring, spring-sustained pawls pivoted to said push-bars to rotate the disks positively, and dogs for locking the disks against return movement, substantially as set forth.

399,081. ECCENTRIC VALVE-GEAR. JOHN V. REES, Jr., Chester, Pa. Filed Oct. 4, 1888. Serial No. 287,191. (No model.)

Claim.—The eccentric valve-gear for steam-engines, consisting of the eccentric having the sleeve fitting loosely on the main shaft and having diametrically-opposite longitudinal slots, the outer sleeve having applied thereto means for the movement of the valve, said main shaft having oblique crossing recesses therein, and the pins or pivots connected to the outer sleeve and passed through the slots in the inner sleeve, and having spiral form of blocks engaging with the oblique crossing slots of the main shaft, substantially as and for the purpose set forth.

399,082. PROCESS OF PURIFYING FERRIC CARBIDE. HAROLD BIRNIE, Ramside, Ulverston, County of Lancaster, England. Filed Nov. 1, 1888. Serial No. 288,751. (No model.) Patented in England June 10, 1887, No. 8,357.

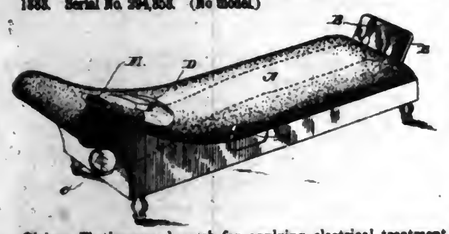
Claim.—1. In the manufacture of magnetic carbide-of-iron filtering material by reducing iron ore through the medium of heat to a lower oxide and combining carbon therewith, the process herein described of purifying the magnetic carbide of iron, which consists in cooling the same and subjecting it to the action of an acid conveyed by water to remove the lime, magnesia, phosphorus, or other impurities, substantially as described.



2. In the manufacture of magnetic carbide-of-iron filtering material by reducing iron ore through the medium of heat to a lower oxide and combining carbon therewith, the process herein described of purifying the magnetic carbide of iron and removing the lime, magnesia, phosphorus, or other impurities therefrom, which consists in cooling the magnetic carbide of iron in water and then subjecting it to the action of hydrochloric acid conveyed by water, substantially as set forth.

3. The process herein described of manufacturing magnetic carbide-of-iron filtering material, which consists in reducing iron ore by heat in a closed chamber to a lower oxide and combining carbon therewith to convert the ore into magnetic carbide of iron, cooling the latter with water, and while cool purifying the same and removing the lime, magnesia, phosphorus, or other impurity by subjecting

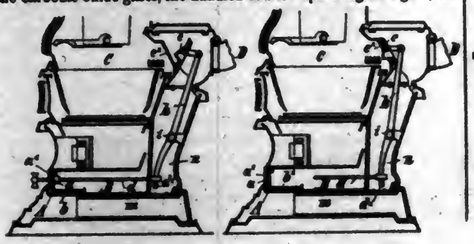
the carbide of iron to the action of an acid conveyed by water, substantially as set forth.



4. The process herein described of manufacturing magnetic carbide-of-iron filtering material, which consists in reducing the iron ore by heat to a lower oxide and combining carbon therewith to convert the ore into magnetic carbide of iron, cooling the latter, and then purifying it and removing the lime, magnesia, phosphorus, or sulphur by subjecting the carbide of iron to the action of hydrochloric acid conveyed by water, substantially as set forth.

399,083. LOCK. JAMES ROCHE, Perryville, Conn., assignor to the Eagle Lock Company, same place. Filed Dec. 14, 1888. Serial No. 293,602. (No model.)

Claim.—In a lock in which a staple is adapted to enter the case to be engaged with the bolt, the bolt hung upon a pivot within the case, and adapted to rock on said pivot in the plane of the case, the bolt constructed with a nose arranged to engage or disengage the staple entering the case, a spring arranged between a stationary bearing in the case and a corresponding seat on the bolt, the said seat on the bolt being adapted to cross the central line of action of the spring as the bolt moves from one extreme to the other, the said bolt constructed with a cam projection in the path of the staple as it enters the case when the bolt is in the unlocked position, the said cam projection inclined to the path of the staple as it enters the case, substantially as described.

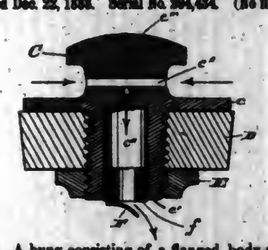


399,084. COUCH FOR APPLYING ELECTRICAL TREATMENT. JOHN R. SCHMALS and JOHN B. FAULKNER, Norfolk, Va. Filed Dec. 26, 1888. Serial No. 294,853. (No model.)

Claim.—The improved couch for applying electrical treatment, having the battery C supported in its lower portion near one end, the sponge E, arranged near the head of the couch and connected with the battery and adapted to be placed on the neck of the patient, the plate F, arranged near the sponge and connected with the battery and adapted to bear against the shoulders of the patient, the foot-plates at the end of the couch connected with the battery, and the hand-plates secured on the upper edges of the sides of the couch and connected with the battery, as specified.

399,085. DRAFT-REGULATING DEVICE FOR STOVES OR FURNACES. MAX SCHWENDER, Doos, near Nuremberg, Germany. Filed Nov. 5, 1888. Serial No. 289,960. (No model.)

Claim.—1. As an improvement in draft-regulators for stoves, the combination of the gate having apertures for the passage of air and the carbonic-oxide gases, the handled rod for operating said gate, the

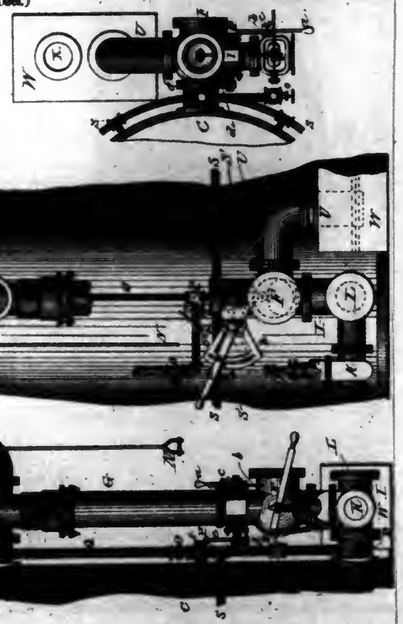


399,085.

hinged damper, and the lever connected to said damper and to said rod, substantially as set forth.

2. As an improvement in draft-regulators, the combination, with a magazine stove or furnace having a lower base-flue, of the gate having a front aperture for the passage of air and a lower aperture for the passage of the carbonic-oxide gases, the handled rod loosely connected to said gate, the upper hinged damper, and the lever connected to said damper at its upper end and to said rod at its lower end, substantially as set forth.

399,086. BUNG. MATTHIAS SCHWEINSBERG and ANTON GROSSCHEL, Cincinnati, Ohio, assignors of one-third to L. H. Buhrmann, same place. Filed Dec. 22, 1888. Serial No. 294,434. (No model.)



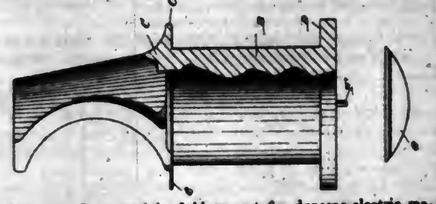
Claim.—1. A bung consisting of a flanged body-piece having a screw-threaded projection taking through a disk, which forms the bearing-surface of the bung, a clamping-piece adjustable on such projection, a vent-passage through the bung, and a valve therein, substantially as and for the purpose specified.

2. A bung consisting of a flanged body-piece having a screw-threaded projection taking through a disk, which forms the bearing-surface of the bung, a clamping-piece adjustable on said projection, a vent-passage through the bung, and a valve therein carried by a removable projection taking into said vent-passage, substantially as and for the purpose described.

3. A bung consisting of a body-piece, C, disk D, projection *d* taking through said disk, vent-passage *c'*, automatic downwardly-opening valve F, and removable projection *f*, substantially as and for the purposes specified.

399,087. APPARATUS FOR THE MANUFACTURE OF GAS. HENRY C. SHIELDS, Troy, N. Y. Filed Dec. 16, 1887. Serial No. 258,060. (No model.)

Claim.—1. In combination with a gas-generator provided with upper and lower gas-outlets and upper and lower steam-supply pipes leading to and connecting with reversing-valves, a valve-reversing lever common to and connected with each of said valves, whereby a single movement of the lever will reverse the direction of steam entering the generator and the direction of gas escaping therefrom, substantially as described, and for the purposes set forth.



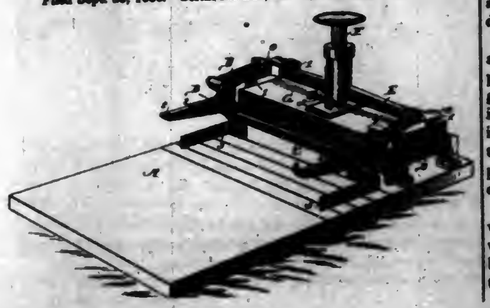
2. The combination, with a gas-generator having valved upper and lower gas-outlet pipes and upper and lower valved steam-supply pipes, of a valved runaround steam-supply pipe having connections leading to the interior of the generator through its sides at a plurality of points intermediately of the upper and lower steam-supply-pipe inlets to the generator, substantially as described.

3. A valve case having interiorly two circular valve-seats, each forming the mouth of one of two inlets to the case, and intermediately of said seats a third opening, which forms the outlet from said case, and a lever-chamber formed by lateral extension of the valve-case, in combination with a valve suspended between and movable from one to the other of said seats, and a valve supporting and actuating lever-arm vertically vibratory in said chamber and fixed upon an actuating-shaft passing through said chamber and projecting exteriorly from the valve-case, substantially as and for the purposes set forth.

4. The combination, with a gas-generator, of upper and lower gas-outlets, valved upper and lower steam-supply pipes, and a single valve-operating lever operative to conversely open and close the valvular openings in said supply-pipes, substantially as described, and for the purposes set forth.

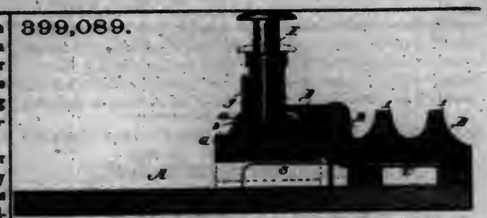
5. The combination, with a gas-generator, of an upper and lower steam-supply pipe, valved upper and lower gas-outlet pipes, and a single valve-operating lever operative to conversely open and close the valvular openings in said outlet-pipes, substantially as described, and for the purposes set forth.

399,088. DYNAMO-ELECTRIC MACHINE. WILLIAM L. SILVEY, Lima, Ohio. Filed Oct. 1, 1888. Serial No. 286,823. (No model.)



Claim.—1. In an upright field-magnet for dynamo-electric machines, the field-magnet core B, cast solid, the pole-piece C, and flanges C' D, in combination with the supplementary flange-plate *e*, for holding the wire in place and collecting and distributing the magnetism of the coils, as set forth.

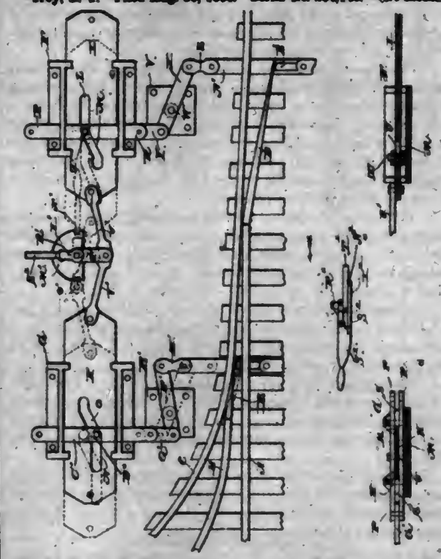
2. The field-magnet for a dynamo-electric machine, the pole-piece C, and the expanded flange C', cast solid, the front part, *e*, of a non-magnetic material, secured thereto by screws, as set forth.



3. In a dynamo-machine having salient poles, the combined base and heel plate A, upright field-magnets B B, their lower ends expanded into flanges D D, their upper ends forming pole-pieces C C, and flanges C' C' and *e e*, for holding the coils of wire in place, as set forth.

4. The combination, in the field-magnet core of a dynamo-electric machine, of the field-magnet core B, and the flange-piece D, cast thereon, and forming a connecting-block for joining the magnet to the base and heel-plate A, the upper end of the core D expanded into the pole-piece C, having a flange, C', as a part thereof, the flanges, pole-pieces, and core cast in one piece, to which a supplementary flange, *e*, is secured, as set forth.

399,089. PRINTING-STAMP. JOHN SCHWALM, Jr., Chicago, Ill. Filed Sept. 26, 1886. Serial No. 214,514. (No model.)

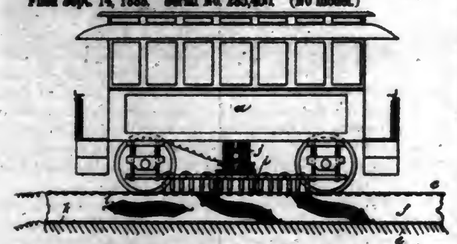


399,089.

Claim.—1. In a printing-stamp, the combination, with the die-plate, the vertical plunger carrying said die-plate, and the die-plate frame wherein said plunger is held in a manner free to move, of vertically-swinging arms whereby said die-plate frame is carried, standards in pivotal connection with the vertically-swinging arms, and stops or rests for sustaining the die-plate frame during the vertical downward movement of the plunger, substantially as described.

2. In a printing-stamp, the combination, with the die-plate and the vertical plunger, of the pivoted die-plate frame E, having rests or seats *c* at each side of its pivotal points, the standards provided with stops whereon said seats will bear, and vertically-swinging arms pivotally connected to the die-plate frame and the standards, whereby during the vertical movement of the plunger the pivoted die-plate frame will be guarded against movement about its pivot-bearings and in downward direction, substantially as described.

399,090. THREE-THROW SPLIT SWITCH. ARON D. SIMPSON, Troy, N. Y. Filed Aug. 30, 1888. Serial No. 284,140. (No model.)



Claim.—1. The combination, in a three-throw switch, of the frames, the longitudinally-movable plates therein having the oblique angled slots, the longitudinally-movable bars guided in the frames and having the bolts, sleeves, or rollers engaging the said slots, whereby said bars are adapted to be operated, the levers X F and links connecting them to the respective bars and switch-rails, the shaft K', mounted between the frames and having the arm T, the links connecting the said arm to the plates, whereby the latter may be operated in unison, and the lever attached to the shaft K', substantially as described.

2. The combination, with the main track and side track, B C, and the switch-rails D E, of the frames, the longitudinally-movable plates guided therein and having the oblique-angled slots, the bars guided in the frames and having the bolts, sleeves, or rollers engaging the slots, for the purpose set forth, the levers and links connecting the bars to the switch-rails, and the operating-lever and connections, substantially as set forth, between the same and the slotted plates, whereby the latter will be moved in unison, substantially as described.

3. In a railway-switch-operating mechanism, the combination, with the frame having the end and side flanges, the former being provided with the openings H, of the plate guided in said openings and between the side flanges, and provided with the oblique-angled slot, the bar guided in transverse openings in the said flanges, and con-

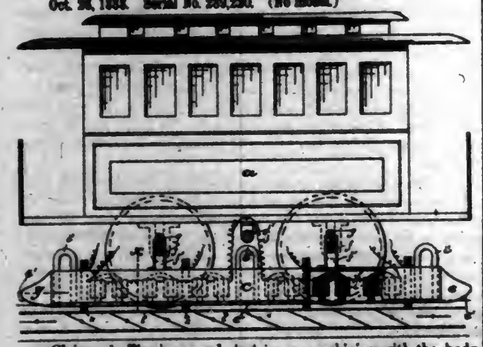
prising the upper and lower portions arranged on the upper and lower side of the plate, and the blocks connecting the ends thereof, the bolt roller, or sleeve secured to the bar and engaging the slot, the lever having one end connected to one end of the bar, and the link connecting the opposite end of the switch-rail, substantially as described.

399,091. ELECTRIC RAILWAY. HARRY W. SMITH, Newark, N. J. Filed Sept. 14, 1888. Serial No. 285,400. (No model.)

Claim.—1. The improved electrical railway having a sealed conduit provided with a conductor, an air-impelling device, *d*, contact-plates, and armatures for connecting said conductor and contact-plates, combined substantially as and for the purposes set forth.

2. The improved electrical railway herein described, combining therein a series of grooved stringers arranged to form a continuous conduit, a series of contact-plates arranged on the top of said stringers and insulated from one another, a series of armatures, a conducting-wire arranged in the groove of said stringers, and a packing or filling for insulating said contact-plates and sealing the conduit, substantially as and for the purposes set forth.

3. The improved electrical railway herein described, combining a longitudinally-grooved stringer, a series of insulated plates covering said groove and packed or sealed, and forming, with said stringer, a closed conduit, a conducting-wire arranged at the bottom of said groove, levers having armatures thereon arranged in said groove over said conducting-wire, and a packing or filling for sealing or closing the openings between said plates to provide an impervious passage in said stringer, substantially as set forth.



4. The improved electric railway combining therein stringers having a continuous passage therein open to allow air to be forced therethrough, plates *h h*, secured on said stringer, covering the groove or passage therein and insulated from one another, armatures, and a conductor, substantially as and for the purposes set forth.

5. In combination, in an electric railway, stringers having a passage, *f*, plates *h h*, a conductor, *k*, levers *m*, having an armature, *c*, and springs or brackets *s*, electrically connected, and stops *r*, all arranged and operating substantially as set forth.

6. The improved electric railway having a conduit, with a conductor and a series of armatures therein, and a series of non-magnetizable plates, *h h*, adapted to be engaged by said armatures and transmit the electric current to the car, substantially as and for the purposes set forth.
